The hypothesis that Oceania served as a highway for the diffusion of an "archaic civilization," originating in Egypt in the 3rd millennium B.C., and including the practices of sun worship, mummification and the building of megalithic structures; and that the stone monuments of Oceania are attributable to the bearers of this culture-complex, has been a subject of considerable controversy. If tradition is right in asserting that Polynesian migrations did not reach the eastern Pacific before the 6th or 7th centuries A.D., and if, as appears probable, these people were the builders of the monuments in that area, it is evident that the older civilizations of America cannot have been inspired by them. On the other hand, since they were in contact with Asia till a relatively late period, they can hardly have escaped the influence of old-world culture or have failed to carry some of its elements with them into the Pacific. The view that Oceania was peopled by migration from America finds little support at the present time. But the theory has recently been advanced that the monuments and culture of eastern Oceania may owe something to the influence of Central and South America, the coasts of which were quite probably visited by the intrepid Polynesian navigators. The absence of pottery has been used by others as an argument for the very early

isolation of the Polynesians; the loss of this art was, however, an inevitable result of prolonged wanderings among coral islands, where the material with which to practise it was not available.

OCEANUS, in Greek mythology, the river which encircles the earth (conceived as flat) (Gr. *Ὠκεανός*). Beyond it, to the west, are the land of the Cimmerians, where the sun never shines, the country of dreams, and the entrance of the underworld. Oceanus is in Hesiod (*Theog.* 133, 337-370) the son of Uranus and Ge, the husband of Tethys, father of 3,000 streams and 4,000 ocean nymphs. In Homer he is the origin of the gods. Herodotus and Euripides use the word in practically the modern sense of *ocean*; see **OCEAN**.

OCELLUS LUCANUS, a Pythagorean philosopher, born in Lucania in the 5th century B.C., perhaps a pupil of Pythagoras himself. Stobaeus (*Ecl. Phys.* i. 13) has preserved a fragment of his *Περὶ νόμων* (if he was really the author) in the Doric dialect but the only one of his alleged works which is extant is a short and unauthentic treatise *On the Nature of the Universe*.

Editions of the *Περὶ τῆς τοῦ παντὸς φύσεως*, by A. F. Rudolph (1801, with commentary), and by F. W. Mullach in *Fragmenta philosophorum graecorum*, i. (1860); H. Diels, *Die Fragmente der Vorsokratiker* (4th ed., 1922); Eng. trans. (1831) by Thomas Taylor. See also Überweg, *Grundriss der Gesch. der Philosophie*, Bd. i. (1926).

OCHINO, BERNARDINO (1487-1564), Italian Reformer, was born at Siena. He entered the order of Observantine Friars, the strictest sect of the Franciscans, and rose to be its general, but, craving a yet stricter rule, transferred himself in 1534 to the newly founded order of Capuchins, of which in 1538 he was elected vicar-general. In 1539 he delivered at Venice a remarkable course of sermons, showing a tendency to the doctrine of justification by faith, which is more marked in his *Dialogi VII.* published soon after. He was suspected and denounced, and when the Inquisition was established at Rome, Ochino was at once cited, but was deterred from presenting himself at Rome by the warnings of Peter Martyr and of Cardinal Contarini. After some hesitation he escaped across the Alps to Geneva. He was cordially received by Calvin, and within two years published six volumes of

Prediche (Eng. trans., Ipswich, 1548), tracts rather than sermons, explaining and vindicating his change of religion. He was minister of the Italian Protestant congregation at Augsburg from 1545 until 1547, when the city was occupied by the imperial forces in the Schmalkaldic War. Escaping by way of Strasbourg he found an asylum in England, where he was made a prebendary of Canterbury, received a pension from Edward VI.'s privy purse, and composed his chief work, *A Trajedy or Dialogue of the unjust usurped Primacy of the Bishop of Rome* (1549), originally written in Latin, but extant only in the translation of John Ponet, bishop of Winchester. The conception of the *Trajedy* bears a remarkable resemblance to that of *Paradise Lost*; and it is almost certain that Milton, whose sympathies with the Italian Reformation were so strong, must have been acquainted with it, and with some of Ochino's later works. In the *Labyrinth* (dedicated to Queen Elizabeth), he assailed the Calvinistic doctrine of predestination.

The accession of Mary in 1553 drove him from England, and he became pastor of the Italian congregation at Zürich. In 1563 the publication of his *Thirty Dialogues*, in one of which his adversaries maintained that he had justified polygamy under colour of a pretended refutation, led to his banishment. He found refuge in Poland until the edict of the 6th of August, 1564, banished all foreign dissidents. He died at Schlakau in Moravia, about the end of 1564.

See *Life* by B. O. Benrath (2nd ed., Brunswick, 1892; Eng. trans. by Helen Zimmern, 1876).

OCHRES, which vary in colour from pale yellow to deep red, brown and violet, and are native earths coloured with hydrated iron oxide, are of two kinds—one having a clayey basis, while the other is a chalky earth; the former variety is in general the richer and purer in colour of the two. Both kinds are widely distributed in beds or pockets, mainly in stratified rocks and rubble and rarely as extensive deposits. Some ochres require only grinding, whereas other varieties require calcination whereby the original colour is modified. In this process the associated earth exercises a marked influence, clayey ochres developing red and violet tints, while chalky varieties take brownish-red and dark brown hues. The well-known ochre, Terra di Siena, which in its native state is a dull-coloured earth, assumes when burnt a fine warm mahogany-brown hue highly valued by artists. Ochres containing much organic matter are sometimes calcined to improve their drying properties in varnish or oil. Ochres are also artificially prepared in large quantities—Mars yellow is either a pure hydrated ferric oxide or an intimate mixture of that substance with an argillaceous or calcareous base, and such compounds by careful calcination can be transformed into Mars orange, violet or red, all reliable pigments. See PAINTS, CHEMISTRY OF.

OCHRIDA (Serbo-Croatian *Ohrid*), a city of South Serbia, Yugoslavia, on the north-east shore of Lake Ochrida. Pop. (1921), 9,603, mainly Albanians, with some Serbs and Bulgars. The lake, 2,260 ft. above sea level, with an area of 107 sq.m. and a maximum depth of 938 ft., lies amid magnificent mountain scenery and is famous for its salmon trout. Malaria is prevalent. Ochrida occupies the site of the ancient *Lychnidos*, which was added to the Macedonian empire by Philip II. (382–336 B.C.) and destroyed by the Bulgars in A.D. 861. The Bulgarian tsar, Samuel, made Ochrida his capital, but was expelled, and in 1014 his empire was conquered by the Greek emperor Basil II. The see of Ochrida was founded by St. Clement in 916, and during the Bulgarian occupation their patriarchate was established here. In 1459 the Serbian patriarchate being suppressed, the administration of the Church was transferred to Ochrida. In 1890 a Bulgarian bishop was appointed to the see, which has since been the centre of Bulgarian propaganda.

OCHS, ADOLPH SIMON (1858–), American newspaper publisher, was born in Cincinnati, O., on March 12, 1858, of well educated Jewish parents who had emigrated in their youth to the United States from Bavaria. The father, Julius Ochs, was

an officer of the U.S. forces in the Mexican War of 1848, and the Civil War 1861–65. In 1865 the family settled in Knoxville, Tenn., where Adolph while attending primary schools delivered newspapers. At the age of 14, he became a printer's devil on the *Knoxville Chronicle*. In 1875–76 he was employed as a compositor by the *Louisville* (Ky.) *Courier Journal*. In 1877 he assisted in establishing the *Chattanooga Dispatch*, and in 1878, at the age of 20, with little or no capital, he gained control of the *Chattanooga Times*, a decrepit newspaper. Assuming the duties of publisher, editor and business manager, he soon placed it on a firm basis, and brought it to a leading position among Southern newspapers. His activities in promoting the growth and prosperity of Chattanooga won him the sobriquet "Builder of Chattanooga," and on his fiftieth anniversary as proprietor and publisher of the *Chattanooga Times* was officially acclaimed "Citizen Emeritus of Chattanooga." He was also a founder of the Southern Associated Press.

In 1896 he acquired the controlling ownership of *The New York Times*, which was in financial difficulties after 30 years of prosperity, and formed The New York Times Company. With a ripe experience in all departments of newspaper making, he steadily strengthened the paper's journalistic and financial position, and resuscitated it from a bankrupt newspaper with less than 10,000 bona fide circulation to a net paid sale (1929) of 425,000 copies week-days and 750,000 Sundays, and from 2,000,000 to 30,000,000 agate lines of advertising annually. Times square, New York, was named after the Times building, which was erected in 1905. It was an early attempt to make a "skyscraper" architecturally attractive, for the tower was fashioned after the famous Campanile of Giotto, in Florence.

The influence of Ochs upon newspaper publishing in the United States has been marked and beneficial. Entering New York publishing when so-called "yellow journalism" was at its height, and in competition with half a dozen of the richest and most powerful newspapers in America, he boldly adopted the slogan, "All The News That's Fit to Print," and devoted his paper not to sensations, but to giving intelligent readers a daily news report, trustworthy, complete, non-partisan and decent. In a few years, Ochs made *The Times* the outstanding example of enterprise in news gathering, spending \$500,000 annually on cable, wireless and telegraph tolls. *The Times* identified itself with pioneers and explorers in various fields—Marconi, Peary, Lindbergh, Byrd (North and South Pole and transatlantic flights), Amundsen, Ellsworth, Scott, Shackleton and others. *The Times* is classed as Independent Democratic, an advocate of sound money, tariff reform, the League of Nations, World Court and the commercialization of debts between nations. It opposed Bryan in his presidential aspirations and was an outstanding supporter of President Wilson. It is more widely read throughout the United States than any other American newspaper.

Steadily withstanding the temptation to print a "comic" section and other features detached from the news of the day, Ochs was a pioneer in many newspaper innovations, among which were the introduction in newspapers of rotogravure printing of news pictures, a book review supplement and an open forum for letters to the editor with the widest latitude for the presentation of views in conflict with the editorial view of *The Times*. Ochs has made *The New York Times* "The newspaper of record" by printing an edition on rag paper for libraries and those who preserve records, and *The Times* also publishes the only complete American newspaper index. He was a pioneer in adoption of standards to improve newspaper advertising typography, and of censorship of advertising so as to exclude whatever is false or misleading. In 1918 the trustees of Columbia university awarded *The New York Times* the first Pulitzer Gold Medal in Journalism for Meritorious Public Service. On May 4, 1927, the National Institute of Social Sciences awarded to Ochs its gold medal for his service to society in promoting and maintaining high standards of journalism.

Ochs and The New York Times Company underwrote in 1925, at a cost of over \$500,000, the preparation of the manuscript of the *Dictionary of American Biography* by the Learned Societies of America, and supports the preparation of the *American Year Book*.

Mr. Ochs has been a conspicuous leader in the establishment and preservation of public parks. He was one of the originators and incorporators of the Chickamauga-Chattanooga National park. He is also the originator and supporter of the Lookout Mountain and Chattanooga park and is an active supporter of the Saratoga Battlefield park. His alert defence of Central park in New York city from invasion and alteration from its original purpose has given *The New York Times* the reputation of being "The Watch-dog of Central park."

Ochs was an organizer of the Publishers' Association of the City of New York, and has been for 25 years a director of the Associated Press. In 1901 he became proprietor of the *Philadelphia Times*, which he merged with the *Public Ledger* and sold to Cyrus H. K. Curtis in 1912.

For the story of *The New York Times* see *History of the New York Times* by Elmer Davis (1921) and *Seventy-fifth Anniversary Supplement of the New York Times*, published Sept. 18, 1926. For the history of the *Chattanooga Times* see *Chattanooga Times Jubilee Issue*, July 1, 1928.

OCHTERLONY, SIR DAVID, Bart. (1758–1825), British general, was born at Boston, Mass, U.S.A., on Feb. 12, 1758, and went to India as a cadet in 1777. He served under Lord Lake in the battles of Koil, Aligarh and Delhi, and was appointed resident at Delhi in 1803. In 1804, having been promoted to the rank of major-general, he defended the city with a very inadequate force against an attack by Holkar. He served in the Nepal War (1814–15), which he brought to a successful conclusion; and in the Pindari War (1817–18) he was equally successful. He was appointed resident in Rajputana in 1818, with which the residency at Delhi was subsequently combined. When Durjan Sal revolted in 1825 against Balwant Singh, the infant Raja of Bharatpur, Ochterlony acting on his own responsibility supported the raja by proclamation and ordered out a force to support him. Lord Amherst, however, repudiated these proceedings. Ochterlony, who was bitterly chagrined by this rebuff, resigned his office, and retired to Delhi. He died at Meerut on July 15, 1825.

See Major Ross of Bladensburg, *The Marquess of Hastings* ("Rulers of India" series) (1893).

OCHTMANN, LEONARD (1854–), American painter, was born in Zonnemaire, Zeeland, Holland, on Oct. 21, 1854. His family removed to Albany (N.Y.), in 1866. In 1882 he began to exhibit landscapes at the National Academy, and he became a National Academician in 1904. His most characteristic pictures, which recall the work of Inness, are scenes on Long Island sound and on the Mianus river.

OCKLEY, SIMON (1678–1720), English orientalist, was born at Exeter in 1678. He was educated at Queen's College, Cambridge, became fellow of Jesus College and vicar of Swavesey, and in 1711 was made professor of Arabic at Cambridge. The pecuniary embarrassments of his later days form the subject of a chapter in D'Israeli's *Calamities of Authors*. The preface to the second volume of his *History of the Saracens* is dated from Cambridge Castle, where he was imprisoned for debt. His chief work is *The History of the Saracens* (1708–1718 3rd. posthumous, vol. 1757). Unfortunately Ockley took as his main authority a ms. in the Bodleian of the pseudo-Wakidi's *Futuh al-Sham*, which is rather historical romance than history.

O'CLERY, MICHAEL (1575–1643), Irish chronicler, grandson of a chief of the sept of O'Clery in Donegal, was born at Kilbarrow on Donegal Bay, and was baptized Tadhg (or "poet"), but took the name of Michael when he became a Franciscan friar. He had already gained a reputation as a student of Irish history and literature, when he entered the Irish College of St. Anthony at Louvain. In 1620, through the initiative of Hugh Boy Macanward (1580–1635), warden of the college, and himself a famous Irish historian and poet, and one of an old family of hereditary bards in Tyrconnell, he began to collect Irish manuscripts and to transcribe everything he could find of historical importance; he was assisted by other Irish scholars, and the results were his *Reim Rioghroidhe* (Royal List) in 1630, *Leabhar Gabhala* (Book of Invasions) in 1631, and his most famous work, called by John Colgan (d. 1659), the Irish biographer, the "Annals of the Four Masters" (1636). Subsequently he produced his

Martyrologium of Irish saints, based on various ancient manuscripts, an Irish glossary and other works. He lived in poverty, and died at Louvain.

OCONEE BELLS (*Shortia galacifolia*), a rare North American plant of the family Diapensiaceae, called also little colt's-

BY COURTESY OF THE WILD FLOWER PRESERVATION SOCIETY

OCONEE BELLS (*SHORTIA GALACIFOLIA*), A RARE PLANT FOUND IN THE CAROLINA MOUNTAINS

foot, found only locally in the mountains of North and South Carolina. It is an early-blooming stemless herb, with round, shining, slightly-toothed leaves borne on stalks rising from the base, and beautiful white, somewhat bell-shaped flowers, each solitary on a stalk, 3 to 6 in. long, which rises above the leaves. It is sparingly cultivated as an ornamental plant.

O'CONNELL, DANIEL (1775–1847), Irish statesman, known as "the Liberator," was born on Aug. 6, 1775, near Cahirciveen, a small town in Kerry. He was sprung from a race the heads of which had been Celtic chiefs, had lost their lands in the wars of Ireland, and had felt the full weight of the harsh penal code which long held the Catholic Irish down. His ancestors in the 18th century had sent recruits to the famous brigade of Irish exiles in the service of France, and those who remained at home either lived as tenants on the possessions of which they had once been lords, or gradually made money by smuggling. While a boy he was adopted by his uncle, Maurice O'Connell of Derrynane, and sent to a school at Queenstown, and then to the colleges of St. Omer and Douai in France.

In 1798 O'Connell was called to the bar of Ireland, where he came rapidly to the front. In examining witnesses, he had no rival at the Irish bar. He was, however, a thorough lawyer besides, inferior in scientific learning to two or three of his most conspicuous rivals, but well read in every department of law, and especially a master in all that relates to criminal and constitutional jurisprudence; as an advocate, too, he stood in the very highest rank.

From early manhood O'Connell had turned his mind to the condition of Ireland and the mass of her people. The worst severities of the penal code had been, in a certain measure, relaxed, but the Catholics were still in a state of vassalage, and they were still pariahs compared with the Protestants. The rebellion of 1798 and the union had dashed the hopes of the Catholic leaders, and their prospects of success seemed very remote when, in the first years of the 19th century, the still unknown lawyer took up their cause. Up to this juncture the question had been in the hands of Grattan and other Protestants, and of a small knot of Catholic nobles and prelates; but they aimed only at a kind of compromise, which, while conceding their principal claims, would have placed their church in subjection to the state. O'Connell gave the Catholic movement an energy it had not before possessed. He formed the bold design of combining the Irish Catholic millions, under the superintendence of the native priesthood, into a vast league against the existing order, and of wresting the concession of the Catholic claims from every opposing party in the state by continuous agitation, embracing almost the whole of the people, but maintained within constitutional limits, though menacing and shaking the frame of society. The Catholic Association, at first small, but slowly assuming larger proportions, was formed; attempts of the government and of the local authorities to put its branches down were skillfully baffled by legal devices of many kinds; and at last, after a conflict of years, all Catholic Ireland was arrayed in a powerful organization. O'Connell stood at the head of this great national movement which, controlled from first to last by himself and the priesthood, was essentially conservative in character. His election for Clare in 1828 proved the forerunner of the inevitable change, and the Catholic claims were granted the next year.

O'Connell joined the Whigs on entering parliament, and gave effective aid to the cause of reform. The agitation, however, on the Catholic question had quickened the sense of the wrongs of

Ireland, and the Irish Catholics were engaged ere long in a crusade against tithes and the established church, the most offensive symbols of their inferiority in the state. It may be questioned whether O'Connell was not rather led than a leader in this; the movement, at least, passed beyond his control, and the country for many months was terrorized. Lord Grey proposed measures of repression which O'Connell opposed with extreme vehemence. This caused a breach between him and the Whigs; but he gradually returned to his allegiance to them when they practically abolished Irish tithes, cut down the revenues of the established church and endeavoured to secularize the surplus. In the British House of Commons O'Connell stood in the front rank as a debater; and his oratory, massive and strong in argument, made a powerful impression. O'Connell steadily supported Lord Melbourne's government, gave it valuable aid in its general measures, and repeatedly expressed his cordial approval of its policy in advancing Irish Catholics to places of trust and power in the state, though personally he refused a high judicial office. He sincerely advocated the rights of conscience, the emancipation of the slave and freedom of trade. But his rooted aversion to the democratic theories imported from France grew stronger with advancing age. His conservatism was most apparent in his tenacious regard for the claims of property. He actually opposed the Irish Poor Law, as encouraging a communistic spirit; he declared a movement against rent a crime, though he advocated a reform of the precarious tenure enjoyed by the Irish peasant.

O'Connell changed his policy as regards Ireland when Peel became minister in 1841. He declared that a Tory régime in his country was incompatible with good government, and he began an agitation for the repeal of the union. He had denounced the union in early manhood as an obstacle to the Catholic cause; he had spoken against the measure in parliament; he believed that the claims of Ireland were set aside or slighted in what he deemed an alien assembly; and, though he had ceased for some years to demand repeal, and regarded it as rather a means than an end, he was throughout life an avowed repealer. In his judgment the repeal of the union would not weaken the real bond between Great Britain and Ireland. The Catholic Association of 1828-29 was recreated for the new project. Enormous meetings convened by the priesthood, and directed or controlled by O'Connell, assembled in 1842-1843, and probably nine-tenths of the Irish Catholics were unanimous in the cry for repeal. O'Connell seems to have thought success certain; but he had not perceived the essential difference between his earlier agitation and this. The enlightened opinion of the three kingdoms for the most part approved the Catholic claims, and as certainly it condemned repeal. After some hesitation Peel resolved to put down the repeal movement. A vast intended meeting was proclaimed unlawful, and in October 1843 O'Connell was arrested and held to bail, with ten or twelve of his principal followers. He was convicted (February 1844) after the trials that followed, but the judges were biased, and the sentence of imprisonment for a year and a fine of £2,000 was reversed on a writ of error by the House of Lords (September 1844), and he and his colleagues were again free. The spell, however, of O'Connell's power had vanished; his health had suffered much from a short confinement; he was verging upon his seventieth year; and he was disturbed by the growth of a party in the repeal ranks who scoffed at his views, and advocated the revolutionary doctrines which he had always feared and abhorred. Before long famine had fallen on the land, and under this visitation the repeal movement, already paralysed, collapsed. O'Connell died on May 15, 1847, at Genoa, whilst on his way to Rome. His body was brought back to Dublin and buried in Glasnevin cemetery.

Catholic Ireland calls O'Connell her "Liberator" still; he possessed the wisdom, the caution and the tact of a real statesman. But the battle in which he fought was not to be won in his generation. O'Connell married in 1802 his cousin Mary O'Connell, by whom he had three daughters and four sons, Maurice, Morgan, John (1810-1858), known as the "Young Liberator," and Daniel, who all sat in parliament.

See his son, John's, *Life* (1846) and *Recollections and Experiences*

(1849), the biographies by W. Fagan (1847), M. F. Cusack (1872), J. O'Rourke and O'Keefe (1875), and J. A. Hamilton (1888); also R. Dunlop, *Daniel O'Connell and the Revival of National Life in Ireland* (1900), R. Houston, *Daniel O'Connell: his Early Life and Journal, 1795-1802* (1906), and A. Zimmermann, *Daniel O'Connell der Befreier und seine politische Bedeutung für Irland und England* (Paderborn, 1909).

O'CONNOR, FEARGUS EDWARD (1794-1855), Chartist leader, was the son of the Irish Nationalist politician Roger O'Connor. He entered parliament as M.P. for Cork and a follower of O'Connell in 1832; but three years later the "Liberator" had him unseated, by petition, for his indiscipline. He then turned to Radical agitation in England and on the publication of the Charter in 1838 became one of the best known Chartist leaders. Owing to his rough humour, his energy and his invective he became their most popular speaker, and the circulation of his journal, the *Northern Star*, outstripped all others. He advocated physical force, generally, however, with the proviso that moral force must be tried first, and at the Chartist convention of 1839 acquiesced on William Lovett's "moral force" leadership. Although not concerned in the insurrection of 1839 he was imprisoned for a year upon another charge. In 1841 he reorganized the movement by the foundation of the National Charter Association, and attained a position of such power that he was able practically to expel or silence Lovett and all others who advocated compromise with the middle class. But though he raised Chartism to its greatest power he was unable to direct it to victory. He permitted the general strike of 1842; in the midst of it his fears overcame him and he condemned it, securing its immediate defeat. After this fiasco he diverted Chartist energies to the support of his land company scheme for settling town workers on small holdings. For a while this appeared successful, and a first settlement, named O'Connorville, was opened at Herringsgate, Bucks. He was also elected M.P. for Nottingham in 1847. Next year, however, the company was found to be bankrupt, and the ignominious collapse of the revolutionary agitation of that year, to which he had pinned his hopes, made O'Connor's behaviour, already eccentric, plainly maniacal. He was, very belatedly, declared insane in 1852 and died in 1855. His funeral procession, 50,000 strong to Kensal Green, may be regarded as the last Chartist demonstration.

O'Connor was a tall, loud-voiced, handsome man, of unlimited devotion and energy and great oratorical powers; he was, however, vacillating, excessively vain, jealous and of small intellectual powers. (See CHARTISM.) (R. W. P.)

OCONOMOWOC, a city of Waukesha county, Wisconsin, U.S.A., on Federal highway 16, 33 m. W. of Milwaukee; served by the Chicago, Milwaukee, St. Paul and Pacific and the Milwaukee Electric railways. Pop. (1920) 3,301. It is a popular summer resort in a region of lakes. The city was founded about 1837 and incorporated in 1875. Its name is an Indian word said to mean "home of the beaver."

O'CONOR, CHARLES (1804-1884), American lawyer, was born in the City of New York on January 22, 1804. He was admitted to the bar in 1824. From 1853 to 1854 he was United States district attorney for New York. After the Civil War he became senior counsel for Jefferson Davis on his indictment for treason, and was one of his bondsmen. He took a prominent part in the prosecution of William M. Tweed and members of the "Tweed Ring" and published *Peculation Triumphant, Being the Record of a Five Years' Campaign against Official Malversation, A.D. 1871-1875* (1875). He removed to Nantucket, Mass., in 1881, and died there on May 12, 1884.

OCONTO, a city of north-eastern Wisconsin, U.S.A., on the W. shore of Green bay (Lake Michigan) at the mouth of the Oconto river; the county seat of Oconto county. It is on Federal highway 41, and is served by the Chicago and North Western and the Chicago, Milwaukee, St. Paul and Pacific railways. Pop. (1920) 4,920. It has a large fishing industry and several manufacturing plants. It was founded in 1846 and chartered in 1882.

OCORONAN, a small group of tribes of South American Indians, provisionally regarded as constituting an independent linguistic stock. The Ocoronas live or lived in eastern Bolivia along the upper Mamore river, at the missions of San Ignacio,

San Martin and Santa Rosa de Moxos. Apart from brief references to them by the early missionaries, little is known concerning their culture. Rivet believes that the Ocoronas are merely a sub-group of the Chapacuran (*q.v.*) stock.

See G. de Crequi-Montfort and P. Rivet, "La Famille linguistique Capakura" (*J. Soc. Américanistes de Paris* [n.s.] vol. x, pp. 119-173).

OCOTILLO (*Fouquieria splendens*), a North American shrub of the candle-wood family (Fouquieriaceae), called also coach-whip, Jacob's-staff and vine-cactus. It is a characteristic shrub of rocky deserts from western Texas to southern California and southward in Mexico. Near the base the stem divides into several slender, erect, furrowed, intensely spiny branches, usually from 8 to 20 ft. high. It bears small rounded leaves, the midribs of which harden into the spines, and showy bright-scarlet flowers in terminal clusters. The ocotillo is sometimes grown as a hedge plant; in Mexico the branches are woven into fences.

OCTAHEDRON: see SOLIDS, GEOMETRIC.

OCTAVE, a period or series of eight members. In ecclesiastical usage the octave is the eighth day after a particular church festival, the feast day itself and the "octave" being counted. The octave thus always falls on the same day of the week as the festival, and any event occurring during the period is said to be "in the octave." In music, an octave is the eighth full tone above or below any given note. It is produced by double or half the number of vibrations corresponding to the given note. In the interval between a note and its octave is contained the full scale, the octave of a note forming the starting-point of another scale of similar intervals to the first. The interval between a note and its octave is also called an octave. The name is also applied to an open metal stop in an organ, and to a flute (more usually known as the piccolo) one octave higher in pitch than the regular flute. It is also a term for a "parade" in fencing. The "law of octaves" was a term applied in 1865 to a relationship among the chemical elements enunciated by J. A. R. Newlands.

In literature an octave is a form of verse consisting of eight iambic lines, and complete in itself. From its use by the poets of Sicily, the form is usually called the Sicilian octave. It is distinguished from a single stanza of *ottava rima* by having only two rhymes, arranged *abababab*. In German literature the octave has been used not infrequently since 1820, when Ruckert published "Sicilianen," as they are called in German, for the first time. The word is often used to describe the eight opening lines of a sonnet.

OCTAVIA, the name of two princesses of the Augustan house. (1) Octavia, daughter of Gaius Octavius and sister of the emperor Augustus, was the wife of Gaius Marcellus, one of the bitterest enemies of Julius Caesar. In 41 B.C. her husband died, and she was married to Marcus Antonius, with the idea of bringing about a reconciliation between him and her brother. Her efforts were at first successful, but in 36 Antony left for the Parthian War and renewed his intrigue with Cleopatra. Though Octavia took out troops and money to him (35), he refused to see her and formally divorced her in 32. (2) OCTAVIA, daughter of the emperor Claudius, was the wife of Nero, by whom she was put to death. A Latin tragedy on her fate is attributed, though wrongly, to Seneca.

OCTOBER, the eighth month of the old Roman year, which began in March. In the Julian calendar, while retaining its old name, it became the tenth month, and had 31 days assigned to it. Several attempts were made to rename the month in honour of the emperors. Thus it was in succession temporarily known as Germanicus, Antoninus, and Hercules, the last a surname of Commodus. The senate's attempt to christen it Faustinus in honour of Faustina, wife of Antoninus, was equally unsuccessful. By the Slavs it is called "yellow month," from the fading of the leaf; to the Anglo-Saxons it was known as Winterfylleth, because at this full moon (*fylleth*) winter was supposed to begin.

OCTOPUS, the name given in zoology to a single genus of eight-armed Cephalopoda (*q.v.*), one of whose distinguishing characters is the presence of two rows of suckers on each arm. As a less strictly defined term the name may be given to all the eight-armed Cephalopoda, of which some 36 genera have been described (*e.g.*, *Eledone*, *Cirrotheuthis*, *Argonauta*). The genus

Octopus is a large one containing upwards of 140 species. Its representatives occur in nearly all seas (though it is poorly represented in Arctic and Antarctic waters) and some are found at great depths. *Octopus vulgaris* is found on British coasts (principally in the south), but it has a limited distribution in these waters, and is not often taken, the allied *Eledone cirrosa* being more common.

The sucker-bearing arms, strong jaws and sinister appearance of these animals have conferred on them a name for ferocity which is not undeserved. The stories of their attacks on man are sufficiently well attested, though they are often exaggerated.

The octopus moves about by means of its arms on the sea bottom, and is not habitually free-swimming, though like other Cephalopods, it can propel itself through the water by means of the funnel (see CEPHALOPODA). *Octopus* and the related genus *Eledone* live on the sea-bottom and are mainly found in shallow coastal water. According to Lo Bianco the common octopus in the Gulf of Naples prefers rocky situations for its lair during its early years. Certain forms (*e.g.*, *Benthoctopus*) are found in very deep water, the greatest depth from which a member of the genus *Octopus* has been obtained being 1,875 fathoms. Other Octopods, however, are inhabitants of the open sea and are found swimming or floating at the surface (*Argonauta*) or at greater depths (*Eledonella*, *Cirrotheuthis*). A species of *Eledonella* has been taken at a depth of 2,900 fathoms. Those which live permanently in very deep water are usually highly modified, having gelatinous tissues, large medusiform webs and reduced gills and dentition.

The common octopus feeds principally on crabs. Lo Bianco has shown that before killing its victims it paralyses them with a poison secreted by its salivary glands. The same observer has recorded that the common octopus in captivity will devour its own arms even if it is amply supplied with its normal food. Certain species of octopus attain a considerable size. The common octopus, *O. vulgaris*, sometimes spans over six feet with its arms and the giant *O. punctatus* of the Pacific has been known to have a diameter of 28 feet.

Most species of this genus lay eggs in grapelike clusters. Lee states that the female *O. vulgaris* broods over the clusters, holding them in the membranous expansion of its arms and syringing them with jets of water from its funnel (see CEPHALOPODA).

Octopods are eaten fresh or dried by the natives of many parts of the world. The flesh of young *O. vulgaris* is still considered a delicacy in Naples.

It has been mentioned above that the true octopus (*Octopus vulgaris*) is usually rare on the English coast. In 1899 and 1900, however, they became so abundant on the south coast as to attract general notice, and to constitute a veritable plague.

OCTOSTYLE, in architecture, a portico with eight columns in front.

OCTROI, a local tax collected on various articles brought into a district for consumption (O. Fr. *octroyer*, to grant, authorize; Lat. *auctor*).

The prescribed groups of commodities, upon which these indirect taxes were levied in 1927 by 1,092 local authorities in France (for the Alsace-Lorraine *octroi* is still governed by the pre-war German regulations) upon their entry for consumption into their area, are six, namely (1) liquids (artificial gaseous drinks, non-alcoholic beverages; vinegar; vegetable oils); (2) foods (meats, poultry, game, fish, butter, eggs, cheese, jams, fruits, etc.); (3) fuel (wood, coal, coke, candles, mineral oils, etc.); (4) fodder (fresh oil-cakes, dog biscuits, etc.); (5) building materials (plaster, lime, stone, bricks, slates, metals, sanitary appliances, woods, glass, etc.); and (6) miscellaneous (soaps, polishes, varnishes, paints, etc.). By presidential decree maximum *octroi* tariff rates for the whole of France must be published officially for all the separate classes within the above groups, particular scales being

OCTOPUS OR DEVIL FISH

This under-water photograph of an octopus shows the animal crawling on the ocean bottom supported by three of its eight arms. The arms are sucker bearing and are used in capturing crustaceans, the animal's chief food, which have been previously paralyzed with a poison secreted by its salivary glands. Octopods also feed on bivalve molluscs and fishes

BY COURTESY OF UFA

fixed according to the six population grades of localities. (Thus in the general tariff of July 1927, the rate on beef is 15 francs per cwt. in the grade under 1,000 inhabitants, 20 francs per cwt. in those from 1 to 10 thousand and 33 francs in those with over 100,000; that on butter per kilogramme ranges from 15 to 40 centimes, on coal per cwt. from 30 centimes to one franc; on petrol per 2 cwt. from 15 to 40 francs.) By a law of Feb. 1918 all *octroi* duties on alcoholic beverages, except on wine in bottle, were abolished. The general regulation of the system was profoundly altered by the law of Aug. 13, 1926, which gave greater freedom of action to the local and prefectural authorities, within the framework of the general tariff, to modify rates or introduce new taxes, and permitted the central government to establish general regulations for the working of the system.

In 1926, out of a total of 1,042 *octrois* (apart from 18 in Alsace-Lorraine), 833 were collected directly, 116 were farmed out, one only (and it was the first instance for a long period of years) being under the farming out with participation system, and 92 employed the revenue authority mentioned. The total population subject to the *octroi* in these 1,042 localities was 14,370,500. The number of *octrois* in France has much diminished since 1918 when the total was 1,491; and for 1927 or Jan. 1928 several noteworthy towns decided to abandon the system (e.g., Bordeaux, Perpignan, Troyes, Clermont-Ferrand, Chalons, St. Mihiel). There is a fairly strong abolition movement on foot which receives the vigorous support of the large body of motorists; the great difficulty is the provision of acceptable substitute local taxes especially in Paris. Lyons discarded it many years ago, and in her department (Rhône) there are only two *octrois*. They appear most numerous in the south-west and Provençal departments, where in some are found over 40 *octrois*.

In Belgium *octroi* duties were abolished in 1870, being replaced by an increase in customs and excise duties; and in 1903 those in Egypt were also abolished. *Octroi* duties exist in Italy, Spain, Portugal and in some of the towns of Austria.

O'CURRY, EUGENE (1796–1862), Irish scholar, was born at Dunaba, county Clare, in 1796, the son of a farmer who was a man of unusual intelligence. After being employed for some time in the topographical and historical section of the Irish ordnance survey, O'Curry earned his living by translating and copying Irish manuscripts. The catalogue of Irish manuscripts in the British Museum was compiled by him. On the founding of the Roman Catholic University of Ireland (1854) he was appointed professor of Irish history and archaeology. His lectures were published by the university in 1860. Three other volumes of lectures were published posthumously, under the title *On the Manners and Customs of the Ancient Irish* (1873). His voluminous transcripts, notably eight huge volumes of ancient Irish law, testify to his unremitting industry. He died in Dublin in 1862.

ODAENATHUS or **ODENATUS** (Gr. *Ὀδαθάθος*, Palm, ܐܕܢܐܬܐ = "little ear"), the Latinized form of ODAINATH, the name of a famous prince of Palmyra, in the second half of the 3rd century A.D., who succeeded in recovering the Roman East from the Persians and restoring it to the Empire. He belonged to the leading family of Palmyra, which bore, in token of Roman citizenship, the *gentilicium* of Septimius; hence his full name was Septimius Odaïnath (Vogüé, *Syrie centrale*, Nos. 23, 28 = Cooke, *North-Semitic Inscr.* Nos. 126, 130). It is practically certain that he was the son of Septimius Hairân the "senator and chief of Tadmor," the son of Septimius Odaïnath "the senator" (*N.S.I.* p. 285). The year when he became chief of Palmyra is not known, but already in an inscription dated A.D. 258 he is styled "the illustrious consul our lord" (*N.S.I.* No. 126). He possessed the characteristic vigour and astuteness of the old Arab stock from which he sprang; and in his wife, the renowned Zenobia (*q.v.*), he found

an able supporter of his policy. The defeat and captivity of the emperor Valerian (A.D. 260) left the eastern provinces largely at the mercy of the Persians; the prospect of Persian supremacy was not one which Palmyra or its prince had any reason to desire. At first, it seems, Odaïnath attempted to propitiate the Parthian monarch Shâpûr (Sapor) I.; but when his gifts were contemptuously rejected (Petr. Patricius, § 10) he decided to throw in his lot with the cause of Rome. The neutrality which had made Palmyra's fortune was abandoned for an active military policy which, while it added to Odaïnath's fame, in a short time brought his native city to its ruin. He fell upon the victorious Persians returning home after the sack of Antioch, and before they could cross the Euphrates inflicted upon them a considerable defeat.

Then, when two usurping emperors were proclaimed in the East (A.D. 261), Odaïnath took the side of Gallienus the son and successor of Valerian, attacked and put to death the usurper Quietus at Emesa (Höms), and was rewarded for his loyalty by the grant of an exceptional position (A.D. 262). He may have assumed the title of king before; but he now became "totius Orientis imperator," not indeed joint-ruler, nor Augustus, but "independent lieutenant of the emperor for the East" (Mommson, *Provinces*, ii. p. 103)¹. In a series of rapid and successful campaigns, during which he left Palmyra under the charge of Septimius Worod his deputy (*N.S.I.* Nos. 127–129), he crossed the Euphrates and relieved Edessa, recovered Nisibis and Carrhae, and even took the offensive against the power of Persia, and twice invested Ctesiphon itself, the capital; probably also he brought back Armenia into the Empire. These brilliant successes restored the Roman rule in the East; and Gallienus did not disdain to hold a triumph with the captives and trophies which Odaïnath had won (A.D. 264).

While observing all due formalities towards his overlord, there can be little doubt that Odaïnath aimed at independent empire; but during his lifetime no breach with Rome occurred. He was about to start for Cappadocia against the Goths when he was assassinated, together with Herôdes his eldest son, by his nephew Maconius; there is no reason to suppose that this deed of violence was instigated from Rome. After his death (A.D. 266–267) Zenobia succeeded to his position, and practically governed Palmyra on behalf of her young son Wahab-allath or Athenodorus. (See PALMYRA.) (G. A. C.)

ODDFELLOWS, ORDER OF, a secret benevolent and social society and subsequently a friendly benefit society also, having mystic signs of recognition, initiatory rites and ceremonies, and various grades of dignity and honour. Great antiquity has been claimed for the order of Oddfellows, but the members themselves now generally admit that the institution cannot be traced back beyond the first half of the 18th century, and explain the name as adopted at a time when the severance into sects and classes was so wide that persons aiming at social union and mutual help were a marked exception to the general rule. Mention is made by Defoe of the society of Oddfellows, but the oldest lodge of which the name has been handed down is the Loyal Aristarcus, No. 9, which met in 1745 "at the Oakley Arms, Borough of Southwark; Globe Tavern, Hatton Garden; or the Boar's Head in Smithfield, as the noble master may direct." The earliest lodges were supported by each member and visitor paying a penny to the secretary on entering the lodge, and special sums were voted to any brother in need. If out of work he was supplied with a card and funds to reach the next lodge, and he went from lodge to lodge until he found employment. The lodges gradually adopted a definite common ritual and became confederated under the name of the Patriotic Order. Towards the end of the century many of the lodges were broken up by State prosecutions on the suspicion that

¹The late Roman chronicler Trebellius Pollio goes further and asserts "Odenatus rex Palmyrenorum optinuit totius Orientis imperium. . . . Gallienus Odenatum participato imperio Augustum vocavit." *Hist. Aug.* xxiii. 10 and 12. This is not borne out by the evidence. The highest rank claimed for him by his own people is recorded in an inscription dated 271 (*N.S.I.* No. 130) set up by the two generals of the Palmyrene army; Odaïnath is styled "king of kings and restorer of the whole city"; but this does not mean that he ever held the title of Augustus, and the inscription was set up after his death and during the revolt of Palmyra.

their purposes were "seditious," but the society continued to exist as the Union Order of Oddfellows until 1809. In 1813, at a convention in Manchester, was formed the Independent Order of Oddfellows, Manchester Unity, which now overshadows all the minor societies in England. Oddfellowship was introduced into the United States from the Manchester Unity in 1819, and the grand lodge of Maryland and the United States was constituted on Feb. 22, 1821. It now rivals in membership and influence the Manchester Unity, from which it severed its connection in 1842. In 1843 it issued a dispensation for opening the Prince of Wales Lodge No. 1, at Montreal, Canada. The American society, including Canada and the United States, has its headquarters at Baltimore. Organizations connected either with the United States or England have been founded in France, Germany, Switzerland, Denmark, The Netherlands, Norway, Sweden, Poland, Czechoslovakia, the British dominions and elsewhere.

The most complete and trustworthy account of the institution is that in *The Complete Manual of Oddfellowship, its History, Principles, Ceremonies and Symbolism*, privately printed (1879). (See also FRIENDLY SOCIETIES.)

ODE, a form of stately and elaborate lyrical verse. The original signification of an ode was a chant, a poem arranged to be sung to an instrumental accompaniment. There were two great divisions of the Greek *melos* or song. One of them, in the hands of Alcaeus, Anacreon and Sappho, came close to what modern criticism knows as lyric. On the other hand, the choir-song, in which the poet spoke for himself, but always supported, or interpreted, by a chorus, led up to what is known as ode proper. It was Alcman who first gave to his poems a strophic arrangement, and the strophe (*q.v.*) has come to be essential to an ode. Stesichorus, Ibycus and Simonides of Ceos led the way to the two great masters of ode among the ancients, Pindar and Bacchylides. The form and verse-arrangement of Pindar's great lyrics have regulated the type of the heroic ode. It is now perceived that they are consciously composed in very elaborate measures. So far from being, as critics long supposed, utterly irregular, they are more like the *canzos* and *serventes* of the mediaeval troubadours than any modern verse. The Latins lost the secret of these complicated harmonies, and made no serious attempt to imitate the odes of Pindar. The ode, as it was practised by the Romans, returned to the lyrical form of Sappho and Alcaeus. This was exemplified, in the most exquisite way, by Horace and Catullus.

The earliest modern writer to perceive the value of the antique ode was Ronsard, who attempted to recover the fire and volume of Pindar; his principal experiments date from 1550 to 1552. The poets of the Pleiad (*q.v.*) recognized in the ode one of the forms of verse with which French prosody should be enriched, but in their use of Greek words crudely introduced, and in their quantitative experiments, they offended the genius of the French language. The ode died in France almost as rapidly as it had come to life. Early in the 19th century the form was resumed, and we have the *Odes* composed between 1817 and 1824 by Victor Hugo, the odes of Lamartine, those of Victor de Laprade (collected in 1844), and the *Odes fumambulesques* of Théodore de Banville (1857).

The earliest odes in English, using the word in its strict form, were the *Epithalamium* and *Prothalamium* of Spenser. Ben Jonson introduced a kind of elaborate lyric to which he gave the name of ode; and some of his disciples, in particular Randolph, Cartwright and Herrick, followed him. The "Hymn on the Morning of Christ's Nativity," begun by Milton in 1629, may be considered an ode, and his lyrics "On Time" and "At a Solemn Music" belong to the same category. But it was Cowley who introduced into English poetry the ode consciously built up, on a solemn theme and as definitely as possible on the ancient Greek pattern. He was no more perspicacious than others, however, in observing what the rules were which Pindar had followed. He published his "Pindaric" odes in 1656. These shapeless pieces became very popular after the Restoration, and enjoyed the sanction of Dryden in three or four irregular odes which are the best of their kind in the English language. In 1705 Congreve published a *Discourse on the Pindaric Ode*, and he wrote odes, in strophe,

antistrophe and epode, which were the earliest of their kind in English; unhappily they were not very poetical. The attempts of Gilbert West (1703-56) to explain the prosody of Pindar (1749) inspired Gray to write his "Progress of Poesy" (1754) and "The Bard" (1756). Collins, meanwhile, had in 1747 published a collection of odes devised in the Aeolian or Lesbian manner. The odes of Wordsworth, Coleridge and Tennyson are entirely irregular. Shelley desired to revive the pure manner of the Greeks, but he understood the principle of the form so little that he began his "Ode to Naples" with two epodes, passed on to two strophes, and then indulged in four successive antistrophes. Coventry Patmore, in 1868, printed a volume of irregular *Odes*. Swinburne, although some of his odes, like those of Keats, are really elaborate lyrics, written in a succession of stanzas identical in form, cultivated the Greek form also, and some of his political odes follow very closely the type of Bacchylides and Pindar. Neither Sir William Watson nor Laurence Binyon, each of whom has written memorable odes in more recent times, has adopted the Pindaric form.

See Philipp August Böckh, *De metris Pindari* (1811); Wilhelm Christ, *Metrik der Griechen und Römer* (1874); Edmund Gosse, *English Odes* (1881).

ODENKIRCHEN, a town in the Prussian Rhine province, 21 m. by rail S.W. of Düsseldorf, and at the junction of lines to Munich, Gladbach and Stolberg. Pop. (1925) 20,023. Odenkirchen became a town in 1856. Its principal industries are cotton spinning and weaving, tanning and dyeing.

ODENSE, a city of Denmark, the chief town of the amt (county) of its name, which forms the northern part of the island of Fünen (Fyen). Pop. (1928) 52,376. Odense, or Odinsey, originally Odinsøe, *i.e.*, Odin's island, is one of the oldest cities of Denmark. St. Canute's shrine was a great resort of pilgrims throughout the middle ages. In the 16th century the town was the meeting-place of several parliaments, and down to 1805 it was the seat of the provincial assembly of Fünen. The city lies 4 m. from Odense fjord on the Odense Aa, the main portion on the north side of the stream, and the industrial Albani quarter on the south side. It has a station on the railway route between Copenhagen and Jutland and Schleswig-Holstein via Korsør. A canal, 15½ ft. to 21 ft. deep, gives access to the town from the fjord. St. Canute's cathedral is one of the largest and finest buildings of its kind in Denmark. It is constructed of brick in a pure Gothic style. Originally dating from 1081-93, it was rebuilt in the 13th century. Under the altar lies Canute (Knud), the patron saint of Denmark, who intended to dispute with William of Normandy the possession of England, but was slain in an insurrection at Odense in 1086; Kings John and Christian II. are also buried within the walls. Our Lady's church, built in the 13th century and restored in 1851-52 and again in 1864, contains a carved altar-piece (16th century) by Claus Berg of Lübeck. Odense castle was erected by Frederick IV., who died there in 1730. Exports, mostly agricultural produce (butter, bacon, eggs); imports, iron, petroleum, coal, yarn and timber.

ODENWALD, a wooded mountain region of Germany, almost entirely in Hesse, with small portions in Bavaria and Baden. It stretches between the Neckar and the Main, and is 50 m. long by 20 to 30 broad. Its highest points are the Katzenbuckel (2,057 ft.), the Neunkircher Höhe (1,985 ft.) and the Krähenberg (1,965 ft.). The wooded heights overlooking the Bergstrasse are surrounded with castles and mediaeval ruins.

ODER (Lat. *Viadua*; Slavonic *Vjodr*), a European river, 560 m. long, which rises in the Odergebirge (Lower Carboniferous rocks of the Bohemian massif). After flowing south-east it quickly turns north-east and after a short distance north-west enters upon the Silesian plain, which general direction it maintains across the recent deposits of the lowlands in a wide valley and with low banks. In its lower course it frequently bifurcates, forming many islands, and its main channel passes Stettin into the Grosses Haff, which is connected with the Baltic sea by three arms, the Peene, Swine and Dievenov forming the islands of Usedom and Wollin. The Swine in the middle, is the main channel for navigation.

Rising in Czechoslovakia it touches the Upper Silesian coalfield

and enters Germany above Ratibor, after forming the frontier between Germany and Poland from Bohumin. It receives a number of left-bank tributaries from the gneisses and granites of the Bohemian massif, the chief being the Glatzer Neisse, Katzbach, Bober and Lausitzer Neisse, but the biggest affluents are those on the right-bank, the Warthe with its tributaries the Netze (Notéc) and the Obra, the Malapane and Bartsch, all of which rise in Poland. The most important towns on the river banks are Ratibor, Oppeln, Brieg, Breslau, Glogau, Frankfort-on-Oder, Küstrin, Stettin and Swinemünde. The river forms an important highway into eastern Germany, Poland and Czechoslovakia. It is utilized by three main currents of traffic, traffic between Stettin and Berlin, goods transported to or from the mining area of Upper Silesia (this traffic was reduced by the partition of Upper Silesia between Germany and Poland) and the traffic to and from Poland by the Warthe and its connections. The river begins to be navigable for barges at Ratibor, when it is about 100 ft. wide, and for larger vessels at Breslau where constant dredging is always necessary. Several parts of the main stream have been canalized, especially in the low-lying reaches, in its upper courses and between Stettin and the sea. It is now possible for sea-going vessels, drawing 24 ft. of water to reach Stettin. In addition navigation is possible on the Warthe, Netze and Obra, and the river is connected by canals with the Vistula, the Havel and the Spree.

By the Treaty of Versailles (1919) Poland extended her territory westwards to include the province of Posen (Posnania) but, although the boundary nowhere touches the Oder, long portions of its right-bank are now in Poland. The treaty also declared international the Oder and all navigable portions of its system which provide natural access to the sea for more than one State, and also appointed a commission consisting of three representatives of Prussia, and one each of Poland, Czechoslovakia, Great Britain, France, Denmark and Sweden to prepare an Act of Navigation. The work of this commission was by no means easy, for unforeseen difficulties arose upon the question of the right of the commission to legislate for the upper reaches of the Warthe, the Netze and the Old Netze.

ODESSA, a seaport of the Ukrainian S.S.R., in 46° 29' N., 30° 44' E., on the southern shore of a semi-circular bay, at the north-west angle of the Black sea. Pop. (1926) 411,416. It has five harbours; the Quarantine, New Harbour, Pratique and Cabotage harbours are sheltered by two breakwaters, 4,020 ft. and 2,120 ft. in length. The Petroleum harbour is sheltered by a breakwater 840 ft. in length. There is very good anchorage in the inner roads and a floating crane with a capacity of 40 tons. There are two patent slips and a double-sided floating dock, lifting power 4,800 tons. The harbours freeze for a few days in each year, and the bay occasionally freezes. Navigation is interrupted on an average for 16 days per annum, though the powerful ice breaker now installed lessens this time. The climate is influenced by its proximity to the steppe, and is continental. Average January temperature 23.2° F, July 72.8° F, average rainfall 14 in. per annum. The exports are mainly grain, linseed, wool, cattle, sugar and timber, and the imports coal, naphtha, iron, machinery, agricultural implements, raw cotton, tobacco, manufactured goods and tea, coffee and other colonial goods. Coal cargoes are discharged in the new harbour, several travelling steam cranes being fitted for the purpose. The Cabotage harbour is reserved for Russian coasting vessels. A repairing yard with a pontoon and fitting out basin is situated near the petroleum harbour. Improvements to the port are now being carried out, with a view to providing quayside and berths for 21 steamers, with warehouses and railway lines along the quay.

The town is picturesquely situated on a plateau 150 ft. above sea-level, which is intersected by ravines and forms the limit of the steppe region. The climate is milder than that of the rest of the Ukraine and in the vicinity of Odessa are numerous health resorts along the *limans*. In these limans, or former river mouths now cut off from the sea by the silting up of the rivers, are waters containing concentrated salt solutions, with high proportions of magnesium and calcium salts, iodine and bromine. Their

mud is strongly impregnated with sulphuretted hydrogen and is highly beneficial to sufferers from rheumatism, nervous disorders and skin diseases. Spring gives the environs of Odessa a brief glory of brightly coloured blossoms but summer heat and drought soon parch the vegetation. The broad streets of the town have been planted with trees, peculiarly grateful in the brief intense heat of summer and in contrast with the general treeless condition of the surrounding steppe. The population is exceedingly mixed even for a seaport, and includes Great Russians, Ukrainians, Jews, Poles, Germans, Greeks, Armenians, Tatars and Turks, among others.

History.—The bay of Odessa has had a chequered history; it was colonised by Greeks at a very early period, but their ports *Istriorum Portus*, *Isiacorum Portus* and *Odessus* at the mouth of the *Tiligul* liman disappeared in the 3rd and 4th centuries.

In spite of its favoured position between the Dniester and the Dnieper estuaries, no further settlements were made until the 14th century, when a Tatar chief Khaji Beg or Bey founded a fort on the present site of Odessa. Olgerd, prince of Lithuania, captured the fort in 1396 and it remained alternately in the power of Lithuania and Poland until its capture by Tatars in the 16th century. During the whole of this period it continued to be an important export centre for grain, salt and fish. The Turks captured it from the Tatars in the 16th century and built a fortress *Yeni-Dunia* to protect the harbour. In 1774 during the Russo-Turkish War, the Russians captured the town, but returned it to the Turks, finally occupying it and the whole territory between the Dniester and the Bug in 1789. A French captain, de Ribas, who had led the Russians in their assault on the town, was afterwards entrusted with the planning, in consultation with the French engineer Voland, of a military and commercial port, and a finely laid out Russian city replaced the former Turco-Tatar settlement.

In 1803 Odessa became the chief town of a separate municipal captaincy under Armand, duc de Richelieu, who developed its trade and importance. In 1824 it became the seat of the governors of Novorossia (New Russia) and Bessarabia and, as a free port, became very prosperous. Railway communication with Kiev and Kharkov and with Jassy in Rumania was established in 1866. The free port was closed in 1859. The town successfully resisted a Turkish attack in 1876-77. A numerous floating population began to be attracted, abundant work being available in years of good harvest, but unemployment became rife in years of bad harvest. Accommodation was insufficient and starving unemployed often took refuge in the catacombs extending under the town from which sandstone for building has been removed, not without danger of subsidence to the town. Fierce discontent prevailed and in the 1905 revolution the workers, supported by the insurrectionary battleship *Potemkin*, of the Black sea fleet, maintained barricade warfare against the military. The rising was suppressed, but broke out with renewed vigour in October of the same year and was again suppressed. Sanguinary pogroms followed, and 80,000 inhabitants fled from the unfortunate city.

After the overthrow of the Kerenski government in October 1917, the Ukrainian Rada (Petlura) occupied the town. In January 1918 the Bolshevik workers of the town, aided by troops from the former Rumanian front and from the Black sea fleet expelled the followers of Petlura and proclaimed a Soviet republic. In mid-March German and Austro-Hungarian troops occupied the town, and later the Hetman government, installed under German protection, called in the Entente troops, who occupied the greater part of the town. The French fleet bombarded the wretched inhabitants and French, Serbian, Polish and later Greek troops were landed. Eventually, however, a second Soviet government was set up in April 1919, but was overthrown by Denikin in August 1919. In February 1920 the Soviet finally captured the town.

During this disastrous period a third of the houses were destroyed and numbers of the population were killed, while others fled into the surrounding villages. During 1921 and 1922 famine and famine diseases further devastated the town and lack of fuel caused the inhabitants to pull down many wooden buildings. But in 1923 conditions became somewhat easier and since then trade

has slowly returned. Another difficulty, however, faced the town. Formerly much of its trade came via the Dniester river and Akkerman (now Cetatea Alba) from Bessarabia and in the present absence of diplomatic relations between Rumania and Russia, a state of armed neutrality exists on that river and trade is practically non-existent. However, in spite of all these adverse conditions, the population in 1926 had reached normal size and trade was flourishing. Housing presents a terrible problem in view of the destruction of the war years, and, though there has been some building and repair work undertaken, much remains to be done and many labourers are homeless, while others are crowded together in small rooms. The extensive Square of the Victims of the Revolution contains two huge common graves, in which are buried the victims of the street fighting, and a pyramid of rough stones has been erected over them. The harbour was considerably damaged by shell fire, and the grain elevators were destroyed; new elevators were erected in 1924.

Industry.—In addition to its trading, port and shipbuilding activities Odessa has numerous industrial enterprises, amongst which the production of salt takes an important place. There are also glass, metal and brick works and factories for producing machinery, especially for agricultural purposes, and munitions, superphosphates, tin, cork, glue and oil from oleaginous seeds are produced. Recently introduced industries are the manufacture of cinematograph apparatus, of water gauges, of twine and of preserved foods. There is also an aeroplane factory and a regular air service has been established between Odessa and Kharkov, with intermediate stations at Poltava and Zinovievsk. The water supply of the town is obtained from the Dniester river. The town has several theatres and museums. The former University of South Russia has been converted into a Technical institute, and there are Medical and Agricultural institutes, a State Public library and a Jewish Academical library. The medley of languages has encouraged the use of Esperanto and there is an Esperanto institute. There is a zoological garden, laid out chiefly for purposes of acclimatisation, and animals destined for the more severe conditions of the north are kept here for some time. The Bacteriological station was the first of its kind in Russia.

ODIN or **OTHIN**, the chief god of the northern pantheon, is represented as an old man with one eye. Frigg is his wife, Thor and Balder, among other gods, are his sons. He is also said to have been the father of several legendary kings. His exploits and adventures are a common theme in the poetic and prose Eddas. Here his character is distinguished rather by wisdom than martial prowess, and reference is frequently made to his skill in poetry and magic. In *Ynglinga Saga* he is represented as reigning in Sweden. In notices relating to religious observances Odin appears chiefly as the giver of victory or as the god of the dead. He receives the souls of the slain, who in his palace, Valhalla (*q.v.*), live a life of fighting and feasting, similar to that which has been their desire on earth. Human sacrifices were frequently offered to Odin, especially prisoners taken in battle. In the poem *Hávamál* the god himself is represented as sacrificed. The worship of Odin seems to have prevailed chiefly, if not solely, in military circles. To the Anglo-Saxons he was known as Woden (*q.v.*) and to the Germans as Wotan (Wuotan). Owing to the peculiar character of this god and the prominent position which he occupies, the mythology of the north presents a striking contrast to that of Greece. See **TEUTONIC PEOPLES**, *ad fin.*; and **WODEN**.

ODO or **EUDES** (d. 898), king of the Franks, a son of Robert the Strong, count of Anjou (d. 866), is sometimes referred to as duke of France and also as count of Paris. For his resistance to the attacks of the Normans Odo was chosen king by the Western Franks when the emperor Charles the Fat was deposed in 887, and was crowned at Compiègne in February 888. He defeated the Normans at Montfaucon and elsewhere, but was soon involved in a struggle with powerful nobles, who supported the claim of Charles, afterwards King Charles III., to the Frankish kingdom. To gain support Odo owned himself a vassal of the German king, Arnulf, but in 894 Arnulf declared for Charles. Eventually, after a struggle of three years, Odo was compelled to come to terms with his rival, and to surrender to him a district north of the

Seine. He died at La Fère on Jan. 1, 898.

See E. Lavisse, *Histoire de France*, tome ii. (1903); and E. Favre, *Eudes, comte de Paris et roi de France* (1893).

ODO or **EUDES** (d. c. 736), king, or duke, of Aquitaine, obtained this dignity about 715, and his territory included the south-western part of Gaul from the Loire to the Pyrenees. In 718 he appears as the ally of Chilperic II., king of Neustria, who was fighting against the Austrasian mayor of the palace, Charles Martel; but after the defeat of Chilperic at Soissons in 719 he probably made peace with Charles by surrendering to him the Neustrian king and his treasures. Odo was also obliged to fight the Saracens who invaded the southern part of his kingdom, and inflicted a severe defeat upon them at Toulouse in 721. When, however, he was again attacked by Charles Martel, the Saracens renewed their ravages, and Odo was defeated near Bordeaux; he was compelled to crave protection from Charles, who took up this struggle and gained his momentous victory at Poitiers in 732. In 735 the king abdicated, and was succeeded by his son Hunold.

ODOACER or **ODOVACAR** (c. 434–493), the first barbarian ruler of Italy, son of Aedico or Idico, was born in the district bordering on the middle Danube about the year 434. He was probably one of the tribe of Scyrrî who had invaded Pannonia about 430. It is said that as a tall young recruit for the Roman armies, dressed in a sordid vesture of skins, on his way to Italy, he entered the cell of St. Severinus, to ask his blessing. The saint had an inward premonition of his future greatness, and in blessing him said, "Fare onward into Italy. Thou who art now clothed in vile raiment wilt soon give precious gifts unto many."

Odoacer was probably about thirty years of age when he thus entered the imperial service. By the year 472 he had risen to some eminence. In the year 475 the emperor Nepos was driven into exile, and the successful rebel Orestes was enabled to array in the purple his son, a handsome boy of fourteen or fifteen, who was named Romulus after his grandfather, and nicknamed Augustulus, from his inability to play the part of the great Augustus. Before this puppet emperor had been a year on the throne the barbarian mercenaries rose in mutiny, demanding to be made proprietors of one-third of the soil of Italy. To this request Orestes returned a peremptory negative. Odoacer now offered his fellow-soldiers to obtain for them all that they desired if they would seat him on the throne. On Aug. 23, 476, he was proclaimed king; five days later Orestes was made prisoner at Placentia and beheaded. Augustulus was compelled to descend from the throne, but his life was spared.

Odoacer was forty-two years of age when he thus became chief ruler of Italy, and he reigned thirteen years with undisputed sway. The administration was conducted as much as possible on the lines of the old imperial government. The settlement of the barbarian soldiers on the lands of Italy probably affected the great landowners rather than the labouring class. To the herd or *coloni* and *servi* it probably made little difference whether the master whom they served called himself Roman or Rugian.

In 477 or 478 the dethroned emperor Nepos sent ambassadors to Zeno, emperor of the East, begging his aid in the reconquest of Italy. These ambassadors met a deputation from the Roman senate, sent nominally by the command of Augustulus, really no doubt by that of Odoacer, to declare that they did not need a separate emperor. The senate had chosen Odoacer, and they therefore prayed Zeno to confer upon him the dignity of patrician, and entrust the "diocese" of Italy to his care. Zeno returned a harsh answer to the senate, requiring them to return to their allegiance to Nepos. In fact, however, he did nothing for the fallen emperor, but accepted the new order of things, and even addressed Odoacer as patrician. On the other hand, the latter sent the ornaments of empire to Constantinople as an acknowledgment of the fact that he did not claim supreme power. Our information as to the actual title assumed by the new ruler is somewhat confused. He does not appear to have called himself king of Italy, but only king of the tribes of barbarians that followed him. By the Roman inhabitants of Italy he was addressed as "dominus noster," but his right to exercise power would in their eyes rest, in theory, on his recognition as patricius by the Byzantine Augustus. At the same time

he marked his own high pretensions by assuming the prefix Flavius. His internal administration was probably, upon the whole, wise and moderate, and he may be looked upon as a not altogether unworthy predecessor of Theodoric.

In the history of the papacy Odoacer figures as the author of a decree promulgated at the election of Felix II. in 483, forbidding the pope to alienate any of the lands or ornaments of the Roman Church, and threatening any pope who should infringe this edict with anathema.

The chief events in the foreign policy of Odoacer were his Dalmatian and Rugian wars. In the year 480 the ex-emperor Nepos, who ruled Dalmatia, was traitorously assassinated in Diocletian's palace at Spalato by the counts Viator and Ovida. In the following year Odoacer invaded Dalmatia, slew the murderer Ovida, and reannexed Dalmatia to the Western state. In 487 he appeared as an invader in his own native Danubian lands. War broke out between him and Feletheus, king of the Rugians. Odoacer entered the Rugian territory, and defeated and captured Feletheus. In the following year Frederick, son of the captive king, endeavoured to raise again the fallen fortunes of his house, but was defeated by Onulf, brother of Odoacer, and took refuge at the court of Theodoric the Ostrogoth.

This Rugian war was probably an indirect cause of the fall of Odoacer. His increasing power rendered him too formidable to the Byzantine court. At the same time, Zeno was embarrassed by the formidable neighbourhood of Theodoric the Ostrogoth. In these circumstances arose the plan of Theodoric's invasion of Italy, the details of which belong properly to the life of Theodoric. It is sufficient to state here that he entered Italy in August 489, defeated Odoacer at the Isontius (Isonzo) on the 28th of August, and at Verona on the 30th of September. Odoacer then shut himself up in Ravenna, and there maintained himself for four years, with one brief gleam of success, during which he emerged from his hiding place and fought the battle of the Addua (Aug. 11, 490), in which he was again defeated. A sally from Ravenna (July 10, 491) was again the occasion of a murderous defeat. At length, the famine in Ravenna having become almost intolerable, and the Goths despairing of ever taking the city by assault, negotiations were opened for a compromise (Feb. 25, 493). It was stipulated that Ravenna should be surrendered, that Odoacer's life should be spared, and that he and Theodoric should be recognized as joint rulers of the Roman state. The arrangement was evidently a precarious one, and was soon terminated by the treachery of Theodoric. He invited his rival to a banquet in the palace of the Lauretum on the 15th of March, and there slew him with his own hand. "Where is God?" cried Odoacer when he perceived the ambush into which he had fallen. "Thus didst thou deal with my kinsman," shouted Theodoric, and clove his rival with the broadsword from shoulder to flank. Thelan, his son, was not long after put to death by order of the conqueror. Thus perished the whole race of Odoacer.

LITERATURE.—The chief authorities for the life of Odoacer are the so-called "Anonymus Valesii" generally printed at the end of Ammianus Marcellinus; the *Life of Severinus*, by Eugippius; the chroniclers, Cassiodorus and "Cuspiniani Anonymus" (both in Roncalli's collection); and the Byzantine historians, Malchus and John of Antioch. A fragment of the latter historian, unknown when Gibbon wrote, is to be found in the fifth volume of Müller's *Fragmenta Historicorum Græcorum*. There is a thorough investigation of the history of Odoacer in R. Pallmann's *Geschichte der Völkerwanderung*, vol. ii. (Weimar, 1864). See also T. Hodgkin, *Italy and Her Invaders*, vol. iii. (Oxford, 1885).

ODOFREDUS, Italian jurist of the 13th century. He was born at Bologna and studied law under Balduinus and Accursius. After having practised as an advocate both in Italy and France, he became professor at Bologna in 1228. The commentaries on Roman law attributed to him are valuable as showing the growth of the study of law in Italy, and for their biographical details of the jurists of the 12th and 13th centuries. Odofredus died at Bologna on Dec. 3, 1265.

Over his name appeared *Lecturae in codicem* (Lyons, 1480), *Lecturae in digestum vetus* (Paris, 1504), *Summa de libellis formandis* (Strasbourg, 1510), *Lecturae in tres libros* (Venice, 1514), and *Lecturae in digestum novum* (Lyons, 1552).

ODONATA, an order of insects (*q.v.*) comprising the dragonflies (*q.v.*).

O'DONNELL, the name of an ancient and powerful Irish family, lords of Tyrconnel in early times, and the chief rivals of the O'Neills in Ulster. Like the family of O'Neill (*q.v.*), that of O'Donnell was descended from Niall of the Nine Hostages, king of Ireland at the beginning of the 5th century; the O'Neills, or Cinel Owen, tracing their pedigree to Owen (Eoghan), and the O'Donnells, or Cinel Connell, to Conall Gulban, both sons of Niall. Tyrconnel, the district named after the Cinel Connell, where the O'Donnells held sway, comprised the greater part of the modern county of Donegal except the peninsula of Inishowen; and since it lay continuous with the territory ruled by the O'Neills of Tyrone, who were continually attempting to assert their supremacy over it, the history of the O'Donnells is for the most part a record of tribal warfare with their powerful neighbours, and of their own efforts to make good their claims to the overlordship of northern Connaught.

The first chieftain of mark in the family was Goffraidh (Godfrey), son of Donnell Mor O'Donnell (d. 1241). Goffraidh, who was "inaugurated" as "The O'Donnell," *i.e.*, chief of the clan, in 1248, successfully raided Tyrone and Connaught, and was severely wounded in the battle of Roscede (1257). In the following year he defeated Brian O'Neill, but died soon after from his old wounds. He was succeeded in the chieftainship by his brother Donnell Oge.

In the 16th century, when the English began to make determined efforts to bring the whole of Ireland under subjection to the Crown, the O'Donnells of Tyrconnel played a leading part, co-operating at times with the English, especially when such co-operation appeared to promise triumph over their ancient enemies the O'Neills, at other times joining with the latter against the English authorities.

MANUS O'DONNELL (d. 1564), son of Hugh Dubh O'Donnell, was left to rule Tyrconnel during his father's pilgrimage to Rome about 1511; and retained the chief authority when Hugh Dubh returned. A family quarrel ensued, but with the help of the O'Neills, Manus established his hold over Tyrconnel. In 1522, however, the O'Neills and O'Donnells were again at war. Conn Bacach O'Neill, 1st earl of Tyrone, determined to subjugate the O'Donnells. Supported by several septs of Munster and Connaught, and assisted by English contingents and the MacDonnells of Antrim, O'Neill took the castle of Ballyshannon, and after devastating a large part of Tyrconnel encamped at Knockavoe, near Strabane. Here he was surprised at night by Hugh Dubh and Manus O'Donnell, and severely defeated. The war continued, however, and in 1531 O'Donnell applied to the English Government for protection, giving assurances of allegiance to Henry VIII. In 1537 Lord Thomas Fitzgerald and his five uncles were executed for rebellion in Munster, and the English Government made every effort to lay hands also on Gerald, the youthful heir to the earldom of Kildare, a boy of 12 years of age who was in the secret custody of his aunt Lady Eleanor McCarthy. This lady, in order to secure a powerful protector for the boy, accepted an offer of marriage by Manus O'Donnell, who on the death of Hugh Dubh in July 1537 was inaugurated The O'Donnell. Conn O'Neill was a relative of Gerald Fitzgerald, and this event accordingly led to the formation of the Geraldine League, a federation which combined the O'Neills, the O'Donnells, the O'Briens of Thomond, and other powerful clans; the primary object of which was to restore Gerald to the earldom of Kildare, but which afterwards aimed at the complete overthrow of English rule in Ireland. In Aug. 1539 Manus O'Donnell and Conn O'Neill were heavily defeated by the lord deputy at Lake Bellahoe, in Monaghan.

In the west Manus continued to assert the supremacy of the O'Donnells in north Connaught, where he compelled O'Conor Sligo to acknowledge his overlordship in 1539. In 1542 he went to England and presented himself, together with Conn O'Neill and other Irish chiefs, before Henry VIII. In his later years Manus was harassed by his son Calvagh, who imprisoned him in 1555, and deposed him from all authority in Tyrconnel. He died in 1564. Manus O'Donnell is also described by the Four Masters

as "a learned man, skilled in many arts, gifted with a profound intellect, and the knowledge of every science." At his castle of Portnatrynod near Strabane he supervised if he did not actually dictate the writing of the *Life of Saint Columbkille* in Irish, which is preserved in the Bodleian library at Oxford. Manus was several times married. His first wife, Joan O'Reilly, was the mother of Calvagh, and two daughters, both of whom married O'Neills; the younger, Margaret, was wife of the famous rebel Shane O'Neill. His second wife, Hugh's mother, by whom he was ancestor of the earls of Tyrconnel (*see below*), was Judith, sister of Conn Bacach O'Neill, 1st earl of Tyrone, and aunt of Shane O'Neill. He died in 1564.

CALVAGH O'DONNELL (d. 1566), eldest son of Manus O'Donnell, in the course of his above-mentioned quarrel with his father and his half-brother Hugh, sought aid in Scotland from the MacDonnells, who assisted him in deposing Manus and securing the lordship of Tyrconnel. Hugh then appealed to Shane O'Neill, who invaded Tyrconnel at the head of a large army in 1557 to secure supremacy over Ulster, and encamped on the shore of Lough Swilly. Calvagh surprised the O'Neills in their camp at night and routed them. Calvagh was then recognized by the English Government as lord of Tyrconnel; but in 1561 he and his wife were captured by Shane O'Neill in the monastery of Kildonnell. His wife, Catherine Maclean, who had previously been the wife of the earl of Argyll, was kept by Shane O'Neill as his mistress and bore him several children, though grossly ill-treated by her savage captor; Calvagh himself was subjected to atrocious torture during the three years that he remained O'Neill's prisoner. He was released in 1564 on conditions which he had no intention of fulfilling; and crossing to England he appealed to Queen Elizabeth. In 1566 Sir Henry Sidney marched to Tyrconnel, and restored Calvagh to his rights. Calvagh, however, died in the same year, and as his son Conn was a prisoner in the hands of Shane O'Neill, his half-brother Hugh MacManus was inaugurated The O'Donnell in his place. Hugh, who in the family feud with Calvagh had allied himself with O'Neill, now turned round and combined with the English to crush the hereditary enemy of his family; and in 1567 he utterly routed Shane at Letterkenny, compelling him to seek refuge with the MacDonnells of Antrim, by whom he was put to death. In 1592 Hugh abdicated in favour of his son Hugh Roe O'Donnell (*see below*); but Niall Garve, second son of Calvagh's son Conn, resented the passing of the chieftainship to the descendants of Manus O'Donnell's second marriage. His elder brother was Hugh of Ramelton, whose son John, an officer in the Spanish army, was father of Hugh Baldearg O'Donnell (d. 1704), known in Spain as Count O'Donnell, who commanded an Irish regiment as brigadier in the Spanish service. This officer came to Ireland in 1690 and raised an army in Ulster to be used in the service of James II., afterwards deserting to the side of William III., from whom he subsequently accepted a pension.

NIALL GARVE O'DONNELL (1569-1626), grandson of Calvagh, made terms with the English Government, to whom he rendered valuable service both against the O'Neills and against his cousin. But in 1601 he quarrelled with the lord deputy, who, though willing to establish Niall Garve in the lordship of Tyrconnel, would not permit him to enforce his supremacy over Cahir O'Dogherty in Inishowen. Charged with complicity in Cahir O'Dogherty's rebellion in 1608, Niall Garve was sent to the Tower of London, where he remained till his death in 1626. He married his cousin Nuala, the sister of Hugh Roe and Rory O'Donnell. When Rory fled with the earl of Tyrone to Rome in 1607, Nuala, who had deserted her husband when he joined the English against her brother, accompanied him, taking with her her daughter Grania. She was the subject of an Irish poem, of which an English version was written by James Mangan from a prose translation by Eugene O'Curry.

HUGH ROE O'DONNELL (1572-1602), eldest son of Hugh MacManus O'Donnell, and grandson of Manus O'Donnell by his second marriage with Judith O'Neill, was the most celebrated member of his clan. His mother was Ineen Dubh, daughter of James MacDonnell of Kintyre; his sister, the second wife of

Hugh O'Neill, 2nd earl of Tyrone. These family connections with the Hebridean Scots and with the O'Neills made the lord deputy, Sir John Perrot, afraid of a powerful combination against the English Government, and induced him to establish garrisons in Tyrconnel and to demand hostages from Hugh MacManus O'Donnell, which the latter refused to hand over. In 1587 Perrot conceived a plan for kidnapping Hugh Roe (Hugh the Red), now a youth of 15, who had already given proof of exceptional ability. A merchant vessel laden with Spanish wines was sent to Lough Swilly, and Hugh Roe with some youthful companions was enticed on board, when the ship immediately set sail and conveyed the party to Dublin. The boys were kept in prison for more than three years. In 1591 young O'Donnell escaped; and after enduring terrible privations he made his way to Tyrconnel, where in the following year his father handed the chieftainship over to him.

Red Hugh then led an expedition against Turlough Luineach O'Neill, who was at war with his kinsman Hugh, earl of Tyrone, with whom O'Donnell was in alliance, at the same time assuring the lord deputy of his loyalty. Determined to vindicate the traditional claims of his family in north Connaught, he aided Hugh Maguire against the English, though on the advice of Tyrone he abstained for a time from committing himself too far. When, however, in 1594 Enniskillen castle was taken and the women and children flung into the river from its walls by order of Sir Richard Bingham, the English governor of Connaught, O'Donnell sent urgent messages to Tyrone for help; and while he himself hurried to Derry to withstand an invasion of Scots from the isles, Maguire defeated the English with heavy loss at Bellanabriske (The Ford of the Biscuits). In 1595 Red Hugh again invaded Connaught, putting to the sword all above 15 years of age unable to speak Irish; he captured Longford and Sligo, which placed north Connaught at his mercy. In 1596 he agreed in conjunction with Tyrone to a cessation of hostilities with the English, and met the Government commissioners near Dundalk.

The terms he demanded were, however, refused. He hoped for help from Philip II. of Spain, with whom he and Tyrone had been in correspondence. In the beginning of 1597 he raided Connaught, where O'Connor Sligo had been set up by the English as a counterpoise to O'Donnell. He devastated the country and returned to Tyrconnel with rich spoils; in 1598 he helped to defeat the English at the Yellow Ford on the Blackwater; and in 1599 he defeated an attempt by the English under Sir Conyers Clifford, governor of Connaught, to succour O'Connor Sligo in Collooney castle, which O'Donnell captured, forcing Sligo to submission. The Government now sent Sir Henry Docwra to Derry, and O'Donnell entrusted to his cousin Niall Garve the task of opposing him. Niall Garve, however, went over to the English, making himself master of O'Donnell's fortresses of Lifford and Donegal. While Hugh Roe was besieging Donegal in 1601, he heard that a Spanish force had landed in Munster. He marched rapidly to the south, and was joined by Tyrone at Bandon, but a night-attack on the English besieging the Spaniards in Kinsale having utterly failed, O'Donnell, who attributed the disaster to the incapacity of the Spanish commander, took ship to Spain on Jan. 6, 1602, to lay his complaint before Philip III. He was favourably received by the Spanish king, but he died at Simancas on Sept. 10 in the same year.

RORY O'DONNELL, 1st earl of Tyrconnel (1575-1608), second son of Hugh MacManus O'Donnell, and younger brother of Hugh Roe, accompanied the latter in the expedition to Kinsale; and when his brother sailed for Spain he transferred his authority as chief to Rory. In 1602 Rory gave in his allegiance to Lord Mountjoy, the lord deputy; and in the following summer he went to London with the earl of Tyrone, when James I. created him earl of Tyrconnel. In 1605 he was made the king's lieutenant in Donegal. But the arrangement between Rory and Niall Garve insisted upon by the Government displeased both O'Donnells, and Rory, like Hugh Roe before him, entered into negotiations with Spain. His country had been devastated by famine and war, and his own extravagance had plunged him in debt. These circumstances and the fear that his designs were known to the Govern-

ment induced him to leave Ireland. In Sept. 1607 "the flight of the earls" (see O'NEILL) took place, Tyrconnel and Tyrone reaching Rome in April 1608, where Tyrconnel died on July 28. His wife, the beautiful daughter of the earl of Kildare, was left behind in the haste of Tyrconnel's flight, and lived to marry Nicholas Barnewell, Lord Kingsland. By Tyrconnel she had a son Hugh; and among other children a daughter Mary Stuart O'Donnell, who, born after her father's flight from Ireland, was so named by James I. after his mother. This lady, after many romantic adventures, married a man called O'Gallagher and died in poverty on the Continent.

Rory O'Donnell was attainted by the Irish parliament in 1614, but his son Hugh, who lived at the Spanish court, assumed the title of earl; and the last titular earl of Tyrconnel was this Hugh's son Hugh Albert, who died without heirs in 1642, and who by his will appointed Hugh Baldearg O'Donnell (see above) his heir, thus restoring the chieftainship to the elder branch of the family. To a still elder branch belonged Daniel O'Donnell (1666-1735), a general of the famous Irish brigade in the French service, whose father, Turlough, was a son of Hugh Dubh O'Donnell, elder brother of Manus, son of an earlier Hugh Dubh mentioned above. Daniel served in the French army in the wars of the period, fighting against Marlborough at Oudenarde and Marplaque at the head of an O'Donnell regiment. He died in 1735.

The famous Cathach, or Battle-Book of the O'Donnells, was in the possession of General Daniel O'Donnell, from whom it passed to more modern representatives of the family, who presented it to the Royal Irish Academy, where it is preserved. This relic, of which a curious legend is told (see P. W. Joyce, *A Social History of Ancient Ireland*, 1903, vol. i. p. 501), is a Psalter said to have belonged to St. Columba, a kinsman of the O'Donnells, which was carried by them in battle as a charm or talisman to secure victory. Two other circumstances connecting the O'Donnells with ancient Irish literature may be mentioned. The family of O'Clery, to which three of the celebrated "Four Masters" belonged, were hereditary Ollaves (doctors of history, music, law, etc.) attached to the family of O'Donnell; while the "Book of the Dun Cow" (*Lebor-na-h Uidhre*), one of the most ancient Irish mss., was in the possession of the O'Donnells in the 14th century; and the estimation in which it was held at that time is proved by the fact that it was given to the O'Connors of Connaught as ransom for an important prisoner, and was forcibly recovered some years later.

See O'NEILL, and the authorities there cited.

O'DONNELL, LEOPOLD (1809-1867), duke of Tetuan, Spanish general and statesman, was born at Santa Cruz, Tenerife, on January 12, 1809. General of division in the army of Queen Christina, he accompanied her into exile in 1840; attempted unsuccessfully a rising in her favour at Pamplona in 1841, helped in the overthrow of Espartero (1843) and from 1844-48 served the new government in Cuba. War minister (1854) under Espartero, he plotted successfully against his chief in 1856 and became head of the cabinet from the July revolution until October, and again in July 1858. He took command of the expedition to Morocco (Dec. 1859) and was made duke after the surrender of Tetuan. He resigned office in 1863 until 1865, resumed it and resigned again in favour of Narvaez in 1866. He died at Bayonne, Nov. 5, 1867.

See C. Navarro y Rodrigo, *O'Donnell y su tiempo* (Madrid, 1869).

O'DONNELL, PATRICK (1856-1927), cardinal archbishop of Armagh, Ireland, was born of humble parents at Kilrain, Donegal, on Nov. 28, 1856, and was educated locally, then at the Catholic university at Dublin, and finally at Maynooth, where he took priest's orders in 1880. Eight years later he became bishop of Raphoe, a see which he held for 34 years, during which he transformed the diocese set in the wild highlands of Donegal. Dr. O'Donnell was a strong constitutional nationalist and one of the wisest men in the party. Perhaps his supreme gift to Ireland was his sense of the importance of substituting peace for the violent religious hatred prevailing in northern Ireland. He believed in good-will for the modification of existing differences due to territorial and religious conditions. He was a member of the Irish convention 1917-18.

In 1923 the pope nominated him coadjutor to Cardinal Logue, archbishop of Armagh, whom he succeeded in the primacy in the following year. In 1925 he received the cardinalate. In 1927

he held a plenary synod of the Irish hierarchy, at which far-reaching reforms were undertaken. The cardinal spoke Gaelic from his childhood and promoted the use of the vernacular. He died on Oct. 22, 1927, at Carlingford.

ODONTOGLOSSUM, a genus of epiphytic plants of the orchid family (Orchidaceae), comprising about 100 species native to the mountains of tropical America. Many species are well known in greenhouse cultivation, including numerous hybrids. *O. grande*, the baby orchid, has showy yellow flowers, barred with cinnamon-brown, 5 in. to 6 in. across. (See ORCHIDS.)

ODONTORNITHES, the term proposed by O. C. Marsh for birds possessed of teeth (Gr. *odon*, tooth, *ornis*, *ornithos* bird), notably the genera *Hesperornis* and *Ichthyornis* from the Cretaceous deposits of Kansas. In 1875 he divided the "sub-class" into *Odontolcae*, with the teeth standing in grooves, and *Odontornithes*, with the teeth in separate alveoles or sockets. In his magnificent work, *Odontornithes: A monograph on the extinct toothed birds of North America* (New Haven [Conn.], 1880), he logically added the *Saururae*, represented by *Archaeopteryx*, as a third order. As it usually happens with the selection of a single anatomical character, the resulting classification was unnatural. The *Odontornithes*, as a matter of fact, are a heterogeneous assembly, and the fact of their possessing teeth proves nothing but that many types of birds still possessed them in Cretaceous times. These teeth are heritages from their reptilian ancestry, of which abundant evidence is found in various parts of the skeleton. No fossil birds of later than Cretaceous age are known to have teeth, and recent birds possess not even embryonic vestiges.

The best known of the *Odontornithes* are *Hesperornis regalis*, standing about 3 ft. high, and the somewhat taller *H. crassipes*. Both show the general configuration of a diver, but whether *Hesperornis* can be regarded as ancestral to the *Colymbiformes* or whether the many points of resemblance to this group are due to "convergence" is a moot point. There are about 14 teeth in a groove of the maxilla and about 21 in the mandible; the vertebrae are typically heterocoelous; of the wing-bones nothing but the humerus, or upper arm-bone, remained and this was reduced to a vestigial condition; clavicles slightly reduced; coracoids short and broad, movably connected with the scapula; sternum very long, broad and quite flat, without the trace of a keel. Hind limbs very strong and of the *Colymbine* type, but the outer or fourth capitulum of the metatarsus is the strongest and longest, an unique arrangement in an otherwise typically *steganopodous* foot. The pelvis shows much resemblance to that of the divers, but there is still an incisura ischiadica instead of a foramen. The tail is composed of about twelve vertebrae, without a pygostyle. *Enaliornis* of the Cambridge Greensand of England, and *Baptornis* of the mid-Cretaceous of North America, are probably allied, but imperfectly known. The vertebrae are biconcave, with heterocoelous indications in the cervicals; the metatarsal bones appear still somewhat imperfectly ankylosed. The absence of a keel led the earlier naturalists to regard *Hesperornis* as one of the *Struthious* birds, and it has even been described as a "swimming ostrich." But there can be no doubt but that it is to be reckoned as one of the *Neognathae* which, becoming flightless, lost the keel of the sternum, as some of the land-birds have also done—e.g., the kakapo (q.v.) of New Zealand.

There remain the *Odontotormae*, notably *Ichthyornis victor*, *I. dispar*, *Apatornis* and *Graculavus* of the middle and upper Cretaceous of Kansas. The teeth stand in separate alveoli. The vertebrae are amphicoelous, but at least the third cervical has somewhat saddle-shaped articular facets. Tail composed of five free vertebrae, followed by a rather small pygostyle. Shoulder girdle and sternum well developed and of the typical carinate type. Pelvis still with incisura ischiadica. Marsh based the restoration of *Ichthyornis*, which was obviously an aquatic bird possessing full powers of flight, upon the skeleton of a tern, though there is no natural affinity between them. The teeth, vertebrae, pelvis and small brain are all primitive so that the *Odontotormae* may form a separate order of the *Neognathae*, near the *Colymbomorphous* Legion. (W. P. P.)

See G. Hellman, *The Origin of Birds* (1927).

ODO OF BAYEUX (c. 1036–1097), Norman bishop and English earl, was a uterine brother of William the Conqueror, from whom he received, while still a youth, the see of Bayeux (1049). But his active career was that of a warrior and statesman. He found ships for the invasion of England and fought in person at Senlac; in 1067 he became earl of Kent, and for some years he was a trusted royal minister. At times he acted as viceroy in William's absence; at times he led the royal forces to chastise rebellions. But in 1083 he was suddenly disgraced and imprisoned for having planned a military expedition to Italy. He was accused of desiring to make himself pope; more probably he thought of serving as a papal condottiere against the emperor Henry IV. The Conqueror, when on his death-bed, reluctantly permitted Odo's release (1087). The bishop returned to his earldom and soon organized a rebellion with the object of handing over England to his eldest nephew, Duke Robert. William Rufus, to the disgust of his supporters, permitted Odo to leave the kingdom after the collapse of this design (1088), and thenceforward Odo was the right-hand man of Robert in Normandy. He took part in the agitation for the first crusade, and started in the duke's company for Palestine, but died on the way, at Palermo (Feb. 1097). Little good is recorded of Odo. His vast wealth was gained by extortion and robbery. His ambitions were boundless and his morals lax. But he was a patron of learning and, like most prelates of his age, a great architect. He rebuilt the cathedral of his see, and may perhaps have commissioned the unknown artist of the celebrated Bayeux tapestry.

Odo must be distinguished from two English prelates of the same name and also from an English earl. Odo or Oda (d. 959), archbishop of Canterbury, was bishop of Ramsbury from 927 to 942, and went with King Aethelstan to the battle of Brunanburh in 937. In 942 he succeeded Wulfhelm as archbishop of Canterbury, and he appears to have been an able and conscientious ruler of the see. He had great influence with King Edwy, whom he had crowned in 956. Odo (d. 1200), abbot of Battle, was a monk of Christ Church, Canterbury, and was prior of this house at the time when Thomas Becket was murdered. In 1175 he was chosen abbot of Battle, and on two occasions the efforts of Henry II. alone prevented him from being elected archbishop of Canterbury. Odo or Odda (d. 1056), a relative of Edward the Confessor, during whose reign he was an earl in the west of England, built the minster at Deerhurst in Gloucestershire.

See the authorities cited for WILLIAM I. and WILLIAM II., the biographical sketch in *Gallia Christiana*, xi. 353–360; H. Wharton, *Anglia Sacra*, i. 334–339 (1691); and F. R. Fowke, *The Bayeux Tapestry* (1898).

ODORIC (c. 1286–1331), styled "of Pordenone," one of the chief travellers of the later middle ages, and a *Beatus* of the Roman Church, was born at Villa Nuova, a hamlet near the town of Pordenone in Friuli, in or about 1286. According to the ecclesiastical biographers, in early years he took the vows of the Franciscan order and joined their convent at Udine, the capital of Friuli.

Friar Odoric was despatched to the East, where a remarkable extension of missionary action was then taking place, about 1316–18, and did not return till the end of 1329 or beginning of 1330. He was in western India soon after 1321 (pretty certainly in 1322) and he spent three years in China between the opening of 1323 and the close of 1328. His route to the East lay by Trebizond and Erzerum to Tabriz and Sultanieh, in all of which places the order had houses. From Sultanieh he proceeded by Kashan and Yâzd, and turning thence followed a devious route by Persepolis and the Shiraz and Baghdad regions, to the Persian gulf. At Hormuz he embarked for India, landing at Thana, near Bombay. After visiting many parts of India he sailed in a junk to Sumatra, visiting various ports on the northern coast of that island, and thence to Java, to the coast (it would seem) of Borneo, to Champa (South Cochin-China), and to Canton, at that time known to western Asiatics as *Chin-Kalan* or Great China (Maha-chin). He travelled extensively in China, and visited Hangchow, then renowned, under the name of *Cansay*, *Khanzai*, or *Quinsai* (i.e., *Kingsze* or royal residence), as the greatest city in the world,

of whose splendours Odoric gives details.

At Peking he remained for three years, attached, no doubt, to one of the churches founded by Archbishop John of Monte Corvino, at this time in extreme old age. Returning overland across Asia, through the Land of Prester John and through Casan, the adventurous traveller seems to have entered Tibet, and even perhaps to have visited Lhasa. He then returned to Venice *via* Persia and Asia Minor. During a part at least of these long journeys the companion of Odoric was Friar James, an Irishman. After his return Odoric went to the Minorite house attached to St. Anthony's at Padua, and there, in May 1330, he related the story of his travels, which was taken down in homely Latin by Friar William of Solagna. Odoric died at Udine on Jan. 14, 1331. The fame of his vast journeys appears to have made a much greater impression on the laity of his native territory than on his Franciscan brethren.

Popular acclamation made him an object of devotion, the municipality erected a noble shrine for his body, and his fame as saint and traveller had spread far and wide before the middle of the century, but it was not till four centuries later (1755) that he was formally beatified.

Odoric's credit was not benefited by the liberties which Sir John Mandeville took with it. The substance of that knight's alleged travels in India and Cathay is stolen from Odoric, though amplified with fables from other sources and from his own invention, and garnished with his own unusually clear astronomical notions. There are many details in Odoric's narrative which prove its genuineness.

The best editions of Odoric are by G. Venni, *Elogio storico alle gesta del Beato Odorico* (Venice, 1761); H. Yule in *Cathay and the Way Thither* (1866), vol. i., pp. 1–162, vol. ii. appendix, pp. 1–42, and H. Cordier, *Les Voyages . . . du . . . frère Odoric . . .* (1891) (edition of Old French version of c. 1350). The edition by T. Domenichelli (Prato, 1881) may also be mentioned; likewise those texts of Odoric embedded in the *Storia universale delle Missioni Franciscane*, iii. 739–781, and in Hakluyt's *Principal Navigations* (1599); ii. 39–67. See also John of Viktring (Joannes Victoriensis) in *Fontes rerum Germanicarum*, ed. J. F. Boehmer; vol. i. ed. by J. G. Cotta (Stuttgart, 1843), p. 391; Wadding, *Annales Minorum*, A.D. 1331, vol. vii., pp. 123–126; Bartholomew Albizzi, *Opus conformitatum . . . B. Francisii* . . . bk. i. par. ii. conf. 8 (fol. 124 of Milan ed. of 1513); John of Winterthur in Eccard, *Corpus historicum mediæ ævi*, vol. i. cols. 1894–97, especially 1894; C. R. Beazley, *Dawn of Modern Geography* (1897, etc.), iii. 250–287, 548–549, 554, 565–566, 612–613, etc.

ODYSSEUS (also ODYSEUS, OLYS[s]EUS, Lat. VLIXES, whereof ULYSSES is a mis-writing), one of the best-known Greek heroes.

(1). In Homer, he is son of Laërtes, king of Ithaca, and Anticleia his queen; he succeeds his father as king, is husband of Penelope (*q.v.*) and father of Telemachus. During the Trojan War (*Iliad*) he is prominent as a brave and skilful fighter, but still more as a giver of shrewd counsel and for his daring and cunning enterprises, alone or with Diomedes. After the war he starts to go home, but is driven off his course by unfavourable winds (*Odyssey*), successively visiting numerous unknown regions, (*see* CIRCE, CYCLOPES, LAESTRYGONES, LOTUS-EATERS, SCYLLA), till, losing all his ships and men, he arrives alone on the island of Calypso (*q.v.*). After eight years he is let go, and is wrecked on the coast of the Phæacians, who receive him hospitably and send him home in one of their ships. All these places are out of the known world, although later writers in antiquity identified them with various regions known to them and have been followed by some moderns. Arrived home, he finds his wife Penelope beset with a number of suitors who are devouring his substance. With the help of Athena, Odysseus and Telemachus, aided by two faithful thralls, kill them all.

(2). After Homer, the character of Odysseus degenerates from a cunning to a wholly unscrupulous and dishonourable man. He tries to shirk service at Troy by pretending to be mad; but Palamedes discovers the trick. In revenge, Odysseus brings about his ruin and death (*see* PALAMEDES). He and Diomedes steal the Palladium (*q.v.*) and in some accounts he tries to murder Diomedes, to get all the credit for himself. After the death of Achilles, Odysseus and Ajax contend for his armour, which is adjudged to the former (*see* AJAX L.). He is at length accidentally killed by

Telegonus, his son by Circe or Calypso; this story is worked up from hints in the *Odyssey*. A common legend makes Odysseus son of Sisyphus (*q.v.*), thus bringing the two notorious rogues together.

There is no need whatever to suppose Odysseus other than a real man, renowned for his skill and resource, about whom in the course of centuries numerous fictions have gathered. The plot of the *Odyssey* is a well-known *märchen*, however, and not a saga; see M. P. Nilsson, *History of Greek Religion*, p.38. His name is not Greek, and probably belongs to a prehellenic speech.

BIBLIOGRAPHY.—J. Schmidt in Roscher's *Lexikon*; P. O. Gruppe, *Griechische Mythologie*, II., 624, 705 ff. (1906); L. Preller and H. Ritter, *Griechische Mythologie*, II. (1865); V. Bérard, *Les Phéniciens et l'Odyssee* (1902-03), and edition of the *Odyssey* (1924-25) contains the most ingenious attempt to localize his wanderings.

(H. J. R.)

OECOLAMPADIUS, JOHN (1482-1531), German Reformer, whose real name was Hussgen or Heussgen¹, was born at Weinsberg, a small town in Württemberg, but then belonging to the Palatinate. He went to school at Weinsberg and Heilbronn, and then, intending to study law, he went to Bologna, but soon returned to Heidelberg and betook himself to theology. He passed from the study of Greek to that of Hebrew, taking his bachelor's degree in 1503. He became cathedral preacher at Basle in 1515, serving under Christopher von Uttenheim, the evangelical bishop of Basle. From the beginning the sermons of Oecolampadius centred in the Atonement, and his first reformatory zeal showed itself in a protest (*De risu paschali*, 1518) against the introduction of humorous stories into Easter sermons. In 1520 he published his *Greek Grammar*. The same year he was asked to become preacher in the high church in Augsburg. Germany was then ablaze with the questions raised by Luther's theses, and his introduction into this new world, when at first he championed Luther's position especially in his anonymous *Canonici indocti* (1519), seems to have compelled Oecolampadius to severe self-examination, which ended in his entering a monastery for a short time. But in Feb. 1522 he made his way to Ebernburg, near Creuznach, where he acted as chaplain to the little group of reformers who had settled there under the leadership of Franz von Sickingen.

The second period of Oecolampadius's life opens with his return to Basle in Nov. 1522, as vicar of St. Martin's and (in 1523) reader of the Holy Scripture at the university, and after more than a year of earnest preaching and four public disputations in which the popular verdict had been given in favour of Oecolampadius and his friends, the authorities of Basle began to see the necessity of some reformation. They began with the convents, and Oecolampadius was able to refrain in public worship on certain festival days from some practices he believed to be superstitious. Basle was slow to accept the Reformation; the news of the Peasants' War and the inroads of Anabaptists prevented progress; but at last, in 1525, it seemed as if the authorities were resolved to listen to schemes for restoring the purity of worship and teaching. In the midst of these hopes and difficulties Oecolampadius married, in the beginning of 1528, Wilibrandis Rosenblatt, the widow of Ludwig Keller, who proved to be *non rixosa vel garrula vel vaga*, he says, and made him a good wife. After his death she married Capito, and, when Capito died, Bucer. She died in 1564. In Jan. 1528 Oecolampadius and Zwingli took part in the disputation at Berne which led to the adoption of the new faith in that canton, and in the following year to the discontinuance of the Mass at Basle. The Anabaptists claimed Oecolampadius for their views, but in a disputation with them he dissociated himself from most of their positions. He died on Nov. 24, 1531.

Oecolampadius was not a great theologian, like Luther, Zwingli or Calvin, and yet he was a trusted theological leader. With Zwingli he represented the Swiss views at the unfortunate conference at Marburg. His views on the Eucharist upheld the metaphorical against the literal interpretation of the word "body," but he asserted that believers partook of the sacrament more for the sake of others than for their own, though later he emphasized it

as a means of grace for the Christian life. To Luther's doctrine of the ubiquity of Christ's body he opposed that of the presence and activity of the Holy Spirit in the church. He did not minutely analyse the doctrine of predestination as Luther, Calvin and Zwingli did, contenting himself with the summary "Our Salvation is of God, our perdition of ourselves."

See J. J. Herzog, *Leben Joh. Oecolampads u. die Reformation der Kirche zu Basel* (1843); K. R. Hagenbach, *Johann Oecolampad u. Oswald Myconius, die Reformatoren Basels* (1859). For other literature see W. Hadorn's art. in Herzog-Hauck's *Realencyklopädie für prot. Rel. u. Kirche*.

OECUMENICAL, a word chiefly used in the sense of belonging to the universal Christian Church. It is thus specifically applied to the general councils of the early church (see COUNCIL). In the Roman Church a council is regarded as oecumenical when it has been summoned from the whole church under the presidency of the pope or his legates; the decrees confirmed by the pope are binding. The word has also been applied to assemblies of other religious bodies, such as the Oecumenical Methodist Conference, which met for the first time in 1881.

OEDIPUS, the central figure of the Theban saga (Gr. *Oidipous*, probably "Swell-foot"). In Homer we are told that he unwittingly killed his father and married his own mother, Epikaste (the Jocasta of later writers), and that she hanged herself when the matter became known. Oedipus continued, though in great tribulation, to reign in Thebes, apparently until his death. (*Odyssey* xi. 271 *et seq.*, *Iliad*, xxiii, 679). According to the post-Homeric story, Laius, king of Thebes, received an oracle that his son should slay him; therefore, when his wife Jocasta bore a son, he exposed him on Mt. Cithaeron, with a spike driven through his feet. He was saved, however, and was adopted by the childless Polybus, king of Corinth. Reaching manhood, he had occasion to visit Delphi, where he was told that he would slay his father and wed his mother. Departing in great horror, and resolving never to return to Corinth, he met Laius, whom he did not recognize, and killed him in a quarrel. Coming to Thebes, he found the city plagued by the Phix or Sphinx, a winged monster, usually represented with the head of a woman, who asked all passers-by a riddle, killing them if they could not answer. Oedipus solved the riddle, the Sphinx killed herself in disgust, and he was rewarded, according to the promise made by the regent, Creon, son of Menoeceus, with the kingdom and the hand of his sister, the widowed queen. They had two sons, Eteocles and Polyneices, and two daughters, Antigone and Ismene. But later, the whole story came to light; Jocasta hanged herself, Oedipus put out his own eyes, and then lived shut up in a room of the palace (ordinary version), or went into exile, ultimately dying at Colonus and becoming a protecting hero of Attica (Athenian version, see Sophocles, *Oedipus Colonus*). His sons proved un dutiful and he cursed them. Therefore they quarrelled over the kingship, finally agreeing to reign alternately. Eteocles' turn came first; Polyneices went into temporary exile, and married Argeia, daughter of Adrastus, king of Argos, whose other daughter, Deiphyle, married Tydeus of Calydon. The latter had gone into exile for homicide; he and Polyneices met and quarrelled, and Adrastus recognized them, by their dress or their shield-devices, as the lion and boar to whom the gods had bidden him betroth his daughters. At the end of a year, Polyneices claimed to rule Thebes in his turn; Eteocles refused, and Adrastus gathered an army to restore his son-in-law. The chieftains, besides the three already named, were Capaneus, Amphiarus (*q.v.*), Eteocles, and Parthenopaeus, son of Atalante. Of these, known as the Seven against Thebes, only Adrastus returned. Tydeus would have been made immortal for his valour, but Athena saw him gnaw the head of a slain enemy as he lay dying, and in disgust withheld the intended gift. Amphiarus was swallowed up in the ground, and in later times was much revered as an oracular hero or god. Polyneices killed Eteocles and was killed by him. Creon now became king; he ordered the bodies of the dead Argives to be left unburied, but Antigone secretly buried her brother, Polyneices. For this, despite the entreaties of his son, Haemon, to whom she was betrothed, Creon walled her up in a tomb (a form of ordeal; the gods might save her if they approved of her conduct). She

¹Changed to Hausschein and then into the Greek equivalent.

hanged herself, Haemon, who had broken into the tomb, killed himself, and so did Creon's wife Eurydice, on hearing the news (so Sophocles; in Euripides, Antigone escaped and lived happily with Haemon, at least for some years; see the fragments of his *Antigone* in Nauck). According to an Attic legend, Theseus (*q.v.*) attacked Thebes at the prayer of the mothers of the slain, and forced the Thebans to bury them; Creon was killed by Theseus in the battle. Another story represents him as surviving for many years, to be ultimately killed by the usurper Lycus (so Euripides, *Herc. Fur.*, 33). Oedipus died before, or not long after, the end of the war.

Adrastus bided his time, and when the sons of the Seven (known as the *Epigonoï*, or second generation; hence the application of the word to successors of the *Diadochi* (*q.v.*), the immediate successors of Alexander the Great) came to manhood, he once more attacked the city. On the advice of Teiresias (*q.v.*) the Thebans evacuated the place by night. Adrastus led his army back, but died on the way, at Megara, from grief at the death of his son Aigialeus, the only one of the *Epigonoï* to fall in the campaign.

There is no reason to doubt that this legend has a historical basis, probably in the events of Minoan-Mycenaean times. Gems from Thisbe show incidents strongly resembling the fight between Oedipus and Laius, and the former's encounter with the Sphinx; see Sir A. Evans in *Journ. Hell. Stud.* xlv. (1925), p. 27 *et seq.* Several incidents, such as the prophecies and the incestuous marriage, are patently folk-tales.

For further details, and the various attempts to make Oedipus a "faded" god of one sort or another, see the relevant articles in Roscher's *Lexikon* and Pauly-Wissowa, *Realencyklopädie*, also Preller-Robert, *Gr. Mythologie*, ii., p. 130; 876 *et seq.*; Farnell, *Hero-Cults*, p. 332 *et seq.*

Mediaeval Legends.—In the *Golden Legend* of Jacobus de Voragine (13th century) and the *Mystère de la Passion* of Jean Michel (15th century) and Arnoul Gréban (15th century), the story of Oedipus is associated with the name of Judas. The main idea is the same as in the classical account. The Judas legend, however, never really became popular, whereas that of Oedipus was handed down both orally and in written national tales (Albanian, Finnish, Cypriote). The Theban legend, which reached its fullest development in the *Thebais* of Statius and in Seneca, reappeared in the *Roman de Thèbes* (the work of an unknown imitator of Benoît de Sainte-More). Oedipus is also the subject of an anonymous mediaeval romance (15th century), *Le Roman d'Oedipus, fils de Layus*, in which the sphinx is depicted as a cunning and ferocious giant. The Oedipus legend was handed down to the period of the Renaissance by the *Roman* and its imitations, which then fell into oblivion. The legend has survived amongst the modern Greeks, without any traces of the influence of Christianity (B. Schmidt, *Griechische Märchen*, 1877). The works of the ancient tragedians (especially Seneca, in preference to the Greek) came into vogue, and were followed by modern imitators down to the 17th century.

See L. Constans, *La Légende d'Oedipe dans l'antiquité, au moyen âge, et dans les temps modernes* (1881); D. Comparetti's *Edipo* and Jebb's introduction to his ed. of Sophocles, *Oedipus Tyrannus*; for the "Oedipus Complex" see *PSYCHOLOGY*. (H. J. R.)

OELS, a town in the Prussian province of Silesia, on the Oelsbach, 20 m. N.E. of Breslau by rail. Pop. (1925) 14,418. Oels was founded about 940, and became a town in 1255. It appears as the capital of an independent principality at the beginning of the 14th century. The principality, with an area of 700 sq.m. and about 130,000 inhabitants, passed through various hands and in 1884 it lapsed to the crown of Prussia. The château, dating from 1558, was restored in 1891-94. Of its three Evangelical churches, the Schlosskirche dates from the 13th century, and the Propstkirche from the 14th. The inhabitants are chiefly engaged in making shoes, furniture and machines.

OELWEIN, a city of Fayette county, Iowa, U.S.A., in the north-eastern part of the State; served by the Chicago Great Western and the Rock Island railways. Pop. (1925 State census) 8,058. It is in a rich farming, dairying and stock-raising region,

and has large railroad shops and various other manufacturing industries. The city was founded in 1873, by August Oelwein; was incorporated in 1888, and chartered as a city in 1897.

OENOMAÏS in Greek legend, son of Ares and Harpinna, king of Pisa in Elis and father of Hippodameia. It was predicted that he should be slain by his daughter's husband. His father gave him winged horses and Oenomaüs promised his daughter to the man who could carry her off in a chariot; he himself was to drive after, and spear the suitor if he could catch him. This may be founded on some marriage rite of simulated capture. Thirteen aspirants having thus perished, Pelops (*q.v.*) arrived, and won, having winged horses which Poseidon had given him. He is usually said to have bribed Oenomaüs' charioteer Myrtilus to take out his master's linch-pins and substitute wax dummies; Oenomaüs was thus thrown and killed.

See Diod. Sic. iv. 73; Pausanias vi. 21, and elsewhere; Sophocles, *Electra*, 504, with Jebb's note; Hyginus, *Fab.* 84. 253.

OENONE, in Greek legend, daughter of the river-god Cebren and wife of Paris, who deserted her to kidnap Helen (*q.v.*). Just before the capture of the city, Paris, wounded by Philoctetes, sought the aid of Oenone, who had told him that she alone could heal him if wounded. She refused to help him, and Paris returned to Troy and died of his wound. Oenone soon repented and hastened after him, but finding that she was too late to save him slew herself from grief at the sight of his dead body.

OENOTHERA, the generic name of the evening primrose, several species of which are favourite garden plants. The genus, which comprises numerous species, is confined to America and belongs to the family Onagraceae. The evening primrose acquired importance in connection with H. de Vries' theory of mutations. (See PRIMROSE, MUTATION, HEREDITY.)

OESL: see SAARE MAÄ.

OESOPHAGUS, DISEASES OF. (See ALIMENTARY CANAL.) The human oesophagus is liable to certain accidents and diseases, from its function and its situation. One of the commonest accidents is the lodgment of foreign bodies. An impacted substance may be removed by the oesophageal forceps, or a coin-catcher or may be pushed down into the stomach. A purgative should never be given, but soft food such as porridge. Should gastric symptoms develop operation may be necessary. Charring and ulceration of the oesophagus may occur from the swallowing of corrosive liquids, strong acids or alkalis, or even of boiling water. Stricture of the oesophagus may be spasmodic, fibrous or malignant. *Spasmodic stricture* usually occurs in young hysterical women; under an anaesthetic a bougie will slip down easily. *Fibrous stricture* is usually situated behind the cricoid cartilage, and results from swallowing corrosive fluids or the healing of a syphilitic ulcer. Occasionally it is congenital. The ordinary treatment is repeated dilatation by bougies. *Malignant strictures* are usually squamous cell carcinoma (see TUMOURS) and chiefly occur in males between the ages of 40 and 70 years. An X-ray photograph taken after the patient has swallowed a preparation of bismuth will show the situation of the growth, and Killian and Brünig have introduced the oesophagoscope, which makes direct examination possible. Dilatation by bougies must not be attempted, the oesophagus being so softened by disease that perforation might take place. Radium treatment, so far, has not been successful. The method of transpleural approach to the thoracic oesophagus and insertion of radium into the wall of the tube has been introduced, but as yet it is too early to evaluate the results. The most satisfactory treatment is the operation of gastrotomy, a permanent artificial opening being made into the stomach through which the patient can be fed.

OETA (mod. *Katavothra*), a mountain in Greece, 7,080 ft. high, to the S. of Thessaly, between the valleys of the Spercheius and the Boeotian Cephissus. Its east end, Callidromus, overhangs the sea at the famous pass of Thermopylae (*q.v.*). There was also a high pass W. of Callidromus into the upper Cephissus. In mythology Oeta is the scene of the death of Heracles.

OFFA (d. 796), king of Mercia, obtained that kingdom in A.D. 757, after driving out Beornred, who had succeeded a few months earlier on the murder of Aethelbald. He traced his

descent from Pybba, the father of Penda, through Eowa, brother of that king, his own father's name being Thingferth. In 779 he was at war with Cynewulf of Wessex from whom he wrested Bensington. It is not unlikely that the Thames became the boundary of the two kingdoms about this time. In 787 the power of Offa was displayed in a synod held at a place called Cealchyth. He deprived Jaenberht, archbishop of Canterbury, of several of his suffragan sees, and assigned them to Lichfield, which, with the leave of the pope, he constituted as a separate archbishopric under Hygeberht. He also took advantage of this meeting to have his son Ecgferth consecrated as his colleague, and that prince subsequently signed charters as *Rex Merciorum*. In 789 Offa secured the alliance of Berhtric of Wessex by giving him his daughter Eadburg in marriage. In 794 he appears to have caused the death of Aethelberht of East Anglia, though some accounts ascribe the murder to Cynethryth, the wife of Offa. In 796 Offa died after a reign of 39 years and was succeeded by his son Ecgferth.

It is customary to ascribe to Offa a policy of limited scope, namely the establishment of Mercia in a position equal to that of Wessex and of Northumbria. This is supposed to be illustrated by his measures with regard to the see of Lichfield. It cannot be doubted, however, that at this time Mercia was a much more formidable power than Wessex. Offa, like most of his predecessors, probably held a kind of supremacy over all kingdoms south of the Humber. He seems to have entertained the design of putting an end to the dependent kingdoms. At all events we hear of no kings of the Hwicce after about 780, and the kings of Sussex seem to have given up the royal title about the same time. Further, there is no evidence for any kings in Kent from 784 until after Offa's death. To Offa is ascribed by Asser, in his life of Alfred, the great fortification against the Welsh which is still known as "Offa's dike." It stretched from sea to sea and consisted of a wall and a rampart. An account of his Welsh campaigns is given in the *Vitae duorum Offarum*, but it is difficult to determine how far the stories there given have an historical basis.

See *Anglo-Saxon Chronicle*, ed. J. Earle and C. Plummer (1899), s.a. 755, 777, 785, 787, 792, 794, 796, 836; W. de G. Birch, *Cartularium Saxonicum* (1885-93), vol. i.; Asser, *Life of Alfred*, ed. W. H. Stevenson (1904); *Vitae duorum Offarum* (in works of Matthew Paris, ed. W. Wats, 1640).

OFFA, the most famous hero of the early Angli. He is said by the Anglo-Saxon poem *Widsith* to have ruled over Angel, and the poem refers briefly to his victorious single combat, a story which is related at length by the Danish historians Saxo and Svend Aagesen. Offa (Uffo) is said to have been dumb or silent during his early years, and to have only recovered his speech when his aged father Wermund was threatened by the Saxons, who insolently demanded the cession of his kingdom. Offa undertook to fight against both the Saxon king's son and a chosen champion at once. The combat took place at Rendsburg on an island in the Eider, and Offa succeeded in killing both his opponents. According to *Widsith* Offa's opponents belonged to a tribe or dynasty called Myrgingas, but both accounts state that he won a great kingdom as the result of his victory. A somewhat corrupt version of the same story is preserved in the *Vitae duorum Offarum*, where, however, the scene is transferred to England. It is very probable that the Offa whose marriage with a lady of murderous disposition is mentioned in Beowulf is the same person; and this story also appears in the *Vitae duorum Offarum*, though it is erroneously told of a later Offa, the famous king of Mercia. Offa of Mercia, however, was a descendant in the 12th generation of Offa, king of Angel. It is probable from this and other considerations that the early Offa lived in the latter part of the 4th century.

See H. M. Chadwick, *Origin of the English Nation* (1907), where references to the original authorities will be found.

OFFALY COUNTY, a county of Ireland in the province of Leinster, bounded north by Meath and Westmeath, west by Roscommon, Galway and Tipperary (the boundary with the first two counties being the river Shannon); south by Tipperary and Leix County, and east by Kildare. The area is 493,999 acres or

about 772 sq.m. Pop. (1926) 51,521. The greater part of the county is included in the Carboniferous Limestone plain of central Ireland. In the south-east the Slieve Bloom Mountains, composed largely of Old Red Sandstone, form the boundary between Offaly County and Leix County, and run into the former county from south-west to north-east for a distance of about 20 m. consisting of precipitous crags through which there are two narrow passes, the Black Gap and the Gap of Glandine. In the north-east, basic volcanic rocks rise in Croghan Hill to a height over 700 ft. In the centre of the county from east to west a large portion is occupied by the Bog of Allen. Here and there drier deposits of esker-gravels rise as green hills above the clay soils and bogs of the plain. The county shares in the advantage of the navigation of the Shannon, which skirts its western side. The Brosna, which issues from Loch Ennell in Westmeath, enters the county near the town of Clara, and joins the Shannon after receiving the Clodagh and the Broughill. A small portion of the north-eastern extremity is skirted by the upper Boyne. The Barrow forms the south-eastern boundary with Leix. The Little Brosna, which rises in the Slieve Bloom Mountains, forms the boundary of Offaly County with Tipperary, and flows into the Shannon.

Offaly County, with portions of Tipperary, Leix County and Kildare, at an early period formed one kingdom under the name of Offaly, a title which it retained after the landing of the English. Subsequently it was known as Glenmallery, Western Glenmallery corresponding closely to the present Offaly County, and Eastern Glenmallery to Leix County. These two divisions were formed into shires in 1556, being then known as King's County and Queen's County respectively.

In the Slieve Bloom Mountains is a pyramid of white stones called the Temple of the Sun or the White Obelisk. There are many Danish raths, and a chain of moats commanding the passes of the bogs extended throughout the county. On the borders of Tipperary is an ancient causeway leading presumably to a crannog or lake-dwelling. The most important ecclesiastical ruins are those of the seven churches of Clonmacnoise (q.v.) on the Shannon in the north-west of the county, where an abbey was founded by St. Kieran in 648, and where the remains include those of churches, two round towers, crosses, inscribed stones and a castle. Other famous religious houses were Durrow Abbey, founded by St. Columba in 550; Monasteris founded in the 14th century by John Bermingham, earl of Louth; and Seirkyran Abbey, founded in the beginning of the 5th century. The principal old castles are Rathmore, probably the most ancient in the county; Banagher, commanding an important pass on the Shannon; Leap Castle, in the Slieve Bloom Mountains; and Birr or Parsonstown.

The whole of the county would appear to have been covered formerly by a vast forest, and the district bordering on Tipperary is still richly wooded. The soil is generally either a deep bog or a shallow gravelly loam. On the borders of the Slieve Bloom Mountains there are some very rich pastures, and there are also extensive grazing districts on the borders of Westmeath, chiefly occupied by sheep. Along the banks of the Shannon there is good meadow land. With the exception of the tract occupied by the Bog of Allen, the county is nearly all under tillage, the most productive portion being that to the north-west of the Hill of Croghan. Oats, barley and rye, potatoes and turnips, are all considerably grown; wheat is almost neglected, and the acreage of all crops has a decreasing tendency. Cattle, sheep, pigs and poultry are bred increasingly; dairies are numerous in the north of the county, and the sheep are pastured chiefly in the hilly districts.

The county is traversed from south-east to north-west by the Portarlington, Tullamore, Clara and Athlone line of the Great Southern railway, with a branch from Clara to Banagher; other branches run from Roscrea (Co. Tipperary), to Parsonstown (Birr), from Enfield (Co. Kildare) to Edenderry, and from Streamstown (Co. Westmeath) to Clara. The Grand Canal runs through the county from east to west, entering the Shannon at Shannon harbour.

The administrative counties of Leix and Offaly together return 5 members to Dáil Eireann.

OFFENBACH, JACQUES (1819-1880), French composer of *opéra bouffe*, was born at Cologne, of German Jewish parents, on June 21, 1819. In 1833 he was sent to Paris to study the violoncello at the conservatoire. As a member of the orchestra of the Opéra Comique, he turned his opportunities to good account and eventually was made conductor at the Théâtre Français. His first complete work, *Pepito* (Opéra Comique, 1853), was followed by a crowd of light dramatic pieces of a light character, which effected a complete revolution in the popular taste of the period. Offenbach obtained a lease of the Théâtre Comte in the Passage Choiseul, reopened it in 1855 under the title of the Bouffes Parisiens, and produced a succession of brilliant, humorous trifles. Ludovic Halévy, the librettist, was associated with him from the first, but still more after 1860, when Halévy obtained Henri Meilhac's collaboration (see HALÉVY). Beginning with *Les Deux Aveugles* and *Le Violoncelle*, the series culminated in 1867 with *La Grande Duchesse de Gérolstein*, perhaps the most popular *opéra bouffe* that ever was written, not excepting even his *Orphée aux enfers*, produced in 1858. In 1866 his own connection with the Bouffes Parisiens ceased, and he wrote for various theatres. In twenty-five years Offenbach produced no less than sixty-nine complete dramatic works, some of which were in three or even in four acts. Among the latest of these were *Le Docteur Ox*, founded on a story by Jules Verne, and *La Boîte au lait*, both produced in 1877, and *Madame Favart* (1879). Offenbach died at Paris on Oct. 5, 1880. *Les Contes d'Hoffmann*, posthumously published, was revised by Léo Delibes, and has proved, as he himself prophesied, the most popular of all his works.

See P. Bekker, *Jacques Offenbach* (1909); E. Rieger, *Offenbach und Seine Wiener Schule* (1920); L. Schneider, *Offenbach* (Paris, 1923).

OFFENBACH, a town of Germany, in the republic of Hesse, on the left bank of the Main, 5 m. E.S.E. of Frankfort-on-Main, with which it is connected by the railway to Bebra and by a local electric line. Pop. (1925) 79,362. The earliest mention of Offenbach is in a document of 970. In 1486 it came into the possession of the counts of Isenburg, and in 1816, when their lands were mediatised, it was assigned to Hesse. French Protestant refugees settled here at the end of the 17th, and the beginning of the 18th century, and brought prosperity which increased with the accession of Hesse to the German Zollverein in 1828. The most interesting building in the town is the Renaissance château of the counts of Isenburg. Offenbach is the principal industrial town of the republic, and manufactures include chemicals, boilers, machines, wire goods and celluloid. Its characteristic industry, however, is the manufacture of fancy goods in leather.

OFFENBURG, a town of Germany, in the republic of Baden, 27 m. by rail S.W. of Baden, on the river Kinzig. Pop. (1925) 16,613. Offenburg is first mentioned about 1100. In 1223 it became a town; in 1248 it passed to the bishop of Strassburg; and in 1289 it became an imperial free city. Soon this position was lost, but it was regained about the middle of the 16th century, and Offenburg remained a free city until 1802, when it became part of Baden. The chief industries are dyeing and the making of cotton, linen, silk, cement, machinery, cigars and glass.

OFFICE, a duty or service, particularly the special duty cast upon a person by his position; also a ceremonial duty, as in the rites paid to the dead, the "last offices." The term is thus especially used of a religious service, the "daily office" of the English Church or the "divine office" of the Roman Church (see BREVARY). It is also used in this sense of a service for a particular occasion, as the Office for the Visitation of the Sick, etc. For the "Holy Office" see INQUISITION.

OFFICE APPLIANCES. Many office tasks, being of a repetitive character, naturally adapt themselves to the principle of "division of labour," and consequently to the use of machinery also. But these facts alone are not sufficient justification for the purchase of appliances. Four purposes are considered by good office management in deciding when the use of machinery is advisable. These are:—

Objects of the Appliances.—(1) To save labour. This saving should be evidenced in a reduced pay roll. Hypothetical savings of "half a man" are seldom realized.

(2) To save time. In many cases this is more important than the saving of labour; to speed up a slow routine, extra expenditure is often an economic advantage.

(3) To promote accuracy. Mechanical methods are advisable when accuracy is vitally important and otherwise difficult to obtain.

(4) To avoid monotony. The substitution of a machine for manual repetitive movements will usually achieve this.

BY COURTESY OF THE ADDRESSOGRAPH MACHINE CO.

ADDRESSOGRAPH MACHINE CAPABLE OF ADDRESSING 3,000 ENVELOPES AN HOUR, ONE PERSON OPERATING IT

later being used more extensively for multiplication and division.

There are two principal types of adding machines: those which print on paper the amount being added, and those which do not—the former being known as listing, and the latter as non-listing machines. The listing machines are again divided into two classes, the first being the full keyboard model carrying a row of keys numbered from 1 to 9 for each column, and the machine of the second class having ten keys arranged in two or three rows. Each of these keys represents a digit, and the depression of a key for an item automatically causes progressive columnar position. Thus, if 23 is to be added, the 2 is first depressed, then the 3 and the mechanism takes care of the numerical order. The items are printed either on a roll of narrow paper or on a wide form held in the carriage of the machine.

Some models have two sets of adding dials—one for accumulating individual totals, the other for accumulating a grand total. On some machines a "split" feature provides for splitting the printing mechanism into two or more sections, so that several columns may be listed and added at the same time and the total of one or more columns printed. On others, subtraction is accomplished by means of complementary numbers, a "complement" being any number which, added to another, makes a full number. Thus if the digits are changed to 9's—as 9, 99, 999 and so on—and a 1 then added, we can convert any number into a full or complementary number on the keyboard of any adding machine. The complementary numbers are usually indicated by small figures on the keys, the two digits on a key, if added, invariably making nine. Other machines perform subtraction by depressing a subtract key. Multiplication is consecutive addition. Thus, if 26 is to be multiplied by 5, it is merely added five times. For division, the divisor is subtracted from the dividend as many times as it is contained in that dividend, the number of subtractions being automatically registered on the counting wheels as a quotient. There is also a small portable adding machine, weighing about 7 lb., operated with a pull-down lever keyboard. A very small adding device, known as a vest pocket machine, is operated by inserting a pick or stylus, in positions for the

Inventive skill and genius have not been lacking to meet these needs, and the list of available devices is very long, machinery being now extensively used.

Adding and calculating machines are largely used for the promotion of accuracy, and save time by avoiding extended search for errors. The ordinary clerk is usually incapable of correctly handling a large amount, even of simple calculations, with a fair degree of accuracy by the manual method, and these machines have therefore become a practical necessity for the modern business office.

Adding Machines.—All adding machines may be used for addition, subtraction, multiplication and division; but as certain types are better adapted for multiplication and division, a technical distinction has grown up in the trade between adding and calculating machines, the latter being used more extensively for multiplication and division.

amounts.

Calculating Machines.—Where rapid addition, multiplication, subtraction and division are required, and no need for a printed record exists, calculating machines are used. They do not print a record of the items, but indicate the result on total dials. One type, known as the key-driven, causes the items to appear immediately on the dials when the keys are depressed, the operation of a crank clearing the figures off the dial faces again. As with adding machines, the four arithmetical operations are all performed as variations of simple addition. In another type, known as the key-set, the amounts are first set up on the keyboard and operation of the machine, either by hand or by motor, effects the calculation. The total dials, situated in the laterally moving carriage above the keyboard, show the total in addition, the product in multiplication, the minuend or remainder in subtraction and the quotient in division. Proof dials, placed in, above or below the carriage, show the multiplier in multiplication and the divisor in division. An extra set of dials is sometimes provided, which furnish an additional check for accuracy by showing the amounts set up on the keyboard. The dials are cleared by various means, distinctive with each make of machine.

For subtraction, the amount from which the deduction is to be made is set up, the operation of the machine causing that figure to appear on the total dials. The figure to be subtracted is then set up and the machine operated and the answer appears on the total dials. Multiplication is consecutive addition, though in some models multiplication is by means of a plus bar; in others, by means of an extra row of multiplying keys. Division is consecutive subtraction, some models dividing by means of a minus key, while another model provides for setting up amounts by means of levers pulled down to the desired numbers, this machine otherwise conforming to the key-set type.

A recent invention is a tape-printing calculating machine which prints the factors, figures and prints the answer and accumulates a total of all answers, all on a single operating stroke. It is primarily designed for accomplishing calculations in multiplication at high speed (20 multiplications a minute) by a direct, single cycle operation, and to provide printed totals of resulting products automatically. It is equally suitable for performing division by reciprocals; as an adding machine, it is equipped to subtract directly. The production speed, after the factors are set up, is uniformly $2\frac{1}{2}$ or 3 seconds per calculation (depending upon the timing of the mechanism) regardless of the size of the factors; that is, a problem such as 649.538×369.486 is as speedily computed as 2×2 . The decimal place in the printed answer is automatically positioned. Its adding feature is not as rapid as with some of the standard adding machines. There are two keyboards with a capacity of six columns; the product or totaling capacity is 14 places. The multiplicand is set up on the left keyboard, the multiplier on the right. The machine, being motor driven, merely needs the depression of the motor control to multiply one factor by the other and print them side by side, together with the product, in a straight line on a detail strip.

Book-keeping Machines.—The so-called book-keeping machine is in reality a device for posting on loose ledger sheets or cards. The amount is not merely entered to the account as in hand book-keeping—to be added and balanced at a specified period—but a balance is struck each time a posting is made. The original entry from which the account is posted is usually a sales ticket, credit slip or copy of the invoice. (See BOOK-KEEPING.)

All such machines are designed to print and add an old balance, print and add debit items, print and subtract credit items and compute the new balance, in some cases printing it automatically, in others showing it in the adding and subtracting mechanism so that it may be copied in the proper column by the operator. Proof of the correctness of posting varies with the type of machine. One type is an adding machine which subtracts directly; it is equipped with means for printing dates, folio numbers, characters and abbreviations, and with a tabulating carriage which moves automatically to the next column as each amount is computed and printed, and in some cases returns automatically to any required position on the printing line. Both vertical and

horizontal columns are added, subtracted and computed. Items are set up as on an adding machine, the operation of the motor causing them to be printed, added or subtracted. When a new balance is printed, the accumulator clears, ready for the next operation. Some models have two counters, thus making it possible to compute individual balances and accumulate a total of all postings. The keyboard may be split into two sections so that both ledger and statement can be inserted in the carriage and posted at the same operation—that posting being automatically repeated.

The design of a second class of book-keeping machine embodies a typewriter—on which any description may be typed—and a calculating machine, built as one unit. Some machines add and subtract in vertical columns; others compute amounts across the sheets as well. The typewriter carriage moves to correct column positions by means of a decimal tabulator. Typing the amounts on the number keys effects addition or subtraction. The amounts are visible in registers or totalizers placed either on the carriage truck, in positions corresponding to the columns to be added or subtracted, or at the front of the machine below the keyboard. In posting, a new balance is computed, and the operator types in the proper column the amount appearing in the register which functions to compute across the sheet. If the typing is correct, this register clears. Ledger and statement are made at the same time, in some cases by means of a carbon and in others by the split-platen method, one machine of this class being unique in that its typewriter section is mounted on a carriage which moves from left to right across a flat printing surface on which the forms are held, a back and forward motion providing line spacing. Registers are mounted on the rear of the typewriter section, and ledger and statement are posted at one operation by means of carbon.

A third class of machine carries, below the typewriter keyboard, a 10-key keyboard which controls the calculating mechanism. Here the split-platen method is used for making ledger and statement at the same time. Still another class, used for ledger posting and instalment accounts, follows cash register design, amounts being set up on a push-in key-set keyboard and turned into the mechanism by the operation of the motor. There is a sliding printing table on which the forms to be posted are inserted. Two forms may be posted at the same time, the amount being printed on one and repeated on the other. This machine automatically computes and prints the amount of the balance outstanding on each account. Debits and credits are classified and a total of each is accumulated, as many as 18 individual and two group totals being obtainable. A detailed record of all postings is printed on a strip of paper inside the machine.

Billing Machines.—The writing of an invoice for goods sold, by means of a carbon duplication, can be made to serve other purposes also, and it is quite common at one writing to make the invoice, the original sales record, the shipping notice, the shipping record and other memoranda required for various kinds of business. By means of calculating devices, the amounts of the items may be computed and totals accumulated for controlling accounts. Combination typewriters designed to do this work are known as billing machines. These are designed to write, at one operation, the several necessary copies of orders, invoices, bills of lading and other forms and in some cases to compute amounts as they are written. Cut forms, printed and padded in individual sets so that each set is torn off and loose carbon inserted between the sheets to make the necessary copies, are used with some machines. Others use continuous-length forms, which provide multiple copies of the same or related forms, in rolls or folded flat, these forms being fed through the machine with the carbon interleaved between the copies, so that it is not necessary to insert new forms after writing each set.

Among the billers which write, but do not compute, is an ordinary correspondence typewriter equipped with an inbuilt carbon-changing device which removes the carbons from a set of continuous-length forms just written and inserts them in another set. Another non-computing biller has a standard keyboard typewriter mounted on a carriage which moves from left

to right across the flat writing surface over which the forms are fed. Cut forms may be used with this machine, and it may be equipped to add in vertical columns and to cross compute as well. Book-keeping machines which combine a typewriter with a calculating mechanism have been adapted to billing work which requires the adding or subtracting of amounts as they are typed. One such has an inbuilt carbon-changing device which provides for the use of continuous-length forms; another uses cut forms and may be equipped with a split cylinder so that billing and ledger posting can be done simultaneously.

Still another embodies a typewriter and a calculating mechanism which handles addition, subtraction and multiplication, and is operated from a separate 10-key keyboard below the typewriter keyboard. By means of a split-platen, billing and ledger posting can be done at the same time.

Accounting and Tabulating Machines.—The preparation of statistics requires, first, the sorting of data and, second, the accumulation, by classes, of the amounts involved. Machines for this work were first used by the U.S. Census Bureau, but are now being rapidly adapted to business uses, such as cost work, sales analysis and similar work.

Cards printed with vertical columns numbered from 0 to 9, or from 0 to 12, and separated into fields of one or more columns, each field representing an item, such as department, job number and so forth, form the basis of two systems. Facts are expressed in figures, letters or symbols, and are recorded by perforations on the card at the proper numerical positions, made by a punching machine which operates like a typewriter. The cards are then arranged by a sorting machine, according to a predetermined classification. Contact—electrical or mechanical, depending on the make of the machine—sets the mechanism in motion. The cards are next fed through the tabulating machine, which makes a printed final report, in multiple if so desired. Contact through the perforations causes the machine to designate and add what has been perforated into the cards—listings, sub-totals, totals or grand totals being obtained, depending upon the arrangement desired for the report.

Alphabetical Machines.—A recent improvement is a machine fitted to print a condensed alphabet by symbols as well as figures. This improvement makes it possible to perform automatically many operations, such as the writing of invoices of standard products, keeping stock records and the like. When detailed listing and printing is not required, a non-printing tabulator registers the quantities in counters which accumulate the totals, the figures being posted by hand to report forms. The 80 column card now available permits finer classification and enables a greater number of products or facts to be recorded.

Another type of machine is built on the same principle as the book-keeping machine of cash-register design. Twenty-seven keys, each representing a classification, accumulate individual totals and as many as three grand totals can be obtained and the number of items in each classification counted. A continuous permanent record of all operations is made within the machine on a roll of paper called a visible audit sheet, and notations may be hand-written opposite any printed item. This record may be used as a posting medium, a proof sheet or a permanent record. A ticket may be issued on any operation, showing the date, serial number, identifying numbers, symbols for the totals used and the amount. It may be used as a voucher, pay ticket, receipt, requisition or posting medium or for filing purposes. The same information may be printed on any form inserted in the printing-table.

Duplicating Machines.—In offices there is much need for devices that will quickly produce multiple copies of typewriting or handwriting, for the time and labour thus saved is an important economy. Sometimes only a few copies are needed, sometimes many. For a limited number of copies, say up to five or six, the carbon method of duplication is perhaps the cheapest in most cases; but where from 5 to 100 copies are required, the hektograph process is preferable.

Stencils.—For a still larger number of copies, the stencil methods and type methods are available. With the former, the

stencil was originally made on a sheet of wax-covered paper, which was written upon either with a stylus or with a typewriter from which the ribbon was removed—a system that had many defects. The modern method utilizes a specially prepared sheet of tough, flexible tissue, which can be filed away after using and used many times. One manufacturer provides a glass-topped, electrically illuminated table for making stencils by hand with a stylus. Typewriting, handwriting and drawing may all be combined on one stencil sheet. The duplicator consists of a hollow revolving cylinder, partially covered by an ink pad, over which the stencil is fastened. Each revolution brings the stencil sheet in contact with the paper, and the ink, passing through the character or design, makes the impression. From 1,500 to 5,000 copies can be made in an hour, depending on whether the model is hand- or motor-operated and whether it is automatically fed.

Hektographs.—The hektograph is many years old, and its operation is based on the principle of absorption. The original writing is done on a sheet of hard bond paper with a water-soluble ink or with a typewriter ribbon impregnated with such ink. This sheet is then placed in contact with a moist surface of gelatin or clay composition, and the writing is absorbed from the paper and appears in reversed form on the gelatin or clay surface. Then, by placing a sheet of blank dry paper on this moist surface, the impression is transferred to the paper. The gelatin was originally used in flat tin pans, and in this form the hektograph was of little use in the office, as registration was difficult. The clay form of hektograph was, and is, extensively used for the reproduction of drawings by architects and draftsmen, because it is a simple matter to prepare this composition for large sizes of work. The modern hektograph uses the old principle, but the gelatin is coated on a long band, a small portion of which is exposed at a time. This band runs over a flat iron surface. Registration is accomplished by a special feeding device. The unique feature of the hektograph duplicator is its use in routines of order or billing systems, in which from 10 to 15 copies of the same writing (or any portion of it) may be transferred to sheets of various sizes and shapes. Such copies are much clearer than carbons, and the paper does not have to be thin. The hektograph can also be used for bulletins of which 100 or less copies are desired.

Type Reproduction.—There are several devices which duplicate from type, the principal feature of most being a simple method of setting the type, which does not require a trained typesetter, the printing also being simplified by means of a revolving drum. The style of type most used is the imitation typewriter face, and the chief use is for the reproduction, through a ribbon, of facsimile typewritten letters, there being also a special device which may be used for the reproduction of the signature. A printing-ink attachment makes possible the use of printer's type and of electrotypes or stereotypes curved to fit the drum. Some models are hand-fed and operated; those which are automatically fed and motor driven attain a speed of 2,400 to 4,800 pieces an hour. Another machine produces letters from typewriter type cast on a linotype machine, at the same time filling in the name, address and salutation from slugs—one for each name on the mailing list—which change automatically as each letter is printed through a ribbon, the slugs being filed for future use. The speed is 1,000 letters and envelopes an hour, the latter being addressed from the same slugs. Certain machines which print from typewriter type are really small presses adapted to the printing needs of the layman, and print from printer's type, electrotypes, linotype, monotype, flat zincs and half-tones.

Automatic Typewriters.—The automatic typewriter is designed to produce actual typewritten letters at three times the average speed of a typist. Its mechanical movements are controlled by a paper roll, similar to that of a player-piano, in which perforations representing characters on the typewriter keys are made by a perforator. When an entire letter has been thus perforated, the paper is cut from the roll, and its ends are cemented together to form an endless belt, which is then placed over the drum of the automatic typewriter. The operator writes by hand the name and address and starts the automatic device. Pins

dropping through the perforations into slots, as the roll is carried forward by the revolution of the drum, actuate the typewriter keys, causing the typing of the words; when all the perforations have passed over the drum, the operator removes the finished letter and then repeats. Insertions of special words or sentences may be made by hand at any desired point.

Photocopying Machines.—A special photographic machine, in which a roll of sensitised paper coated on rag stock is used as a negative, photographing directly without the intervention of plates, has of late years been highly developed and used extensively as an office device. It offers a means of quickly producing a fac-simile copy of any document, and has therefore to a great extent eliminated the laborious hand copying of records, deeds, insurance applications, contracts and the like. The equipment consists of a large camera combined with a developing machine, so that after an exposure is made the sensitised paper is carried first to the developing bath and then to the fixing bath. Dials and levers control all operations, and the machine is so scientifically adjusted that an office boy can turn out perfect copies. The colours are reversed in the first print, called a "black print"; that is, the whites in the original are black and the blacks are white. As the photograph is made through a reversing prism, the letters appear exactly as in the original. A white positive print is made by re-photographing the black print. By continuing to photograph the original, as many black prints as desired can be made; and as many positives as required can be made by photographing the black prints. It is also possible, by using a special kind of paper, coated on both sides, to print two sides of a page simultaneously and have the photograph with an image on each side.

Addressing Machines.—These are in reality devices designed for duplicating small pieces of writing. Originally designed for duplicating names and addresses—hence the name—they now have many other uses, such as the making of invoices, statements, receipts and other office records. They are of especial value in businesses where the same list of names and addresses must be repeatedly used. Each name and address must first be impressed upon a metal plate, cut on a fibre stencil or set in type, according to the character of the machine. The metal plate is prepared by an embossing machine operated by hand or electric motor; a blank plate is inserted in the machine, and the required characters are selected by an indicator and stamped into the metal. Some embossers have a typewriter keyboard, the embossing being performed by depressing the keys. Some metal plates carry a name card and others a record card for recording relevant data. A fibre stencil consists of a frame in which is mounted a panel of semi-transparent paper coated with a gelatinous material, some frames having spaces for the insertion of relevant data. The name and address are cut by means of a typewriter from which the ribbon has been removed, a special device holding the stencil while it is cut. When printer's type is used, names and addresses are cast on a linotype machine.

Addressing machines, despite many structural differences, operate on the same general principle. The metal plates, stencils or slugs are fed from a magazine to the printing point where the envelope or other matter to be addressed is placed either by hand or by a mechanical device. Directly over the printing point is a stamping arm which comes down on the envelope when the machine is operated, thereby bringing it into contact with the plate, stencil or slug either directly, in case ink is used, or through a ribbon. As the arm rises, another plate comes to the printing point, the one just used passing to a receiving machine, where it re-files itself in original order. Models are hand, foot-treadle or motor operated, the speed varying from 1,000 to 15,000 impressions an hour. Special models are designed for publishers addressing on large envelopes, on mailer strip or directly on the margins of newspapers and magazines. The adaptability of addressing machines is greatly increased by attachments, some of which are so common as to be considered standard equipment. The metal plates and fibre stencils are filed like index cards in drawers kept in cabinets, slugs being filed in galleys and stored in cabinets. One machine is unique in that its metal plates are

linked together to form an endless chain; they pass to the printing point from a reel on which they are wound and they are then re-wound on another reel, the reels being stored in cabinets.

Hand Stamp Affixers.—Stamps provided in rolls of 500 by the post-office are locked in a stamp affixer and applied to envelopes by the downstroke of a plunger, moisture being applied in some cases to the stamp, in others to the envelope. Extra containers, allowing for quick change from one denomination to another, are furnished with some models. Some machines are spring-locked; others are key-locked to guard against unauthorized operation; still others count the stamps used.

Sealing Machines.—These are designed for the rapid sealing of large quantities of envelopes. The envelopes are fed to the machine one at a time, either by hand, semi-automatically by holding them against revolving feed rollers or automatically from a hopper—depending on the type of machine. The gummed flaps come in contact with a moistening device—a wick, a roller or a metal disk—which receives its water-supply from a reservoir or by a position feed suction. The envelopes then pass between sealing rollers and are ejected from the machine. Letter opening machines are frequently used in offices. In many mail order houses and similar establishments these are considered a necessity. Their principles of operation usually include mechanism for placing, cutting and sorting various sizes of letters.

Permit Mailing Machines.—An office having occasion to mail a thousand or more letters a day could greatly expedite their passage through the routine of mailing if the office were permitted to cancel the stamps or to print some indication that postage was paid. For this purpose, a U.S. post office regulation, passed in 1920, provides for the printing of the permit, or indicia, as it is called, directly on the envelope in the office of the mailer. Permit mail is of two kinds—metered and non-metered; for either, the licence must be obtained from the Post Office Department through the local postmaster, the mail being delivered to the post office by the sender, as such mail is handled separately. Machines which handle non-metered mail print the indicia, seal the envelopes and count the pieces. The impression must show the postmark—city and state, month, day and year, denomination and sender's permit number. The number shown in the counter of the machine after a mailing is completed, multiplied by the denomination, gives the amount of postage to be paid. Payment is made either with each individual mailing or by a cash balance carried at the post office. Certain machines will print the indicia without sealing, seal without printing, or count without either sealing or printing.

The basis of the meter system is a printing and recording mechanism demountable from the machine with which it is used, so that it can be taken to the post office to be set for a given number of impressions, payment being made at that time, and the mechanism locked and sealed. Two sets of registers indicate how much postage has been used. A separate meter is used for each denomination, and any number of meters can be secured for one machine. The indicia are the same as those printed by the non-metering type, except that the sender's meter number is shown. The speed of such machines varies from 150 to 200 a minute. One type of machine is adapted for use with either the metered or the non-metered system. In 1924 the U.S. Post Office Department issued a regulation permitting first-class mail to be sent out with pre-cancelled stamps attached. The stamps, obtained in coils from the post office, are applied by a hand stamp-affixer and the envelopes are then passed through a non-metering permit machine which seals and counts them and prints the postmark and additional cancellation required. Where bulk of mail does not warrant a permit machine, the postmark and additional cancellation are applied by a rubber stamp bearing a changeable date. One sealing machine is adapted to metered, non-metered and pre-cancelled systems, without mechanical alteration.

Cash Registers (q.v.).—Motor-driven models have now become available.

Autographic Registers.—On many occasions it is necessary to make by the carbon method several copies of pencil memoranda. The autographic register is a device for making at one writing an original and from one to six copies of sales slips, bills

of lading, requisitions and other business records on continuous forms. These, interleaved with carbon, are retained within the register and fed across a writing table or platen. Some registers use rolled forms, one roll for each copy of the record; others use flat folded forms. Various types of registers have various methods of aligning the several copies that make up a set. As a written set is issued from the register, either by pulling out by hand or by the turn of a crank, and is torn off against a knife edge, another set, automatically leaved with carbon, is brought into a writing position.

Coin-handling Devices.—In all business houses where large amounts of coin are handled and packaged daily, the use of mechanical devices for sorting, counting and packaging saves time and labour. Coin-counters simply sort mixed coins into denominations. The usual type of machine has a disk revolving in a hopper and the coins are carried by the disk to a rail finger from which they roll by gravity and are sorted by dropping through slots of various diameters into separate boxes. From 1,000 to 12,000 coins can be separated in a minute, depending on whether the model is hand or motor operated. Coin-counting and packaging machines count the coins and deliver them into bags or wrappers, and, in specific cases, check pre-determined amounts into bags. One denomination of coin is dumped into the machine and a revolving disk throws the coins to the outer edge of the hopper, where they pass under a register which counts them.

In some models the coins fall through a stem into a tubular wrapper which the operator has previously placed there; other models wrap with continuous rolls of paper, fed down as the coins are counted; when the required number of coins are in place, they are carried over to the paper and tightly wrapped, the machine automatically locking off further passage of coins. Coin-counters and separators serve the dual purpose of counting and sorting coins of mixed denominations at the same operation. The registering devices of some machines provide for a totalled sum in connection with each separate adding counter; others have a sub-total and a total register. Other coin-handling devices are, bag-loading machines; proving and bagging machines which recount and bag coins that have been previously separated; continuous counting and bagging machines, which count and bag coins at a high rate of speed; counting machine heads, which handle one denomination at a time and handle metal tokens also; manual counters and packagers, which combine in one operation hand-counting and wrapping.

Dictating Machines.—By means of the cylinder phonograph the time of a stenographer taking notes may be saved. The executive who uses this system speaks into the mouthpiece of a small machine which records his voice by engraving on a revolving wax cylinder. He may pause in his dictation, correct an error, and at any time listen back to what he has said. When the cylinder is full, a typist puts it in a transcribing machine placed alongside her typewriter, and the reproduction of what has been dictated is carried to her by receivers placed over her ears, she typing the words as she hears them. The engraved surface of a used cylinder is removed by a shaving machine so that it may be used again and again.

Phone Recorder.—It is also possible—and several devices are available for the purpose—to record automatically an entire telephone conversation. As the conversation proceeds, it is recorded on the wax cylinder of the device which is attached to the telephone.

Typewriters (q.v.).—One type of machine which has been on the market a comparatively short time is practically noiseless in operation, because the principle of pressure printing instead of percussion printing is utilized. Another is electrically powered and can be operated either from a direct or an alternating current; the keys are touched lightly—about one-quarter of an inch depression—and electricity takes up the burden. Portable typewriters serve the need of the individual for a personal writing machine. Their construction embodies many features of standard office typewriters. The machine is usually secured to the bottom of the case in which it is carried, a permanent base being

thus provided, making its use convenient under all conditions. The weight varies from 7 to 12 pounds. A wide selection of special keyboards and type arrangements for engineers, doctors, chemists and all those requiring special symbols and extra characters is available.

Cheque Writers and Protectors.—Besides writing the permanent and unchangeable amounts on cheques, thereby protecting, as far as it is mechanically possible, against losses from raised and forged cheques, these devices save time and labour in concerns which issue large quantities of payroll cheques and in banks and establishments which issue dividend cheques periodically. Protection is afforded by printing, by shredding or by perforating the amount, using acid ink in one or two colours. The amount is written in words, in figures or in words and figures. Certain models protect the payee's name as well, by "crimping" or shredding an un-linked design over it. After a cheque is inserted in the machine, the amount to be written is selected by slide levers set in vertical columns, by a hand-wheel or by an indicator on the dial, depending on the type of machine. Some models require one stroke of the operating handle for each word or number; others print the whole amount at one operation. In some models the amount is visible before and after printing, and in certain cases the name of the user is also printed. Repeated writing of the same amount on a number of cheques, without change of set-up, is a feature of some cheque writers. An interesting development is the cheque writer with many combinations of foreign denominations for use in foreign banking.

Cheque Certifiers.—These devices print a form of acceptance on cheques, either through a ribbon from a bronze die or from steel wheels inked by a felt pad. Some number the cheques with consecutive serial numbers. Certain models are locked against unauthorized operation.

Cheque Endorsers.—Motor-driven machines are used for endorsing large numbers of cheques. Impressions are made from either a rubber or a metal die inked from rollers and having movable type for dates and batch numbers. Cheques are fed by hand, one at a time, to those models designed for use alongside an adding machine, so that as each cheque is listed for clearing-house, transit or deposit, the operator turns it over and drops it into the endorser, which prints the endorsement and places the cheque in its original order in a tray beneath the machine. Other models provide for feeding a large number of cheques held at the feeder guide by the operator's hand.

Cheque Cancellers.—Enduring and ineradicable evidence that a cheque has been paid, together with the date of payment, is provided by machines which perforate the cancellation through cheques, and if desired, the bank's American Bankers Association number. Dating of deposit slips, notes, mortgages and other papers may also be done. Hand models cancel from 100 to 225 cheques a minute; motor-driven models are speedier.

Cheque Signers.—Pay-cheque signing is speeded by devices which sign from five to ten cheques at once. A sheet of cheques is placed on an extension table under a writing frame to which are attached five to ten fountain pens controlled by a monitor penholder. As the operator signs a sheet of cheques they are pushed into a tray and another sheet is brought into position.

Finding and Filing Devices.—Simplification of filing and locating data compiled in digest form is achieved by three mechanical devices differing in construction, operation and purpose. The purpose of one is to find a single card by number. It is a metal, desk-like affair, in the top of which are ten trays, each holding numerically filed cards numbered from 0 to 999—1,000 in all. A card is found and filed according to its number. By depressing the proper number-keys of the finding mechanism, the corresponding card is instantly raised above the others in the file. In filing a card, the operator raises the card immediately following to indicate the filing position. Means are provided for finding misfiled cards.

Another device finds a single card by means of the general class or name under which it has been classified. This system uses a steel drawer, on the front of which are two rows of keys marked with the classifications, such as "Farm Lands," "West

Side Property," etc. The keys are connected with rods extending back through the drawer. One card can be filed under many classifications, by means of clips placed in position along its lower edge, which correspond to the classifications desired. Pressure on the proper key raises the desired card, together with all those having a clip corresponding to the key. A tap returns the card to position.

A third system provides for the automatic selection and segregation of cards according to any number of classifications, the basis of the system being the card. The top carries a brief summary of the record, or can be extensive enough for a posting record. The body of the card is perforated, two vertical perforations constituting a "position" to which some classification is assigned. Each card is prepared for automatic selection by converting the two holes of significant positions into a slot by means of a hand-operated slotting punch. The cards are placed in a file drawer, which has a brass front perforated to conform to the cards. If, for example, the device is used for a list of garages, and all garage cards are to be selected, a steel rod is placed in the position designating garages. If all garages having service stations for a particular motor-car are to be selected, another rod is placed in the position designating that information. The more rods, the finer the classification. The drawer is then inverted, and the cards that are suitably slotted drop down. A rod inserted at the bottom of the drawer locks them in place, and when the drawer is held upright, the desired cards are held above the others in the file. When the work is finished, the locking rods are removed and the cards fall into place.

Visible Index Systems.—An operation on a card system may be divided into several parts: (1) locating and removing the card; (2) making the record or noting the information; and (3) returning the card to place. If the second part is a small proportion of the whole time required, the total operation may be greatly simplified by using the so-called visible system.

The cards are usually mounted on panels in such manner that they overlap, showing only the title line, a slight lifting movement revealing the whole card. The panels are housed in several ways. Sometimes they fit into steel cabinets and may be pulled out at a convenient angle for posting or removed entirely. In other cases, the panels—with cards inserted on both sides—are hung vertically, either on a circular track which rotates at the touch of a finger to bring the panel with the desired card before the eye or on a straight track so that they turn like the pages of a book. Another type of visible index is in book form, the cards being either held on panels inserted between the covers or fastened into the binder, as in a loose-leaf binder. Still another kind, which looks like a card drawer with the sides and ends cut down, consists of an aluminium tray in which cards tabbed at different heights so that a portion of each tab is always visible are held by a lock rod. Aluminium guides permit indexing. Pulling forward a guide exposes the tabs of a group of 24 cards, and the full surface of any one is visible when the intervening ones are thrown over. With each type of visible index colour signal systems may be used to call attention to pertinent facts.

Electric Paging Systems.—By audible code signals sounded throughout the premises, this equipment immediately locates individuals who are away from their desks. The central station is usually placed near the telephone switchboard, and the telephone operator sends the signals.

Telegraph Typewriter.—An electrically operated typewriter used in hotel offices, banks and other businesses where information is daily transmitted to distant points, transmits messages in written form to any number of distant stations. As the message is typed on the sending typewriter, the words are written simultaneously and automatically by the distant receiving typewriter. The paper is fed from a roll mounted on a frame behind the typewriter. Tabulated forms and duplicated copies can be written. The telautograph is used for a similar purpose, but the message is handwritten instead of typed.

Credit Authorizing Systems.—Three distinct types of systems are used for transmitting to a department making a charge sale the credit department's O.K. on the sale. One is an electric

telephone system with a switchboard in the credit department and a telephone in each sales department. As the sales person calls the credit department, she places the slip in an aperture in the telephone, and the credit authorizer causes his approval to be printed on it if the sale is approved.

(W. H. Le.)

OFFICE MANAGEMENT. The office is that part of an enterprise which is devoted to the direction and co-ordination of the various activities of the enterprise. It is characterized by the gathering, classification and preservation of data of all sorts; the making, using and preservation of all kinds of records; the analysis and utilization of these data in planning, executing and determining the results of operation; the preparation, issuing and preservation of instructions and orders and the composition, copying and filing of written messages.

Though clerks and clerical work have existed for centuries and large groups of clerks for decades, it is only in recent years that the management of clerks or office management, has become a problem of importance. This is wholly due to the rapidity of industrial change, which is best shown in the United States. In 1880, when there were but 172,575 clerks in that country, mostly book-keepers and accountants, the problem might be considered as practically non-existent; but in 1920, when the number of clerical workers of all kinds had grown to 2,951,008, it assumed proportions that could not be ignored. In 1920, one in ten of all persons engaged in "gainful occupations" was a clerical worker. The change was necessitated by the exigencies of an ever-growing large-scale industry. While business organizations were small, and direct contact existed between producer and consumer, beyond simple book-keeping few records were required, there was little written communication between sections of an organization, and consequently few clerks were needed. All this has changed, and to-day the office has attained a position of major importance in business.

Many offices employ more than 100 clerks each and a considerable number employ several thousands. Evidently the employment of such numbers of workers requires management of a high order, yet it is only recently and among the most progressive companies that the subject has received the attention it deserves. Ingenious systems of record keeping and filing have been invented, scores of clever appliances and marvellous office machines are available (see OFFICE APPLIANCES), but the problem of securing the greatest result for the least expenditure of effort has not been given the attention in the office that it has in other lines of endeavour. This is due to the newness of the problem, but there are signs that this condition is sure to change as time passes.

Frederick Winslow Taylor (*q.v.*), the "father of scientific management," was himself probably the first person to apply—at least in a limited measure—scientific principles to office work. In Copley's biography of Taylor is shown a "Time Note," dated about 1885, giving "piece-work" rates on 17 clerical operations, the implication being that Taylor had at least studied these operations, found the best method of performing them and controlled them to the extent that he offered an incentive wage for their accomplishment.

THE HUMAN ELEMENT

The major divisions of office work are given herewith, but not necessarily in the order of their importance.

Organization.—The most essential factor here is clearly defined lines of authority, and its lack is the greatest defect to be found in many companies. In the struggle for advancement it seems difficult to prevent officers from claiming more authority than is granted them, and where confusion of this kind exists, loss of morale invariably results. Functionalization—one of the leading principles of scientific management—is as efficacious in the office as elsewhere. The office manager himself holds a functional position—that of managing clerks, wherever placed. Where this principle is fully carried out, work, instead of being departmentalized, will be functionalized, and therefore performed much more effectively. Thus, a stenographer employed exclusively in taking notes and transcribing letters, will do much more effective work than one who also keeps and files records, answers telephone calls

and performs other miscellaneous work. Functionalization, however, is to its fullest extent only feasible in large offices. It is uneconomical to have too many departments under the charge of one officer. A chart of the organization, and an organization diagram, both giving not only the position of each individual in the office but his duties and relation to others, are necessities. Also there should be standard methods for performing each task, and written standard practice instructions so that the carefully devised methods may be perpetuated. Otherwise great loss of output will result.

Personnel Methods.—Progressive records of each employee's performance are necessary as they serve as a basis for future advancement. Special tests for ascertaining the ability of new employees will prevent to a large extent the great wastage of continuous hiring and discharging. Many psychological tests, special ability and trade tests have been prepared, extensively used and found advantageous. (See INTELLIGENCE TESTS.) While there are many clerical positions which demand the very highest intelligence, all clerical work does not, and much of the simpler clerical work is found irksome when allotted to those capable of a higher grade of activity. Training is extremely important, though often sadly neglected. In some offices the various lines of promotion are laid down and made known to all employees, so they can prepare themselves for advancement. Some offices also have officers who devote their activities wholly to employment, and all persons who are to be discharged are referred for final adjudication to this officer—the employment manager. The advantage here is that competent employees are not lost to the organization solely because of the personal pique of some hasty or temperamental officer. The employment manager also ascertains by tactful questioning the reasons why employees leave, and by a careful, classified record of such reasons is enabled to check bad practices, and to determine any other causes for dissatisfaction.

Turnover.—The "rate of turnover," that is, the ratio of employees leaving to those on the pay roll, is a most important factor in good office management. An average cost of over \$100 is represented in the training of a new employee who replaces one who has left, so that it is evidently desirable to retain employees for long periods. Turnover is dependent upon many factors. If employees are not properly selected, many replacements will be needed; if salaries are not right, physical conditions bad, or the relations of officers not as they should be, there will be many voluntary separations. A minimum turnover is considered to be about 10% annually. Length of service depends upon much the same conditions as rate of turnover.

Routines and Methods.—A routine is a collection of separate operations through which a piece of work successively passes. Division of labour has been highly developed in office work, and few operations are complete in themselves. Routines as a rule are seldom consciously developed but come into existence gradually through the use of machinery combined with hand-work. As a result, operations wholly or partially useless and of little or no value to the "finished product"—the result desired—are frequently found. Methods also have generally speaking a similar evolution, and yield great results from scientific research. Unless both routines and methods are carefully studied, there is apt to be much waste.

Control of Output.—To secure maximum results for minimum effort, a continuous and uninterrupted flow of work is necessary, and this is one of the most difficult achievements in office work. In the manufacturing of any material commodity the work can be precisely scheduled, step by step, and the maintenance of a steady flow is largely a mechanical problem, as every piece of similar character goes through precisely the same steps. But in the office there is the added difficulty that office work of similar character does not always take the same course; and even in some work of exactly the same nature, the flow is governed by conditions beyond the control of the office manager. Because of this fact it was, until very recently, considered impossible to plan and schedule office work. Peaks, that is, periods demanding intensified and additional work, were handled either by over-

time work, or by the permanent maintenance of a sufficient force of clerks to handle them, both plans being evidently wasteful. Analysis of this matter, however, showed that in many cases they could be adequately met by pre-planning. The office force should be well balanced, and sufficiently large to handle average conditions; but a sufficient number of clerks should be trained in several operations. Then by utilizing the idea of the "flying squadron"—a selected group of clerks that can be used almost anywhere in an emergency—most of the minor peaks can be handled without difficulty. Major peaks can be dealt with by a re-adjustment of working force and the employment of extra clerks for positions which require only a minimum of training.

Clerical Output.—On this subject all the major factors of office management converge, and all have a bearing upon it. Under conditions where all factors have been scientifically studied, clerical output is invariably much greater than in organizations in which they are largely ignored. Thus in the office of the latter character the average output of a stenographer will rarely exceed 100 sq.in. per hour, while in a scientifically managed office this particular output will be increased to an average of 200 sq.in. per hour. The maintenance of the latter rate does not depend alone upon the skill and application of the stenographer—for 200 sq.in. per hour is but 30 words a minute, while the world's typewriting record is over 800 sq.in. per hour—but largely upon other factors outside the control of the operator and decidedly within that of the office manager. As with typewriting, so it is with all other clerical operations; the output usually depends much more upon the efforts of the management than upon those of the individual clerk. The effort should not be to obtain the highest possible output from any individual, but that which should be expected from a first-class worker.

The Incentive Wage.—Still another factor which aids in obtaining a high clerical output is an incentive wage of some kind, wherever it is possible to measure the work. The various methods of incentive wage used in other lines of business endeavour have all been tried in the office, some with considerable success, others with disastrous results. In the cases of failure the main causes generally are that (1) work was not properly standardized; (2) not properly measured; (3) steady flow not obtained; (4) work not properly controlled; and (5) no adequate check upon its quality. Piece-work in the office is not so generally applicable, because the worker must have a guaranteed minimum wage, and it is not always possible to supply him with sufficient work to make that wage on a piece-work basis.

THE MECHANICAL SIDE

The preceding factors deal almost wholly with the management of the human element, and now other factors must be considered—those physical factors without which efficient management is not possible.

Arrangement.—The physical arrangement of an office affects all other factors of management. As most offices are in large cities, rentals are high and therefore space must be conserved. For this reason the cubicles of the old-fashioned office are giving way to the open office. Departments having relations with each other should be contiguously situated, and the seating of the workers in each department be regulated also on this principle. Work should flow in straight lines. Adequate light, both daylight and artificial, should be provided, the standard of the latter being placed by experts at not less than 10 foot-candles. (See ILLUMINATION ENGINEERING.) The completely indirect system, in which the light is thrown from its source to the ceiling, and thence reflected down, is considered the best. Ventilation is an important matter also. Experiments show that the best ventilating system is that which brings in fresh air from the outside without altering it in any way, this being superior to the elaborate washed and heated air systems. (See HEATING AND VENTILATION.) Excessive noise is also detrimental to good work, and noisy machines, if numerous, should be segregated.

Equipment.—Under this head are included desks, tables, chairs, filing cabinets and similar furnishings. The old-fashioned roll-top desk is being rapidly eliminated, and as the present tend-

ency is to the extended use of small loose-leaf books and cards, the high-standing book-keeper's desk has largely disappeared. At present the usual office desk is too large and contains too many drawers, and as clerks have little need for more than one or two drawers, a table is generally preferable. The size of a desk depends naturally upon the character of the work, but a desk larger than 54×30 in. is rarely needed, though no desk should be smaller than 40×30 inches. Chairs to be comfortable require designing to fit the human anatomy in an upright seated position. A few good anatomical chair types are available, but most of the others are uncomfortable.

Office Machinery.—Here the greatest development has taken place, office appliances being now available for almost every occasion. (See OFFICE APPLIANCES.) There was a tendency to use machines to the exclusion of competent brainwork, but office managers are beginning to see that this is a mistake.

Correspondence.—This is naturally an extremely important part of office management, not only between the company and outside correspondence, but within the organization itself. The present tendency is toward brevity and clarity, and the florid style and redundant expressions of the so-called "business English" are in process of elimination.

Filing.—The vertical system of filing has almost entirely superseded the old-fashioned flat file, and elaborate systems have been greatly simplified. Its greatest present misuse is the filing of valueless and superfluous material. The filing problem requires not only adequacy in equipment and system, but also accuracy, which necessitates adequately trained operators, for misfiled papers may easily cause great loss.

Stock-keeping.—In a large office the maintenance and issue of an adequate stock of all forms in use becomes a problem in scientific stock-keeping. Order and neatness are necessary, and an adequate location system, so that material can be found with a minimum loss of time. Stores should be classified according to some well-devised system, and there should be a perpetual inventory and a systematic method of issuing stores to, or on the order of, authorized persons.

Intercommunications.—This factor is a most important one in large offices. The telephone is of course the most common method, but there is usually a large transfer of papers from one part of the organization to another, and this must be taken care of by well-organized messenger systems with regularly scheduled trips. In many offices automatic belt systems or other forms of conveyors are used. Mechanical devices of other kinds are automatic signalling systems, automatic telephones and so forth.

Forms.—Most office work is performed by writing upon some kind of blank form, whether they be detached or loose-leaf forms. The quality of paper selected for any form should be governed by the use to which it is put. If it is to be written upon with pencil it is wasteful to use a high-grade paper designed for writing with ink. When forms have a temporary value only, the paper should be of a cheaper quality than that of forms to be kept for a number of years. Selecting standard qualities of paper for these various purposes requires considerable study. A large variety of colours should not be used, as many of them—particularly the reds and blues with their varying shades—are difficult to read under artificial light. Not more than nine standard sizes of forms are usually needed.

Salary Standards.—In most offices salaries vary widely and often unreasonably, clerks doing similar work frequently receiving widely different salaries. Some of the best-managed organizations have made a careful gradation of salaries, with a maximum and minimum for each class of worker. The minimum is that salary which a clerk is entitled to as soon as he is assigned his position, and the maximum the highest salary which the company can afford to pay for that type of work. Such gradation eliminates gross inequalities, gives more equitable payment for results and minimizes dissatisfaction among the office force.

SUMMARY

Office management is highly complicated, and requires a specialist—a manager of high order who at the same time thoroughly

understands clerical work. The scientific approach to the factors of office management may be briefly defined. First it is necessary to define thoroughly the purpose of any work about to be undertaken, for if this is neglected the path of the subsequent investigation is likely to follow incorrect lines. Then the problem should be carefully analysed by dividing it into its factors. These preliminary steps, though simple in a statement, are by no means so simple in fact. The next step involves a careful search for all the facts in the situation which govern each and every factor in the analysis. It is a very common oversight to gather an abundance of facts on one part of a problem, and ignore or minimize other parts. To infer, without investigating, is a most prolific source of error, the method of actual test being by far the best. These three steps are precisely those of experimental science, and may be called the scientific method of thinking out a problem. By its use, the office manager can correctly approach each problem and devise the right method, otherwise known in management as "the one best way." With the best method secured, it is then necessary to select the person best fitted to perform it, for all cannot be equally proficient in the same things. The person best fitted for any particular task will invariably produce better results than the so-called "average" person. When found, it then becomes necessary to teach the person who has been thus selected.

These six steps constitute the basic procedure in any form of scientific management and lead up to the seventh, which is planning. Without careful planning, all the scientifically designed work which has gone before will be wasted. Finally, to secure the best results it is vitally important to win the co-operation of the workers. An office force labouring without interest or enthusiasm will accomplish some results, but certainly not of the type desired by a competent office manager. The management which does not and cannot secure co-operation is necessarily defective. These eight steps cover the basic principles of scientific management in all activities. There is also a considerable tendency toward the simplification of office methods and the entire elimination of much that has been done in the past, on the ground that it is either superfluous or not worth the effort expended. These tendencies are continuously accelerated by economic conditions. Scientific management will be the principal means of reducing the numerical growth of office workers.

OFFICERS. The employment of the word "officer" to denote a person holding a military or naval command as representative of the State, and not as deriving his authority from his own powers or privileges, marks an entire change in the character of the armed forces of civilized nations. Originally signifying an official, one who performs an assigned duty (Lat. *officium*), an agent, and in the 15th century actually meaning the subordinate of such an official (even to-day a constable is so called), the word seems to have acquired a military significance late in the 16th century. (At sea the relatively clear partition of actual duties amongst the authorities of a ship brought about the adoption of the term "officer" somewhat earlier.) It was at this time that armies, though not yet "standing," came to be constituted almost exclusively of professional soldiers in the king's pay. Mercenaries, and great numbers of mercenaries, had always existed, and their captains were not feudal magnates. But the bond between mercenaries and their captains was entirely personal, and the bond between the captain and the sovereign was of the nature of a contract. The non-mercenary portion of the older armies was feudal in character. It was the lord and not a king's officer who commanded it, and he commanded in virtue of his rights, not of a warrant or commission.

HISTORICAL

European history in the late 15th century is the story of the

victory of the Crown over the feudatories. The instrument of the Crown was its army, raised and commanded by its deputies. But these deputies were still largely soldiers of fortune and, in the higher ranks, feudal personages, who created the armies themselves by their personal influence with the would-be soldier or the unemployed professional fighting man. Thus the first system to replace the obsolete combination of feudalism and "free companies" was what may be called the proprietary system. Under this the colonel was the proprietor of his regiment, the captain the proprietor of his company. The king accepted them as his officers, and armed them with authority to raise men, but they themselves raised the men as a rule from experienced soldiers who were in search of employment, although, like Falstaff, some captains and colonels "misused the King's press damnably." All alike were most rigorously watched lest by showing imaginary men on their pay-sheets they should make undue profits. A "muster" was the production of a number of living men on parade corresponding to the number shown on the pay-roll. An inspection was an inspection not so much of the efficiency as of the numbers and the accounts of units. A full account of these practices, which were neither more nor less prevalent in England than elsewhere, will be found in J. W. Fortescue's *History of the British Army*, vol. i. So faithfully was the custom observed of requiring the showing of a man for a man's pay, that the grant of a special allowance to officers administering companies was often made in the form of allowing them to show imaginary John Does and Richard Roes on the pay-sheets. The next step was taken when armies, instead of being raised for each campaign and from the qualified men who at each recruiting time offered themselves, became "standing" armies fed by untrained recruits. During the late 17th and 18th centuries the Crown supplied the recruits, and also the money for maintaining the forces, but the colonels and captains retained in a more or less restricted degree their proprietorship.

Thus, the profits of military office without its earlier burdens were in time of peace considerable, and an officer's commission had therefore a "surrender value." The practice of buying and selling commissions was a natural consequence, and this continued long after the system of proprietary regiments and companies had disappeared. In England "purchase" endured until 1873, nearly 100 years after it had ceased on the Continent of Europe and more than 50 after the clothing, feeding and payment of the soldiers had been taken out of the colonels' hands. The purchase system, it should be mentioned, did not affect artillery and engineer officers, either in England or in the rest of Europe. These officers, who were rather semi-civil than military officials until about 1715, executed an office rather than a command—superintending gun-making, built fortresses and so on. As late as 1780 the right of a general officer promoted from the Royal Artillery to command troops of other arms was challenged. In its original form, therefore, the proprietary system was a most serious bar to efficiency. So long as war was chronic, and self-trained recruits were forthcoming, it had been a good working method of devolving responsibility. But when drill and the handling of arms became more complicated, and, above all, when the supply of trained men died away, the State took recruiting out of the colonels' and captains' hands, and, as the individual officer had now nothing to offer the Crown but his own potential military capacity (part of which resided in his social status, but by no means all), the Crown was able to make him, in the full sense of the word, an officer of itself. This was most fully seen in the reorganization of the French army by Louis XIV. and Louvois. The colonelcies and captaincies of horse and foot remained proprietary offices in the hands of the nobles but these offices were sinecures or almost sinecures. The colonels, in peace at any rate, were not expected to do regimental duty. They were at liberty to make such profits as they could make under a stringent inspection system. But they were expected to be the influential figure-heads of their regiments and to pay large sums for the privilege of being proprietors. This classification of officers into two bodies, the poorer, which did the whole of the work, and the richer, upon which the holding of a commission

conferred an honour that birth or wealth did not confer, marks two very notable advances in the history of army organization, the professionalization of the officer and the creation of the prestige attaching to the holder of a commission *because* he holds it and not for any extraneous reason.

The distinction between working and quasi-honorary officers was much older, of course, than Louvois's reorganization. Moreover, it extended to the highest ranks. About 1600 the "general" of a European army, except in the Italian republics, was always a king, prince or nobleman. The lieutenant-general, by custom the commander of the cavalry, was also, as a rule, a noble, in virtue of his command of the aristocratic arm. But the commander of the foot, the "sergeant-major-general" or "major-general," was invariably a professional soldier. It was his duty to draw up the army (not merely the foot) for battle, and in other respects to act as chief of staff to the general. In the infantry regiment, the "sergeant-major" or "major" was second-in-command and adjutant combined. Often, if not always, he was promoted from amongst the lieutenants and not the (proprietary) captains. The lieutenants were the backbone of the army. Seventy years later, on the organization of the first great standing army by Louvois, the "proprietors," as mentioned above, were reduced to a minimum both in numbers and in military importance. The word "major" in its various meanings had come, in the French service, to imply staff functions. Thus the sergeant-major of infantry became the "adjutant-major." The sergeant-major-general, as commander of the foot, had disappeared and given place to numerous lieutenant-generals and "brigadiers," but as chief of the staff he survived; and in modern times the chief of staff of a French army is known by the title of "the major-general."

Moreover, a new title had come into prominence, that of "marshal" or "field-marshal." This marks one of the most important points in the evolution of the military officer, his classification by rank and not by the actual command he holds. In the 16th century an officer was a lieutenant *of*, not *in*, a particular regiment, and the higher officers were general, lieutenant-general and major-general *of* a particular army. When their army was disbanded they had no command and possessed therefore no rank—except of course when, as was usually the case, they were colonels of permanent regiments or governors of fortresses. Thus in the British army it was not until late in the 18th century that general officers received any pay as such. The introduction of a distinctively military rank of "marshal" or "field-marshal," which took place in France and the empire in the first years of the 17th century, meant the establishment of a list of general officers, and the list spread downwards through the various regimental ranks, in proportion as the close proprietary system broke up, until it became the general army list of an army of to-day. At first field-m Marshals were merely officers of high rank and experience, eligible for appointment to the offices of general, lieutenant-general, etc., in a particular army. On an army being formed, the list of field-m Marshals was drawn upon, and the necessary number appointed. Thus an army of Gustavus Adolphus's time often included six or eight field-m Marshals as subordinate general officers. But soon armies grew larger, more mobile and more flexible and more general officers were needed. Thus fresh grades of general arose. The next rank below that of marshal, in France, was that of lieutenant-general, which had formerly implied the second-in-command of an army, and a little further back in history the king's lieutenant-general or military viceroy. Below the lieutenant-general was the *maréchal de camp*, the heir of the sergeant-major-general. In the imperial service the ranks were field-marshal and lieutenant field-marshal (both of which survived up to the World War) and major-general. A further grade of general officer was created by Louis XIV., that of brigadier, and this completes the process of evolution, for the regimental system had already provided the lower titles. (X.)

MODERN ARMY OFFICERS

The ranks of officers of a modern army are therefore as follows:—

(a) *Field-Marshal*:—In Spain, *Capitan-General*; in France, *maréchal*¹; in Germany, *Generaloberst*.

(b) *General*:—In the British army this officer is not identified with any particular arm but generally commands an army, of all arms. In Germany, however, he is general of infantry, general of cavalry or general of artillery. In France, the highest grade of general officer is the general of division.² In the United States, before the World War, the grade of full general had only been held by Washington, Grant, Sherman and Sheridan. In 1917 Pershing was selected to command the U.S. army in Europe, and he was made a general in Oct. 1917. He was confirmed in the permanent rank of general by the U.S. Senate on Sept. 1, 1919.³

(c) *Lieutenant-General* (except in France):—In the U.S. army the title lieutenant-general before the 20th century was comparatively rare. It was abolished as an American rank in 1907, but during the World War the army commanders were made temporary lieutenant-generals. In the British army a lieutenant-general commands a corps. *Général de division* is the relative rank in France; in Germany, *Generalleutnant*.

(d) *Major-General* (in France, general of brigade):—This is the highest grade normally found in the U.S. army, generals and lieutenant-generals being promoted for special service only.⁴ In the British service a major-general commands a division in war and either a division or an "area" in peace; in Germany, *Generalmajor*.

(e) *Brigadier-General*:—In British and U. S. service, before and during the World War, commander of a brigade; also served on the staff of corps and higher formations. In France, *général de brigade*; Germany, *Oberst*. In Great Britain, this rank was superseded by *colonel-commandant* after the World War, but from June 1, 1928, the latter has been superseded by "brigadier." (See BRIGADIER.)

The above are the ranks of the higher commanders and, with the exception of the colonel-commandant, are termed general officers. With slight modifications their duties are practically the same in all the chief countries; viz., field-m Marshals and generals command groups of armies, generals command armies, lieutenant-generals command corps, major-generals command divisions, and brigadier-generals command brigades. Each country has, however, some peculiarity of its own either in the rank of the commander or the composition of his command.

The next class of officers in seniority to general-officers is field-officers (France, *officiers supérieurs*; Germany, *Stabsoffiziere*); they are as follows:—

(a) *Colonel*:—This rank exists in its primitive significance in almost every army, and denotes a regimental commander, or an officer of equal status on the staff. In Great Britain, however, regiments of infantry do not work as units, and the executive command of battalions, regiments of cavalry and brigades of artillery is in the hands of lieutenant-colonels, and when brigaded are under a brigadier. In the British service the colonel of the regiment or colonel commandant of a corps holds a quasi-honorary appointment, and is usually a royal personage or general officer, and sometimes, though rarely, a colonel. The holders of these appointments now vacate them on reaching the age of 70. Some regiments and corps have colonels-in-chief who are invariably royal personages.

(b) *Lieutenant-Colonel*:—In Great Britain, the commanding officer of a battalion of equivalent unit; in the United States and elsewhere, where the regiment and not the battalion is the executive unit, the second in command and sometimes commander of one of the battalions. In Germany, *Oberstleutnant*.

(c) *Major*:—In France, *chef de bataillon* or *chef d'escadron*, colloquially *commandant*. In the British infantry he preserves

¹The full title is "maréchal de France."

²In France, the ranks of "général de corps d'armée" and "général d'armée" are likely to be created soon. In war, the rank of "général de groupe d'armées" will be created.

³Under the Army Reorganization Act 1920 a "general of the army" is allowed for.

⁴In the Confederate service the grades were General for army commanders, lieutenant-general for corps commanders, major-general for divisional commanders and brigadier-general for brigade commanders.

some of the characteristics of the ancient sergeant-major as a second-in-command with certain administrative duties. The junior majors command companies. In the cavalry the majors, other than the second-in-command, command squadrons; in the artillery they command batteries. In armies which have the regiment as the executive unit, majors command battalions ("wings" of cavalry, "groups" of artillery).

Lastly, the company officers (called in France and Germany, subaltern officers) are as follows:—

(a) *Captain* (Germany and Austria all arms except cavalry, *Hauptmann*; cavalry, *Rittmeister*; in Belgium, *le commandant de compagnie*). In the infantry of most countries he is the company commander, and in the British Service a captain is also second in command of a company. Under the captain, with such commands and powers as are delegated to them, are the subalterns usually graded as:—

(b) *Lieutenant* (first lieutenant in the United States, *Oberleutnant* in Germany and Austria, in Belgium *le chef de peloton*).

(c) *Sub-lieutenant* (*sous-lieutenant* in France, second-lieutenant in Great Britain and the United States, *Leutnant* in Germany and Austria).

(d) *Aspirants*, or probationary young officers, not of full commissioned status.

BRITISH ARMY

Methods of Entry into the Regular Army.—There are two methods of obtaining admission to the cadet colleges, i.e., Royal Military academy, Woolwich, and Royal Military college, Sandhurst: (i) By successful competition at Army entrance examination. (Provided they fulfil other conditions, the following enter without competition:—King's cadets, honorary King's cadets, King's India cadets, honorary King's India cadets, and pages of honour, the three latter to Royal Military college only.) (2) On the nomination of the Army Council. As to general qualifications, a candidate must be unmarried; he must also be a British subject and the son of British subjects, and of pure European descent. No candidate is accepted unless the Army Council consider he is suitable in all respects to hold a commission in the army; must have attained the age of 18 but not 19. The Army entrance examination is conducted by the civil service commissioners, and a fairly high standard of education is essential. All candidates for nomination sit for the competitive army entrance examination and are required to fulfil various conditions. From the 18th century warrant officers, n.c.o.'s and men have been promoted to commissioned rank during war, but since the World War a limited number of specially selected n.c.o.'s under the age of 23 can, in peace, obtain cadetships under certain conditions.

Candidates for cadet colleges come under three headings: (i.) Those from approved schools, i.e., public or secondary schools approved by the Army Council; (ii.) Candidates recommended to the Army Council by the secretary of State for the colonies, the governors-general of the dominions and certain governors. (iii.) Certain naval officers, midshipmen and cadets recommended by the lords commissioners of the Admiralty; in such cases the upper age limit is raised to 21 years.

Cadet Colleges.—The course of instruction is designed (a) to lay the foundation of military and academic knowledge upon which the future military studies of an officer can be built, (b) to ensure that a gentleman cadet joins his unit so thoroughly grounded in drill, weapon training, equitation and physical training as a private soldier that no further instruction of this kind is required.

Appointment to Commissions and Choice of Regiments.

—Cadets on passing out receive seniority according to their places on the passing-out list. Appointment to particular regiments is governed by the existing vacancies and the requirements of the service. Subject to these conditions, cadets passing out highest receive first choice of regiments, but territorial and special family claims are also considered irrespective of position on the list.

Commissions Granted to Candidates from Certain Universities.—Commissions are granted to duly qualified candidates nominated each half-year by certain universities. The universities, which must be "recognized" by the Army Council, are in two groups: (i.) Those with established courses of military study—

Oxford, Cambridge, London, Edinburgh, Manchester, McGill (Montreal) and Sydney (New South Wales), and (ii.) those without established courses of military study—St. Andrews, Glasgow, Aberdeen, Durham, Wales, Birmingham, Liverpool, Leeds, Belfast, Bristol, Sheffield, Dublin (Trinity College), Toronto. Candidates from group (i.) are commissioned senior to those from group (ii.).

Training of Officers.—A cadet becomes an officer from the date of his commission as published in the *London Gazette*. The training of officers in the various branches of the army differs considerably, and the officers of each branch might be regarded as specialists in their own particular line. Before the World War the infantry weapons were simply the rifle and bayonet, but now, in addition, an efficient officer is required to possess expert knowledge of the various kinds of grenades, machine guns, Lewis guns and gas. Even with this diversity of specialized training, there are some basic features common to all arms, such as drill, physical training, duties in barracks and on the march, dress and certain elements of discipline and military law which are fairly common to the everyday life of the army. This elementary instruction is carried out at the regimental or corps dépôt or with the home service unit, and usually occupies the first six months of the officer's service. Having completed his recruit's course, the young officer is drafted to a service unit, where his training is continued on a higher level, his responsibilities increasing with efficiency. For the first few weeks he carries out the various duties as "super-numerary" to another officer until he is considered fit to undertake the duties by himself. Not the least part of his training is that of entering into the games of his men.

According to the *King's Regulations*: "Every officer is expected, if he has been two years in the service, to be capable of commanding and exercising a company, etc., in every situation, and to be perfectly acquainted with its interior management, economy and discipline." Also, "Officers above the rank of 2nd Lieutenant will be required to pass professional tests comprising examinations or courses of instruction for each step of substantive promotion up to and including the rank of Lieutenant-Colonel." The courses have for their object the specialized training of selected officers and other ranks, and are carried out at schools set apart for the purpose, and an official programme of the *Courses of Instruction* is published annually.

Advanced Training.—During the young officer's first few years he is absorbing knowledge and experience from the above-mentioned sources, in addition to special lectures arranged by the higher commands and delivered by experts on some particular phase of military science. Not only the young officer but officers generally are kept busy in an endeavour to keep abreast with the development of modern fighting methods. The mechanization of the army, the development of the tank, and the various kinds of grenades, guns, etc., all demand constant attention. The views of officers on military topics find expression in "service" journals under the control of unofficial bodies, the chief being *The Journal of the Royal United Institution*, *The Army Quarterly*, *Fighting Forces*, *The Cavalry Journal*, *Journal of the Royal Artillery* and other corps journals.

The regulations for promotion examinations are contained in the *King's Regulations*, and are divided into two parts, written and practical. The result of any examination may fall under one of the following three heads: "fail," "pass," or, higher still, "special certificate." Officers awarded the "special certificate" become eligible for special consideration for advancement and employment. Second lieutenants are not required to pass an examination for lieutenant but must receive satisfactory reports from the three senior officers present with the corps. An officer who fails twice in "duties in the field" is not, as a rule, permitted to remain in the service.

An officer below the rank of substantive lieutenant-colonel is required, before promotion to higher substantive rank (lieutenant-colonel or colonel) to undergo a course at the senior officers' school.

The Staff Colleges.—The staff colleges at Camberley and Quetta (India) are maintained for the purpose of affording se-

lected officers instruction in the higher branches of the science of war and in the duties of the staff. The course lasts two years. An officer who graduates at either college has the letters "p.s.c." recorded after his name in the *Army List* and is eligible for employment on the staff. Both colleges are open to officers of all arms, including the Indian army and the Royal Marines, but that at Quetta is limited to officers borne on the Indian establishment. The entrance examination for both colleges is identical. A limited number of officers of the permanent staff of the permanent forces of the dominions selected by their respective Governments are permitted to undergo the course. For instructional purposes the staff college is divided into two divisions—senior and junior—each under a general staff officer, first grade. The junior division comprises students in their first year and the senior division students in their second year. Instruction is given by means of lectures, conferences, indoor exercises, sand models, practical work on the ground, and by visits to the other services and various technical schools and colleges. During the vacations the students are attached to arms of the service other than their own.

Promotion from the Ranks in Time of War.—On active service soldiers are promoted to commissioned rank direct from private, n.c.o. rank or warrant officer rank "for service in the field." In such cases they are not required to pass any examination. In addition to this type of war-time promotion from the ranks, there are cadet schools to which promising n.c.o.'s are sent for a course of instruction at home, usually lasting six months. Successful students are granted commissions into regiments where their services are required. Any soldier who shows ability has, therefore, an opportunity of rising to commissioned rank, and though he may not have a field-marshal's bâton in his knapsack, he has a splendid opportunity of commanding a company and even a battalion. Quartermasters and equivalent grades are invariably promoted from the ranks, and such promotion only comes at the end of many years of faithful service.

FRANCE

Physical training is compulsory in all primary schools and forms part of the curriculum of the great majority of secondary schools. The military preparation of the youth of France may, therefore, be said to commence at the age of seven to ten, according to whether a boy goes to a primary or secondary school, and is continued up to the time of incorporation in the army. Up to the age of 15 the training is chiefly of a physical nature, but from 16 onwards his education in definitely military subjects is undertaken in addition. Military preparation is arranged in two degrees, for each of which certificates are granted to those successful in the respective tests and examinations. The *certificat de préparation militaire* is the lower of the two, and the tests entailed are such as will enable those successful therein rapidly to become efficient soldiers on joining the colours. The *brevet de préparation militaire supérieure* (B.P.M.S.) is the higher, and successful competitors are qualified to join one of the special units for the training of prospective reserve officers. In addition to these two certificates there are certain *brevets de spécialité* or special diplomas, which may be obtained by individuals who care to specialize in various branches of training, and are designed especially to attract young men of intelligence to become officers of the reserve.

Cadet Colleges.—(a) The *École Spéciale Militaire* at St. Cyr, founded by Napoleon in 1808, situated close to Versailles. It trains candidates for appointment to commissions in the infantry, colonial infantry, cavalry, tanks and aviation of the active army and prospective reserve officers for the infantry and colonial infantry. Entrance to the college is by competitive examination, which may be taken by candidates of not less than 18 years of age, and not more than 22 on Dec. 31 preceding the examination. Candidates for examination must be in possession of the certificate of the *baccalauréat secondaire*, obtained by passing an examination comparable with the Oxford and Cambridge local examinations.

Choice of Arms by Candidates.—An annual decree enumerates the units in which vacancies will exist for those successfully passing out of St. Cyr. This is communicated to the candidates on the occasion of the oral part of the examination for entrance

to the college who submit to the president of the board their wishes as to the arm in which they prefer to serve. The duration of the course is, normally, two years. The subjects taught are similar to those of the Royal Military college, Sandhurst.

(b) *The École Polytechnique, Paris*, established in 1794, and, although under the War Ministry, is not designed exclusively for the training of candidates for the army. The conditions of entry are similar to those of St. Cyr. The course lasts two years. A greater number of non-military subjects are taught than at St. Cyr. Successful students are given their choice of appointments existing in the various public services for which the course qualifies them. Those who do not succeed in obtaining an appointment in the army or navy, and those who select an appointment in the services other than the army or navy, are compelled to perform one year of service as second lieutenants of the reserve.

(c) *The St. Cyr Marocain*.—At the end of 1918 Marshal Lyautey created a Corps of Moroccan officers, recruited from amongst the élite belonging to the best class in Morocco, so that the *Goums*, *tirailleurs* and *spahis* should have officers in command of them endowed with that prestige which belongs to those bearing a name which the traditions of the country associate with the sons of leading Arab chiefs. In June 1919 was formed the first "promotion" of 11 students. These officers are confirmed in their native rank in the same way as other Tunisian or Algerian officers. North African officers, however, are always promoted in separate lists to French officers, and cannot rise above the rank of captain.

Schools of Instruction for N. C. O. Candidates for Commissioned Rank.—These schools are (a) infantry and tanks at St. Maixent; (b) artillery at Fontainebleau; (c) cavalry at Saumur; (d) engineers and air service at Versailles. Entry is by competitive examination. European n.c.o.'s of the metropolitan and colonial armies are allowed to compete, who must have performed two years' service as n.c.o.'s (sergeant and upwards). The course lasts one year and is divided into two parts—general instruction and military instruction. After leaving their schools, candidates go to the *École d'application* for their arm of the service, except in the case of infantry students, who join the unit to which they are posted after completing their two months' leave.

École d'Administration Militaire at Vincennes.—This school is designed for the instruction of n.c.o.'s recommended for appointment as officers in the *service d'administration*.

Training of Officers of the Active Army.—The whole of the French military educational system is directed towards the formulation and propagation of one common doctrine, and from the moment when a prospective officer comes under the influence of military teaching to the time when he leaves the army, even though he rises to the highest rank, his education is continuously and progressively assured and his thought and action kept within accepted bounds by the precepts of the common doctrine. This training is provided at courses and schools for specialists dealing exclusively with one arm of the service or with some special branch of instruction.

Cycles d'information (courses for senior officers).—Officers of the rank of colonel and upwards attend courses which consist of a series of visits to the principal schools and centres of instruction. These courses occupy about six weeks and are attended by officers of all branches of the service.

École Supérieure de Guerre (Staff College).—The course at the school is designed, first and foremost, as one at which the higher art of war is taught, as opposed to a course devoted exclusively to the study of staff duties. The entrance examination is open to majors, captains and subalterns of all arms of the metropolitan and colonial armies who are between 28 and 38 years of age.

THE UNITED STATES ARMY

Appointment of Officers.—Appointments of second lieutenants in the active army are made from (a) graduates of the military academy at West Point; (b) warrant officers and enlisted men of the regular army with at least two years' service; (c) officers of the Officers' Reserve Corps, and officers, warrant officers and enlisted men of the National Guard; (d) members of the

Enlisted Reserve Corps; (e) graduates of certain technical institutions approved by the secretary of war. Candidates from categories (b), (c), (d) and (e) must be within the ages of 21 and 30 years. Original appointments in the judge-advocate-general's department are made in the rank of captain under separate regulations. Appointments to the medical, dental, veterinary, medical administrative and chaplain's corps are also governed by special regulations. Appointments as second lieutenants in the Philippine Scouts are open to citizens of the Philippine Islands only, between the ages of 21 and 30 years.

(a) *The Military Academy at West Point*.—This is the only purely military cadet college in the United States. Candidates must, at the date of admission, be between the ages of 17 and 22 years. All cadets are appointed by the President. On conclusion of the four-year course the successful cadets are assigned to branches of the service as far as possible in accordance with their choice, and take their place on the promotion list as second lieutenants in the order obtained by them on leaving the academy. Each cadet on entry into the academy is required to give a written undertaking that he will serve at least four years in the army after obtaining his first commission. The number of cadets at the academy is usually about 1,250, of whom roughly one-quarter graduate each year.

(b) *From Warrant Officers and Enlisted Men*.—Warrant officers and enlisted men must establish their fitness for appointments to commissions as second lieutenants by taking the prescribed examination. Those who qualify in this examination are commissioned ahead of all other applicants examined at the same time.

(c) and (d).—The conditions for candidates in categories (c) and (d) are as for category (b).

(e) *Graduates of Technical Institutions Approved by the Secretary of War*.—The approved institutions are those which maintain the full equivalent of a four years' course of instruction in technical or scientific subjects, the successful completion of which entitles a graduate to a degree in a recognized technical subject. Any candidate who has graduated or who will graduate within six months from a technical course in any recognized college is considered eligible for appointment to the army.

Promotion of Officers.—All officers of the combatant arms and supply departments are included on a "single list" for promotion; those of the medical, chaplains, etc., departments belong to what is called the "non-single list." Promotions from colonel to brigadier-general and from brigadier-general to major-general are made from an eligible list prepared annually by a board of not less than five general officers. The examination of officers for promotion in technical subjects is the function of the corps area or department commanders, except in the case of the medical, dental, and veterinary corps, in which promotion takes place after stated periods of service.

GERMANY

Officers of the combatant branches of the German army are taken from the ranks. This does not, however, in practice involve any lowering of the social scale of the officers' corps, as candidates for commissions are youths of good family recruited with a view to their adoption of an officer's career. Candidates for commissions volunteer direct to regimental commanders during the recruiting period, April 1 to Oct. 1 each year. Candidates for commissions who, on enlistment, are in possession of an education certificate from a "higher school" (*höhere Schule*) of at least nine classes, receive preferential treatment. The candidate, at the end of his first year's service, if recommended for a commission by his commanding officer, undergoes an examination on general and elementary military subjects (officer probationer's examination: *Offizieranwärterprüfung*). On passing this, he is, in the course of his second year's service, promoted to lance-corporal (*Gefreiter*) and then to corporal (*Unteroffizier*) as vacancies in his unit permit. At the end of his second year (whatever his arm or branch) he proceeds to the infantry school at Dresden to undergo a course of instruction as corporal and officer probationer (*Unteroffizier und Offizieranwärter*) for 10½ months, at the end of which period he sits for the ensign's examination (*Fähnrichsprüfung*). If he passes

this examination he is promoted to ensign (*Fähnrich*) and undergoes a course of 10½ months at the special school of his arm, which culminates in the officers' examination (*Offiziersprüfung*). On passing the officers' examination he is immediately promoted to senior ensign (*Oberfähnrich*). He is simultaneously posted to his regiment, where he serves as senior ensign, until the following March, when, with the permission of his commanding officer, he comes up for election to a commission as second lieutenant (*Leutnant*) by the officers' corps of his regiment.

In the case of candidates without school certificates the minimum training from enlistment to promotion to senior ensign is six years. For the first two years the candidate continues to serve in the ranks. In the third year he undergoes a preliminary examination in general subjects. In the fourth year he must sit for a second examination in general subjects, and, if successful, for the officers' probation examination. From this point his training continues under the same conditions as those described above for candidates with school certificates until his promotion to senior ensign at the end of the sixth year.

Reserve of Officers.—No official reserve of officers is permitted by the Treaty of Versailles. A considerable number of ex-officers of the imperial army are, however, still (1928) of military age, and these, together with officers who have retired from the present army, would be available in case of war. Ex-officers are forbidden to assist at manoeuvres, and to take part in training of any kind with the army. They do, however, keep in close touch with those units of the present army which maintain the traditions of their respective regiments.

Reports on Officers.—A confidential report (*Qualifikationsbericht*) is written every two years on second lieutenants and annually in the case of all other officer ranks.

ITALY

Officers are recruited from two sources: (a) cadets from military colleges at Rome and Naples, who leave these colleges at the age of 17 or 18, and (b) youths with the necessary educational qualifications who apply for commissions shortly before they are called up for conscript service at the age of 20. Both categories go through the same process of further education before they are commissioned. First, they attend an army corps cadet school for student reserve officers, one of which is established in each army corps area, for seven or eight months; then they are attached to a regiment for three months, which qualifies them as second lieutenants of reserve (*di complemento*), with which rank they can then return to civil life if they like. Finally, if they carry out their original intention of taking regular commissions, they go to the military school at Modena for two or three years, or, if entering the artillery or engineers, to the military academy at Turin for four years. On passing out, all officers are commissioned as first lieutenants in the regular army. Artillery and engineer officers are antedated a year for seniority when they pass out, to put them on an equality with those passing out at Modena. A certain number of commissions as second lieutenants in the Commissariat and Administrative Corps are given to under-officers (i.e., n.c.o.'s) of the corps and to civilians.

Categories of Officers.—Officers of the Italian army are nominated by royal decree but do not hold documentary "commissions," as in the British army. Honorary nominations and honorary ranks do not exist. All officers are classified into two groups, each of which is divided into certain categories. The first group is known as "*ufficiali in servizio attivo permanente*" (officers in permanent service), and corresponds approximately to the British "active list." The second group is called "*ufficiali in congedo*," a term for which no correct British equivalent exists. The verbal translation is "officers on furlough," but as this group forms the reserve of officers of the Italian army, the latter term has been adopted.

The system of training is similar to that of the British service, and similarly there are schools of instruction and courses for every kind of specialist training.

Promotion.—During peace, promotion is carried out partly by selection and partly by seniority throughout the army, a

general list being kept for each arm up to and including a certain rank, which varies with each arm, e.g., in the Carabinieri up to general of division, but in the Commissariat Corps up to lieutenant-colonel. In order to qualify for promotion, officers must serve a minimum period of (a) three years as a lieutenant, (b) four years as a captain, and (c) two years in all other ranks. In addition to this time qualification confidential reports have to be rendered on all officers concerning their general efficiency. Up to and including majors, these reports are rendered separately by three senior officers, and on officers above this rank by two senior officers and a central promotion commission. This body exists for the purpose of considering promotions to the rank of colonel and to the various ranks of general. It consists of the chief of staff and the four army commanders designate. Other senior officers may also be co-opted to give evidence for or against the promotion of an officer under their command, but such officers have no vote. The decisions of the C.P.C. are final, provided they are approved by the minister of war. If they are not approved, or if there is an equality of votes, the final decision rests with the minister of war.

BELGIUM

The combatant officers are drawn from a very wide social class. Entry can be effected through the ranks or by direct appointment to the *École militaire*. In both cases a preliminary examination is compulsory. Examinations are held yearly for entrance to the *École militaire*, the equivalent to Sandhurst and Woolwich. Candidates are drawn from three sources: (a) private life, (b) the *École des Pupilles*, and (c) n.c.o.'s and men of the active army, who have a special examination and are afforded facilities for study with a view to passing it.

Reserve of Officers.—This is a most difficult problem in the Belgian army owing to the absence of a statute defining the exact status and duties of reserve officers and the dislike of the average citizen to undertaking a duty which means giving up his business or his holidays for training. The supply of officers in war emanates from the following sources: (a) actual army, (b) regular officers unattached, on half-pay, or in the Congo, (c) retired regular officers, under the age limit and fit, (d) *École militaire* and *École d'Application* students, (e) voluntary engagements of retired officers, not subject to recall, (f) men specially selected, (g) promoted n.c.o.'s.

Reports on Officers.—After passing the schools prior to commission, officers have no further examination until they come up for promotion to field rank. They are, however, reported upon periodically by their commanding officers.

SWITZERLAND

All officers pass through the ranks prior to commission, and have attended certain definite courses of instruction in each rank. The training of recruits and cadres (officers and n.c.o.'s) is carried out at courses of instruction, specially held for that purpose, by a small permanent body of officers and n.c.o.'s, called the corps of instructors. As a general rule, officers of each rank must have held that rank for four years before they can be promoted. They must prove their fitness for promotion by obtaining a certificate of efficiency. Promotion to lieutenant is by seniority, to all other ranks by selection.

POLAND

All citizens of the Polish State can become officers; thus Jews, or men of Russian or German nationality who are citizens of Poland, are equally eligible, with the native Pole, to become officers. As a general rule, only men of good social position are taken into the cavalry and horse artillery. The corps of officers is divided into several branches, but all have equal rights and stand on an equal footing. All officers who were previously officers in the old Russian, Austrian or German armies were accepted into the Polish army in the same rank as they held in their previous army. A young man may become a regular officer either by direct entry or by passing through the ranks. Young men wishing to obtain a direct commission must pass through the *podchorząży* or officers' school. N.c.o.'s who desire to obtain commissions

must complete three years' service as n.c.o.'s, have reached the rank of *plutonowy* (sergeant), be specially recommended, and have passed certain middle school classes or have war service. Selected n.c.o.'s are sent for a two years' course at the officers' school for n.c.o.'s at Bydgosc. Promotion is by selection and seniority; second lieutenants are promoted lieutenant after two years' service; further promotion is governed by length of service and selection.

BALTIC STATES

Estonia, Latvia and Lithuania.—Officers are obtained solely from cadet schools, which in Estonia and Latvia are the smartest and most efficient institutions in the army. The cadets are drawn mainly from the secondary schools and universities. They do a two years' course of training (in Estonia three years, for all except infantry). The cadet schools contain in Estonia about 300 cadets, in Latvia 200, in Lithuania 400. All officers on retirement, except in special circumstances, are held to serve in the reserve.

THE NETHERLANDS

Officers are obtained from (a) cadets from the Royal Military college at Breda, (b) n.c.o.'s who have graduated at the *Hoofd cursus* or final course at Kampen; such n.c.o.'s must previously have passed through the instructional battalion. The training of officers is on the same general lines as other European armies. The staff college (*hoogere krijgsschool*) at The Hague trains officers for the staff, the course being of three years' duration. There are various schools of instruction for specialized training.

THE AIR SERVICES

The systems of appointment to commissions in the air services differ under the various governments and are dealt with accordingly under the headings of their several countries.

GREAT BRITAIN—THE ROYAL AIR FORCE

Methods of Entry.—There are three methods of entry into the general duties branch: (i.) By passing through Cranwell Cadet college by means of a competitive examination similar to Sandhurst and Woolwich. The course lasts two years and the training is on lines similar to Sandhurst and Woolwich. In addition, the flight-cadet receives training in the elements of engineering and is taught to fly a service aeroplane. As physical fitness is an essential for efficient piloting, the closest attention is given to athletics. (ii.) By direct entry of university candidates similar to the army system. (iii.) By obtaining a short service commission of five years' duration, offered to candidates between the ages of 18 and 30. On appointment, these officers are posted direct to a flying training school to undergo a 12 months' course, which includes training in discipline, administration, aero engines, meteorology, navigation, armament, signals and photography. In addition, they are taught to fly a service aeroplane.

Training.—On leaving Cranwell on first commissioning, the young officer is posted to a service unit for four to five years, during which he carries out his duties as a pilot. At the end of this time he is expected to specialize in one of the several branches, and along one of these channels he looks for promotion. An officer who does not specialize has little prospect, if any, of promotion above the rank of squadron leader. Flying is carried out as an essential part of normal duties. On successfully passing out of the flying training school short-service commission officers are confirmed in their rank and posted to service units for four years. At the end of their five years' engagement they are transferred to the reserve for a further four years, during which they undergo periodical training in flying. Those who remain efficient may have their reserve service extended, four years at a time, up to the age of 40.

The Air Force Staff College, situated at Andover, is for training officers in staff duties. Entry is made by selection from successful candidates after a qualifying examination. The course lasts one year.

General Training.—R.A.F. officers undergo various courses of instruction, one of the most important being the engineering course. This starts with a period of two years at the home air-

craft depôt at Hendon, followed, in some cases, by a two years' course at Cambridge. A few of the most successful are selected to undergo a final course of 10 months at the Imperial college. Other courses are for wireless at Flower Down; armament at Eastchurch; photography at Farnborough; navigation at Calshot.

UNITED STATES OF AMERICA

Aviation in the United States is in three distinct branches, the army, the navy and the post office air mail services. The army air service is administered by the office of the chief of the air service, who is a subordinate of the chief of staff. There are two methods of entry to commissioned rank: (i.) direct entry through West Point or by competitive examination from civil life; (ii.) by transfer from another arm of the army. Other ranks are obtained by voluntary enlistment. The army air service training establishments are under the training division, which embraces schools for primary flying, advanced flying, mechanics, communication, photography, tactics, engineering, flight surgeons, balloons and airships. Officers on joining pass through the primary and advanced flying schools, after which they are available for duty in a unit as pilots. There is no specified duration for the courses. To become an observer, an officer must first qualify as a pilot. Technical training is carried out at the technical school group (mechanics, communications and photography), where there are numerous courses of varying duration for the specialist trades required. The higher technical training of officers is carried out at the engineering division, McCook Field, Dayton.

FRANCE

The French military air service is an integral part of the army. The service relies to a very large extent on non-commissioned personnel for its pilots, and the proportion of officer pilots is small, which is rather an assurance that an officer can make a career in that service. Officers are drawn from three sources: (i.) École Militaire de St. Cyr, (ii.) École Polytechnique, (iii.) by promotion from the ranks. The n.c.o. ranks are divided into three branches: (i.) flying personnel, (ii.) skilled ground personnel, (iii.) unskilled ground personnel. The flying personnel is recruited from those who obtain a pilot's bursary (i.e., are allowed to joint the colours a year before their due date and are trained at the Government's expense) and by enlistment into the flying branch of the service. The skilled ground personnel is recruited from men who obtain a mechanic's bursary by enlistment or re-enlistment and by the incorporation of conscripts. The unskilled ground personnel is recruited by the incorporation of conscripts. Warrant officers, n.c.o.'s or soldier pilots receive the same rates of "flying pay" as officers.

GERMANY

By the aeronautical clauses of the Treaty of Versailles, Germany is forbidden to maintain a military or naval air service. In 1926, however, the terms of these clauses were modified and Germany is now permitted to construct aircraft of certain patterns. Not more than six members of the fighting forces (army and navy) per annum may be trained as pilots up to a total of 36; thereafter three per annum may be trained as replacements. Such training is to be undertaken at the private expense of the pupil and must not include instruction in military aviation.

BELGIUM

The military aviation service is under the Ministry of National Defence. Only officers, *sous-officiers* and corporals are held on the permanent establishment. All officer personnel are only attached to the air service, being seconded from their regiments. During their term in the air service they receive special promotion according to the most favoured arm. If, however, they revert to regimental duty, they return to their permanent rank according to regimental seniority.

Officers are drawn from the following sources: (i.) Officers transferred during 1914-18; these are chiefly senior officers employed on administrative duties; (ii.) young officers seconded from other arms for an indefinite period, who must, prior to trans-

fer, pass all the military tests for an observer and a balloon or aeroplane pilot; (iii.) adjutants of the aviation troops; (iv.) *sous-lieutenants de réserve*, who are chosen from volunteers; (v.) reserve officers. Other ranks: Any unmarried Belgian, civilian or *milicien* performing, or having performed, his active service, and between 18 and 25 years of age and able to pass certain physical and educational tests, can become a candidate n.c.o. in the navigating branch of the aviation service. If a civilian, he enlists for two years. Balloonists, observers and bomber n.c.o.'s are trained under similar conditions. Training beyond that carried out in the squadrons is organized as follows: (i.) the civilian flying schools train 100 pilots annually; (ii.) the military flying school at Courtrai takes all the officers, *sous-officiers* and corporals required for training yearly; (iii.) the école de sous-lieutenants de réserve attached to (ii.) trains 40 pupils yearly; (iv.) the school for mechanics deals with *miliciens*. There is no air staff college.

JAPAN

The air forces of the army and navy are quite distinct. That of the army is administered by the war department. Officers for flying duties are recruited from young officer volunteers of all arms who have at least one year's service. The majority of senior officers have been selected for command and for administrative purposes, from other arms. Other ranks are recruited from those possessing general intelligence and experience in mechanical trades.

SWITZERLAND

(a) The Swiss air service is under the general staff. The service is composed of all classes, subject to military duty, and all ranks belonging to it are liable to the same periods of training and musketry as other troops. Officers are either promoted from flying duties or recruited from young officer volunteers of all n.c.o.'s and men are recruited in the ordinary way. Training is carried on at schools of instruction chiefly at Dübendorf and Thun, the curriculum being similar to that of other countries.

NETHERLANDS

The air services of the army and navy are separate. The air service of the colonial army is, like that army, under the Colonial Office. The headquarters of the air service is at Soesterberg, where the main workshops, training schools and other services are situated. There are schools for every form of specialized training.

POLAND

The air force is part of the regular army under the Ministry of War. The force is organized into aeroplane regiments. Recruiting and terms of service for aviation are identical with those for the rest of the army. Officers are obtained either from cadets or from officers transferring from other arms. The officers' aviation school is at Deblin, where they undergo a two years' course. There are schools for specialized subjects at Lida and Bydgoszcz.

CZECHOSLOVAKIA

The air service is an integral part of the army under the Ministry of National Defence. It is organized in regiments, each consisting of four wings, viz., reconnaissance, fighting, bombing and training. The majority of pilots are n.c.o.'s. The normal channel of recruitment of officers is from the academy at Hranice or by transfer from other arms. N.c.o.'s are eligible for promotion to commissioned rank. Schools exist for training in specialized subjects.

YUGOSLAVIA

The air service is a part of the army. It is organized in regiments. Officers are recruited from the military academy at Belgrade, who have served at least one year in a unit. N.c.o.'s form a special body and generally serve for 15 years with the force. No commissions are given to n.c.o.'s in air regiments. Training in specialized subjects is carried out at schools at Novi Sad, Mostar and Sarajevo.

BALTIC STATES

The air forces of the three States (Estonia, Latvia and Lithuania) were founded in 1918. In Estonia the air force is a

separate service, but in Latvia and Lithuania the air forces are an integral part of the army. In Estonia, the junior officers are regulars, who are posted from other arms or join direct from the military cadet school. The other ranks are conscripts. Preliminary training is carried out at Reval. In Latvia, the officer personnel is obtained either by direct entry or by attachment from the army. Other ranks are selected conscripts, and in Lithuania officers and n.c.o.'s are selected from the army.

Corresponding Ranks in the British Services

Army	Navy	Royal Air Force
Field-marshal	Admiral of the fleet	Marshal of the Royal Air Force.
General	Admiral	Air chief marshal.
Lieutenant-general	Vice-admiral	Air marshal.
Major-general	Rear-admiral	Air Vice-marshal.
Brigadier	{Commodore (1st and 2nd class)}	Air commodore.
Colonel	Captain	Group captain.
Lieutenant-colonel	Commander	Wing commander.
Major	Lieutenant-commander	Squadron leader.
Captain	Lieutenant	Flight lieutenant.
Lieutenant	Sub-lieutenant	Flying officer or observer officer.
Second-lieutenant	{Commissioned officer from warrant officer}	Pilot officer.

(T. J. E.)

OFFICIAL SECRETS. Except in so far as acts against the safety of the realm could be brought within the law relating to treason, no statutory authority for preventing and punishing the disclosure of official secrets existed in England until 1889. In that year the Official Secrets Act was passed, but that statute was repealed in 1911 and the Official Secrets Act of that year substituted. During the World War the Defence of the Realm Regulations dealt with the disclosure of official documents and information. But these were only war measures, and in 1920 the Official Secrets Act of that year was passed, which amended the Act of 1911, and at the present time the law is to be found in the Official Secrets Acts of 1911 and 1920. Penalties are imposed for spying, and for the wrongful communication or use of information which has been obtained in contravention of the Acts, or which has been entrusted in confidence to anybody by any person holding office under his majesty, or which has been obtained or to which a person has access owing to his position as a person who holds or has held office under his majesty. Power is also given to issue search warrants where there is reasonable ground for suspecting that an offence has been or is about to be committed. The prosecution for an offence cannot be instituted except by or with the consent of the attorney-general, but this consent may be given after arrest.

Felony under the Acts is punishable by penal servitude of not less than 3 years and not exceeding 14 years; a misdemeanour on conviction on indictment to imprisonment with or without hard labour for a term not exceeding two years. Where the conviction is under the Summary Jurisdiction Acts the imprisonment is limited to three months or to a fine not exceeding £50 or both, but no misdemeanour can be dealt with summarily except with the consent of the attorney-general. It is further provided that, if in the course of the proceedings application is made by the prosecution, on the ground that the publication of any evidence to be given or of any statement to be made in the course of the case would be prejudicial to the national safety, all or any portion of the public shall be excluded during that part of the hearing, the court can make an order to that effect, but the passing of sentence must take place in public. (W. DE B. H.)

OFFSET, a term expressing the distance between two parallel planes, or between two parallel axes in a machine; also used in plumbing work to describe a connection between a large and a small pipe, in which the opening of the smaller pipe is eccentrically placed, so that the axes of the pipes, although parallel, are not in the same line. In architecture, an offset is a slanting plane, forming a transition between a thin wall above and a thick wall below, or between varying depths of a buttress; an offset buttress

is one deeper at the bottom than at the top, with the difference between the upper and lower faces taken up by one or more offsets.

OFFSET PRINTING: see PRINTING.

OGASAWARA JIMA form a group of 27 small islands having a total area of but 29sq.m. and lying in the Western Pacific 27°N. 143°E. The whole coast of Eastern Asia is fringed by island arcs, the innermost of which consist of large islands such as Japan, Formosa and the Philippines, but the outermost of small islands alone. The Ogasawara Jima form part of one outer festoon which stretches from the central volcanic zone of Japan through the Volcano, Marianne, Mackenzie, Yap and Pelew Is. to the Moluccas and which, originating in the latter stages of the "Alpine" fold movements, is still unstable. The northern end of the arc passes into central Honshu, that part of Japan where earthquakes are most frequent, and in the Ogasawara group tiny islands appear and disappear. The arc has an important strategic position with regard to the Pacific approaches of the Far East and, with a single exception, the whole is administered by Japan either in her own right or as a mandatory power. The exception, Guam, the most southerly of the Marianne group, belongs to the United States for it lies on the route to her possessions in the Philippines.

Although known to several explorers, each of whom gave the group a different name, these islands, originally called Bonin, were not permanently settled, so far as is known, until 1830. The term "Bonin" is a corruption of the Japanese "Munin To" meaning "empty of men," but the Japanese themselves term them "Ogasawara Jima" after Ogasawara, their first discoverer in 1593. Japan asserted her claim to them in 1861 and has since established regular steamship communications with Yokohama. The vegetation is of a most tropical luxuriance—palms, wild pineapples and ferns growing profusely, and the valleys being filled with wild beans and patches of taro. The valuable timber wealth includes cedar, rose-wood, iron-wood, box-wood, sandal and white oak. The population, which is of very mixed origins—as in so many Pacific islands to-day—numbers about 5,000.

OGDEN, a city of Utah, U.S.A., 35 m. N. of Salt Lake City, at the confluence of the Ogden and the Weber rivers and the foot of the Wasatch mountains; the county seat of Weber county and the second city of the State in size. It is on Federal highways 30S and 91; has a municipal airport; and is served by the Denver and Rio Grande Western, the Southern Pacific, the Union Pacific, and several electric railways. The population was 32,804 in 1920 (84% native white) and was estimated locally at 47,000 in 1928. Ogden is 15 m. E. of the point on Great Salt lake where the Lucin cut-off begins (the railroad trestle 32 m. long, completed in 1903). It lies 4,300 ft. above sea-level, on an alluvial fan or semi-circular delta, formed under the water of the ancient Lake Bonneville. Mt. Ogden (10,100 ft. high, from which the entire shore line of the ancient lake, covering 19,750 sq.m., may be clearly seen) and Mt. Ben Lomond (10,900 ft.) rise abruptly on the east, and between them the Ogden river makes its way through one of the most picturesque canyons in America. In a

Chief among them are flour-milling, meat-packing, vegetable-canning, and the manufacture of beet-sugar, candy, tin cans, cement, butter and powdered milk. A large oil refinery was established in 1927. The city's assessed valuation for 1927 was \$40,046,381. Bank debits for 1926 totalled \$249,248,000.

Ogden was settled by the Mormons in 1847; was laid out under the direction of Brigham Young in 1850; and was incorporated in 1851. It had long been known as Ogden's Hole, from the cache which the trapper, Peter Skene Ogden, had located here in 1826. The northern end of the city was a grassy meadow, where the Indians met for games and races and to trade with the white men.

OGDENSBURG, a city of St. Lawrence county, New York, U.S.A., on the St. Lawrence river at the mouth of the Oswegatchie, 50 m. from Lake Ontario. It is served by the New York Central and the Rutland railways and lake and river steamers, and is connected by passenger and car ferry with the Canadian Pacific and the Grand Trunk railways at Prescott, Ontario, on the opposite bank of the St. Lawrence. Pop. (1920), 14,609 (81% native white); 1928 local estimate, 17,000. The city lies on high ground above the river, which is a mile wide here. It has a fine harbour, open throughout the year, and is an important shipping and transfer point, especially for lumber, grain and coal. The traffic of the harbour in 1925 amounted to 660,121 tons by lake vessels and 906,480 tons by car-ferry. With the completion of the Welland canal in 1930 it will be accessible to the largest lake vessels. Ogdensburg is a port of entry, headquarters of the St. Lawrence customs district, which in the fiscal year 1927-28 exported goods to the value of \$78,196,568 and received imports valued at \$137,751,982. In the same period 47,650 automobiles and 454,617 persons were transferred through the port. The city's manufactures (including silk, shade-rollers, paper and pulp) were valued in 1925 at \$23,979,049. It is the seat of a State hospital for the insane; a State armory; and the Remington Art memorial, containing the collection of Indian relics and many of the paintings and statuettes of Frederic Remington, who was born in Canton, the county seat. The Thousand Islands of the St. Lawrence lie about 30 m. south-west. Ogdensburg was the site of the Indian settlement of La Présentation, founded in 1749 by the Abbé François Piquet for converted Iroquois, and of Ft. Presentation, built by the British at the outbreak of the Revolution and held by them until 1796. The settlement that grew up about the fort was named after Abraham Ogden (1743-98), a New Jersey lawyer who bought land here. During the early part of the War of 1812 it was an important point on the American line of defence, and on Feb. 22, 1813, both fort and village were captured and partly destroyed by the British. Ogdensburg was incorporated as a village in 1818 and as a city in 1868.

OGEE, in architecture, a curve of double curvature, concave below and convex above. Thus an ogee arch is a pointed arch in which each side has an ogee curve; also applied to the moulding (q.v.) more commonly known as a *cyma reversa*.

OGHAM LANGUAGE. The language of the Ogham inscriptions is the oldest form of Goidelic with which we are ac-

SYMBOLS OF THE OGHAM ALPHABET. ORIGINALLY USED BY THE CELTS IN BRITAIN AND IRELAND

broad valley 10 m. up the canyon is Artesian park, where a cluster of 43 fountains spout water that is chemically pure, from a depth of 150 ft., for the municipal supply. Ogden is the principal railroad centre of the region between the Rockies and the coast. Four roads maintain roundhouses and repair shops within its limits, and it is headquarters for much of the construction work in the western States. Its manufacturing industries are important, with an aggregate output valued at \$17,112,645 in 1925.

quainted. Some 300 inscriptions have been discovered in this alphabet, the majority of them hailing from the south-west of Ireland (Kerry and Cork). In Scotland 22 are known, whilst in England and Wales about 30 have turned up. Most of the latter are in South Wales, but odd ones have been found in North Wales, Devon and Cornwall, and one occurs in Hampshire. The Isle of Man possesses two. The letters in the oldest inscriptions are formed by strokes or notches scored on either side of the edge of an

upright stone. Thus we obtain the alphabet on the preceding page.

This system, which was eked out with other signs, would seem to have been framed in the south-west of Ireland by a person or persons who were familiar with the Latin alphabet. Some of the inscriptions probably go back to the 5th century and may even be earlier. The simplest forms of Ogham inscriptions are: *Doveti maqqi Cattini*, i.e. "(the stone) of Dovetos son of Cattinos"; *Trenagusu Maqi Maqi-Treni* is rendered in Latin *Trenegussi Fili Macutreni hic jacit*; *Sagramni Maqi Cumatami*, "(the stone) of Sagramnos son of Cunotamos"; *Ovanos avi Ivacattos*, "(the stone) of Ovanus descendant of Ivacattus."

In the oldest of these inscriptions *q* is still kept apart from *k* (*c*), and the final syllables have not disappeared (cf. *maqqi*, O.Ir. *maicc*); but it appears certain that in Oghamic writing stereotyped forms were used long after they had disappeared in ordinary speech. Several stones contain bilingual inscriptions, but the key to the Ogham alphabet is supplied by a treatise on Oghamic writing contained in the Book of Ballymote, a manuscript of the late 14th century.

See R. R. Brash, *The Ogham Inscribed Monuments of the Gaedhil* (1879); R. A. Stewart Macalister, *Studies in Irish Epigraphy* (3 vols., 1897-1907), and *Archaeology of Ireland* (1928). Welsh inscriptions are given in J. Rhys, *Lectures on Welsh Philology* (1879). The Scottish stones have also been treated by Rhys in the *Proceedings of the Scottish Society of Antiquaries* (Edinburgh, 1892). See also G. M. Atkinson for the tract in the Book of Ballymote, *Kilkenny Journal of Archaeology* (1874). The Irish Christian inscriptions were published by Margaret Stokes as the annual volumes of the Roy Hist. and Archaeol. Association of Ireland (1870-77), and have been republished by R. A. Stewart Macalister.

OGIER THE DANE, a hero of romance, identified with the Frankish warrior Autchar (Autgarius, Auctarius, Otgarius, Oggerius) who in 771 or 772 accompanied Gerberga, widow of Charlo-man, Charlemagne's brother, and her children to the court of Desiderius, king of the Lombards, with whom he marched against Rome. In 773 he submitted to Charles at Verona. He finally entered the cloister of St. Fare at Meaux. Colour is lent to the theory of the Bavarian origin of the Ogier of romance by the fact that he, with Duke Naimes of Bavaria, led the Bavarian contingent at Roncevaux.

In the romances of the Carolingian cycle he is, on account of his revolt against Charlemagne, placed in the family of Doon de Mayence, being the son of Gaufrey de "Dannemarche." Ogier, who was the hostage for his father at Charlemagne's court, gained the emperor's favour by his exploits in Italy. One Easter at the court of Laon, however, his son Balduinet was slain by Charlemagne's son, Charlot, with a chess-board. Ogier in his rage slew the queen's nephew Loher, and would have slain Charlemagne himself but for the timely intervention of the knights. In his stronghold at Castelfort he resisted the imperial forces for seven years, but was at last taken prisoner. He was eventually released to fight the Saracen chief Bréhus or Braihier, who had defied Charlemagne to single combat. Ogier, after marrying an English princess, received from Charlemagne the fiefs of Hainaut and Brabant.

OGILBY, JOHN (1600-1676), British writer, was born in or near Edinburgh in Nov. 1600. He accompanied Thomas Wentworth, earl of Strafford, when he went to Ireland as lord deputy, and became tutor to his children. Strafford made him deputy-master of the revels, and he built a little theatre in St. Werburgh Street, Dublin, which was very successful. The outbreak of the Civil War ruined his fortunes, and in 1646 he returned to England. Finding his way to Cambridge, he learned Latin from kindly scholars who had been impressed by his industry. He then ventured to translate Virgil into English verse (1649-50), which

brought him a considerable sum of money. Ogilby learnt Greek from David Whitford, who was usher in the school kept by James Shirley the dramatist. *Homer his Iliads translated* . . . appeared in 1660, and in 1665 *Homer his Odysses translated* . . . Anthony à Wood asserts that in these undertakings he had the assistance of Shirley. At the Restoration Ogilby received a commission for the "poetical part" of the coronation. His property was destroyed in the Great Fire of 1666, but he rebuilt his house in Whitefriars, and set up a printing press, from which he issued many magnificent books; the most important were a series of atlases by Hollar and others. He died in London on Sept. 4, 1676.

Ogilby also translated the fables of Aesop, and wrote three epic poems. His bulky output was ridiculed by John Dryden in *MacFlecknoe* and by Alexander Pope in the *Dunciad*.

OGILVIE (or OGILBY), **JOHN** (c. 1580-1615), English Jesuit, was born in Scotland and educated mainly in Germany, where he entered the Society of Jesus, being ordained priest at Paris in 1613. As an emissary of the society he returned to Scotland in this year disguised as a soldier, and in Oct. 1614 he was arrested in Glasgow. He defended himself stoutly when he was tried in Edinburgh, but he was condemned to death and was hanged on Feb. 28, 1615.

A True Relation of the Proceedings against John Ogilvie, a Jesuit (Edinburgh, 1615), is usually attributed to Archbishop Spottiswoode. See also James Forbes, *L'Église catholique en Ecosse: martyre de Jean Ogilvie* (Paris, 1885); and W. Forbes-Leith, *Narratives of Scottish Catholics* (1885).

OGILVY, the name of a celebrated Scottish family of which the earl of Airlie is the head. The family was probably descended from a certain Gillebride, earl of Angus, who received lands from William the Lion. The earldom of Findlater, bestowed on James Ogilvy, Lord Ogilvy of Deskford, in 1638, was united in 1711 with the earldom of Seafield and became dormant after the death of James Ogilvy, the 7th earl, in October 1811.

James Ogilvy (c. 1593-1666), was created earl of Airlie by Charles I. at York in 1639. A loyal partisan of the king, he joined Montrose in Scotland in 1644 and was one of the royalist leaders at the battle of Kilsyth. The destruction of the earl's castles of Airlie and of Forther in 1640 by the earl of Argyll, who "left him not in all his lands a cock to crow day," gave rise to the song, "The bonny house o'Airlie." His eldest son, James, the 2nd earl (c. 1615-c. 1704) also fought among the royalists in Scotland. He was three times a prisoner of the English, and was in the Tower of London during most of the years of the Commonwealth. This earl's grandson, James Ogilvy (d. 1731), took part in the Jacobite rising of 1715 and was attainted; consequently on his father's death in 1717 he was not allowed to succeed to the earldom, although he was pardoned in 1725. When he died his brother John (d. 1761) became earl *de jure*, and John's son David (1725-1803) joined the standard of Prince Charles Edward in 1745. He was attainted, and after the defeat of the prince at Culloden escaped to Norway and Sweden, afterwards serving in the French army, where he commanded "*le régiment Ogilvy*" and was known as "*le bel Ecossais*." In 1778 he was pardoned and was allowed to return to Scotland, and his family became extinct when his son David died unmarried in April 1812. After this event David's cousin, another David Ogilvy (1785-1849), claimed the earldom. In 1826 the attainders were reversed by act of parliament and David (d. 1849) became 6th earl of Airlie. The title remains in the hands of his descendants.

See Sir R. Douglas, *Peerage of Scotland*, new ed. by Sir J. B. Paul (1904 fol.).

OGIVE, in architecture, the diagonal ribs of a Gothic vault; in French usage applied to any pointed arch. As a result Gothic architecture is frequently termed in France *le style ogival*.

OGLESBY, a city of La Salle county, Illinois, U.S.A., 100 m. S.W. of Chicago, on the Illinois river at the mouth of the Vermilion, opposite La Salle and Peru. It is on Federal highway 51, and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Illinois Central, and (through La Salle and Peru) the Burlington Route railways. Pop. (1920), 4,135 (35% foreign-born white); estimated locally at over 5,000 in 1928. It is part of the Tri-City industrial district, engaged chiefly in the manufacture of cement

and coal-mining. The city was founded in 1856 and incorporated in 1903. Until 1914 it was called Portland.

OGLETHORPE, JAMES EDWARD (1696-1785), English general and philanthropist, the founder of the State of Georgia, was born in London on Dec. 21, 1696, the son of Sir Theophilus Oglethorpe (1650-1702) of Westbrook Place, Godalming, Surrey. He entered Corpus Christi college, Oxford, in 1714, but in the same year joined the army of Prince Eugene. He became aide-de-camp to the prince, and served in the campaign against the Turks, 1716-17, more especially at the siege and capture of Belgrade. After his return to England he was in 1722 elected member of parliament. With the idea of providing an asylum for persons who had become insolvent, and for oppressed Protestants on the continent, he projected the settlement of a colony in America between Carolina and Florida (see GEORGIA). In 1745 Oglethorpe was promoted to the rank of major-general. His conduct in connection with the Scottish rebellion of that year was the subject of a court-martial, but he was acquitted. In 1765 he was breveted general. He died at Cranham Hall, Essex, in 1785.

Sir Theophilus Oglethorpe, the father, had four sons and four daughters, James Edward being the youngest son, and another James having died in infancy. Of the daughters, Anne Henrietta, Eleanor and Frances Charlotte (Bolingbroke's "Fanny Oglethorpe") may be specified as having played rather curious parts in the Jacobitism of their time; their careers are described in the essay on "Queen Oglethorpe" by Miss A. Shield and A. Lang, in the latter's *Historical Mysteries* (1904). See also Lives by Harris (1841), Wright (1867), Bruce (1890), and Harriet C. Cooper (1904).

OGOWÉ, a river of West Central Africa, about 750 m. long, rising in 3° S. in the highlands known as the Crystal range, and flowing north-west and west, reaches the Gabon coast of the Atlantic by Cape Lopez, a little south of the equator. Here it forms a considerable delta. In its upper course the Ogowé is much obstructed by rapids as it descends the successive steps of the tablelands. It breaks through the outer chains of the mountainous zone, between 10½° and 11½° E. In its lower course the river passes through a lacustrine region in which it sends off secondary channels. These channels, before reuniting with the main stream, traverse a series of lakes, one north, the other south, of the river. These lakes are natural regulators of the river when in flood. Of its tributaries the chief are the Lolo, which joins on the south bank in 12° 20' E., and the Iwindo, which enters the Ogowé a few miles lower down. Below the Iwindo the largest tributaries are the Ofowé, 400 yd. wide at its mouth (11° 47' E.), but unnavigable except in the rains, and the Ngunye, the largest southern tributary, navigable for 60 m. to the Samba or Eugénie Falls. Apart from the narrow coast plain the whole region of the lower Ogowé is densely forested and the predominant industry of the region is the timber trade. The fauna includes the gorilla and chimpanzee.

The Ogowé rises in March and April, and again in October and November; it is navigable for steamers at low-water as far as the junction of the Ngunye, and at flood time for a distance of 235 m. to N'Jole. The first person to explore the valley of the Ogowé was Paul du Chaillu, who travelled in the country during 1857-59. The Ogowé lies wholly in French Equatorial Africa (q.v.).

For a vivid account of life on the lower Ogowé see A. Schweitzer, *On the Edge of the Primeval Forest* (1922).

O'GRADY, STANDISH JAMES (1846-1928), Irish man of letters, was born at Castletown, Co. Cork, on Sept. 18, 1846, the son of a Protestant clergyman, studied at Trinity college, Dublin, and after taking his degree in 1868 was called to the bar in 1872. He died at Shanklin, Isle of Wight, on May 18, 1928. O'Grady was one of the pioneers of the Celtic renaissance in Ireland. His interest in Irish antiquities was roused by the reading of O'Halloran's *History of Ireland*, and he set himself to awaken living interest in the Irish past by telling over again the Irish legends of the heroic age. He himself believed in the historical existence of the heroes of Irish epic, being convinced that primitive singers could not have invented them. His first work, *History of Ireland: the Heroic Period* (Dublin, 1878), was

republished, in part, under the title of *Cuculain: an Epic*, in London (1882), and was succeeded by *History of Ireland: Cuculain and his Contemporaries* (Dublin, 1880). From these he developed his cycle of romantic histories: *Finn and his Companions* (1892), *The Coming of Cuculain* (1894), *In the Gates of the North* (Kilkenny, 1901), and the *Passing of Cuculain* (Dublin, 1917). He began a *History of Ireland, Critical and Philosophical*, of which the first volume only was written (Dublin, 1881). He also wrote *Ulrick the Ready* (1896); *The Bog of Stars* (1893); *Red Hugh's Captivity* (1889).

See Standish O'Grady, *Selected Essays and Passages*, with introduction by E. A. Boyd (Dublin, 1918).

OGUNQUIT, a village of York county, Maine, U.S.A., 36 m. S.W. of Portland, and 6 m. S. of Wells Beach, the nearest railway station (on the Boston and Maine railroad). Pop. (1920) 468. It is a summer resort, in one of the most beautiful spots on the Maine coast. The name, according to tradition, is a Natick Indian word meaning "a beautiful place by the sea."

OGYGES or **OGYGUS**, in Greek mythology, the first king of Thebes. During his reign came a great deluge (see DEUCALION); this is one of the two Greek versions of the widespread flood-legend. Ogyges is variously described as a Boeotian autochthon, as the son of Cadmus, or of Poseidon.

O'HIGGINS, BERNARDO (1776-1842), soldier and statesman, head of the first permanent national Government of Chile, was born at Chillán on Aug. 20, 1776, the natural son of the Irishman Ambrosio O'Higgins, governor of Chile (1778-95), and viceroy of Peru (1795-1801). Educated in England and Spain, he returned to Chile in 1802, and on the outbreak of the nationalist revolution in 1810 joined the party of Martínez de Rozas and distinguished himself in the early fighting against the royalists. In Nov. 1813, he was appointed to supersede J. M. Carrera in command of the patriot forces, and the rivalry of Carrera eventually resulted in the defeat of the national troops at Rancagua, in Oct. 1814. O'Higgins fled with most of the patriots across the Andes to Mendoza, where José de San Martín (q.v.) was preparing a force for the liberation of Chile and Peru. San Martín espoused O'Higgins's part against Carrera, and O'Higgins readily consented to serve under San Martín. His loyalty and energy were an important factor in the success of the campaign, especially in the decisive victories of Chacabuco (Feb. 1817) where O'Higgins's cavalry charge carried the day, and of Maipú (April 1818). After the battle of Chacabuco O'Higgins was entrusted with the administration of Chile; he kept order in the country and co-operated loyally with San Martín in his preparation for the invasion of Peru. But once the overthrow of the Spanish supremacy in Peru had freed Chile from fear of attack, agitation broke out for constitutional government. O'Higgins called a congress which adopted a Constitution (1822) giving him dictatorial powers. The discontent, however, continued; risings occurred in Concepción and Coquimbo, and on January 28, 1823, O'Higgins gave up his post of director-general. He retired to Peru where he was granted an estate, and lived quietly until his death on Oct. 24, 1842. In 1839 the Chilean senate had restored him to his honours and his military rank.

O'HIGGINS, KEVIN CHRISTOPHER (1892-1927), Irish statesman, youngest son of Dr. T. Higgins (who was murdered by unknown men in 1923), of Stradbally, Queen's County, was born in 1892 at Stradbally and educated at Clongowes and St. Patrick's College, Carlow, and in the National University of Ireland. He was articled to his uncle Maurice Healy, a solicitor in Cork. After the Easter rebellion in 1916 he joined the Sinn Féin movement, and was interned. While still in gaol he was elected member for Queen's County (1918). He acted as assistant minister for local government to Mr. Cosgrave, and in 1922 became a member of the provisional government as minister of justice and vice president of the Executive Council. As minister of justice he established the Civic Guard, and put down disorder with a strong hand. He was called to the Irish bar in 1923, and in June 1927 added to his existing duties those of minister for external affairs.

In the midst of the controversy with De Valera over the taking

of the oath in the Dail he was waylaid by three armed men while on his way to mass at Booterstown, outside Dublin, and shot dead (July 10, 1927). It was believed that the crime was connected with the fact that, as minister of justice O'Higgins had been largely responsible for the 77 executions which were carried out in the course of the civil war. He married Bridget Mary Cole, of Dublin, in 1921, who, with the two children of the marriage, survived him.

OHIO, popularly known as the "Buckeye State," is a north central State of the United States of America, lying between latitudes $38^{\circ} 27'$ and $41^{\circ} 57'$ N. and between longitudes $80^{\circ} 34'$ and $84^{\circ} 49'$ W. of Greenwich. It is bounded north by Michigan and Lake Erie, east by Pennsylvania and by the Ohio river, which separates it from West Virginia, south by the Ohio river which separates it from West Virginia and Kentucky and west by Indiana. The State is nearly square in shape, its extremes from north to south and from east to west being about 210 m. and 220 m. respectively. The total area is 41,040 sq.m. of which 300 sq.m. exclusive of its Lake Erie jurisdiction, are water surface.

Physical Features.—The State lies on the borderland between the Prairie plains and the Allegheny plateau. The disturbances among the underlying rocks of Ohio have been slight, and originally the surface was a plain only slightly undulating; stream dissection changed the region to one of numberless hills and valleys; glacial drift then filled up the valleys over large broken areas, forming the remarkably level till plains of north-western Ohio; but at the same time other areas were broken by the uneven distribution of the drift, and south-eastern Ohio, which was unglaciated, retains its rugged hilly character, gradually merging with the typical plateau country farther south-east. The average elevation of the State above the sea is about 850 ft. but extremes vary from 425 ft. at the confluence of the Great Miami and Ohio rivers in the south-west corner; to 1,550 ft. on the summit of Hogue's hill about $1\frac{1}{2}$ m. east of Bellefontaine in the west central part.

The main water-parting is formed by a range of hills which are composed chiefly of drift and extend west south-west across the State from Trumbull county in the north-east to Darke county, or about the middle of the west border. North of this water-parting the rivers flow into Lake Erie; south of it into the Ohio river. Passing the village of Cuyahoga Falls the Cuyahoga river descends more than 200 ft. in three miles; a part of

DISTRIBUTION OF POPULATION BETWEEN URBAN AND COUNTRY DISTRICTS, 1890-1920

its course is between walls of sandstone 100 ft. or more in height, and near its mouth, at Cleveland, its bed has been cut down through 60 ft. of drift. In the middle north part of the State the Black, Vermilion and Huron rivers have their sources in swamps on the water-parting and flow directly to the lake through narrow valleys. The till plains of north-western Ohio are drained chiefly by the Maumee and Sandusky rivers, with their tributaries.

In the south-west the Great Miami and Little Miami rivers have uniform falls through basins that are decidedly rolling and that contain the extremes of elevation for the entire State. The

central and south middle part is drained by the Scioto river and its tributaries. Its basin is about 40 m. wide and only moderately rolling, but toward the mouth of the river the basin becomes narrow and is shut in by high hills. In the eastern part of Ohio the Muskingum river and its tributaries drain an area of about 7,750 sq.m. or nearly one-fifth of the entire State. The Ohio flows for 436 m. through a narrow valley on the southern border of the State, and Lake Erie forms the northern boundary for a distance of 230 miles. At the west end of the lake are Sandusky and Maumee bays, each with a good natural harbour. There are several small lakes on the water-parting, especially in the vicinity of Akron and Canton.

Fauna and Flora.—Opossums, skunks and raccoons are plentiful in some parts of the State; and rabbits and squirrels are still numerous. Most of the song-birds and birds of prey of the temperate zone are plentiful. Whitefish, bass, trout and pickerel are important as food from the waters of Lake Erie, and the land streams and lakes are stocked with game fish.

Ohio is known as the "Buckeye State" from the prevalence of the buckeye chestnut (*Aesculus glabra*). The State was originally covered with a dense forest mostly of hardwood timber, and although the merchantable portion of this has been practically all cut away, there are still undergrowths of young timber and a great variety of trees. The white oak is the most common, but there are 13 other varieties of oak, six of hickory, five of ash, five of poplar, five of pine, three of elm, three of birch, two of locust and two of cherry. Beech, black walnut, butternut, chestnut, catalpa, hemlock and tamarack trees are also common. Wild flowers are well represented. Of native ferns there are many.

Climate.—The mean annual temperature of Ohio is about 51° F; in the north, 49.5° , and in the south, 53.5° . But except where influenced by Lake Erie the temperature is subject to great extremes; at Coalton, Jackson county, in the south-east part of the State, the highest recorded range of extremes is from 104° to -38° or 142° ; at Wauseon, Fulton county, near the north-west corner, it is from 104° to -32° or 136° ; while at Toledo, on the lake shore, the range is only from 99° to -16° or 115° . July is the warmest month, and in most parts of the State January is the coldest; in a few valleys, however, February has a colder record than January. The normal annual precipitation for the entire State is about 39 inches. It is greatest in the south-east and least in the north-west. At Marietta, for example, it is 42.1 in., but at Toledo it is only 30.8 inches. The prevailing winds in most parts are westerly, but sudden changes, as well as the extremes of temperature, are caused mainly by the frequent shifting of the wind between north-west and south-west.

Soil.—In the driftless area, the south-east part of the State, the soil is largely a decomposition of the underlying rocks, and its fertility varies according to their composition; there is considerable limestone in the east central portion, and this renders the soil very productive. In the valleys also are strips covered with a fertile alluvial deposit. In the other parts of the State the soil is composed mainly of glacial drift, and is generally deep and fertile. It is deeper and more fertile, however, in the basins of the Great Miami and Little Miami rivers, where there is a liberal mixture of decomposed limestone and where extensive areas with a clay subsoil are covered with alluvial deposits.

Population.—The population of Ohio on July 1, 1928 was 6,826,000, according to the estimate of the U.S. census bureau. The population of the State at certain of the decennial censuses was: 45,365 in 1800; 581,434 in 1820; 1,519,467 in 1840; 2,339,511 in 1860; 3,198,062 in 1880; 3,672,329 in 1890; 4,157,545 in 1900; 4,767,121 in 1910; and 5,759,394 in 1920—an increase of 20.8% during the decade. Since 1900 Ohio has ranked fourth in population among the States. Of the total population in 1920, 5,571,893 or 96.7% were whites and 187,501 were coloured (186,187 negroes, 941 Chinese, 151 Indians and 130 Japanese). During the decade 1910-20 there was a marked increase in the negro population of the cities owing to immigration from the South; the percentage increased from 2.3 to 3.2 of the total. Of the total white population, 4,893,196 were native-born and 678,697 or 12.18% were foreign-born. Chief among the foreign-born na-

nationalities were: 111,893 native of Germany, 73,181 of Hungary, 67,579 of Poland, 60,658 of Italy, 48,073 of Austria, 43,690 of Russia, 43,140 of England, 42,121 of Czechoslovakia, 30,377 of Yugoslavia, 29,262 of Ireland and 24,176 of Canada. The density of population rose from 117 per square mile in 1910, to 141.4 in 1920; a density of population exceeding that of any State west of the Appalachian mountains. The urban population (in places of 2,500 inhabitants or more) formed 55.9% of the total in 1910 and 63.8% in 1920. There were, in 1920, 50 cities with a population exceeding 10,000. In 1928 the eight cities listed below had a population in excess of 100,000.

City	1920	1928 estimate
Cleveland	796,841	1,010,300
Cincinnati	401,247	413,700
Toledo	243,164	313,200
Columbus	238,702	299,000
Akron	208,435	...
Dayton	152,559	184,500
Youngstown	132,358	174,200
Canton	87,091	116,800

Government.—Ohio is governed under the Constitution of 1851 as revised by a constitutional convention in 1912 and subsequently amended. An amendment may be proposed at any time by either branch of the general assembly, and if after being approved by $\frac{2}{3}$ of the members of both branches it is also approved at a general election by a majority of those voting on the question, it is declared adopted. Under the Constitutions of 1802 and 1851 the suffrage was limited to "white male" citizens of the United States, but by an amendment approved in 1923 these words were stricken out and the Constitution was made to conform with the 15th and 19th amendments to the Federal Constitution. The right of suffrage is bestowed on every United States citizen 21 years of age or over (with certain restrictions), provided he or she has resided within the State one year, in the county 30 days and in the ward or precinct for 20 days previous to the election. All voters living in cities with a population between 11,800 and 100,000 are required to register once in every four years; in the larger cities they must register annually. The Constitution requires that all elections be by ballot. Constitutional amendments, approved in 1912, provide for the use of the initiative and referendum in legislation.

The executive department consists of a governor, lieutenant governor, secretary of State, auditor, treasurer and attorney general. All are elected in November of even-numbered years for a term of two years; an exception is the auditor, who serves for four years. The right of veto was not given the governor until the adoption of a constitutional amendment in 1903. Bills must be vetoed in their entirety, except that in appropriation bills specific, individual items may be vetoed; a $\frac{2}{3}$ vote of all the members of each house is required for re-passage. The governor has full power to grant pardons and reprieves except for treason or conviction after impeachment by the general assembly. If he die in office, resign or be impeached and removed from office, the officers standing next in succession are the lieutenant governor, the president of the senate and the speaker of the house of representatives in the order named. By an administrative reorganization act, passed in 1921, 37 departments, commissions, etc., were combined into eight departments—finance, commerce, highways and public works, agriculture, health, industrial relations, educa-

tion and public welfare—in which the former departments are known as divisions. Each department has at the head a director who is appointed by the governor and serves during his pleasure; each departmental director receives an annual salary of \$6,500. In 1927 the division of public works was separated from the department of highways and made the ninth department with a

GRAPH SHOWING PRODUCTION OF PIG IRON AND FERRO-ALLOYS, 1900-25

director at its head. The system of administration thus established is closely analogous to that of the Federal Government.

The general assembly consists of a senate and a house of representatives, the members of which are elected for terms of two years. The ratio of representation in the senate is obtained by dividing the total population of the State by 35, the ratio in the house by dividing the population by 100. The membership in each house, however, is above these figures (37 in the senate and 136 in the house in 1928), because of a system of fractional representation and of the Constitutional amendment of 1903 which allows each county at least one representative in the lower house. The Constitution provides for a reapportionment every ten years beginning in 1861. Biennial sessions are held beginning on the first Monday in January of the odd-numbered years. The Constitution prohibits special, local and retroactive legislation, legislation impairing the obligation of contracts and legislation levying a tax on State, municipal and public school bonds, and it limits the amount and specifies the character of public debts which the legislature may contract.

The judicial department in 1927 was composed of a supreme court of seven judges, nine judicial courts of appeals of three judges each, courts of common pleas, and probate, juvenile, justice of the peace and municipal courts. Under the Constitution of 1802 judges were chosen by the legislature, but since 1851 they have been elected by direct popular vote—the judges of the supreme court being chosen at large. They are removable by a concurrent resolution approved by a $\frac{2}{3}$ majority in each house of the general assembly. The terms of supreme court judges, judges of the courts of appeals and judges of the courts of common pleas are six years; that of probate judges and justices of the peace is four years.

The principal units of local government are the county, the township, the city and the village. The chief county authority is the board of commissioners of three members elected for terms of four years. The other officials are the auditor and surveyor, elected for four years, and sheriff, treasurer, recorder, coroner, clerk of courts and prosecuting attorney, elected for two years. The county also has a board of education elected by the qualified voters. This board appoints the county superintendent of schools. The chief township authority is a board of trustees of three mem-

AGGREGATE VALUE OF MANUFACTURED PRODUCTS
Lower half of columns represent value of materials; upper half, value added by manufacture

bers, elected by popular vote for two years. The other township officials are the clerk, treasurer, assessor, supervisor of roads, justices of the peace, constables, board of education and board of health. Under the Constitution of 1821, municipal corporations were established by special legislation. The Constitution of 1851, however, provided for a general law, and the legislature in 1852 enacted a "general municipal corporation act," the first of its kind in the United States. The system was changed again in 1912 when the so-called "home rule" amendment was put into the Constitution. This allows each city to make its own charter or constitution. As a result, a variety of charters exist, and the three outstanding types of municipal government—mayor and council, city manager and commission—are found.

In Ohio all State and county officials as well as U.S. senators and representatives are nominated at primaries held in even-numbered years on the second Tuesday in August.

Finances.—The ordinary expenses of the State Government are met entirely by indirect taxation. There was, however, in 1926, a State levy of .25 mills for the redemption of the \$25,000,000 issue of World War compensation bonds. These bonds were the only bonded indebtedness of the State; the amount outstanding on June 30, 1926, was \$16,250,000. This debt was being redeemed at the rate of \$1,250,000 of the principal each six months. The chief sources of the general revenue fund are a one-twelfth of 1% tax on the asset valuation of domestic and foreign corporations, a premium tax on insurance companies, a 4% gross earnings tax on steam railways, a tax of 1.2% of the gross receipts of miscellaneous utilities, an inheritance tax, assessments on banks and finance companies, a franchise tax on new corporations, a 1.2% gross earnings tax on electric railways, a cigarette tax and receipts from various institutions. In 1926 the net receipts for this fund were \$31,105,277.69, the disbursements \$30,606,005.71, and the balance at the end of the fiscal year \$3,112,371.77. The gasoline tax, automobile registration fees and certain other revenues are handled as separate funds. The disbursements of the highway department for the fiscal year were \$23,801,459. The total revenue derived from tax levies on the grand duplicate of the State for all divisions for the tax year ending Aug. 31, 1926 was \$255,808,459. Of this total tax, \$3,108,905 was State (World War compensation bonds); \$51,632,960 county; \$13,712,878 township; \$114,969,009 school; and \$72,384,807 municipal. There were, on June 30, 1926, 1,084 commercial and savings banks operating within the State; their total resources were \$3,055,640,000 and deposits \$2,402,088,000. Of the total number of banking institutions 351 were national banks, and their resources totalled \$963,786,000.

Education.—Ohio has an excellent system of public education extending from the kindergarten through college and university work. The basis of Ohio's educational system was laid by an act of Congress in 1785 setting apart 1 sq.m. in each township of 36 sq.m. for the support of education. The public-school system, however, was established in 1825. The legislature in 1837 established the office of State commissioner of common schools. This office was abolished in 1840, but was revived in 1843 and continued to function until displaced by that of the superintendent of public instruction in 1912. After the reorganization of the administrative departments in 1921, the superintendent of public instruction became the chief administrative officer of the department of education with the title director of education. According to the annual report of the director of education the total school revenue receipts for the year ending June 30, 1926, were \$117,093,130, and the non-revenue receipts (i.e., sale of bonds, gifts, etc.) amounted to \$58,026,511, or a grand total of \$175,119,641. The school enrolment in 1925-26, according to the above mentioned source, was 1,255,323. Of this total, 36,751 were in the kindergarten, 979,073 in elementary grades, 214,777 in secondary schools and the remaining 24,722 were in normal, vocational or special schools. The parochial school enrolment for the same year was 115,762 in the elementary schools and 15,074 in the high-school departments. The percentage of illiteracy in Ohio is very low; it was 2.8% in 1920. All children between the ages of 6 and 16 are required to attend school for the full term.

The institutions of higher education supported in whole or in part by the State are: Ohio university at Athens, founded in 1804 on the proceeds derived from two townships granted by Congress to the Ohio company; Miami university (chartered in 1809) at Oxford, which received the proceeds from a township granted by Congress in the Symmes purchase; Ohio State university (1873) at Columbus, which received the proceeds from the lands granted by Congress under the act of 1862 for the establishment of agricultural and mechanical colleges, and reorganized as a university in 1878; and two State normal colleges, one at Bowling Green, the other at Kent. Wilberforce university, for negroes (1856), at Wilberforce, is under the African Methodist Episcopal church; Akron, Cincinnati, Cleveland, Dayton and Toledo support universities; and three, Columbus, Dayton and Warren, support public normal schools. Among the numerous denominational or privately endowed colleges and universities within the State are Western Reserve university at Cleveland, Oberlin college at Oberlin and Ohio Wesleyan university at Delaware.

Charities and Corrections.—The State charitable and penal institutions in 1925 were under the general control of the department of public welfare, this department having superseded the board of administration on July 1, 1921. The director of public welfare has control of hospitals for the insane at Athens, Cleveland, Columbus, Dayton, Lima, Cincinnati (the Longview State hospital), Massillon and Toledo; a hospital for epileptics at Gallipolis; a sanatorium for tubercular patients at Mt. Vernon; an institution for the feeble-minded, a school for the blind and a similar institution for the deaf, at Columbus; a soldiers' and sailors' home at Sandusky; the Madison Home at Madison; the Bureau of Juvenile Research at Columbus; the commission for the blind at Columbus; an industrial home for boys at Lancaster and a similar institution for girls at Delaware; the State penitentiary at Columbus; and others.

Agriculture.—Ohio, in 1926, ranked tenth among the States in the total value of its agricultural products. The estimated value of all farm crops in that year was \$299,900,000 as compared with \$309,400,000 as an average for the four preceding years. Of its total land surface (26,073,600 ac.), 22,219,248 ac. or 85.2% were, in 1925, included in farms. The number of farms in the State has decreased steadily since 1900, the total in that year being 276,719 as compared with 244,703 in 1925. In acreage per farm, however, there has been a slight increase, the average in 1925 being 90.8 as compared with 88.5 in 1900. The percentage of tenancy in 1925 was 25.5 as compared with 29.5 in 1920 and 28.4 in 1910. The total value of all farm property in 1925 was \$2,236,906,636 as compared with \$3,095,666,336 in 1920. The farm population, in 1925, was 1,031,718, or approximately 16% of the State's total.

There was a great variety of produce, but the principal crops in 1926 were Indian corn, hay, wheat, oats, potatoes, apples, tobacco and barley. The Indian corn crop was 145,436,000 bu. in 1926; it was grown on 3,591,000 acres. The wheat crop grown on 1,795,000 ac. had a product of 40,384,000 bu. valued at \$51,286,000. Oats was the cereal next in importance. The 1,980,000 ac. devoted to its culture produced 75,240,000 bu. of grain valued at \$29,344,000. The acreage planted in barley increased from 25,000 ac., the average for 1909-13, to 116,000 ac. in 1926; but during the same period the rye acreage decreased from 65,000 ac. to 50,000 acres. The product of these cereals in 1926 was 3,712,000 bu. of barley and 875,000 bu. of rye. The hay crop, chiefly timothy and timothy mixed with clover, amounted to 4,007,000 tons valued at \$56,098,000. The cultivation of tobacco was of little importance in the State until about 1840; but the product increased after 1850 and for a time was one of the State's leading agricultural crops. In 1926 the crop was 38,189,000 lb. grown on 44,000 ac. as compared with 81,948,000 lb. and 94,000 ac., the average for the years 1909-13. The potato crop was 10,058,000 bu. (from 107,000 ac.) valued at \$17,099,000. Chief among the fruits were apples (11,900,000 bu.), peaches (2,120,000 bu.) and pears (430,000 bu.).

The live stock and poultry products of Ohio are of great importance. The value of the dairy products alone, in 1924, was \$62,125,816. On June 1, 1927, it was estimated that the dairy

cattle within the State numbered 926,000. The 1,749,089 sheep shorn in 1924 produced 14,100,742 lb. of wool valued at \$6,185,369. In the number of sheep within the State, Ohio ranks first among the States east of the Mississippi river. The chickens raised and the eggs produced had, in 1924, a value of \$59,871,861. The live stock on the farms of the State on Jan. 1, 1927, consisted of 1,630,000 cattle, 2,439,000 swine, 2,080,000 sheep, 568,000 horses and 33,000 mules; their estimated value was \$206,114,000.

Mineral Products.—The mineral wealth of Ohio is well distributed both as to products and area. In 1926, clay products, bituminous coal, natural gas and petroleum were the chief products, but the State also ranked high in the production of stone, lime, cement, gypsum, salt and grindstones. The total production was valued at \$247,506,588.

The fire-clay mines of Tuscarawas, Jefferson, Columbiana, Stark and Carroll counties supply the raw material for the greater part of the State's pottery, tile and brick industry. The 393 firms engaged in manufacturing clay products, in 1925, had an output valued at \$97,991,821 (brick and tile, \$57,602,803, and pottery, \$40,389,018). The coal-fields, comprising a total area of 10,000 sq.m. or more, are in the eastern half of the State. In 1923, 40,546,433 tons were produced as compared with 28,034,112 tons in 1925 and 29,150,000 tons in 1926. There were, in 1925, 27 counties in which coal was produced, but over 90% of it came from Belmont, Athens, Harrison, Jefferson, Guernsey, Perry and Tuscarawas counties. Natural gas is found in the eastern, central and north-western parts of the State. Most of the fields have been in operation many years but the flow continues strong; the product in 1925 was 43,235,000,000 cu. ft. valued at \$22,377,000. In 1896 Ohio produced 23,941,169 bbl. of petroleum, or 39% of the total output in the United States; in 1926 it was 7,322,000 bbl. or slightly over one-half of 1% of the total output in the United States.

The output of the stone quarries in 1925 was valued at \$13,084,572. Some of the best sandstone in the country is obtained from Cuyahoga and Lorain counties; it is exceptionally pure in texture and durable. From the sandstone known as Berea grit, a large portion of the country's grindstones, pulpstones and oilstones are obtained. The quantity of Portland cement made in Ohio has increased steadily since its first production about 1890; in 1926 the output was 7,422,720 bbl. valued at \$12,793,537. Other important mineral products with their values in 1925 were: lime, \$10,970,605; sand and gravel, \$8,353,913; gypsum, \$6,394,132; salt, \$4,116,625; grindstones and pulpstones, \$1,065,301.

Manufactures.—Ohio is pre-eminently a manufacturing State. The output of its factories in 1925 was exceeded in value by those of New York and Pennsylvania only. The value of the factory products increased from \$748,670,855 in 1900 to \$1,782,808,000 in 1914 and to \$5,347,522,464 in 1925, or an increase of approximately 200% during the 11 year period 1914-25. The most notable advance was in the production of motor cars and in the manufacture of motor car tires. Ohio ranked first of the States in foundry and machine shop products, rubber tyres and tubes, ornamental iron-work and pottery; and second in iron and steel, motor vehicles and clay products. The most important manufacturing industry is that of iron and steel, established near Youngstown in 1804. The value of the output increased from \$138,935,256 in 1900 to \$968,264,000 (blast furnace, \$178,722,017, and steel works and roller mills, \$789,542,038) in 1925. The industry second in importance was the manufacture of rubber tyres and inner tubes for motor vehicles. This industry, in 1925, gave employment to 50,350 wage-earners and had a product valued at \$556,262,424. The manufacture of motor vehicles, their bodies and parts, ranked third in importance; the industry gave employment to 43,791 wage-earners and had an output valued at \$514,775,843. Foundry and machine-shop products, consisting largely of engines, boilers, tools, stoves and various kinds of machinery, ranked fourth among the State's manufactures; their value increased from \$72,399,632 in 1900 to \$345,222,837 in 1925. Electrical machinery, apparatus and supplies ranked fifth with a product valued at \$181,351,409. Other leading manufactures in 1925 were slaughtering and meat-packing (\$128,777,955), printing and

publishing newspapers and periodicals (\$101,515,510), construction and repair done in steam railway shops (\$89,861,317), bakery products (\$89,107,013), men's clothing (\$78,001,683), paper and wood pulp (\$75,923,880), food preparations (\$71,525,920), petroleum refining (\$63,296,901), paints and varnishes (\$58,765,437), brick and tile (\$57,566,109), coke, other than gas-house (\$57,542,166), printing and publishing books and job work (\$56,086,717), butter, cheese and evaporated milk (\$53,065,098), structural and ornamental iron-work (\$52,630,751), boots and shoes (\$51,546,890) and grain-mill products (\$51,264,871).

The great manufacturing centres are Cleveland, Akron, Cincinnati, Toledo, Youngstown, Dayton, Columbus, Canton and Springfield. The value of the products of these cities in 1925 amounted to approximately 62% of that for the entire State. A large portion of the iron and steel was manufactured in Cleveland, Youngstown, Steubenville, Lorain, Bellaire, Cleveland Heights, East Youngstown and Irontown. Most of the motor vehicles were manufactured in Cleveland and Cincinnati; most of the cash registers and calculating machines in Dayton; most of the motor tyres and other rubber goods in Akron.

Transportation and Commerce.—The most important natural means of transportation are the Ohio river on the southern border and Lake Erie on the northern border. One of the first great public improvements made within the State was the connection of these waterways by two canals—the Ohio and Erie canal from Cleveland to Portsmouth, and the Miami and Erie canal from Toledo to Cincinnati. The Ohio and Erie was opened throughout its entire length (309 m.) in 1832. The Miami and Erie was completed from Middletown to Cincinnati in 1827; in 1845 it was opened to the lake (250 m. from Cincinnati). A flood in 1913 wrecked these canals, and they had not been restored by 1928. The national Government began in 1825 to extend the National road across Ohio from Bridgeport, opposite Wheeling, West Virginia, through Zanesville and Columbus, and completed it to Springfield in 1837. Before the completion of the Miami and Erie canal to Toledo, the building of railways was begun in this region, and in 1836 a railway was completed from that city to Adrian, Michigan. At the close of 1925 there was a total mileage of 8,812 as compared with 9,159 in 1915, this reduction being a part of a general shrinkage prevalent throughout the country during this period. As the building of steam railways lessened and then ceased, the building of suburban and inter-urban electric railways was begun. These railways were rapidly extended until a maximum of 4,236 m. was reached in 1917, and all the more populous districts were connected by them; in 1925 there were 59 companies operating a total of 3,827 m. within the State. There were on Jan. 1, 1928, 11,000 m. of highway in the State system. Of this total 10,300 m. were surfaced. The total motor vehicle registration for the year ending Dec. 31, 1926, was 1,490,026.

The 15 Lake Erie ports of Ohio had, in 1926, a foreign commerce valued at \$35,826,709 and a domestic trade of \$461,101,707. Chief among the ports was Cleveland with over 41% of the total. Others of great importance were Toledo, Ashtabula, Conneaut, Sandusky, Fairport and Lorain. Ashtabula, according to the *Annual Report of the Chief of Engineers, U.S. Army*, had over 50% of the foreign trade (imports, \$5,079,821 and exports, \$13,135,440). Cincinnati is the State's chief port on the Ohio river.

History.—Ohio was the pioneer State of the old North-West Territory, which embraced also what are now the States of Indiana, Illinois, Michigan and Wisconsin and the north-east corner of Minnesota. When explored by Europeans, late in the first half of the 17th century, the territory included within what is now Ohio was a battle-ground of Indian tribes. From the middle to the close of the 17th century the French were establishing a claim to the territory between the Great Lakes and the Ohio river by discovery and occupation.

About 1730 English traders from Pennsylvania and Virginia began to visit the eastern and southern parts of the territory and a conflict approached as a French Canadian expedition under Céleron de Bienville took formal possession of the upper Ohio valley by planting leaden plates at the mouths of the principal streams. This was in 1749 and in the same year George II. char-

tered the first Ohio company, formed by Virginians and London merchants trading with Virginia for the purpose of colonizing the West. This company, in 1750, sent Christopher Gist down the Ohio river to explore the country as far as the mouth of the Scioto river, and four years later the erection of a fort was begun in its interest at the forks of the Ohio. The French drove the English away and completed the fort (Ft. Duquesne) for themselves. The Seven Years' War was the immediate consequence and this ended in the cession of the entire North-West to Great Britain. The former Indian allies of the French, however, immediately rose up in opposition to British rule in what is known as the conspiracy of Pontiac (*see* PONTIAC), and the suppression of this was not completed until Col. Henry Bouquet made an expedition (1764) into the valley of the Muskingum and there brought the Shawnees, Wyandots and Delawares to terms. With the North-West won from the French, Great Britain no longer recognized those claims of her Colonies to this territory which she had asserted against that nation, but in a royal proclamation of Oct. 7, 1763, the granting of land west of the Alleghenies was forbidden and on June 22, 1774 parliament passed the Quebec act which annexed the region to the province of Quebec. This was one of the grievances which brought on the Revolutionary War, during which the North-West was won for the Americans by George Rogers Clark (*q.v.*). During that war also, those States which had no claims in the West contended that title of these western lands should pass to the Union and when the Articles of Confederation were submitted for ratification in 1777, Maryland refused to ratify them except on that condition. The result was that New York ceded its claim to the United States in 1780, Virginia in 1784, Massachusetts in 1785 and Connecticut in 1786. Connecticut, however, excepted a strip bordering on Lake Erie for 120 m. and containing 3,250,000 acres. This district, known as the Western Reserve, was ceded in 1800 on condition that Congress would guarantee the titles to land already granted by the State. Virginia reserved a tract between the Little Miami and Scioto rivers, known as the Virginia Military district, for her soldiers in the Revolutionary War. When the war was over and these cessions had been made, a great number of war veterans wished an opportunity to repair their broken fortunes in the West, and Congress, hopeful of receiving a large revenue from the sale of lands here, passed an ordinance on May 20, 1785, by which the present national system of land-surveys into townships 6 m. sq. was inaugurated in what is now southwest Ohio in the summer of 1786. In March 1786 the second Ohio company (*q.v.*), composed chiefly of New England officers and soldiers, was organized in Boston, Mass., with a view to founding a new State between Lake Erie and the Ohio river. The famous North-West Ordinance was passed by Congress on July 13, 1787. This instrument provided a temporary government for the territory with the understanding that, as soon as the population was sufficient, the representative system should be adopted, and later that States should be formed and admitted into the Union. There were to be not less than three nor more than five States.

On the adoption of the North-West Ordinance the work of settlement made rapid progress. There were four main centres. The Ohio company founded Marietta at the mouth of the Muskingum in 1788, and this is regarded as the oldest permanent settlement in the State. An association of New Jersey people, organized by John Cleves Symmes, secured a grant from Congress in 1788-92 to a strip of 248,540 ac. on the Ohio, between the Great Miami and the Little Miami, which came to be known as the Symmes Purchase. Their chief settlements were Columbia (1788) and Cincinnati (1789). The Virginia Military district, between the Scioto and the Little Miami, reserved in 1784 for bounties to Virginia continental troops, was colonized in large measure by people from that State. Their chief towns were Massieville, now Manchester (1790) and Chillicothe (1796). A small company of Connecticut people under Moses Cleaveland founded Cleveland in 1796 and Youngstown was begun a few years later, but that portion of the State made very slow progress until after the opening of the Ohio and Erie canal in 1832.

During the Territorial period (1787-1803), Ohio was first a

part of the unorganized North-West Territory (1787-99), then a part of the organized North-West Territory (1799-1800) and later the organized North-West Territory (1800-03), Indiana Territory having been detached from it on the west in 1800. The first Territorial government was established at Marietta in July 1788, and Gen. Arthur St. Clair, the governor, arrived in that month. His administration was characterized by the final struggle with the Indians. The Revolutionary War was succeeded by a series of Indian uprisings. Two campaigns, the first under Gen. Josiah Harmar (1753-1813) in 1790, and the second under Gen. St. Clair in 1791, failed on account of bad management and ignorance of Indian methods of warfare, and in 1793 Gen. Anthony Wayne (*q.v.*) was sent out in command of a large force of regulars and volunteers. The decisive conflict, fought on Aug. 20, 1794, near the rapids of the Maumee, is called the battle of Fallen Timbers, because the Indians concealed themselves behind the trunks of trees which had been felled by a storm. Wayne's dragoons broke through the brushwood, attacked the left flank of the Indians and soon put them to flight. In the treaty of Greenville (Aug. 3, 1795) the Indians ceded their claims to the territory east and south of the Cuyahoga, the Tuscarawas, and an irregular line from Ft. Laurens (Bolivar) in Tuscarawas county to Ft. Recovery in Mercer county, practically the whole of eastern and southern Ohio. The Jay treaty was ratified in the same year, and in 1796 the British finally evacuated Detroit and the Maumee and Sandusky forts. By cessions and purchase in 1804, 1808 and 1817-18, the State secured all of the lands of the Indians except their immediate homes, and these were finally exchanged for territory west of the Mississippi. The last remnant migrated in 1841. Gen. Wayne's victory was followed by an extensive immigration of New Englanders, of Germans, Scotch-Irish and Quakers from Pennsylvania and of settlers from Virginia and Kentucky, many of whom came to escape the evils of slavery. This rapid increase of population led to the establishment of the organized Territorial government in 1799, and to the admission of the State into the Union in 1803.

The Congressional Enabling act of April 30, 1802 followed that alternative of the North-West Ordinance which provided for five States in determining the boundaries, and in consequence the Indiana and Michigan districts were detached. A rigid adherence to the boundary authorized in 1787, however, would have resulted in the loss to Ohio of 470 sq.m. of territory in the north-western part of the State, including the lake port of Toledo. After a long and bitter dispute—the Toledo War (*see* TOLEDO)—the present line, which is several miles north of the south bend of Lake Michigan, was definitely fixed in 1837, when Michigan came into the Union. (For the settlement of the eastern boundary, *see* PENNSYLVANIA.) After having been temporarily at Marietta, Cincinnati, Chillicothe and Zanesville, the capital was established at Columbus in 1816.

Since Congress did not pass any formal act of admission there has been some controversy as to when Ohio became a State. The Enabling act was passed April 30, 1802, the first State Legislature met March 1, 1803, the Territorial judges gave up their offices on April 15, 1803, and the Federal senators and representatives took their seats in Congress Oct. 17, 1803. Congress decided in 1806, in connection with the payment of salaries to Territorial officials, that March 1, 1803, was the date when State Government began. During the War of 1812 the Indians under the lead of Tecumseh were again on the side of the British. Battles were fought at Ft. Meigs (1813) and Ft. Stephenson (Fremont, 1813), and Commodore Oliver Hazard Perry's naval victory on Lake Erie in 1813 was on the Ohio side of the boundary line.

Owing to the prohibition of slavery, the vast majority of the early immigrants to Ohio came from the north, but, until the Mexican War forced the slavery question into the foreground, the Democrats usually controlled the State, because the principles of that party were more in harmony with frontier ideas of equality. The Whigs were successful in the presidential elections of 1836 and 1840, partly because of the financial panic and partly because their candidate, William Henry Harrison, was a "favourite son," and in the election of 1844, because of the unpopularity of

the Texas issue. Victory was with the Democrats in 1848 and 1852, but since the organization of the Republican Party in 1854 the State has uniformly given to the Republican presidential candidates its electoral votes, except in 1912 and 1916 when a split in the dominant party (Republican) allowed the Democrats to win. In the Civil War Ohio loyally supported the Union, furnishing 319,659 men for the army. Dissatisfaction with the President's emancipation programme resulted in the election of a Democratic Congressional delegation in 1862, but the tide turned again after Gettysburg and Vicksburg; Clement L. Vallandigham, the Democratic leader, was deported from the State by military order, and the Republicans were successful in the elections of 1863 and 1864. A detachment of the Confederate cavalry under Gen. John Morgan invaded the State in 1863, but was badly defeated in the battle of Buffington's island (July 18). In 1873 the Democrats succeeded for the first time since 1856 in electing a governor, but in the years that have since elapsed the administrations have been almost evenly divided between Democrats and Republicans. Six presidents have come from Ohio, William Henry Harrison, Rutherford B. Hayes, James A. Garfield, William McKinley, William Howard Taft and Warren G. Harding.

Distinctive advance has been made in adapting the Constitution and the system of administration to the new needs of the State. At the election in 1910, a general Constitutional Convention was approved by a large majority. Delegates were chosen in Nov. 1911, and the convention sat from January to June 1912. The delegates, of whom the majority were Democrats, represented the progressive elements of both major parties. Forty-two amendments were submitted to the voters on Sept. 3, 1912, of which 34 were ratified; among those defeated were the abolition of capital punishment, woman suffrage and a \$50,000,000 bond issue for a State system of roads. The tax-reformers secured for the general assembly the power to impose inheritance, income and franchise taxes as well as taxes upon the production of coal, oil, gas and other minerals. Several of these sources of taxation have since been adopted. The League for Direct Legislation secured the initiative and referendum, and those opposed to the liquor interests succeeded, in 1918, in establishing prohibition by a constitutional amendment. As the result of an administrative reorganization act passed in 1921, the numerous departments, commissions and boards were combined into eight departments, each with a director at its head—a system of administration similar to that of the Federal Government.

Insurance.—The State has attempted to regulate the health and safety of its industrial population. The workmen's compensation act of 1911 established voluntary "compensation for industrial accidents, which compensation is to be paid out of a State insurance fund, to which both employer and employees contribute (90% and 10% respectively) in lieu of the civil action for damages." A constitutional amendment of 1912 and a permanent law of 1913 made compulsory the system of State insurance. Ohio, under the act, maintains its own State insurance fund. By 1928 the premium income to the State amounted annually to more than \$13,300,000, and protection was furnished to more than 1,600,000 workmen. Employers also were required to guard the safety of employees and to arrange reasonable hours of work. A statute of 1919 created a State-wide system of municipal and general health districts and the powers of the department of health were greatly increased. A State teachers' retirement system also was instituted in 1919. In 1926 the voters of the State rejected a proposed constitutional amendment which would have abolished the State primary election system and substituted in its stead a system of nominating conventions.

Southern Ohio has suffered at various times from floods. During the great flood of 1884, the Ohio river at Cincinnati reached the highest flood stage ever recorded at that place (over 71 ft. above normal), and throughout the Ohio valley millions of dollars worth of damage was done. Another disastrous flood in 1913, affecting especially the inhabitants of the Miami, the Scioto and the Muskingum river valleys, led to a measure for the protection of the river valley from future damage of the kind. The pro-

tective system, which consists of a series of dry reservoir dams, was undertaken by two conservancy districts—the Miami and the Upper Scioto—at a cost of \$34,700,000 and \$306,300 respectively.

BIBLIOGRAPHY.—For a treatment of the physical features of Ohio see Stella A. Wilson, *Ohio* (1902); the publications of the Geological Survey of Ohio (1837 seq.); and the volumes of the *Ohio Co-operative Topographical Survey* (1916 seq.). For administration see the *Report of the Joint Committee on Administrative Reorganization* (Columbus, 1921); *Americanisation Bulletin* No. 1 published by the education department (1922); and the annual reports of the various State officials and departments. Older works of merit are S. P. Orth, *The Centralization of Administration in Ohio*, in the Columbia university Studies in History, Economics and Public Law, xvi., No. 3 (1903), and W. H. Seibert, *The Government of Ohio, its History and Administration* (1904). The work of J. A. Wilgus, "Evolution of Township Government in Ohio," in the *Annual Report of the American Historical Association* for 1894 (1895), is a study in local government.

Archaeology and History: P. G. Thomson's *Bibliography of Ohio* (1880) is an old but excellent guide to the study of Ohio's history. For archaeology see Cyrus Thomas, *Catalogue of Prehistoric Works East of the Rocky Mountains* (1891), and his *Report on the Mound Explorations of the Bureau of Ethnology* in the 12th Report (1894) of that bureau; G. Fowke, *Archaeological History of Ohio; the Mound Builders and Later Indians* (1902); W. K. Moorehead, "The Hopewell Mound Group of Ohio" in *Publication No. 211* of the Field museum of natural history, Anthropological Series, vol. vi.; W. C. Mills, *Archaeological Atlas of Ohio* (1914); and the volumes of the *Ohio Archaeological and Historical Quarterly* (1887 seq.). The best histories are Rufus King, *Ohio; First Fruits of the Ordinance of 1787* (2nd ed. 1903); and E. O. Randall and D. J. Ryan, *History of Ohio; the Rise and Progress of an American State* (1912). Charles B. Galbreath's *History of Ohio* (1925) contains many facts but is poorly arranged. B. A. Hinsdale, *The Old North-West* (2nd ed., 1899), is good for the period before 1803. Of the older histories Caleb Atwater, *History of the State of Ohio, Natural and Civil* (1838) and James W. Taylor, *History of the State of Ohio: First Period 1650-1787* (1854), are useful. For the Territorial period, and especially for the Indian wars of 1790-94, see W. H. Smith (ed.) *The St. Clair Papers: Life and Services of Arthur St. Clair* (1882); C. E. Slocum, *Ohio Country Between 1783 and 1815* (1910); John Armstrong, *Life of Anthony Wayne* in Sparks' "Library of American Biography" (1834-38), series i., vol. iv.; and A. B. Hulbert (ed.), *Ohio in the Time of the Confederation* in Marietta college historical collections. There is considerable material of value, especially for local history, in the *Ohio Archaeological and Historical Society Publications* (1887 seq.); in H. Howe, *Historical Collections of Ohio* (1889-91); *The Ohio Hundred Year Book* compiled by Elliot H. Gilkey (1901); and *The Western Reserve Historical Society Tracts*. See also W. F. Gephart, *Transportation and Industrial Development in the Middle West* (1909), a commercial history of Ohio; D. J. Ryan, *Ohio in Four Wars* (1917); and Thomas E. Powell (ed.), *The Democratic Party of the State of Ohio* (1913).

OHIO COMPANY, a name of two companies organized in the 18th century for the colonization of the Ohio valley. The first Ohio company was organized in 1749, partly to aid in securing for the English control of the valley, then in dispute between England and France, and partly as a commercial project for trade with the Indians. The company was composed of Virginians, including Thomas Lee (d. 1750) and the two brothers of George Washington, Lawrence (who succeeded to the management upon the death of Lee) and Augustine; and of Englishmen, including John Hanbury, a wealthy London merchant. In 1752 the company had a pathway blazed between the small fortified posts at Will's creek (Cumberland), Maryland, and at Redstone creek (Brownsville), Pennsylvania, which it had established in 1750; but it was finally merged in the Walpole company (an organization in which Benjamin Franklin was interested), which in 1772 had received from the British Government a grant of a large tract lying along the southern bank of the Ohio as far west as the mouth of the Scioto river. The Revolutionary War interrupted colonization and nothing was accomplished.

The second company, the Ohio company of Associates, was formed at Boston in 1786. The leaders in the movement were General Rufus Putnam, Benjamin Tupper (1738-92), Samuel Holden Parsons (1737-89) and Manasseh Cutler. Dr. Cutler was selected to negotiate with Congress, and seems to have helped to secure the incorporation in the ordinance for the government of the North-West Territory of the paragraphs which prohibited slavery and provided for public education and for the support of the ministry. On Oct. 27, 1787, Cutler and Major Winthrop Sargent (1753-1820), who had joined him in the negotiations,

signed two contracts; one was for the absolute purchase for the Ohio company, at 66½ cents an acre, of 1,500,000ac. of land lying along the north bank of the Ohio river, from a point near the site of the present Marietta, to a point nearly opposite the site of the present Huntington, Kentucky; the other was for an option to buy all the land between the Ohio and the Scioto rivers and the western boundary line of the Ohio company's tract, extending north of the tenth township from the Ohio, this tract being preempted by "Manasseh Cutler and Winthrop Sargent for themselves and others"—actually for the Scioto company (see GAL-LIPOLIS). On the same day Cutler and Sargent "for themselves and associates" transferred to William Duer, then secretary of the Treasury board, and his associates "one equal moiety of the Scioto tract of land mentioned in the second contract," it being provided that both parties were to be equally interested in the sale of the land, and were to share equally any profit or loss. Colonists were sent out by the Ohio company from New England, and Marietta, the first permanent settlement in the present state of Ohio, was founded in April, 1788.

See E. J. Benton, ed., "Side Lights on the Ohio Company of Associates from the John May Papers," Western Reserve Hist. Soc. Tracts, No. 97 (Cleveland, 1917); A. B. Hulbert, ed., *The Records of the Original Proceedings of the Ohio Company* (Marietta, O., 1917); and Herbert T. Leyland, "The Ohio Company," *Hist. and Philos. Soc. of Ohio, Quart. Pub.*, vol. xvi, no. 1 (Cincinnati, 1921).

OHIO RIVER, the principal eastern tributary of the Mississippi river, U.S.A. It is formed by the confluence of the Allegheny and Monongahela rivers at Pittsburgh (Pa.), and flows north-west nearly to the west border of Pennsylvania, south-south-west between Ohio and West Virginia, west by north between Ohio and Kentucky, and west-south-west between Indiana and Illinois on the north and Kentucky on the south. It is the largest of all the tributaries of the Mississippi in respect to the amount of water discharged (an average of about 158,000cu.ft. per sec.), is first in importance as a highway of commerce, and in length (967m.) as well as in the area of its drainage basin (approximately 210,000sq.m.) it is exceeded only by the Missouri. The slope of the river at low water ranges from 1ft. or more per mile in the upper section to about 0.75ft. per mile in the middle section and 0.29ft. per mile in the lower section, and the total fall is approximately 500ft. The greatest falls are at Louisville, where the river within a distance of 2.25m. descends 23.9ft. over an irregular mass of limestone. The ordinary width of the upper

A SHIPMENT OF STEEL TUBES AWAITING TRANSPORTATION DOWN THE OHIO RIVER

half of the river is uniform, from 1,200 to 1,500ft. Islands are numerous and vary in size from an acre or less to 5,000ac.

Besides its parent streams, the Allegheny and the Monongahela, the Ohio has numerous large branches. On the north it receives the waters of the Muskingum, Scioto, Miami and Wabash rivers, and on the south those of the Kanawha, Big Sandy, Licking, Kentucky, Green, Cumberland and Tennessee.

The drainage basin of the Ohio, in which the annual rainfall averages about 43in., is especially in the southern part of the river, of the "quick-spilling" kind, and as the swift mountain streams in that section are filled, the Ohio rises very suddenly and not infrequently attains a height of 30 to 50ft. or more above

low water level spreads out 10 to 15 times its usual width, submerges the bottom lands, and causes great damage. In March 1913, an especially destructive flood reached the highest stages on record on that part of the river between Wheeling and Cincinnati and on the tributaries entering from the north.

Robert Cavalier, Sieur de La Salle, asserted that he discovered the Ohio and descended it until his course was obstructed by a fall (thought to be the falls at Louisville); this was probably in 1670, but until the middle of the next century, when its strategic importance in the struggle of the French and the English for the possession of the interior of the continent became fully recognized, little was generally known of it. By the treaty of 1763 ending the Seven Years' War the English finally gained undisputed control of the territory along its banks. By the treaty of 1783 the entire Ohio country became a part of the United States and by the famous Ordinance of 1787 the north side was opened to settlement. Most of the settlers entered the region by the headwaters of the Ohio and carried much of their market produce down the Ohio and Mississippi to New Orleans.

DEVELOPMENT

Until the successful navigation of the river by steamboats a considerable portion of the imports was carried overland from Philadelphia or Baltimore to Pittsburgh. The first steamboat on the Ohio was the "New Orleans," which was built in 1811 by Nicholas J. Roosevelt and sailed from Pittsburgh to New Orleans in the same year, but it remained for Capt. Henry M. Shreve (1785-1854) to demonstrate with the "Washington," which he built in 1816, the success of this kind of navigation on the river. From 1820 to the Civil War the steamboat on the system of inland waterways of which the Ohio was a part was a dominant factor in the industrial life of the Middle West. Cincinnati, Louisville and Pittsburgh on its banks were extensively engaged in building these vessels. Until the Erie canal was opened in 1825 the Ohio river was the chief commercial highway between the East and the West.

The Federal Government in the year 1827 undertook to remove the snags and to increase the depth of water on the bars by the construction of contraction works, such as dikes and wing dams, and appropriations for these purposes as well as for dredging were continued until 1844 and resumed in 1866; but as the channel obtained was less than 3ft. in 1870, locks with movable dams—that is, dams that can be thrown down on the approach of a flood—were then advocated, and five years later Congress made an appropriation for constructing such a dam, the Davis island dam immediately below Pittsburgh, as an experiment. This was opened in 1885 and was a recognized success. As a result of the activity of the Ohio Valley Improvement Association, Congress authorized the secretary of war to appoint a board of engineers to report on the merits of a channel 9ft. in depth. The board reported in 1908 in favour of such a channel.

In 1910 Congress adopted the report and provision was made for a comprehensive project for canalizing the Ohio. Only slight changes have since been authorized. As it stood in 1926, the project provided for 50 locks and dams, all of the movable type, except the one immediately below Pittsburgh (Pa.), which is a fixed dam, completed in 1921. Of these dams 42 were completed and in operation, and the other eight were under construction.

The total tonnage shipped via the Ohio river in 1925 was 15,737,072 tons, of which 43.5% was sand and gravel and 41.4% was coal.

See the board of engineers' *Report of Examination of Ohio River with a view to obtaining channel depths of 6 and 9ft. respectively* (Washington, 1908); and A. B. Hulbert, *Waterways of Westward Expansion* (Cleveland, 1903) and *The Ohio River, a Course of Empire* (1906).

ÖHLAU, a town in the Prussian province of Silesia, 16 m. by rail S.E. of Breslau, on the left bank of the Oder. Pop. (1925) 11,369. It has a castle, became a town in 1291 and passed to Prussia in 1742. Ohlau is the centre of a tobacco-growing district.

ÖHLENSCHLÄGER, ADAM GOTTLÖB (1779-1850), Danish poet, was born in Vesterbro, a suburb of Copenhagen, on

Nov. 14, 1779. His father, a Schleswiger by birth, was at that time organist, and later became keeper, of the royal palace of Frederiksberg. Through Edvard Storm, Adam received a nomination to the college called "Posterity's High School," of which Storm was the principal. Storm himself taught the class of Scandinavian mythology, and thus Öhlenschläger received his earliest bias towards the traditions of his ancestors. His studies were interrupted first by the death of his mother, and by the English attack on Copenhagen in April 1801, which, however, inspired a dramatic sketch (*April the Second 1801*).

In the summer of 1802, when Öhlenschläger had an old Scandinavian romance, as well as a volume of lyrics, in the press, the young Norse philosopher, Henrik Steffens, came back to Copenhagen after a long visit to Schelling in Germany, full of new romantic ideas. His lectures at the university, in which Goethe and Schiller were for the first time revealed to the Danish public, created a great sensation. Steffens and Öhlenschläger met, and after a conversation of sixteen hours the latter went home and wrote at a sitting his splendid poem *Guldhornene*, in a manner totally new to Danish literature. A volume of poems in the romantic style is now chiefly remembered as containing the lovely piece called *Sanct-Hansaften-Spil*. The next two years saw the production of the epic of *Thors Reise til Jotunheim*, the charming poem in hexameters called *Langlandsreisen*, and fantasy *Aladdin's Lampe* (1805).

At the age of twenty-six Öhlenschläger was universally recognized, even by the opponents of the romantic revival, as the leading poet of Denmark. He now collected his *Poetical Writings* in two volumes. He obtained a grant for foreign travel from the government, and joined Steffens at Halle in August 1805. Here he wrote the first of his great historical tragedies, *Hakon Jarl*. In the spring of 1806 he went on to Weimar, where he spent several months in daily intercourse with Goethe. The autumn of the same year he spent with Tieck in Dresden, and proceeded in December to Paris. Here he resided eighteen months, and wrote his three famous masterpieces, *Baldur hin Gode* (1808), *Palnatoke* (1809) and *Axel og Valborg* (1810). In the spring of 1809 Öhlenschläger went to Rome to visit Thorwaldsen, and in his house wrote (in German) his tragedy of *Correggio*.

He returned to Denmark in the spring of 1810 to take the chair of aesthetics at the University of Copenhagen. In 1811 he published the Oriental tale of *Ali og Gulhyndi*, and in 1812 the last of his great tragedies, *Staerkodder*. His talent culminated in the cycle of verse-romances called *Helge*, published in 1814. The tragedy of *Hagbarth og Signe*, 1815, showed a distinct falling-off in style. In 1817 he went back to Paris, and published *Hroors Saga* and the tragedy of *Fostbrødrene*. In 1818 he was again in Copenhagen, and wrote the idyll of *Den lille Hyrdedreng* and the Eddaic cycle called *Nordens Guder*. His next productions were the tragedies of *Erik og Abel* (1820) and *Vaeringerne i Mikla-gaard* (1826), and the epic of *Hrolf Krake* (1829).

In 1829 Öhlenschläger was publicly crowned with laurel in front of the high altar in Lund cathedral by Bishop Esaias Tegnér, as the "Scandinavian King of Song." His last volumes were *Tordenskjold* (1833), *Dronning Margrethe* (1833), *Sokrates* (1835), *Olaf den Hellige* (1836), *Knud den Store* (1838), *Dina* (1842), *Erik Glipping* (1843) and *Kiartan og Gudrun* (1847). On his seventieth birthday, Nov. 14, 1849, a public festival was arranged in his honour, and he was decorated by the king of Denmark. He died on Jan. 20, 1850, and was buried in the cemetery of Frederiksberg. Immediately after his death his *Erindringer* ("Recollections") were published in two volumes.

With the exception of Holberg, there has been no Danish writer who has exercised so wide an influence as Öhlenschläger. He awakened in his countrymen an enthusiasm for the poetry and religion of their ancestors, and his name remains to this day synonymous with Scandinavian romance. His plays, partly, no doubt, in consequence of his own early familiarity with acting, fulfilled the stage requirements of the day, and were popular beyond all expectation. The earliest are the best—Öhlenschläger's dramatic masterpiece being, without doubt his first tragedy, *Hakon Jarl*. In his poems and plays alike his style is limpid,

elevated, profuse; his flight is sustained at a high pitch without visible excitement. His fluent tenderness and romantic zest have been the secrets of his extreme popularity. Although his inspiration came from Germany, he is not much like a German poet, except when he is consciously following Goethe; his analogy is much rather to be found among the English poets, his contemporaries. With all his faults he was a very great writer, and one of the principal pioneers of the romantic movement in Europe.

(E. G.; X.)

The critical edition of Öhlenschläger's works is that by J. L. Lubenber (32 vols., 1857-62). See B. Andersen, *Öhlenschläger et livs poesie* (3 vols., 1899).

OHLIGS, a town in the Prussian Rhine Province, before 1891 known as Merscheid, 17 m. by rail N. of Cologne, on the railway to Elberfeld. Pop. (1925) 29,812. Its chief manufactures are cutlery, surgical instruments and hardware.

OHM, GEORG SIMON (1787-1854), German physicist, was born at Erlangen on March 16, 1787, and was educated at the university there. He became professor of mathematics in the Jesuits' college at Cologne in 1817, and in the polytechnic school of Nuremberg in 1833. In 1849 he was appointed conservator of the physical collection at Munich, and in 1852 professor of experimental physics in the High School of Munich, where he died of apoplexy on July 7, 1854. His writings were numerous, but, with one important exception, not of the first order. The exception is his pamphlet, published in Berlin in 1827, with the title *Die galvanische Kette mathematisch bearbeitet*. This work, the germs of which had appeared during the two preceding years in the journals of Schweigger and Poggendorff, has exerted a great influence on the whole development of the theory and applications of current electricity. (See ELECTRICITY.) The most important part of the pamphlet is summarized in what is now known as Ohm's Law. (See RESISTANCE, MEASUREMENT OF.) This work was so coldly received that Ohm's susceptibilities were hurt, and he resigned his post at Cologne. He eked out a precarious livelihood until appointed at Nuremberg. At this time his work began to be recognized, he was awarded the Copley medal of the Royal Society in 1841 and was made a foreign member of that society in 1842. In addition to a number of papers on mathematical subjects, Ohm wrote a memoir on interference in uniaxial crystals, and also a *Text Book of Physics* (1854).

See a memoir on Ohm by J. Lamont in *Denkschrift Münchener Akademie*.

OHMMETER (also known as a "Megger") an electrical instrument employed for measuring insulation-resistance or other high electrical resistances. The ohmmeter is described in INSTRUMENTS, ELECTRICAL: *Resistance Measuring Instruments* (q.v.).

OHNET, GEORGES (1848-1918), French novelist and man of letters, was born in Paris on April 3, 1848. After the war of 1870 he became editor of the *Pays* and the *Constitutionnel* in succession. In collaboration with the engineer and dramatist Louis Denayrouze (b. 1848) he produced the play *Regina Sarpi*, and in 1877 *Marthe*. He was an admirer of George Sand and bitterly opposed to the realistic modern novel. He began a series of novels, *Les batailles de la vie*. The series included *Serge Panine* (1881) which was crowned by the Academy; *Le Maître de forges* (1882), *La Grande Marnière* (1885), *Volonté* (1888), *Dernier amour* (1891). Many of his novels have been dramatized with great success, *Le Maître de forges*, produced at the Gymnase in 1883, holding the stage for a year. He published in 1908 *La route rouge*, and in 1912 *La serre de l'aigle*. His last work was *Journal d'un bourgeois de Paris pendant la guerre de 1914* (1914-18).

OIL, MINERAL: see PETROLEUM.

OIL, PALM: see PALM OIL.

OIL, SHALE: see SHALE OIL.

OIL-BIRD or **GUACHARO** (*Steatornis caripensis*), the sole member of a family, *Steatornithidae*. As big as a crow, its plumage exhibits blended tints of chocolate-colour and grey, barred and pencilled with dark-brown or black, and spotted in places with white. The guacharo is nocturnal, slumbering by day in deep and dark caverns. Towards evening it arouses itself and, with croaking and clattering, which has been likened to that of casta-

nets, it approaches the exit of its retreat. In Trinidad the young are esteemed a great delicacy for the table.

OIL BUNKERING: see BUNKERING OF SHIPS.

OIL-CAKE, a feeding-stuff of great value, prepared from the residue resulting from the crushing of various oil-seeds. For details see FEEDING STUFFS; COTTON INDUSTRY; LINSEED; COCONUT OIL AND CAKE.

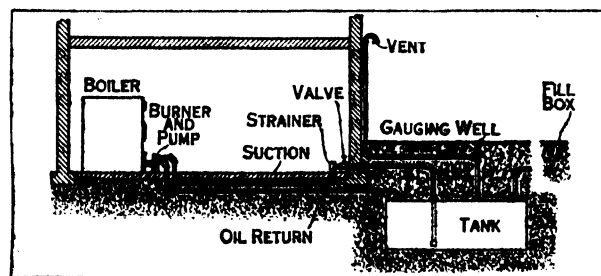

OIL CITY, a city of Venango county, Pennsylvania, U.S.A., on the Allegheny river, at the mouth of Oil creek, 75 m. N. of Pittsburgh. It is served by the Erie, the New York Central and the Pennsylvania railways. A municipal airport of 65 ac. is under construction. Pop. (1920) 21,274 (88% native white); 1928 local estimate 25,000, with 30,000 more in the immediate suburbs. The city lies 1,000 ft. above sea-level, in a rolling and wooded country. The central part is almost encircled by a deep bend of the river, and is connected with the south, west, and east sides by several bridges. Oil City is the metropolis and market of the Pennsylvania oil region; has large oil refineries and machine shops; and manufactures steel drums, boilers, pumping machinery, oil-well supplies and various other commodities. The aggregate factory output in 1925 was valued at \$8,801,386. Natural gas is used for domestic and industrial purposes. The city has a commission form of government. Oil City was founded in 1860, following the drilling of the Drake well at Titusville (16 m. N.) on Aug. 27, 1859. It was incorporated as a borough in 1863, as a city in 1874. Between 1860 and 1870 there were 20 passenger and tow boats and 3,000 flatboats plying on the river, and 17,000,000 bbl. of oil were shipped to Pittsburgh. Trading in oil certificates led to the establishment of the Oil Exchange, which for many years set the price of oil for the world. On May 14 and 15, 1884, sales aggregated 29,000,000 and 27,000,000 bbl. respectively, and clearings for 1885 amounted to \$1,433,738,000.

OIL-ELECTRIC LOCOMOTIVES: see LOCOMOTIVES.

OIL ENGINE: see INTERNAL COMBUSTION ENGINE.

OIL FUEL: see FUEL.

OIL HEATING, DOMESTIC, that branch of the heating of dwellings and other buildings in which the fuel burned is a mineral oil, such as shale oil or one of the heavier and less expensive grades of petroleum (*q.v.*, see also PARAFFIN OIL). Oil has been used for fuel and for heating since the time of Moses; but the mechanical development of the oil burner dates from the middle

of the 19th century, and only since 1922, in the United States particularly, has it come into widespread use. "Oil heating" refers here only to the method of generating heat, without regard to the medium (steam, hot water or air) used to carry the heat throughout the building; "oil" refers here only to petroleum. Oil in its native state will burn, but not with maximum effect until it is atomized and mixed with air. The history of modern oil heating is the record of the search for simple and efficient methods of preparing heavy oils for complete combustion. In 1861 a mechanic named Werner, employed in one of the refineries of the Russian oil fields of the Caucasus, first suggested that what was then "refuse oil" be used as fuel; his burner, consisting of a series of griddles over which the oil trickled and burned was widely used though not patented until 1867. In 1862 two experimenters took out patents on an oil burner which solved the combustion problem by introducing the oil into the furnace in a gaseous state, the heavy oil first being heated and made to give off lighter oils.

In 1863 Brydges Adams introduced into America the first spray burner, and in 1866 Ayden brought out a burner using hot air to atomize the oil and Spakorsky one using super-heated steam. Spakorsky's method was later embodied in an oil burner by Thomas Urquhart, an American at that time in the employ of a Russian railway.

Public interest was attracted by the possibilities of oil burning with a very considerable increase in the oil production of Cali-

fornia and Texas about 1900. Small burners, suitable for heating forges, treating furnaces, drying ovens and melting furnaces were soon produced. Larger burners were designed for boilers producing steam for power and heat. In 1902 and 1903 the U.S. naval liquid fuel board conducted tests of all available burners to determine whether vessels of the U.S. navy should be equipped for oil burning. The report, completed in 1904, was so favourable that the newer vessels were immediately designed to burn oil fuel and many of the older ones were converted.

The first attempts at domestic oil burning were crude and, in the majority of cases, consisted primarily of a pipe from a tank dropping the oil on hot, refractory material in an open pan. These were followed by natural-draught vaporizing burners, which, however, did not provide the uniform combustion necessary for economical and reliable operation. A later development was the mechanical-draught automatic burner, the foundation of the modern, domestic oil heating industry. In 1919, following the World War, oil fuel began to enter the American home on a national scale. By 1928 close to 450,000 American homes and buildings had been equipped for oil heating. The rapid rise of the oil burner lies in its convenience; an oil fire can be built or banked by the turn of a switch. Through electrical control, all the processes of furnace tending have been made automatic.

Another advantage is that oil may be conveniently stored in congested business districts. The labour required for attending oil-fired boilers is considerably less than that where coal is used, even when this is handled by modern equipment.

Types of Burners.—There are numerous varieties of oil burners, but all may be included under two distinct types: the natural draught and the mechanical draught burners. In the first type, sometimes called a gravity burner, there are no moving parts and the force of the draught depends on the size and height of the chimney, and on the differences in temperature and density between the outside air and the flue gases in the chimney. For this reason it is affected by changes in the weather, wind currents above the chimney and similar factors controlling variations in draught intensity. The natural draught burner is usually limited to heating on a small scale and requires lighter oils for efficient operation. In the second type, the air for combustion is supplied by a fan or blower. When a fan is used, the entire amount of air for combustion is usually supplied under pressure. The mechanical draught burner, since its air supply is controlled for the most part by the fan or blower, is more efficient than the natural draught burner, and maintains uniformly efficient combustion under all conditions.

Burners are also classified by the means employed to prepare the fuel for combustion. The oil may be atomized or vaporized. In the latter type, oil is prepared for combustion by first being heated. The vapour is mixed with the air just before or during

the combustion process. Burners of this type are especially flexible, with low oil capacities, and moving mechanical parts can be eliminated. In the atomizing burner, high or low pressure air or steam, mechanical pressure or rotating parts break up the fuel into small particles which are quickly vaporized by the heat of combustion. In commercial installations, where oil fuel is used in the heating of factories, office buildings, schools, theatres, apartments, etc., atomizing burners are used almost to the exclusion of other types.

The modern oil burner is automatic. A room thermostat electrically controls the burner so that the heat of the house can be kept constant within two degrees on either side of the desired temperature. A boiler or furnace control prevents overheating of the boiler and, in the case of a steam boiler, prevents abnormal pressures being developed. A burner safety control establishes a time limit within which the oil must be ignited every time the burner is started up; if the oil is not ignited the burner mechanism is shut down. When ignition is electric, it is accomplished by means of a spark from a high-tension transformer or by a hot resistance coil. The spark type of ignition is more widely used. Some burners require a gas pilot. In general there is no particular advantage of one type of ignition over another. An oil burner can be installed in practically any hot water or steam boiler, or in any warm-air heater.

The oil used in automatic oil-heating equipment varies in accordance with needs of the individual burner. It may range from light, untreated kerosene to the straw-coloured distillate, to dark brown gas or Diesel oil. The American Oil Burner Association has adopted specifications covering such grades of oil fuel, the number and names of which are given in the following table together with their old designations and approximate A.P.I. (American Petroleum Institute) gravity range.

Specification Number	A.O.B.A. Designation Name	Gravity range	Old Designation Name
1	Furnace oil—light	40–36	Distillate
2	Furnace oil—medium	36–32	Gas oil
3	Furnace oil—heavy	32–28	Light fuel oil
4	Fuel oil—light	24–28	Medium fuel oil
5	Fuel oil—medium	24–18	Heavy fuel oil
6	Fuel oil—heavy	18–12	Very heavy fuel oil

Oils number 1, 2, 3 are most generally used in automatic burners. Oil number 4 can be used in some types of automatic burners, but its application is not general. Oils 5 and 6 because they require pre-heating are used primarily in large commercial and industrial installations.

The utility of a fuel oil for domestic heating depends also upon its flash point. The flash point of any oil is the lowest temperature at which the vapours on the surface of the oil will ignite and burn momentarily on application of a spark or flame. About 20° above the flash point is the fire point of the oil. This is the temperature at which the oil will ignite and burn continuously. It is desirable that this fire point should be sufficiently low so that the oil will ignite from a cold start without hesitation. A flash point as low as 100° or 110° is allowable, and an oil with a flash point above 170° should not be used with most burners because of the difficulty of initiating ignition.

OIL ISLANDS: see CHAGOS.

OILLETS, the architectural term for the arrow slits in the walls of mediaeval fortifications, but more strictly applied to the round hole or circle with which the openings terminate; also applied to the small circles in the tracery head of the windows of the Decorated and Perpendicular periods which were sometimes varied with trefoils and quatrefoils.

OIL PAINTING, TECHNIQUE OF. As the musician must be taught, and the subtlest of harmonies are subject to material limitations, so the art of the painter must be learned, and he, more perhaps than any other artist, is bound by severe material necessities. It is not intended here to give instruction in the art of painting or to express individual preferences. The object in view is rather, taking as a basis the various methods employed by the great masters, to give an account of the technical considerations which all painters are obliged to bear in mind.

One thing to be noted in a consideration of painting is that there is a wider divergence in the techniques employed than in that of any other art. We should not find this diversity so extensive if, instead of discussing the technique of oil painting, we were analysing the technical methods of the Primitives who painted with wax, yolk of egg, or in fresco. Whatever difference there may be in the appearance of a painting by Cimabue and one by Mantegna, it will be very much less than the difference between the work of two artists painting after the invention of oil painting.

It may not be necessary to recall that all the colours used in painting, whether they are of mineral or vegetable origin, finally appear in the form of more or less soft stones which are ground to a powder in order to be used. These coloured powders require some binding vehicle in order to bring them to a sufficient consistency. The vehicle may be wax, mortar, glue, glycerine or resin. The brothers Van Eyck are generally believed to have been the first to mix their colours with oil. From the numerous controversies to which their discovery has given rise, it would seem that the principal achievement of the brothers Van Eyck was that they perfected, for the purpose of painting easel pictures, the results of the much earlier practice which had been to use oil for the painting of large surfaces, and especially for the painting of boats. The effect of oil in rendering colours durable had been observed previously; pictures painted with yolk of egg had been covered with a coating of oil which was hardened by drying in the sun and which at once protected and intensified the colours.

Once, however, the practical method of grinding colours with oil had been discovered, a vast field of technical research opened up before painters, and they were naturally tempted to explore the new possibilities which were provided. It was this possibility of variety in technical methods which, in combination with the individual genius of the great masters, enabled the art of oil painting strictly so called to rise to such great heights at the time of the Renaissance.

The Support.—Oil paint will adhere to a number of materials, and during the ages painters have experimented in painting on a number of metal and mineral grounds. Slate, marble and alabaster have been used, but comparatively rarely owing to their fragility. Copper has also been utilised, though, of course, only for works of small size. Paper deserves special mention. Far from being an inferior material as might be supposed, paper is perhaps the most suitable ground for works of a spontaneous character. It was used by Flemish painters, who glued it to wood panels or canvases by means of casein. Later, in the 18th and early 19th centuries, a large number of French painters used this process, which was of great value in setting off their brilliant execution. No other material gives such transparency to browns or so much depth to blacks.

Practical considerations have, however, led most painters to prefer two supporting materials: first, wood, and second, canvas. Up to the end of the Renaissance period wood was generally employed; but it would be an error to suppose that the change to canvas was a sudden one. There are a number of examples of wood panels upon which a fine canvas has been glued. Besides, although the use of canvas became very frequent after the Renaissance, it cannot be said to have been universal, since at all periods in the history of painting, including the present, many artists have painted on wood. In Italy the white poplar was generally used; in Flanders they used oak. To-day mahogany, which does not crack so easily as oak, is often used.

Canvas appears to be the most suitable material for pictures of a large size. There are, however, exceptions, even among painters.

who habitually used canvas for their large works. Thus Rubens' *Magi* in the Antwerp Museum, one of the largest as well as one of the most admired compositions of that master, is executed on an enormous wooden panel formed by several transverse sections. Rubens' choice of a panel in this case and in others is not a mere chance. It may be laid down as an axiom that everything counts in the execution of a picture, and the support is not the least important factor in the final appearance of the work. It is an even more important factor in its preservation. Too much stress cannot, therefore, be laid on the importance of seeing that the support of the painting is of the best quality.

The history of painting shows so many examples of fine works which have perished that we must take every possible precaution to prevent damage to those which may be painted in the future. If wood is used, it must be carefully seasoned, thoroughly dry and cut radially, as otherwise it will be affected by changes of temperature and the picture will warp or split. If canvas is chosen, it should be of hemp, or better still of pure, unbleached flax fibre, without any admixture of cotton; this will prevent its being too liable to suffer from changes of temperature. It will easily be understood that if the tissue is constantly expanding and contracting the priming or the paint itself will be likely to scale off.

Preparation of the Support.—There is, however, another important matter to consider; the wood or canvas may be treated with a priming or used without. The latter method, which is the simplest, may be dealt with first without regard to chronology; for though it was occasionally used by old masters, such as Rembrandt and Van Goyen, it is in the main a modern practice. Many present-day painters prefer to dispense with priming, and this often gives good results, especially in painting on wood. If canvas is used the method has certain disadvantages, for contact with the oil renders the canvas brittle, and it thus loses the flexibility which is one of its principal merits.

Canvas, therefore, needs to be covered with priming before it is used, and the priming is, of course, an important factor. It has been the subject of extensive research from the time when it was first used. The basis of all priming is either size or casein mixed with plaster or carbonate of lime, or else a thin coating of white lead over a coating of size. These simple elements can be combined in a great variety of ways. Experiments with different kinds of priming have been tried at all periods of the history of painting. The Primitives used plaster and carbonate of lime for tempera painting, and this practice was continued long after the invention of oil painting. It was principally in the 17th century that it became customary to use white lead, more or less strongly tinted with grey, red or brown. A transitional method, which the present writer regards as excellent, was to cover the canvas with a thin coat of carbonate of lime, and then to complete the priming with white lead. Later, painters contented themselves with sizing the canvas and then covering it with one or two thin coatings of white lead. This process has become almost universal at the present day, but some painters are tending to return to plaster priming. It should never be forgotten that the principal quality which should be possessed by the priming of canvases is flexibility. Consequently the first coating of size which is placed over the canvas in order to fill up the interstices in the fabric must not be too thick, and if subsequent coats of carbonate of lime or white lead, or both of those materials in succession, are put on, they also should be very thinly applied. If the canvas is to dry well, it is better to apply several thin coats of priming than one thick one. It is extremely important to make sure that the canvas has dried properly. This is not always done with sufficient care before a picture is begun, and yet nothing is more dangerous than to use a canvas which has not dried properly. The dark colours will inevitably crack sooner or later. Industrially prepared canvases are often prepared without paying pre-consideration to the artist's requirements and so expose the paintings to accidents of this kind. This can be proved by a very simple experiment; take a piece of wood or canvas, and cover it with a coat of white lead; then, instead of waiting several months, as would be necessary if a picture were to be painted, paint on it patches of brown, madder lake, ultramarine and emerald green. These colours will rapidly

crack; the first cracks will be noticeable on the emerald green after a few days only.

Colours and Their Preparation.—Colours, in the state in which they reached the painter when he prepared them himself, and in the state in which they now reach the manufacturer, are in the form of blocks, either crystalline or powdery, but generally of the consistency of soft chalk. Their quality undoubtedly depends above all on the purity of the raw materials used. The chemist isolates the colouring matter from the crude materials which he receives. In some cases the material is earth, as in the case of ochres; the earth is in its natural state in the case of yellow and red ochre, and it can be calcined so as to obtain other colours such as burnt sienna. Other colours are obtained from elementary materials; thus different kinds of black are produced from lamp black, bone charcoal and charcoal obtained from vine stocks. Ultramarine is also a natural stone—*lapis lazuli*. But unlike the coloured earths, which are abundant, natural ultramarine is so rare that it is scarcely used. By means of laboratory research a fairly stable blue resembling natural ultramarine has been obtained from sodium sulphide and silicate of aluminium.

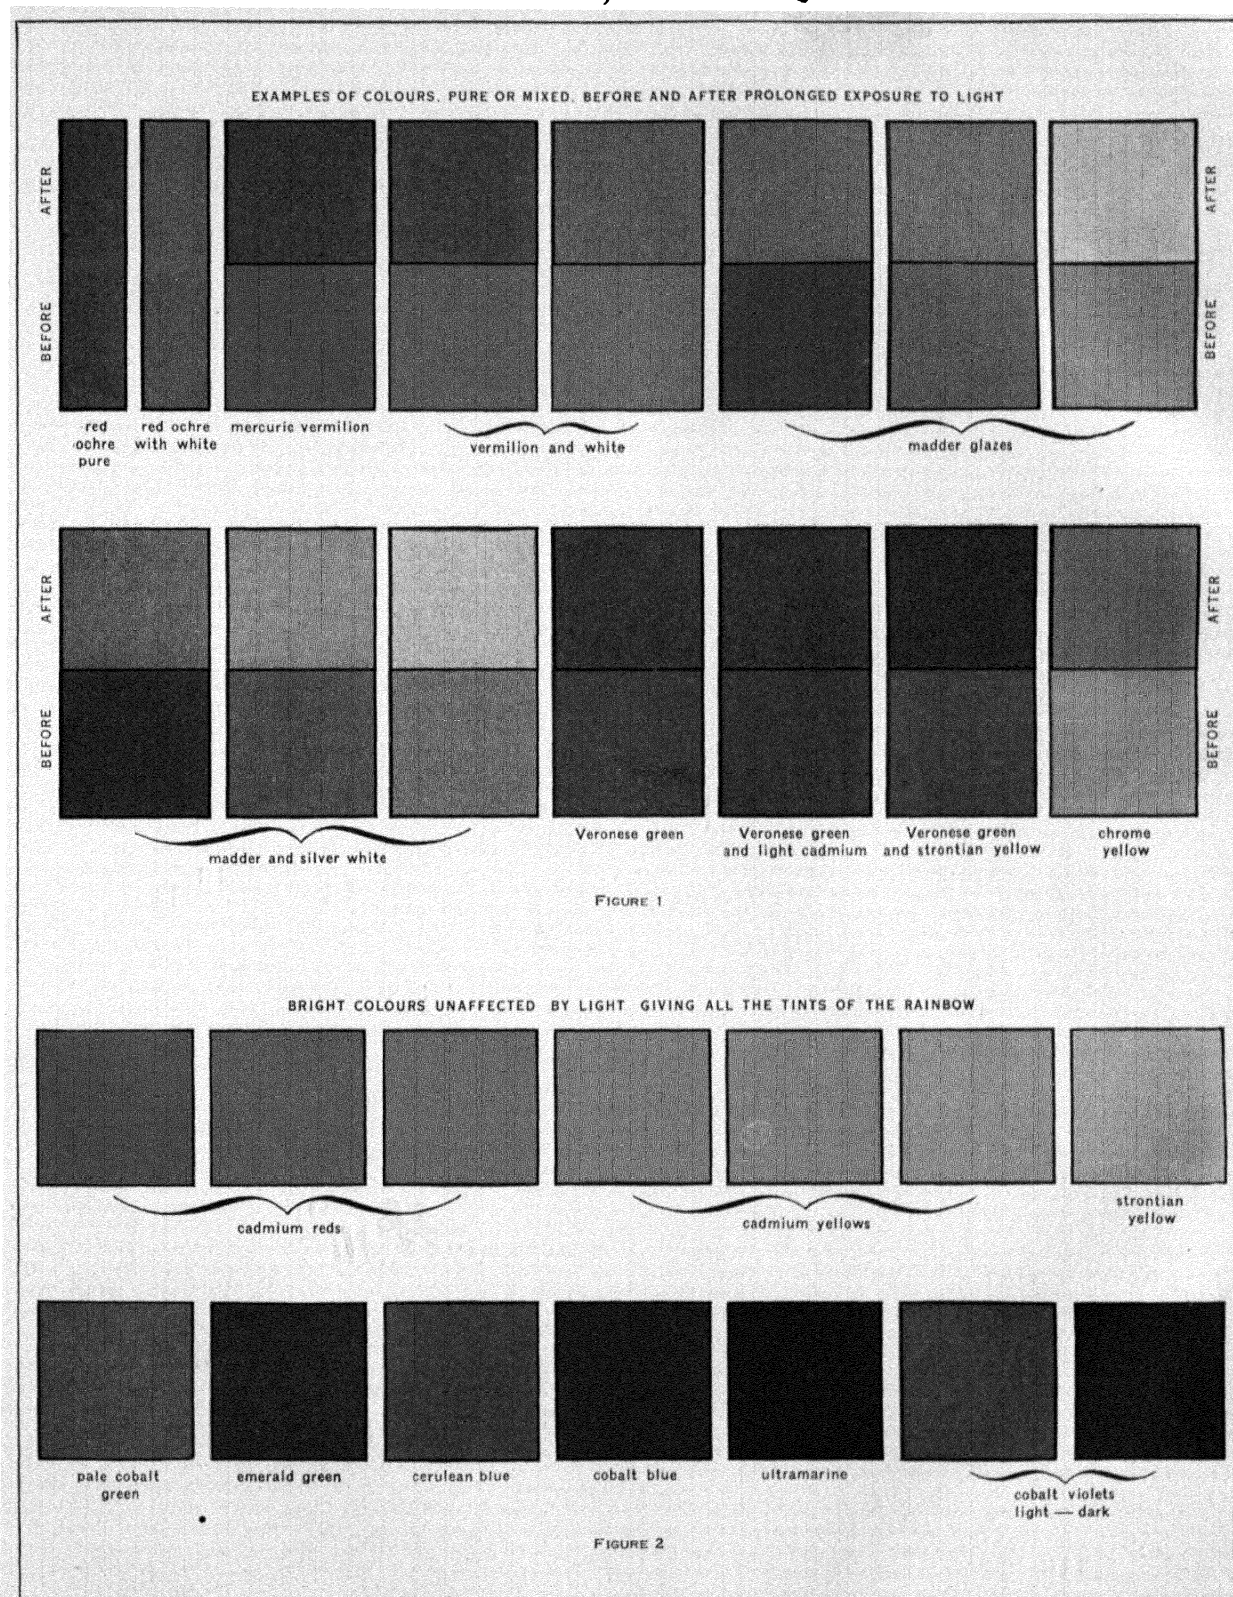

It would be desirable if painters could use only colours extracted from simple sources such as earths. A colourist can do a great deal merely with yellow ochre, red ochre and black. These materials are little subject to alteration. Even the most skilful artist, however, cannot go far without the use of white; and this is the first stumbling block. The white which is known as flake white (in French, *blanc d'argent*) is a carbonate of lead, or in other words a purified form of white lead. It turns black in the course of time. The least that can happen is that it will turn yellow. Zinc white has not this disadvantage, but it cracks, does not spread easily and dries slowly. Moreover, even if the problem of the stability of white were solved, there would remain that of other colours which are absolutely necessary to the painter, such as bright yellow, whether strontian or cadmium, red, such as vermilion or even madder lake, blue, green and brown. These colours are the product of chemical combination and are only relatively stable. Some turn black, others absorb the colours mixed with them, while others become opaque.

However, not all of the hundreds of colours at the painter's disposal are equally bad. In order to choose the lesser of two evils, the painter should only add to the tones obtained from earths the indispensable minimum of other less durable colours.

Prussian blue, which was discovered in 1710 and was used to excess in the early 19th century, is today almost abandoned. Unless it is laid on as a light glaze, or supported by a considerable admixture of white, it tends to turn black and to absorb the colours mixed with it. A green composed of Prussian blue and a yellow (especially if this is not one of the earth yellows) gradually turns blue; similarly a violet into which Prussian blue enters gradually loses its red elements. Cobalt blue has the serious defect of appearing violet by artificial light.

It is possible to make a verbal distinction and to say that Rubens and Rembrandt did not use bitumen; they used a bituminous colour, and so did all the Dutch and Flemish painters; indeed all painters of whatever school have used a transparent brown resembling bitumen and fulfilling the same function; but it was recognised that the use of this colour was subject to certain strict technical conditions. At the end of the 18th century an attempt was made to recover the exact tone of bitumen which was believed to be that used by Rembrandt; it was believed to be very durable, and most of the painters of the day made abundant use of it. The terrible consequences are well known at the present time. The worst of it is that the damage due to bitumen, which never dries, combined with varnish which dries rapidly, may not become apparent until after many years.

The industrialisation of the manufacture of colours thus gives rise to a number of problems and technical points with which modern painters are unacquainted. They ought themselves to try experiments on the power of resistance of colours by exposing them to sunlight, and to fumes containing sulphur, sulphuretted hydrogen and ammonia; and in addition it would be in their interest to simplify their palette. Experience has shown, for

REPRODUCED BY FOUR-COLOUR PROCESS AFTER A LITHOGRAPHED PLATE IN 26 COLOURS IN "THE TECHNIQUE OF PAINTING" BY CHARLES MOREAU VAUTHIER, BY COURTESY OF HATCHETTE AND G. P. PUTNAM'S SONS. THERE HAS BEEN A SLIGHT, BUT NEGLIGIBLE, LOSS OF QUALITY IN THE COLOURS OF THE ORIGINAL BECAUSE OF THE DIFFERENT METHOD OF REPRODUCTION

CHART ILLUSTRATING THE INFLUENCE OF LIGHT ON COLOURS

1. Red ochre, a dull but permanent colour, is redder after exposure to light than the brilliant mercuric vermilion. 2. Formerly only a single colour of the rainbow, lapis lazuli (blue), was absolutely permanent. At the present day all are so except madder (red), which is not represented in this table

example, that Naples yellow becomes dull and greenish; that umber darkens and rapidly alters the colours mixed with it; that cadmiums lose their brightness in time; that ultramarine becomes opaque; that bitumen should only be used as a light glaze; and that colours which may be highly recommended must pass the test of time, and cannot be used with certainty until they have done so. It is only possible to calculate their palettes by making a close study of the old masters' pictures in a good light. It is possible to train oneself in a study of this kind by beginning with modern pictures. If the painting of a picture is closely examined, it is almost always possible to discern, in a single brush stroke, particles of the pure colours of which it is composed. If a study of several pictures by the same painter gives the same results, they may be taken as accurate.

A simple example may be found in the works of Pissarro; in all his pictures painted between 1878 and 1885 approximately, a mixture of Veronese green and ultramarine can clearly be distinguished. The use of these two colours during the period in question is thus established. This example has been selected because Pissarro obtains highly characteristic effects by this means. The remainder of his palette could easily be ascertained by continuing the analysis. Although, however, analysis may be simple in the case of the Impressionist school, it becomes more difficult as we go further back in the history of painting. The present writer frankly confesses that he cannot himself read the palette of all painters from their works. It is, however, possible to derive one general conclusion from a close study of the works of the great masters: that it is not necessarily the number of colours used which makes the colourist.

The grinding of the colours is a long and somewhat difficult business. It consists in pounding the powder, moistened with oil, until the grains are so fine as to be imperceptible. (*See COLOUR MILLS.*) This is done with a heavy muller, the under surface of which is as smooth as the slab of granite, on which the colours are ground. From time to time the grinder adds a few drops of oil. He has to continue kneading the paste until it is of the requisite fineness and consistency. It should be noted that a colour which reaches different grinders in the same state of chemical purity may not be of equal quality when it leaves their hands; the cleanliness with which the operation is carried out and the quality of the oil used affect the final result. The manufacture of colours is not a simple operation. Great practice is for example necessary to bring cobalt blue to the right consistency. Oil alone will not bind the paste sufficiently, and wax has to be added. The kind of oil used has its importance; olive oil, which was formerly much used in Italy because of its abundance, has now been given up because it dries slowly. Linseed oil on the other hand dries rapidly; copal oil is much esteemed by certain manufacturers; but poppy oil, which is light and colourless, is by far the most frequently used.

The painter should be able to use the paints in the form in which they reach him. He may use a siccativ to make them dry more rapidly, but he should remember that this is an evil, even if a necessary one. He may use the colours in a thick paste, or slightly diluted, or as a thin wash; they are diluted with a quantity of oil, or turpentine, or a mixture of the two. It may be explained that the thin wash or glaze is composed of a transparent colour for choice, very much diluted, and its purpose is to heighten the value or activity of a tone which has already been laid on and has dried. Delicate effects and fine harmonies may be obtained in this way. The colours which are in practice used for this purpose are as a rule transparent yellows (Indian yellow, yellow lake, raw sienna and sometimes dark cadmium), nearly all the reds, but principally the lakes, black, nearly all the browns, and particularly bitumen. Although they have immense advantages, glazes have the defect of being liable to damage by the hand of time. They are slow in drying, and there is a risk that they may become incorporated in the varnish if the latter is applied too soon; and it must be admitted as an axiom that a picture will sooner or later have to be devarnished, and the painting itself should not be liable to injury when this happens.

A great number of prepared colours are now available; and

while it is not necessary to give a list of them, it may be of use to mention a small number of specially durable colours with which a great variety of effects may be obtained. These are: flake white, golden ochre, strontian yellow, deep cadmium yellow, Venetian red, burnt sienna, cadmium red or vermillion, dark madder lake, ultramarine, cobalt blue, emerald green and ivory black or blue black.

This palette is only given as an example, since it would be arbitrary and useless to attempt to establish a uniform palette suitable to all temperaments. Some colours, too, may in themselves be injurious, and should be avoided as far as possible, but nevertheless may assist in creating the effect which is desired if they are used in the right place and with the necessary skill. For the nature of the colour itself is not the only factor; the manner in which it is used matters perhaps even more.

Brushes.—There are two kinds in general use, very different from one another; those made of sable hairs and those made of hogs' bristles. The latter are the most generally used. They consist of a metal collar which is generally flattened and keeps flat the bundle of bristles which form the brush itself. (*See BRUSH: in Art.*) The change from the round brushes, which were used until the 19th century, to flat brushes is due to the almost universal desire of the modern school to paint in separate touches with a full brush. The shape of the brush undoubtedly affects the nature of the stroke; but though it is difficult to describe the subtle difference made by the use of a round or a flat brush, because everything depends on the hand which uses it, it is easy to distinguish between passages executed with a sable brush and those executed with a hogs' bristle brush. The sable brush is better where precision of detail is required. The touch can be impasted and yet smooth, where bristle would not follow the exact intention of the painter with the same docility. Sable brushes are best for painting small pictures on panels, and for compositions where emphasis on detail gives the work part of its character. On the other hand it would be difficult to paint a life-size portrait or a large landscape with sable. The softness of the hairs would make it difficult to deal with a considerable quantity of paint, and the touch would be greasy and soft while a firm hogs' bristle brush would enable the painter to lay on a broad and vigorous surface.

Painters have at all times used their fingers and this use of the finger as a sort of flesh-and-blood trowel gave Courbet the idea of using the palette knife as a partial substitute for the brush. By using a flexible steel knife it is possible to obtain a vigorous touch and great variety of technique. It would of course be impossible to do any delicate drawing with the palette knife, but no instrument can be compared with it for preserving the purity of tones which often leave the palette fresh but are impaired by the time they reach the canvas. The palette knife can be wiped clean with a rag after each stroke; it represents an absolutely clean means of transferring the paint from the palette to the canvas, while only too often the brush is insufficiently cleaned and contains traces of all sorts of other colours. This does not however mean that the palette knife can take the place of the brush. The knife can only be used for certain restricted purposes, and for general use nothing can replace the brush. But everyone knows how important cleanliness is in the composition of colours, and it is only too often forgotten that the palette, the vessel which contains the vehicle, and the brushes, need careful attention because they are the last recipients of the colours, and colours cannot be beautiful unless they are skilfully used.

DEVELOPMENT OF THE ACTUAL PAINTING

We often hear it said that a picture has darkened or turned yellow. We are not here referring to the changes to which the varnish is subject, since although varnish gives the colours their maximum intensity, it does not form an integral part of the picture and will be dealt with only at the end of the article. What we now have to consider is the development of the paint which actually constitutes the picture.

Preparation of the Groundwork.—It has already been said that artists should give the utmost personal attention to the prep-

aration of their canvases. Upon the preparation of the ground-work the final aspect of the finished picture may depend. The old masters varied the priming of their panels or canvases according to the nature of the picture which they intended to paint. Rubens used a ground-work which was sometimes grey, sometimes tinted with ochre, sometimes greenish, and sometimes plain white as in the "Miraculous draught of fishes." Poussin used a grey ground-work for his "Autumn," and Boucher a pink-tinted one for his "Three Graces."

There is no doubt that the ground-work affects the painting which is superimposed on it. Let us suppose that two replicas of the same picture are painted, one on a yellow and one on a red canvas. After a few years the two pictures will be seen to differ from one another, and their general colour harmony will change, becoming nearer to that of the ground-work. A painter can thus, to a limited extent, plan in advance the future development of his picture, and should not neglect a factor which may add to its beauty later.

The desire to obtain rich colour harmonies must however always be subordinated to the numerous and complex exigencies of paint. Many pictures painted on light grounds have preserved an astonishing freshness down to the present day, while others painted on red, brown and even black grounds have suffered; indeed such paintings have generally worn badly, even if they were painted by Tintoretto, Poussin or Courbet.

The red grounds which so many painters have found attractive certainly make it easy to obtain a vibrant and transparent tone. But such a ground is of no value unless the paint itself is very lightly applied over it. And although the results may be satisfactory at first and may remain so for a number of years, the thin layer of paint which covers the coloured ground nevertheless gradually tends to disappear, and the tone of the ground begins to prevail over the others, thus putting out the colour harmony of the picture and destroying the balance of values; for, as will readily be supposed, the only parts which resist will be the high lights, which are generally painted in strong colours and which last all the better because they have probably been applied with fairly vigorous impasto in order to hide more completely the dark ground on which they were painted.

From the last observations we may at once draw a general conclusion which is of the greatest consequence to the painter: it must never be thought that the colours of a picture can be neutralized by the final layers of paint which are applied over them. A proof of this may be found in the curious phenomena connected with what are known in France as *repentirs*. These are corrections of a part of a picture which has already been painted, made before the whole picture is complete. If for example, at one of the sittings for a portrait, the artist sees that the arm or leg of his subject would produce a more characteristic effect if its position were changed, he may merely repaint the arm or leg without scraping off the original paint. Or again, accessories which prove inconvenient in the composition of a picture may be covered over with a few strokes of the brush. It often happens that after a longer or a shorter period the original detail begins to show through, and sometimes becomes quite clearly visible. This can be seen in Velasquez' portrait of Philip IV. in the Prado, in Ingres' "Jesus among the doctors" at Montauban, and in Bonington's "View of Venice" and Gros' "Portrait of the Comte Fournier-Sarlovèze" in the Louvre, to mention a few examples chosen haphazard from hundreds of others equally striking.

Development of Colours.—It is difficult to praise too highly the fertility of invention in colour harmonies and the bold experiments in technique which are due to the painters of the present generation. Only too often, however, these inventions contain an element of risk, and only too often, quite apart from the quality of the work, technical considerations are sacrificed. The creation of a picture makes great demands on the intellect, and in its execution, strict discipline must be observed; otherwise the paint in time takes its revenge.

Some painters, having carefully studied portraits by Titian and important pieces of painting by Tintoretto, in which those masters obtained astonishing effects simply by the use of four durable

colours, white, black, yellow ochre and red ochre, have tried to reduce their palette to that basis, adding the minimum of additional colours when necessary. Some very good work has certainly been done by this method in the last few years. At the same time there are a number of pictures painted in this way which are heavy even when freshly painted, and which soon afterwards become painfully opaque. And yet, even leaving aside the Italian Renaissance, even leaving aside Velasquez, it is easy to show what variety can be obtained with this sober palette. It is only necessary to look at what has been done by men such as Manet, Corot in some of his figure subjects, Whistler, and Cézanne in his first manner.

There is however one often tested axiom which will give us one of the keys of the enigma: When the same colour, with the same value, is applied twice in the same place, the second application becomes opaque. It is owing to skilful organisation of their work that painters are able to include other colours in their palette besides the ochres, which, incomparably valuable as they are, have their limitations. For it has been proved that the best colours, if not cleanly applied, may lose their qualities, while others, which are not usually used, may be so employed that they will stand the test of time. No more typical example could be found than that of Veronese green. Too many painters use this colour in all circumstances, for it is very attractive owing to the variety of tones which can be derived from it. Unfortunately the effects which it gives do not last, and the subtlest harmonies, the most delicate greys, turn to a muddy and leaden black. Yet Gauguin constantly uses Veronese green without ill results. It should however be noted that Gauguin only employs this dangerous colour either pure or mixed with strontian yellow. Another example is that of vermilion, which loses its freshness and intensity in a few days unless it is applied boldly and without retouching.

Colours have characteristics of their own and however gifted an artist may be, he cannot dispense with patient observation of the difficult technical side of his art. In this respect, the best example in modern times is set by the Impressionists. If we take their best period, arbitrarily selecting 1890 as the final date, we shall find that their palette does not by any means consist of the most stable colours. The cadmiums and the madders play a much greater part than the earth colours, which the Impressionists did not use very frequently; but what admirable technical knowledge was shown by these painters, who were so long criticised for their revolutionary ideas! In their pictures we may note a light and luminous outline; the spots of colour are interlaced, but yet remain distinct. The colour effects are produced rather by the juxtaposition than by the mingling of tones, and it is left to the hand of time to blend and harmonise colours whose original bloom has been respected.

III. Technique of Execution.—A painter cannot with impunity retouch his picture whenever he feels inclined; a fact which only too many fail to realise, much to their detriment. The coloured paste which is transferred from the palette to the canvas is a fragile and capricious substance. To paint as inspiration and fancy dictate is not to paint soundly, especially if the work undertaken is on a large scale. Pictures completed at a sitting give the best account of the painter's talent. Everyone knows that studies for pictures are nearly always more brilliant than the completed work. A good example may be provided by a comparison between the female torso by Delacroix in the Musée d'Angers and the same passage as it appears in the "Sardanapalus" in the Louvre.

What can be done with a small picture, however, becomes much more difficult when it is desired to paint on a larger scale. Some masters have, nevertheless, in certain cases been able to paint large canvases without going back over what they had once begun; examples are Tintoretto's "End of the World" in the Madonna dell'Orto at Venice, and Franz Hals' "Banquet of the officers of the corps of archers at Saint-Georges," at Haarlem. By this means they attained an extraordinary vitality of colouring, and their works defy the passage of time. Spontaneous execution of this kind is, however, necessarily limited to certain effects; it is, for example, impossible to arrive all at once at all the pro-

VARIETY OF TECHNIQUE IN COLOUR AND LIGHT

1. Miracle of St. Mark (1548), by Tintoretto (Jacopo Robusti, 1518–94), Venetian School (The Academy, Venice). This artist was one of the first to project vast canvases in oil. He covered gigantic surfaces with rich oil colour, where fresco (on the fresh plaster) had been previously used as a medium.
2. Landscape, by Nicolas Poussin (1594–1665), French. (The Prado, Madrid). Poussin used a canvas with a brown priming. His paintings have suffered accordingly and his landscapes are badly faded.
3. The Bay of Baiae, with Apollo and the Sibyl, by J. M. W. Turner (1775–1851), English. Turner was fascinated with light, and uses colour with fluidity and brilliance. He greatly influenced the Impressionists.
4. Adoration of the Magi, by Peter-Paul Rubens (1577–1640), Flemish. (Musée Royale des Beaux-Arts, Antwerp). This unparalleled achievement from the technical point of view is one of the largest and most admired of the master's compositions. It is executed on a large wooden panel, made up of several sections, directly over a ground-sketched in brown. Signs of the removal by the restorer of the vermillion and the old varnish appear below, right.
5. Two Gentlemen, portrait of George Huddesford and of Codrington Warwick Bramfylde, by Sir Joshua Reynolds (1723–92), English. Reynolds worked with very long brushes, being thus enabled to see the effect of his work from some distance while laying on the colour. He often blocked in his pictures in *impasto* or *grisaille*, then coloured it and carried it further with glazes. His paintings evaporated, turned yellow, cracked, and perished even during his life time.

VARIETY IN TECHNIQUE OF EXECUTION

1. "The letter" (*Le billet-doux*) by Jean-Honoré Fragonard (1732–1806), French. This illustrates dexterity of handling. Fragonard was one of the most brilliant sketchers ever known, equally notable for the virtuosity of his facile swift brushwork and for his pure, delicate colouring. He was a master of the sketch as a thing complete in itself.
2. "Young woman with a jug" by Jan Vermeer of Delft (1632–75), Dutch. A great colourist, famous for his light effects, Vermeer achieved his smooth even handling with a round soft brush.
3. "The Isle of Shoals" by Childe Hassam (1859–), American. Childe Hassam, as an Impressionist and a follower of Monet, frequently paints in the *pointilliste* method, with separate points or touches of pure colour, applied in conformity with the configuration of the surface to get the modelling. The whole scene vibrates with light.
4. "Cannon Rock" by Winslow Homer (1836–1910), American. This painting of the Maine Coast series, sometimes called Homer's "Ocean Symphony," illustrates the artist's technical command of palette-knife and brush in the use of thick and thin paint.

FAULTS AND DEFECTS OF PAINTINGS—ENLARGED VIEWS SHOWING DETAILS OF TECHNIQUE

1. Head of a Girl, by Jan Vermeer of Delft (1632–75), Dutch. In the Royal Picture Gallery at The Hague. The cracks are caused by painting over a smooth priming. 2. Portrait of M. Leblanc, by Jean Auguste Dominique Ingres (1780–1867), French. The cracks due to bitumen are clearly visible. 3. The Harvesters, by Pieter Bruegel the Elder (1525–69), Flemish. Underpainting showing through an overpainted correction is

known as a *penimento*. Here the underpainting shows through, owing to the fact that the colours have become transparent from age. The tree trunk shows through the hat. 4. Portrait of Philip IV., by Diego Velasquez (1599–1660), Spanish. In this famous portrait the original detail is beginning to show through and is clearly visible in places. In the Prado, Madrid

VARIETY OF TECHNIQUE IN EXECUTION AND COLOUR

1. "A Woman Bathing," by Rembrandt van Rijn (1606-1669), Dutch. Rembrandt used glazes to add to the richness and luminous depth of the picture. 2. "The Three Graces," by François Boucher (1703-1770), French. Boucher here used a pink-tinted ground-work. 3. "The Judgment of Paris," by Peter Paul Rubens (1577-1640), Flemish. Rubens used

glazes freely to add to the brilliance and charm of his colour. 4. "The Sleep of Antiope," by Correggio (1494-1534), Italian. In the Louvre. The glazes and half-tones have largely disappeared because of poor restoration in the 18th century. 5. "Portrait of Mme. Récamier" (unfinished), by Jacques Louis David (1748-1825), French. In the Louvre

fundities of technique and observation which go to make up a Rembrandt; in such cases sketches must be made first.

Several methods of preparation have been and still are adopted. In order to retain as far as possible the impression of a picture executed without repainting, some masters have first sketched in their picture with a thin wash of a single colour, very much diluted. They thus mass in the lights and shadows and lay down the main lines of their subject, after which they attempt the final painting. This system was used for a great many 18th-century pictures in which the colours work in admirably with the original sketch executed in a reddish brown wash. An example is Fragonard's "Music Lesson," which has all the spontaneity of a rapid sketch.

Even before the 18th century Rubens, whose genius delighted in the overcoming of difficulties, was naturally attracted by this method. Not content with studies or simple compositions, he painted his "Kermesse" in the Louvre and his great "Adoration of the Magi" in Antwerp directly over a ground-sketch in brown. The latter work is an unparalleled *tour de force* from the technical point of view. But not all artists are Rubens, and a painter who does not possess his incomparable technical mastery cannot execute large-scale canvases by this method. There is, moreover, a danger; however vigorously the picture is painted, the colour in which the preliminary sketch is executed gradually tends to prevail in the general harmony. The result of this is indeed sometimes admirable; the "Portrait of Helène Fourment and her children" in the Louvre owes to its warm-tinted ground sketch a golden tone which is independent of the thick coat of varnish which has been applied.

Thus this attractive, but difficult and sometimes dangerous method, can only be used for limited purposes. It is more usual for painters to make use of all the materials at their disposal for sketching in their pictures; they use all the colours of their palette for the first groundwork, which matters so much to the success of the picture and still more to how it will develop in the future, and they gradually work up to the desired colour harmony. Great masters, such as Raphael, Chardin and Delacroix, have painted in this way. But they have never lost sight of the discipline which must be observed if a painting is to keep its pristine qualities. Like the sound technicians that they were, they did not forget the twofold danger which has to be avoided in the painting of a picture: overdone brushwork and muddy overlaid colour. A canvas painted without method is doomed to perish. If a sketch is painted over while it is only half dry, the paint will become muddy and dead; if solid colours, such as ochres, are applied over fragile groundwork painted with madders, or if a dark tone is put in over a light ground which is still fresh, cracking will result. What most often happens, however, is that one part of the canvas is painted over again to correct it without sufficient care; then all the dark parts become opaque black, while the lights lose their brilliance.

In order to avoid these dangers and to ensure good and solid quality in their paint, many painters work according to a system of division of labour. They use *grisaille* in the form of an undiluted paste for the preparation of their works, following a method first used by Italian Renaissance artists. Their pictures are sketched in with two colours, white and black or white and brown, as in a chalk and charcoal drawing. The painter can then, without any danger of working over the colour too much, work on a particular passage or modify the composition until the balance of the whole is satisfactory. The colour can then be put in on this solid foundation of *grisaille*; the final painting should be executed as rapidly as possible. This method has been used by Titian in his nudes and most of his portraits, El Greco and Rubens in many of their great works, Watteau in his "Gilles," Prud'hon in nearly all his pictures, and nearer to our own time Ricard and Gustave Moreau. Some painters go so far as to obtain their final harmony simply with glazes and a few touches of *impasto* over a monochrome ground; a typical example of this method carried to an extreme is to be found in Reynolds' "Portrait of Master Hare" in the Louvre. It will be observed that with this method the paint never becomes heavy, the colour may in some cases

fade if it is put on too lightly, but no method of work does more to protect the delicate effects of a colourist or to preserve the unity of execution.

The Varnish.—The part played by varnish is twofold. In the first place it protects the picture from impurities in the air. In the second place it restores freshness to the picture when this has been lost, for as it dries, the oil which enters into the composition of the colours penetrates to the lower layers, as well as evaporates, leaving the colours dimmed. Varnish restores them to their original vigour, and it has the property of remaining transparent when it hardens. The theoretical value of varnish is thus simple and obvious. Its application is, however, often criticised. When painters leave the varnishing of their pictures to their colour dealers, and it is curious to note how many of them do, the dealer frequently puts on the varnish too thickly and irregularly. Pictures varnished in this way are painfully shiny, and as many modern painters give as much emphasis to their dark tones as to their high lights, it often happens that all the intersections of the dark strokes shine to such an extent that the picture cannot be properly seen. The first results of bad varnishing soon show themselves in the form of large stains on the picture corresponding to the irregularities in the application of the varnish.

Not only is varnishing sometimes badly done, but it is done too soon and at the wrong moment. Since varnish solidifies very quickly, it is quite obvious that it should not be applied until a painting is perfectly dry. This will prevent it from softening the paint even to the slightest extent, and thus causing it to crack by drying differently. Care should also be taken never to varnish a picture while it has dust on it; otherwise impurities will remain between the paint and the varnish and will in time spoil the picture. The coat of varnish should be extremely thin and applied firmly and regularly, since it loses its qualities and dries cloudy if it is put on thickly. Varnishing should not be done on a wet day, or moisture will be imprisoned between the varnish and the canvas. If this precaution is neglected, there will be a bluish film over the picture.

One of the most frequent stumbling-blocks for the painter is the result known as "matt" effect. The dulling of the paint, which has already been mentioned as one of the reasons for which varnish has to be used, may be produced while the picture is being painted, and will be especially marked if the first sketch is painted over before it is properly dry. The oil of the second coat may be absorbed so rapidly that the last touches which are put on appear to be of a dull grey nothing like the real colour. The "matt" effect at once disappears if any liquid is passed over the picture; but it often causes worse damage in the end, for the repeated imprisonment of moisture between the various layers of paint constituted by retouching will slowly but surely destroy the picture.

Siccatives, heavy oils and mixtures of all kinds are really responsible for much of the damage which is attributed to varnish. It is a matter of common knowledge that Delacroix was not always as strong on the technical side as he was lofty in his conceptions. It is difficult to say which did most to destroy his paintings—the curious mixtures of liquids which he used, or the disastrous qualities of the materials which entered into the composition of the colours with which he habitually painted. We can obtain some idea of the splendour which his works ought to have retained by looking at those canvases which he executed simply, such as the "Algerian Women," "The Artist's Studio" and the "Still Life" in the Moreau-Nélaton collection in Paris. And very often that delicate artist Prud'hon made excessive use of heavy oil and bitumen, which caused immense cracks to form in his pictures, as for example in his "Christ" in the Louvre.

How then, it will be asked, is it possible to correct a passage which is seen in the course of painting a picture to be unsatisfactory? And once the picture is painted, how can it be made fit for exhibition if it cannot yet be varnished without danger, and if the colours have a "matt" effect.

There are on the market a number of varnishes known as retouching varnishes, the merits or demerits of which cannot be discussed here. It may, however, be said that the lighter and more transparent the liquid to be applied over the piece which it

is desired to repaint, the less danger there is that it will impair its freshness in time to come.

When the painting is completed, the general effect can be clearly seen if it is washed over with a mixture of white of egg, water and sugar. This preparatory varnish does not affect the colours in any way, and it can be sponged off with water when the time comes, about a year later, to apply the final coat of varnish which it has by this means been possible to defer.

Some have thought that varnish can be replaced by glass, and many have followed the example of the British picture galleries by glazing oil paintings. Glass is an effective protection against damp, especially if the back of the picture is felted. This is the reason why it is used in London, where the air is very damp. At the same time glass protects the picture from the fingers of clumsy visitors to public galleries, and from smoke in private houses. But it can never be a substitute for varnish; indeed it often makes it impossible to see and appreciate a picture properly. Not only is glass no substitute for varnish, but it transforms the picture into a mirror, so that the spectator sees a reflection of himself rather than the painting.

The disadvantages of glass are not so serious in the case of pictures in which the general tone is light. The difficulty still exists, but it is lessened because white does not transform a sheet of glass placed in front of it into a mirror. Many modern painters who paint in light tones have refrained from varnishing their pictures, as it does not help very much to bring out light tones. The objection to varnish dates, naturally enough, from the Impressionist period. The Impressionists wished their colours to produce as vibrant an effect as possible, and they therefore took care not to cover the paint with a foreign substance which was liable to develop in a way which they did not like.

It was inevitable that as painters gave up the use of varnish, they should gradually come to use turpentine to dilute their colours, and at the same time to paint on absorbent canvas. Mat painting has the technical advantage of avoiding the difficulty of "bloom" which was mentioned above; a deliberate attempt is made to obtain harmonies by the use of colours which do not shine because they contain less oil, either on account of their having been mixed with turpentine or on account of the oil having been absorbed by the canvas. So many admirable works have been produced by this method that we cannot fail to rejoice at a new discovery in the technique of painting. It must, nevertheless, be asked in all impartiality how a painting from which for one reason or another varnish has been excluded will stand the effects of time. If pictures were always to be exhibited under favourable circumstances, in a dry climate, not exposed to changes of temperature, and sheltered from dust, smoke and fumes of all kinds, we could allow varnish to be an unnecessary protection. All persons who have had occasion to see a large number of paintings will, however, have met with cases, somewhat rare, it is true, of 18th century decorative panels which have never been varnished. As a general rule about one centimetre of the edge of the painting is concealed by a frame or beading. The painting has not turned yellow as it would have done if it had been too heavily varnished, but at the same time it has not kept its original brilliance; it is covered, as it were, with a veil of warm grey except under the frame, where it has been protected from the light and from the impurities in the air and has preserved its original freshness. The worst feature is that there is no way of cleaning pictures of this kind. The dust fixed on the paint by the moisture in the air has become incorporated with it; but still more, the very body of the colour has been affected. Simple tones such as light greys have remained comparatively luminous, but the reds have become purplish, the yellows have turned brown, and the browns have lost their transparency. The dirt produced by dust fixed on the picture by the moisture of the air has worked right into the grain of the canvas. Such attacks by foreign bodies would not have had so much effect on varnish, and even if owing to circumstances the varnished picture had suffered an accumulation of dirt, it would still be possible to remove the varnish and find underneath the picture as the painter conceived it.

It is most desirable to protect these mat pictures with glass, unless a coating of wax is put over them to preserve their non-shiny appearance. The merits of wax for this purpose have always been known; it is one of the best means of preserving paintings, and it isolates them from injury from without in the same way as varnish.

(See PAINTING; LANDSCAPE PAINTING; PORTRAIT PAINTING; STILL LIFE PAINTING; MURAL PAINTING; FLOWER PAINTING.)

OIL-PALM (*Elaeis*), a genus of palms closely allied botanically to the coconut palm (*Cocos*). Two species are generally recognized, both medium-sized trees native to the tropics—one of considerable range in the Old World and the other found in South America.

The African oil-palm (*E. guineensis*), the source of palm oil and of palm-kernel oil, is a widely-known tree of great economic value. It occurs throughout an extensive area in tropical West Africa, and is also found in Malay archipelago and in the Sunda islands. It has been introduced into the West Indies and South America, and is grown to a limited extent in southern Florida. It is a handsome tree with a stout, deeply and coarsely ringed stem, 20 ft. to 30 ft. high, bearing at its summit a somewhat irregular crown of immense feathery leaves, 10 ft. to 15 ft. long. The leaves, which are pinnately divided into from 50 to 60 narrowly lance-shaped, sharp-pointed leaflets, are alike in colour on both sides, and are borne on stout leaf-stalks with spiny-toothed margins. The exceedingly numerous flowers are crowded on a short spadix and develop into a huge ovate fruit cluster containing usually from 150 to 200 reddish or orange-coloured thin-skinned drupes. The ripe drupes have a red or golden pulp which surrounds from one to three black hard-shelled stones or nuts with oily kernels (seeds). Upon attaining a height of several feet this species is one of the most attractive palms, and in suitably mild climates, as in southern California, young trees are grown for purely ornamental purposes.

The South America representative of the genus, *E. melanococca*, is a similar but much smaller tree. The leaves yield a useful fibre and the fruit, like that of the Old World species, contains oil.

Palm oil, called also palm butter and palm grease, is extracted by a process of fermentation from the pulp of the oil-palm fruit. It is a fixed, butter-like, reddish-yellow fatty oil, possessing a faint violet odour, which is remarkably persistent, being conveyed to soap manufactured from it. Its chief constituents are free palmitic acid, varying from 12% in fresh oil to 55% in older oil, together with stearic acid and glycerides of palmitic and oleic acids. Its specific gravity varies from 0.920 to 0.927; its melting point is such (80.5° F to 108.5° F) that while it is usually a liquid in the Tropics, it is a semi-solid in temperate regions. Its saponification number is 202; its iodine value ranges from 65 to 72, and its Reichert number is 0.5. Palm oil is soluble in alcohol,

ether, carbon bisulphide and chloroform.

Palm oil is extensively used in the manufacture of soap and also of candles. Mixed with cottonseed oil and mineral oil it is widely utilized in the tin-plate industry for coating iron. It has long been employed as a lubricant, particularly for railway-car axles. It is also used to give colour to butter-substitutes. Palm oils that are low in fatty acids are called "soft oils"; those containing a high percentage of fatty acids are known as "hard oils." In tropical West Africa, especially in the Gold Coast, a specially prepared palm oil, called chop oil, is a staple article of food, being used in the same manner as olive oil, soy bean oil and butter are in temperate regions.

Palm-kernel oil or palm-nut oil, is extracted from the kernels of the crushed nuts either by pressure or with solvents, the yield ranging from 45% to 50%. It is a yellowish fatty oil more closely resembling coconut oil than palm oil. When fresh, palm-kernel oil is free from fatty acid, but, upon exposure to the air, quickly becomes rancid. Its principal constituents are triolein 15% to 25%; triglycerides of stearic, palmitic and myristic acids about 33%; and triglycerides of lauric, capric, caprylic and caproic acids 45% to 55%. The specific gravity of palm-kernel oil is 0.952; its melting point varies from 78.6° F to 86° F; its saponification number is 247.6, and its iodine value is 13.4-13.6. It is extensively used in the manufacture of soaps, chocolate products, pharmaceutical preparations and perfumery.

Tropical West Africa is the main source of the world's supply of palm oil. Nigeria is the leading producer, exporting in 1926 113,267 tons, valued at £3,616,159. French Guinea and the Ivory Coast are the chief exporting dependencies of French West Africa. Ashanti, Gambia, the Gold Coast, Sierra Leone, the Cameroons, Dahomey, Togo and Liberia are also exporters of palm oil.

While palm oil is prepared directly from the fruit pulp in the regions where the oil palm grows, the hard-shelled nuts are largely exported in bulk and the extraction of oil from their kernels is made elsewhere. In 1926 the exports of palm kernels from Nigeria amounted to 249,100 tons, valued at £4,440,452. In 1927 the exports of palm kernels from the Ivory Coast were valued at 32,260,165 fr. and those from French Guinea at 26,424,468 fr. The total oil-equivalent of the products of the oil palm in all countries in 1926 was estimated at about 400,000 tons. (See OILS, FATS AND WAXES; PALM; PALM OIL.)

OIL REFINING: see PETROLEUM.

OILS, FATS AND WAXES. The term "oils" is loosely used as a generic term for substances having the common property of being greasy fluids, either at the ordinary temperature, or at temperatures below the boiling-point of water. Formerly, when substances were principally classified by obvious characteristics, the word included such a body as "oil of vitriol" (sulphuric acid), which has, of course, nothing in common with what is now understood under the term oils.

In its most comprehensive ordinary acceptance the word embraces at present the fluid, "fixed," or fatty oils (e.g., olive oil), the soft fats which may be fluid in their country of origin (e.g., coconut oil, palm oil), the hard fats (e.g., tallow), the still harder vegetable and animal waxes (e.g., carnauba wax, beeswax), the odoriferous ethereal (essential) oils and the fluid and solid volatile hydrocarbons—mineral hydrocarbons—found in nature or obtained from natural products by destructive distillation (petroleum, shale oils, oils from the low-temperature distillation of coal).

The importance of fatty and mineral oils to the life and industry of a nation is a commonplace of everyday observation; the exigencies arising from the World War did but emphasize human dependence on these raw materials for food and power, and stimulated development and research in all branches of the industries connected with them. Great advances have been made in the utilisation of mineral (petroleum) oils (*q.v.*). The last two decades have seen great developments in oil-fuelled internal combustion engines and the widespread adoption of oil as a fuel for steam-raising, both in stationary boilers and for shipping, and more especially for battleships, where high power output com-

bined with economy in fuel-storage space and stokehold labour are of primary importance. Improvements in the production of lubricating oils have been necessitated by the advances in modern machinery, which involve higher working temperatures and pressures. We may note in passing the development, especially in Germany, probably as a direct result of war-time isolation from supplies of mineral oils, of the production of oils by the distillation of lignites and by synthesis from producer gas.

The fatty oils, ever of paramount importance as food, acquired an increased significance during the War as sources of glycerine, the basis of explosives of the dynamite class. In England, strict government supervision was exercised over soap manufacture, and all industries involving the hydrolysis of fats, to ensure the maximum recovery of glycerine (about 10-14% of the weight of a fresh oil). Towards the end of the War period a process was mooted to replace the glycerol in edible fats by mannitol or a similar sugar, in order to obtain both the glycerine and a product equal in nutritive value to the original fat.

The shortage of edible oils in all countries during the War led to great advances in the technique of oil-refining; oils hitherto regarded as purely industrial became available for food as a result of improved methods of purification, and it may be said that to-day almost all fats, with the exception of those possessing marked physiological action, such as castor, curcas and chaulmoogra oils, can be utilised as food. Especially in the Central European countries, where, as a result of the blockade, the shortage of fats became acute, every effort was made to stimulate the investigation and production of synthetic fats. In some cases processes were put into actual operation; and in Germany attempts were made to supplement available resources with fat obtained from yeast under intensive cultivation. Synthetic fatty acids can be prepared by the oxidation of paraffin wax and other hydrocarbons, and glycerides have been synthesised on the large scale by heating these acids, under pressure, with glycerol, which may be obtained by the fermentation of non-crystallisable sugars. In view, however, of the enormous expansion of which the natural production of the fats is capable, it is extremely improbable that these methods will be commercially successful under normal economic conditions.

The common characteristic of all the "oils" is that they consist principally, in some cases exclusively, of compounds of carbon and hydrogen. They are all readily inflammable and are practically insoluble in water. The mineral hydrocarbons found in nature, or obtained by destructive distillation do not come within the range of this article (see NAPHTHA, PARAFFIN, PETROLEUM), which is restricted to the following two large groups of bodies, formed naturally within the vegetable and animal organisms, viz. (1) Fixed oils, fats and waxes, and (2) Essential, ethereal or volatile oils.

FIXED [FATTY] OILS, FATS AND WAXES

The substances to be considered under this head divide themselves naturally into two large classes, viz., fatty (fixed) oils and fats on the one hand, and waxes on the other, the distinction between the two classes being based on a most important chemical difference. The fixed oils and fats consist essentially of *glycerides*, i.e., esters formed by the union of three molecules of fatty acids with one molecule of the trihydric alcohol *glycerol* (glycerine, *q.v.*).

In a class of glycerides known as the phosphatides (*q.v.*) or phospholipines one or more of the fatty acid radicles is replaced by a grouping containing nitrogen and phosphorus, as, for example, lecithin.

The waxes consist of esters formed by the combination of one molecule of fatty acid with one molecule of a monohydric alcohol, such as cetyl alcohol, cholesterol, etc. Only in the case of the wax *coccerin* are two molecules of fatty acids combined with a dihydric alcohol. It must be pointed out that this distinction does not find ready expression in common parlance; thus *Japan wax* is a glyceride and should be more correctly termed Japan tallow, whereas *sperm oil* is, chemically speaking, a liquid wax. Although these two classes of substances have a number of physical properties in common it is better, for some purposes, to consider them

under separate heads. The true chemical constitution of oils and fats was first expounded by the classical researches of Chevreul, embodied in his work, *Recherches sur les corps gras d'origine animale* (1823, reprinted 1889).

Occurrence.—The oils and fats cannot be looked upon as definite chemical individuals, but as representatives of natural species which vary, although within narrow limits, according to the climate and soil in which the plants producing them are grown, or, in the case of animal fats, according to the climate, the race, the age of the animal and especially the food as well as the idiosyncrasy of the individual animal. The oils and fats are distributed throughout the animal and vegetable kingdom, from the lowest organisms to the highest, and are found in almost all tissues and organs. The vegetable oils and fats occur almost exclusively in the seeds and fruits; the waxes appear usually as thin films covering leaves and fruits. In animals the fats are enclosed mainly in the cellular tissues of the intestines and of the back, although a certain amount of fat is present in all the organs; in the lower animals fat is also stored in the liver, muscles, etc. There are a few liquid waxes known, occurring in the blubber and head cavity of sperm whales and stored in the stomach of certain arctic and antarctic birds (e.g., Australian mutton-bird [*q.v.*]); other waxes occur as insect secretions, while wool-wax is the natural grease found in sheep's wool.

Physiology of the Fats.—The most evident function of the fats in animal organisms is that of food-reserve, to supply, by subsequent oxidation, energy for the growing and working tissues. The storage of fats and oils in vegetable seeds can be similarly explained as food-reserve for the embryo; it is difficult, however, to account for the presence of oil in large quantities in the pericarp of fruits such as the olive and palm, which is probably destroyed before germination of the seed. The fats, and especially the waxes, can fulfil other valuable service by virtue of their physical properties, e.g., insolubility in water, and their chemical inertness. For instance, subcutaneous fat deposits protect the organism from cold; beeswax prevents dilution of the concentrated sugar solutions of the comb by external moisture; the waxes, and in some cases the fats, secreted in the leaves of plants preserve the underlying tissues from loss or access of water. It is probable that the resistant powers of the tubercle bacillus are largely attributable to the protective effect of the wax coating in which it is encased; this waxy secretion is remarkably inert and resists the action of the usual hydrolysing measures. It is probable that the fats fulfil still other, though more recondite, essential functions, quite distinct from their office as fuel supply for the cells.

It is only within the last few years that the importance of the animal fats as sources of the fat-soluble vitamins has been recognised: the discovery that vitamins (*q.v.*) may be produced in some non-active vegetable oils by the action of light is among one of the most recent advances of biochemistry. These bodies, of vital physiological importance as accessory growth factors, appear in minute proportions in the unsaponifiable (non-glyceridic) fraction of natural oils probably as a result of their physical solubility in these media; nevertheless the recognition of the part played by these substances attaches a new significance to the rôle played by the fats in animal metabolism.

Synthesis and Oxidation of Fats in Living Organisms.—The fat of the flesh-eating animals appears to be mainly derived from the fats consumed in the food; it has been demonstrated, however, by the classical researches of Lawes and Gilbert, that animal fats can be derived from carbohydrate food, while it is probable, although the proof is not so clear, that carbohydrates are the source of the fats in herbivorous animals and plants. In the case of vegetable seeds and fruits the formation of fats occurs late in the ripening process; in the unripe condition carbohydrates (sugars, starches, etc.) are to be found in the fruits and sap, but no fatty acids (or oils) and it is likely that the former are broken up and converted into fatty acids and subsequently into glycerides during the maturing process. In the case of almonds it has been observed that carbohydrates disappear as fat is formed.

It is a noteworthy fact that, almost without exception, only acids with an even number of carbon atoms in the molecule occur

in the natural fats. The preponderance of C_{18} acids suggests the hypothesis that the fats are derived from the C_{18} nucleus of the polysaccharides, or, perhaps, from three molecules of glucose. Secondary oxidations and condensations are necessitated to explain the formation of C_{16} and the higher acids C_{20} , C_{22} and C_{24} . To account for the formation of milk fats and fats of the coconut class, which are distinguished by the presence of the lower fatty acids, a second type of synthesis has been postulated, involving a building-up process of the acids, one from another, and originating from simple sugars instead of the more complex polysaccharides. Yet other theories have been propounded to account for the formation of the unsaturated link in the middle of the oleic acid chain. It is possible that fats can be formed from protein material.

The utilisation of the stored fat by the plant embryo has been but little studied; it seems that the fat is hydrolysed by lipolytic (fat-splitting) enzymes and broken down, possibly into simpler fatty acids, with the ultimate production of carbohydrates (*c.f.* conversion of fat into sugars in animals under abnormal conditions of glucosuria).

In the animal body the fats of the food are emulsified and hydrolysed by enzymes in the intestine; the glycerol and fatty acids are absorbed through the intestinal epithelium, recombined to form glycerides characteristic of the animal in question and transported *via* the blood and chyle to the connective tissues for storage. It may be noted that the fat of an individual animal can vary according to the fatty food supplied; for instance, the milk-fat of cows fed on a diet rich in coconut-oil simulates the latter in its properties; the fat of the Eskimo possesses an abnormally high iodine value, and resembles blubber oil.

The way in which the fat reserves are circulated to the organs in which combustion of the fat with the liberation of energy occurs, is scarcely understood. It is established that when mobilisation of reserve fat takes place the stream is primarily directed to the liver, where the fatty acids are desaturated, *i.e.*, unsaturated linkages are introduced into the fatty acid molecules. It is uncertain whether unsaturated acids so produced are distributed to the working cells as glycerides; it is possible that compounds of the fatty acids with nitrogen and phosphorus (the phospholipines, which are found in the liver and other organs) must be built up by the liver prior to transfer by the blood to the various organs. The unsaturated links introduced into the fatty acids by the liver appear to provide weak points for attack by the working cells in the process of combustion to the ultimate products of carbon dioxide and water.

FATTY OILS AND FATS

The fixed oils and fats form a well-defined and homogeneous group of substances passing through all gradations of consistency, from oils which are fluid even below the freezing point of water, up to the hardest fats which melt at about 50° C. Therefore, no sharp distinction can be made between fatty oils and fats. Nevertheless it is convenient to apply the term "oil" to those glycerides which are fluid below 20° C, and the word "fat" to those which are solid above this temperature. As a general inclusive term the expression "fat" is preferable, since this avoids confusion with mineral and essential oils.

Chemical Composition.—No oil or fat is found in nature consisting of a single chemical individual. Following on Chevreul's work, the fats were considered to consist in the main of mixtures of "simple triglycerides," this is, of glycerides in which each molecule of glycerol is combined with three molecules of the same acid, e.g., tristearin, $C_{17}H_{35}(O\cdot CO\cdot C_{17}H_{35})_3$, the glyceryl ester of stearic acid, $C_{17}H_{35}COOH$; triolein, $C_{17}H_{33}(O\cdot CO\cdot C_{17}H_{33})_3$. Recently, however, it has been shown that "mixed glycerides," *i.e.*, compounds wherein one molecule of glycerol is united with two or three different fatty acid radicles, preponderate, e.g., dipalmito-stearin, $C_{17}H_{35}(O\cdot CO\cdot C_{15}H_{31})_2(O\cdot CO\cdot C_{17}H_{35})$; palmito-oleo-stearin, $C_{17}H_{35}(O\cdot CO\cdot C_{15}H_{31})(O\cdot CO\cdot C_{17}H_{33})(O\cdot CO\cdot C_{17}H_{35})$. The natural fats, therefore, may differ, firstly in the fatty acids which they contain, and, secondly, by the different arrangement of the acids in simple and mixed glycerides. Fatty diglycerides only

occur occasionally as products of partial hydrolysis of the oil by ferment action.

Fatty Acids.—The most important and widespread of the fatty acids are *palmitic*, $C_{15}H_{31}COOH$ and *stearic*, $C_{17}H_{33}COOH$, acids (of the saturated series), and the unsaturated *oleic* acid, $C_{17}H_{33}COOH$.

The fatty acids are classified into related (homologous) series according to their degree of unsaturation, *i.e.*, the number of unsaturated or ethenoid bonds $>C=C<$, in the molecule of the acid. This classification is amplified in the list of examples which here follows.

Straight chain fatty acids.—The acids of the saturated (*acetic*, or *stearic*) series, general formula $C_nH_{2n+1}COOH$, include among the lower members butyric acid, C_3H_7COOH , characteristic of but-

ter fat (*q.v.*), caproic, $C_5H_{11}COOH$, caprylic, $C_7H_{13}COOH$, capric, $C_8H_{15}COOH$, lauric, $C_{11}H_{23}COOH$, and myristic acids, present in butter and fats of the coconut class; stearic and palmitic acids are higher in the series. Acids of the oleic series, $C_nH_{2n-1}COOH$, (one pair of doubly-linked carbon atoms), of which oleic acid $C_{17}H_{33}COOH$, present in nearly all oils and fats, and erucic acid $C_{21}H_{41}COOH$, characteristic of rape and fish oils, are the most important. Acids of the linoleic series, $C_nH_{2n-3}COOH$ (two ethenoid bonds), include linoleic acid, $C_{17}H_{31}COOH$, present to a large extent in maize and cottonseed oils. The linolenic series acids, $C_nH_{2n-5}COOH$ (three double bonds) of which linolenic acid, $C_{17}H_{29}COOH$, the characteristic acid of linseed oil is very important, as the high degree of unsaturation of this acid is responsible for the "drying" power or oxidisability upon which the commer-

TABLE I.

Vegetable Oils				
Oil	Principal sources of raw material	Yield %	Iodine value	Principal applications
<i>Drying oils</i>				
Linseed	Argentina, India, N. America, Russia .	38-40	175-205	Paint, varnish, linoleum, soft soap.
Tung	China, Japan	40-41	150-165	" " "
Hempseed	W. Europe, N. America, India, Japan .	30-35	148	" " soft soap, rubber substitute.
Poppyseed	Levant, India	41-50	123-143	Salad oil, artists' oil, soft soap.
<i>Semi-drying oils</i>				
Soya bean	China, Japan	13-17	122	Edible, burning.
Maize; corn	U.S.A., Argentina	6-10	113-125	" soap.
Cottonseed	" India, Egypt	30-32	116	Food, soap, steel-plate industry.
Sesame	India, etc., Egypt, Levant	24-26	108-110	" " "
Rape (Colza)	E. India, Europe	33-43	94-102	Food, lubricant, burning, wool oils, steel-plate industry.
<i>Non-drying oils</i>				
Almond	S. Europe, N. Africa	45-55	93-100	Perfumery, pharmacy.
Arachis (ground-nut)	India, W. Africa, China, U.S.A.	43-45	83-100	Edible, soap.
Olive	Mediterranean countries	40-60	79-88	" , soap, perfumery, lubricating, pharmacy.
Castor	E. India, Mediterranean, C. America .	46-53	83-86	Medicine, soap, lubricant, Turkey-red oil.
<i>Animal Oils</i>				
<i>Marine Animal Oils</i>				
Fish oils:				
Menhaden	Atlantic coast of N. America	140-173	Leather currying, steel-plate industry, linoleum.
Herring	N. Sea, Japan	124-142	Leather currying.
Liver oils:				
Cod liver	N. Sea, E. coast N. America	167	Medicine, leather currying.
Shark liver	Coasts of N. America	115	Leather currying.
Blubber oils:				
Seal	Arctic and Antarctic seas	127-147	Burning, leather currying.
Whale	" " " "	121-136	" soap, fibre dressing, margarine (after hardening), leather currying, screw oils, greases.
Dolphin, jaw and body oils	" " " "	33, 99-126	Lubricating oil for delicate machinery.
Porpoise " " " "	" " " "	36, 119	
<i>Terrestrial Animal Oils</i>				
Neat's-foot	U.S.A., S. America, Europe	67-73	Lubricating, high-grade leather-dressing.
<i>Vegetable Fats</i>				
Mahua (Illipé) butter	India, Malaya	50-55	53-67	Food, soap, candles, inferior chocolate fat.
Shea butter	W. Africa, Sudan	49-52	56	Food, soap, candles.
Palm oil	W. Africa	65-72	53	Candles, soap, tin-plate industry.
Cacao (cocoa) butter	W. Indies	32-41	32-41	Chocolate, pharmacy, perfumery.
Palm-kernel oil	W. Africa	45-50	13-14	Food, soap.
Coconut oil	E. Indies, Ceylon, Oceania, S. American coasts	20-25	8-10	" " , candles.
Japan wax	China, India, Japan	25	4-10	Polishes.
<i>Animal Fats</i>				
<i>Non-drying fats</i>				
Lard	U.S.A., Central Europe	50-70	Food, soap, pharmacy, perfumery.
Bone	" India, Europe	46-56	Soap, candles.

" mutton	Australasia	35-46	" " "
Butter	N.W. Europe, Australasia, Canada	26-38	Food.

cial application of the oil in the paint industry depends. Still more unsaturated acids occur, such as clupanodonic acid, $C_{22}H_{32}COOH$ (four ethenoid bonds), typical of fish, liver and blubber oils. The oxidation products of these oils, however, do not form such tenacious films as linseed oil, to which they are much inferior as paint oils. The hydroxylated acids of the ricinoleic series, $C_{18}H_{32}n-2(OH)COOH$, are typified by ricinoleic acid, $C_{17}H_{32}(OH)COOH$, the occurrence of which is responsible for the solubility of castor oil in alcohol.

The occurrence of *cyclic* (closed chain) acids is confined to oils of the chaulmoograc and hydnocarpus family. Acids with more than twenty-two carbon atoms in the molecule are rare among the fats, but are of fairly frequent occurrence among the waxes.

Unsaponifiable Matter.—Since the methods of preparing the vegetable and animal fats are comparatively crude, they usually contain certain impurities of one kind or another, such as colouring and mucilaginous matter, remnants of animal and vegetable tissues, etc. For the most part these foreign substances can be removed by processes of refining, but even after this purification the fats still retain small quantities of foreign bodies, such as traces of colouring matter, albumenoid and (or) resinous substances, and other non-glyceridic compounds; these substances can only be isolated after saponification of the fat, and are comprised in the term "unsaponifiable matter." Included among the "unsaponifiable matter" are the *sterols* (cyclic alcohols)—*phytosterol*, $C_{27}H_{46}O$, *sitosterol*, $C_{27}H_{46}O$, *stigmasterol*, $C_{30}H_{48}O$, *ergosterol*, $C_{27}H_{42}O$, and the animal sterols—*cholesterol*, $C_{27}H_{46}O$, *coprosterol*, $C_{27}H_{46}O$, etc. Phytosterol (i.e., "plant-sterol") occurs in all oils and fats of vegetable origin; cholesterol is characteristic of all oils and fats of animal origin. This important difference affords a means of distinguishing by chemical methods vegetable oils and fats from animal fats. It is in the "unsaponifiable" fraction of oils that the bodies known as the fat-soluble vitamins (*q.v.*) have been located; these appear to be substances related to the sterols; for example, it has recently been clearly demonstrated that vitamin D can be produced from inactive ergosterol by irradiation with ultra-violet light.

The amount of unsaponifiable matter in an oil or fat does not, as a rule, exceed 2%, but in the case of some shark-liver oils the proportion is abnormally high, as large quantities (up to 85%) of highly unsaturated hydrocarbons, such as spinacene and squalene ($C_{30}H_{50}$) are present; the relationship of these bodies to the glycerides normally occurring in oils, including fish-body oils, is still a matter for research.

Classification.—Following subdivision into animal and vegetable oils and fats, a second guiding principle to classification is afforded by a consideration of the amount of iodine the various fats are capable of absorbing. This is a measure of the unsaturated acids present, since iodine is absorbed (under suitable conditions) at the ethenoid linkages of the molecule of fatty acid.

About 80 of the natural fats are commonly utilised to a greater or less extent; the annual world consumption of each of about 20 of these approaches or exceeds 100,000 tons, and in the case of some half dozen is in the neighbourhood of 1,000,000 tons. They are classified as follows:—

Solid Vegetable Fats.—These are found mainly in the kernels and seeds of tropical fruits. They melt at from 20–35° C, and contain in general but little combined oleic acid, the bulk of the component fatty acids being lauric, myristic and palmitic. Fruits of many of the palm family, notably coconut oil and palm kernel oil, contain very large amounts of combined lauric acid. Palm oil contains chiefly palmitic and oleic glycerides. All these fats, when suitably refined, are used for edible purposes, and many are used in the manufacture of the higher grades of toilet and other soaps.

Solid Animal Fats.—A most important group of animal fats is that of milk fats, which are used universally as *butter*. All milk fats are characterized by the presence of definite, if relatively small, quantities of fatty acids which are known respectively as butyric, caproic and caprylic acids.

Physical Properties.—The specific gravities of oils and fats

ranges from 0.913 (rape oil) to 0.975 (Japan wax, myrtle wax); for the bulk of the fats the value is between 0.915 and 0.945. Some oils, notably those of the castor oil and chaulmoogra groups, rotate the plane of polarisation of light.

The oils and fats are practically insoluble in water; with the exception of oils of the castor oil group they are insoluble in cold, and only sparingly soluble in boiling, alcohol. They are completely soluble in ether, carbon disulphide, chloroform, carbon tetrachloride, petroleum ether and benzene. Oils and fats have no distinct melting or solidifying point; this is not solely due to the fact that they are mixtures of several glycerides, for even pure glycerides exhibit the phenomenon of a "double melting-point." The freezing points of the oils range from a few degrees above zero down to –28° C (linseed oil). At low temperatures (e.g., at 12° C in the case of cottonseed oil), solid portions, usually termed "stearine" separate out from many oils. These solid portions can be filtered off; the filtrates constitute the commercial "demarginated oils" or "winter oils" which will remain limpid at low temperatures.

Oils and fats can be heated to a temperature of 200° to 250° C without undergoing any material change, provided prolonged contact with air is avoided. On being heated above 250° up to 300° C some oils, e.g., linseed oil, safflower oil, tung oil (Chinese or Japanese wood oil, *q.v.*) and even castor oil, undergo a change, probably due to polymerisation, resulting in the formation of semi-solid or solid products. Above 300° C fats are decomposed; this is evidenced by the evolution of acrolein (a decomposition product of glycerin), which possesses the pungent odour of burning fat. Hydrocarbons are formed at the same time (*see PETROLEUM*).

On exposure to the air oils and fats gradually undergo certain changes. The *drying* oils absorb oxygen ("dry") somewhat rapidly, thin layers forming a skin or film. Extensive use of this property is made in the paint and varnish trades. The *semi-drying* oils absorb oxygen more slowly than the drying oils and are, therefore, useless as paint oils; still, in course of time, sufficient oxygen is absorbed to produce distinct thickening. The oxidation of the semi-drying oils is accelerated by spreading such oils over a large surface, notably over woollen or cotton fibres, when oxygen absorption may proceed so rapidly that spontaneous inflammation ensues. Many fires in cotton and woollen mills have been caused in this way. The *non-drying* oils, of which olive oil is typical, do not become oxidised readily on exposure to the air, although gradually changes take place, including slow hydrolysis (splitting to fatty acids and glycerol) and subsequent oxidation; the oils thicken slightly and acquire the peculiar disagreeable smell and acrid taste defined by the term "rancidity." The chemical reactions involved in the development of rancidity have not yet been fully explained. If the action of the air and moisture is allowed free play, the hydrolysis of the oils and fats may become so complete that only the insoluble fatty acids remain, the glycerol being washed away. This is exemplified by *adipocere* (corpse fat) and also by Irish bog butter, which consists chiefly of free fatty acids.

The property of the fats of being readily hydrolysed is most important, and extensive use of it is made in the arts (soap-making, candle manufacture, etc., and recovery of their by-products). If treated with water alone under high pressure (corresponding to a temperature of about 220° C), or in the presence of water with caustic alkalies, alkaline earths, or basic metallic oxides (which act as catalysers), at lower pressures, they are converted in the first instance into free fatty acids and glycerol, e.g.: If bases sufficient in amount to combine with the fatty acids be present, the corresponding salts of these acids are formed, such as the sodium salts of fatty acids (hard soap), or potassium salts (soft soaps), soaps of the alkaline earths (lime soap) or of the metallic oxides (zinc soap), etc. For detailed descriptions of the methods employed in commercial hydrolysis, *see CANDLES, SOAP*.

Extraction.—Since the oils and fats have always served the human race as one of the most important articles of food the oil and fat industry may well be considered to be as old as the human race itself. The methods of preparing oils and fats range

themselves under three heads: (1) Extraction by "rendering," i.e., boiling out with water; (2) extraction by expression, and (3) extraction by means of solvents.

Rendering.—The crudest method of rendering oil from seeds, still practised in Central Africa, in Indo-China and on some of the South Sea Islands, consists in heaping up oleaginous fruits and exposing them to the heat of the sun, when the exuding oil runs off and is collected. In a somewhat improved form this process of rendering is practised in the preparation of palm oil (*q.v.*) and the rendering of the best (Cochin) coconut oil by boiling the fresh kernels with water. Naturally these processes can only be applied to those seeds which contain large quantities of fatty matter, such as coconuts and olives. The rendering process is, however, applied on a very large scale to the production of animal fats, such as tallow (*q.v.*), lard, bone fat and whale oil (*q.v.*). The method consists essentially in cutting up the fatty matter into small fragments, which are transferred to vessels containing water, wherein the comminuted mass is heated by steam, either under atmospheric pressure in open vats or under higher pressure in digesters. The fat gradually exudes and collects on top of the water, whilst the membranous matter, "greaves," falls to the bottom. The fat is drawn off the aqueous (gluey) layer and strained through sieves or filters. The greaves are placed in hair or woollen bags and submitted to hydraulic pressure, by which a further portion of fat is obtained (*cf. Pressing*). In the case of animal fats intended for edible purposes, such as lard, suet for margarine, etc., the greatest cleanliness must, of course, be observed, and the temperature kept as low as possible in order to obtain a perfectly sweet and pure material. To obtain a harder product, fats, such as tallow, are frequently subjected to pressing to squeeze out the more liquid portions, which are sold as oleo oil, lard oil, etc.

Pressing.—The boiling out process cannot be applied to small seeds, such as linseed, rapeseed, etc. Whilst, perhaps, the most primitive method of expression was to crush the seed in mortars until the oil should exude, in the East, where vegetable oils form an important article of food and serve also for other domestic purposes, various ingenious applications of lever and of wedge presses have been used from the remotest times. A detailed description is given by Pliny of the screw presses used by the Romans for the production of olive oil. At an early stage in history the Chinese employed the same series of operations which are followed in the most advanced mills of modern times, viz., bruising and reducing the seeds to meal under edge-stones, heating the meal in open pans and pressing out the oil in a wedge press. This primitive process is still carried out in Manchuria, in the production of soya bean cake and oil, one of the staple industries of that country. The Dutch or stamper press, invented in Holland in the 17th century, was almost exclusively employed in Europe for pressing oil-seeds until the early years of the 19th century; it yielded place to the hydraulic press which has practically superseded all other appliances for expression. The sequence of operations in treating oil-seeds, oil-nuts, etc., is as follows: As an important preliminary operation the seeds, etc., are freed from dust, sand, and other impurities by sifting; in the case of seeds amongst which are found pieces of iron (hammer heads among palm-kernels, etc.), the seeds are passed over magnetic separators. The seeds and nuts are then decorticated (where requisite), the shells removed and the kernels ("meats") converted into a meal by grinding between finely grooved rollers. The comminuted mass, forming a more or less coarse meal, is either expressed in this state, or subjected to preliminary heating according to the quality of product required. For the preparation of *edible* oils, the meal is packed in bags and expressed in hydraulic presses in the cold, under a pressure of 300 atmospheres or more. The cakes remain under pressure for about seven minutes. Oil expressed in the cold dissolves the least amount of colouring matter, etc., and hence has suffered least in quality; oils so obtained are known in commerce as "cold-drawn oils," "cold pressed oils," "salad oils," "virgin oils."

By pressing in the cold only part of the oil is recovered. A further quantity is obtained by pressing the meal at a somewhat

elevated temperature, either after the cold-drawn oil has been taken off, or in the case of oleaginous seeds of low value, e.g., cottonseed, coconut, where it is of importance to extract as much oil as possible in one operation, immediately after the meal has left the mill. The process, which is general in application to all oil-seeds is described in some detail, with illustrations of typical hydraulic presses, in the article COCONUT OIL AND COPRA. Oil obtained from heated meal is usually more highly coloured and harsher to the taste than cold-drawn oil, more of the extractive substances being dissolved and intermixed with the oil. Such oils are hardly suitable for edible purposes and are chiefly used in manufacturing processes. According to the care exercised by the manufacturer and the range of temperature to which the seed is heated, various grades of oil are obtained. The residual meal is used as cattle-food, or if from poisonous seeds such as castor beans, as manure.

Extraction by Solvents.—The cakes obtained in the foregoing process still retain considerable proportions of oil, usually about 10%. If it be desired to obtain larger quantities than are yielded by the methods described above, the extraction of the seeds must be performed by the use of volatile solvents. Extraction by carbon disulphide was first introduced in 1843 by Jesse Fisher of Birmingham. For several years the process made little advance, for the colour of the resulting oils was dark and the taste sharp. The oil retained traces of sulphur, causing a disagreeable smell in soaps made from it, and the blackening of substances with which it was used. The meal was so tainted with carbon disulphide that it was absolutely out of the question to use it as cattle-food. With improvement in the manufacture of carbon disulphide these drawbacks have been surmounted to a large extent, and the practice of extraction with this solvent has especially gained extension for waste olive marc in France, Italy and Spain. Modern methods largely use petroleum ether (shale naphtha is more usual for the oil extraction of bone-fat); benzene and the non-inflammable hydrocarbons such as trichlorethylene, have been used, but have not proved so satisfactory, and in the latter case the risk of physiological action on the workmen, has militated against their wider utilisation. The methods of operation have been improved so that losses of solvent do not amount to more than 1%. Good quality oils can be obtained, and the processes are able to compete with expression, the choice of method resting mainly on considerations of the particular seed to be treated and the type of meal desired.

The apparatus employed on the large scale depends on the temperature at which the extraction is to be carried out. In the main two types of plant are differentiated, viz., for extraction in the cold, and for hot extraction. The seed is prepared as for pressing, but the grinding is coarser. In cold extraction the meal is placed in a series of closed vessels, and the solvent allowed to percolate by displacement (upward, in a recent process) on the "counter-current" system. The solution of extracted fat is then transferred to a steam-heated still, where the solvent is driven off and recovered by condensation to be used again. The last remnants of volatile solvent in the oil are driven off by a current of steam blown through the oil in the warm state. The hot-extraction process is carried out in apparatus, the principle of which is exemplified in the well-known Soxhlet extractor. The comminuted seed, spread on trays, is placed inside a vessel containing the solvent and fitted with a reflux condenser. On heating the solvent by means of a steam-coil or jacket the vapours rise through and around the meal, passing into the condenser, whence the solvent drops back as liquid on to the hot meal, percolating through it, and reaches the bottom of the vessel as a more or less saturated solution of oil in the solvent. The solvent is again evaporated, leaving the oil behind, the process proceeding continuously until the extraction is deemed finished. The oil solution is run into a still and the oil freed from solvent as already described. The solvent remaining in the meal is removed by a similar steaming process. It is true that on the European continent extracted meal, especially rape meal from good Indian seed and palm kernel meal, is somewhat largely used as cattle-food in admixture with press-cake; in England extracted meal is not

so employed, but finds its proper use in manuring the land.

Refining and Bleaching.—The oils and fats prepared from fresh ("sweet") material by any of the methods detailed above are practically neutral. Carefully rendered or cold-drawn oils are, as a rule, sufficiently pure to be delivered to the consumer, after a preliminary settling has allowed any mucilaginous matter, animal or vegetable fibres, etc., to separate. The clarification process may be shortened by filtering the oils, or otherwise brightening them, *e.g.*, by blowing with air. In many cases these methods still suffice for the production of commercial fats. Oils intended for use as salad oils, or as lubricants, which deposit "stearine" in the cold are "demarginated" (*see p. 749*).

In special cases, such as the preparation of edible oils and fats, a further improvement in colour and greater purity is obtained by filtering the oils over absorbent materials such as charcoal, fuller's earth, etc. As in the case of coconut and palm-kernel oils, a preliminary purification in a current of steam may be employed. For refining oils and fats intended for edible purposes, only the foregoing methods, which may be summarized by the name of physical methods, can be used; the only chemicals permissible are alkalis or alkaline earths to remove free fatty acids. The practice of refining by caustic soda has gained considerable extension; the fatty acids are neutralised by caustic soda and removed in the form of soaps by washing, but technically, the process is complicated by the formation of emulsions. Treatment with other chemicals renders the fats unfit for consumption. Hence, all bleaching and refining processes involving other means than those enumerated can only be used for technical oils and fats. There is no universal method of oil refining applicable to any and every oil and fat. Not only must each kind of fat be considered as a special problem, but frequently even varieties of one and the same fat are apt to cause the same difficulties as would a new individual. In many cases purification by sulphuric acid is still usefully applied. The oil is treated with a small proportion of concentrated sulphuric acid; this acts on the suspended impurities, carbonising them to some extent, and causes them to coagulate in the form of a flocculent mass, which settles out carrying with it mechanically other impurities that have not been acted upon. This method is chiefly used in the refining of linseed and rape oils. After treatment with sulphuric acid or caustic soda the oils must be thoroughly washed; the water is allowed to settle out and the oils finally filtered.

A large variety of reagents are in use for bleaching technical oils intended for soaps, lubricants, paints, etc. In general, besides treatment with absorbent media, or exposure to air and light (olive oil), bleaching methods involve the use of oxidising agents such as sodium dichromate and acid, permanganate, hypochlorites, metallic per-salts, peroxides, etc.

Fat-hardening.—There is great demand in the arts for hard fats, and a great development of the fats and oils industry took place in the early years of the present century as a result of the invention of a successful method for converting the liquid unsaturated fatty acids and glycerides into the corresponding solid saturated bodies. The change ("hardening," "hydrogenation") which consists in the addition of hydrogen to the unsaturated bonds, *e.g.*,

proved to be difficult of practical realisation. Many attempts had been made; stearylactone had been prepared by the action of concentrated sulphuric acid on oleic acid, and palmitic acid by treatment with potash, while the conversion into stearic acid itself had been effected by heating oleic acid under pressure with small quantities of iodine, or by subjecting it to the action of hydrogen under the influence of the silent electric discharge. None of these processes, however, proved economically successful on the commercial scale. The problem was solved by the application of the general reaction discovered by Sabatier and Senderens, namely, that hydrogen could be assimilated by unsaturated compounds in the presence of a metallic catalyst. The principle was found to be readily applicable, not only to fatty acids, but also to the glycer-

ides. The metal in general use is nickel; platinum and palladium are active catalysts, and by their use the reaction can be effected at much lower temperatures, but their high cost and susceptibility to poisoning by traces of impurities preclude their commercial use.

The usual process consists in passing hydrogen through the oil, which is intimately mixed with the catalyst; this consists of finely divided metallic nickel, which, as a rule, has been deposited on an inert support, such as kieselguhr or fuller's earth. The reaction is conducted at temperatures between 140° and 200° C, according to conditions. After hydrogenation the oil has to be filtered to free it from powdered catalyst; the nickel from the latter is recovered. A recent innovation, designed to allow of continuous working, and to obviate the tedious processes of filtration and recovery of the nickel from the oil-saturated residue, employs fine nickel turnings. The turnings are placed in perforated cages in the reaction vessel. The pre-heated oil and the hydrogen flow over them on the counter-current system. The oil delivered is free from nickel and does not require filtration; when the activity of the catalyst becomes reduced, as a result of gradual poisoning, it is easily regenerated by electrolytic oxidation and subsequent reduction. The mechanism of oil-hydrogenation, and the way in which the nickel assists the reduction, has not been fully explained; it appears that the reduction takes place in stages, the most unsaturated acids being first attacked. As the hardening process is always accompanied by a certain amount of deodorisation, more especially in the case of whale and fish oils, it has rendered possible the utilisation of these oils for the manufacture of hard soap, and has led to the substitution of cheaper vegetable oils, hydrogenated to the required consistency, for the more expensive tallow and lard.

The detection of hardened fats in a mixture is a difficult, if not an insoluble, problem. Indications may be furnished by the detection of fatty acids of high molecular weight, *e.g.*, behenic acid from hardened rape or marine animal oils, or of considerable proportions of iso-oleic acid, which is a transition product in the conversion of oleic into stearic acid.

Applications.—It is almost impossible to enumerate the many applications of the fats: in the table above the principal uses of some typical oils and fats are given. Almost all the best quality fats, including hardened whale oil, etc., can be used for edible purposes (margarine, cooking fats, salad oils, etc.), and some constitute a staple article of diet for native races, for instance, palm oil in W. Africa, soya bean oil in Manchuria.

In the arts the fats are used for soap-making (*q.v.*), candle stearine manufacture (*q.v.*) and leather-dressing; the latter industry provides an outlet for fish-oils and other low grade fats. Linseed oil, tung oil, and to a less extent other drying oils, are employed as the basis of paints, varnishes and for linoleum. Many of the non-drying oils (*e.g.*, neat's foot oil, sperm oil, etc.), are employed as lubricants, either alone or compounded with mineral oils (rape, castor oil), while lubricating greases are made from metallic soaps. Rape oil (colza) and other oils are still used as burning oils in remoter districts. Castor, and "tournant" olive oils provide the turkey-red oils used in dyeing textiles (*see also GLYCERINE*).

In medicine.—Some of the oils possess peculiar properties for which they are valued medicinally. Castor (*q.v.*) and curcas oils have a strong purgative action, while chaulmoogra oil, and others of the same group, have recently attracted attention as specifics for leprosy. Lard, olive, almond and other oils find application in pharmacy as vehicles for various medicaments (*see also COD LIVER OIL*).

Commerce.—In the table the principal countries of origin of the sources (seeds, etc.) of the fats are given. In a great many cases the oils are not extracted in their country of origin; the raw materials are shipped to European countries and America; thus Marseilles becomes the centre of the coconut oil trade, Liverpool and Hull centres of oil-seed expression, etc. Recent

development of industry in tropical countries, together with the war-time need for economy in freightage, has led, however, to increased production of oils and fats in the native countries; thus we find exports of copra from the Philippines decreasing, while the exports of oil increase. Statistics for the production of fats are very scanty; estimations based on available import and export returns take no account of the consumption in the countries of origin, which may be considerable, e.g., coco-nut oil in the Philippines, palm oil in W. Africa. For the available data, the reader is referred to the trade returns (U.K., U.S.A., etc.) and to the publications of the International Institute of Agriculture, Rome—*Oleaginous Products and Vegetable Oils* and the *Year Book of Agricultural Statistics*.

Production.—The production of oils is liable to considerable fluctuation, but the following estimates may be taken as representative. On the whole the production and consumption of oils and fats has steadily augmented since the War, the increase being especially marked in the case of soya-bean, coco-nut, palm-kernel and groundnut (peanut) oils.

Production of Oil-seeds, Nuts, etc. (reduced to Oil-equivalent), and Oils

Oil	1924*	1926†	Estimate for 1928†
	1,000 quintals	Tons	Tons
Cottonseed	19,260	931,963	1,246,800
Copra	13,000	733,431	902,500
Groundnut (peanut)	12,366	527,441	835,000
Linseed	10,000	634,292	885,000
Olive	7,653	626,000	650,000
Rapeseed	4,652	73,786	297,500
Soya	4,000	398,961	380,000
Sesamum	2,020	..	153,000
Sunflower	..	136,730	375,000
Palm and palmkernel	..	408,891	422,000
Other vegetable oils	251,200
Lard	645,000
Tallow	90,000
Total	7,142,900
	Barrels	Barrels	1927, barrels
Whale oil production	641,583	1,166,857	1,220,415

WAXES

The *waxes* consist chiefly of the fatty acid esters of the higher monohydric alcohols, with which are frequently associated free alcohols as also free fatty acids. Important among the acids found are palmitic acid, occurring in beeswax and spermaceti (*q.v.*), cerotic acid, $C_{25}H_{51}COOH$, in beeswax, wool-wax and other waxes, and melissic acid, $C_{29}H_{59}COOH$, of beeswax.

The hydroxylated lanopalmic, $C_{15}H_{31}(OH)COOH$, and lanoceric, $C_{26}H_{53}(OH)_2COOH$, acids also occur in wool-wax. The alcohols cetyl alcohol, $C_{16}H_{33}(OH)$ ("ethal" of the older writers) of spermaceti, and myricyl (melissyl) alcohol, $C_{30}H_{61}(OH)$, of beeswax and carnauba wax are the most important, while the cyclic sterols, cholesterol and ischolesterol, occur in considerable amounts in wool-wax.

Spermaceti consists practically of cetyl palmitate, Chinese wax of ceryl palmitate. The other waxes, especially wool-wax, are of more complex composition.

The waxes can be simply classified, similarly to the fats, as follows:—

- I. Liquid waxes
- II. Solid waxes
 - A. Vegetable waxes
 - B. Animal waxes.

The table enumerates the most important waxes (see also separate articles, SPERMACEITI, etc.).

The occurrence and physiological importance of the waxes have been discussed above. In their physical properties the natural waxes resemble the fats. They behave similarly towards solvents, and in the liquid condition leave a grease-spot on paper.

Wax	Occurrence	Iodine value	Principal use
<i>Liquid waxes</i>			
Sperm oil	Atlantic, Pacific	81-90	Lubricant
Arctic sperm oil	Arctic	67-82	"
<i>Solid waxes</i>			
<i>Vegetable waxes:</i>			
Carnauba wax	Brazil	13	Polishes, phonograph mass
Sugar cane wax	..	60	Polishes
Montan wax (distilled from peat)	Germany, Ireland, etc.	12-16	" phonograph mass
<i>Animal waxes:</i>			
Wool-wax	As mutton-tallow	30-35 (Wijs)	Ointment ("lanolin")
Beeswax	General	8	Candles, polishes
Spermaceti	As sperm oil	0-4	Candles, surgery
Insect wax, Chinese wax	China	0-1.4	Candles, polishes, sizes

An important property is that of easily forming emulsions with water, of which large quantities can readily be incorporated (lanolin [*q.v.*]).

Only a few vegetable waxes are found in sufficiently large quantities to be of commercial importance; so far carnauba and sugar-cane waxes are practically the only plant waxes of importance in the world's markets. The most important animal wax is beeswax (*q.v.*), collected in almost all parts of the world. An exceptional position is occupied by wool-wax, the main constituent of the natural wool fat that covers the hair of sheep, which is obtained as a by-product in scouring raw wool. Wool-fat is purified on a large scale and brought into commerce, under the name *lanolin*, as an ointment, which is valued for its property of easy assimilation by the skin.

OIRAT AUTONOMOUS AREA, an administrative division of the Russian S.F.S.R., created in 1922, within the Siberian area, bounded by Kazakhstan on the south-west and Mongolia, with the Mongolian Tannu-Tubinsk republic on the south and east, and by the Siberian area on the north. Area 91,200 sq.km. Pop. (1926) about 100,000. It lies between 49° 5' and 52° 4' N. and 84° and 89° 55' E., and is entirely rural, the administrative centre Ulala, on the Katun river, having 5,726 inhabitants in 1926. The area is mountainous, lying in the Altai region of West Siberia, which forms part of the Alpine highlands bordering the Mongolian plateau. Within it lies Mount Byelukha, whose summits rise to 14,890 feet and 14,560 feet respectively, and on which several glaciers exist. Numerous spurs strike from the Sailughem mountains towards the Siberian plain in all directions, amongst which are the Chuya Alps, average altitude 9,000 feet, with peaks rising to 12,000 feet, and at least 10 glaciers on the northern slope, and the snow clad Katun Alps (10,000 feet). The Katun river rises in a glacier in a wild gorge on the south-west slope of Byelukha and, after making a wide curve, pierces the Katun range and flows to the north. The upper course of the Biya, which with the Katun later forms the Ob, lies in the Oirat area. The Biya flows from the beautiful alpine Lake Teletskoye, to the south of which are the high Bashkaus. Chulyshman and Chulcha valleys all draining into the lake. The Kok-su and the Argut are the chief among the numerous tributaries of the Katun.

The climate is severe, average winter temperature —13° to —16° C. summer 16° to 18° C. The maximum rainfall is in the

Chernevoi district of the north-east, on the right bank of the Katun river, thickly forested with Siberian cedar and fir. In the north-west the conifers are mixed with birch, poplar and aspen. The Chuya, Kurai and Chulyshman Alps lie above the tree limit and have much tundra. The soils are mainly bog, meadow, rubble and forest clays; their poor character, the short vegetation period and the drought of the region under the influence of winds from Mongolia make cultivation difficult. Wheat and oats, with a little barley, rye, millet, flax, hemp, buckwheat and potato are grown, but only 10% of the area is under cultivation. Primitive irrigation channels had rendered crop production possible in the Uimonsk district in the bend of the Katun river, but during the civil war following the 1917 revolution, the irrigation canals were ruined and have not yet been restored. Grain has to be imported, but the absence of railway or steamer transport makes its cost heavy and many peasants cannot purchase it, especially as war conditions heavily depleted flocks and herds, horses and mules being still far below pre-war level. This is a disaster as many of the natives depended on transport in connection with the trade between Kobdo in Mongolia and Biisk in Siberia for supplementary income.

Forest fires and reckless exploitation for army purposes diminished the timber in accessible places and also reduced the number of fur-bearing animals, already diminishing in pre-war times through intensive hunting. Squirrel, bear, fox, ermine and sable are the chief fur-bearing animals of the region. The collection of cedar nuts for the oil pressing factories of Siberia, formerly an important occupation, was also affected by the causes given above. Timber, in any case, is difficult to exploit in the absence of transport facilities in a wild and rocky country. The chief occupation of the people is stock-raising, horses, working and dairy cattle, sheep, goats and pigs being bred. War conditions, followed by a period when troops of bandits infested the region, not only destroyed many of the best breeds, but caused the herdsmen to cross into Mongolia, with their remaining cattle and flocks. Epizootic diseases are prevalent, possibly because of their spread along the road from Mongolia. Milk and meat, with fermented mare's milk (kumiss) form the staple diet of the people. Raw leather with butter from the farms of the Russian settlers, are exported to a small extent. Meat and wool are used locally, for peasant industries have to supply local needs of homespun, felt, wooden and leather articles and flour and cheese. There is no factory industry. Beekeeping is profitable among the Russian settlers, and is increasing. The maral deer, from whose horns a substance called *panty*, used as a medicine in China, is obtained, is kept by the natives.

Of the population about 50% are Russians, partly descendants of the Old Believers who took refuge here from religious persecution from 1761 onwards. Colonization began in the 19th century, the settlers being mainly peasants from the crown lands, but no attempt was made to organize Russian colonization until 1874-1879. The colonists have occupied the areas suitable for cultivation, especially the Uimonsk region. Disputes between the Russian tillers of the soil and the nomad herdsmen of the hills were frequent and sharp before the creation of the autonomous area. The etymology of the word Oirat or Uirad is uncertain. Remusat and Pallas considered the term Durben Uirad, by which name Chinese writers speak of the Kalmucks, to mean The Four Allies, referring to the confederacy of four Kalmuck tribes which existed in the middle ages. Schmidt states that the Volga Kalmucks call themselves Uirad or Mongol Uirad, and the term Uirad Buriat also occurs in the records. Howarth after at first inclining to the view of Pallas and Remusat and considering that the term had no racial significance, later decided that Uirad was an indigenous term among the Kalmucks. Marco Polo says that Jenghiz Khan allowed the Horiads, out of gratitude for a victory they had won for him, to share the milk of his private herd of white mares, and Yule identifies the Horiads with the Uirads. According to Vambéry the term means grey mare.

The Uirads are recorded as living in the region of the "eight rivers," i.e., the sources of the Kem or Upper Yenisei, at the accession of Jenghiz Khan. Apparently they were Mongols with

a Turkish admixture. They submitted to Jenghiz Khan without any struggle and their chieftain Kara Kiragho was one of the nine famous generals or *orloks* who commanded divisions of Jenghiz Khan's army. A long struggle afterwards ensued between the Uirads and the Mongols, and in the 15th century the greater part of the western Mongols were under Uirad overlordship. Towards the end of the 16th century the Uirad power decayed and the Mongols recovered their supremacy. The Dzungarians later overran the Uirad territory, but were themselves conquered by the Chinese in the 18th century, when many took refuge with the Kirghiz in Russian territory. The non-Russian population of the Oirat autonomous area is thus composed of the descendants of these various Turkish, Kalmuck and Mongol tribes and includes also some Kirghiz shepherds. These Altai hill tribes are all nomad herdsmen, supplementing their income by hunting and by undertaking transport along the road from Kobdo to Biisk which passes through the Oirat area. It should be noted that the Telengets of the district north of Kusnetsk, lying outside the Oirat area, call themselves Oirat and that their language and poetry is similar to that of the Altaians, Howarth suggests that they may have been closely allied. Another division of the Uirads in 1296 deserted the Khan of Persia and went to Damascus. Among Altai mountain peoples are the Mountain or Black Forest Tatars, living in the cedar forest region between the Katun and Lake Teletskoye and supplementing their semi-nomad herding by collecting cedar nuts and roots and hoeing the soil in a primitive way for wheat and barley cultivation. The Kumandins, live on both banks of the Biya from the mouth of the Lebed downwards, and are taking to settled agriculture. Another Tatar group lives along the Lebed shores and is mainly occupied in hunting.

See Henry Howarth, *The History of the Mongols* (1876), and in Russian *Atlas of the U.S.S.R.* (1928).

OISE, a department of northern France, three-fourths of which belonged to Ile-de-France and the rest to Picardy, bounded north by Somme, east by Aisne, south by Seine-et-Marne and Seine-et-Oise, and west by Eure and Seine-Inférieure. Pop. (1926) 405,971; area 2,272 sq.m. As its name implies, the department includes a good deal of the lower basin of the Oise and its tributaries, forming a broad basin dissected from the outlying zone of the Eocene deposits. To the south-east of the Oise the Eocene forms a plateau with a considerable amount of forest, especially towards the north. To the north-west of the Oise the Eocene is capped along various south-east-north-west ridges by Pliocene, forming the hills of the Pays de Bray (770 ft.). The valley of the Oise itself is a sunny region, with less than 24 in. of rain per annum, and a range of seasonal averages of temperature from about 38° to 64° F.

Clay for bricks and earthenware, sand and building-stone are among the mineral products of Oise, and peat is also worked. Pierrefonds, Gouvieux, Chantilly and Fontaine Bonneleau have mineral springs. Wheat, oats and other cereals, potatoes and sugar beet are the chief agricultural crops. Cattle are reared especially in the western districts, where dairying is actively carried on. Bee-keeping is general. Racing stables are numerous in the neighbourhood of Chantilly and Compiègne. The chief industries of the department are manufactures of sugar and alcohol from beetroot. The manufacture of furniture, brushes (Beauvais) and other wooden goods and of toys, fancy-ware, buttons, fans and other articles in wood, ivory, bone or mother-of-pearl are important. There are also woollen and cotton mills, and manufactories of woollen fabrics, blankets, carpets (Beauvais), hosiery and lace (Chantilly and its vicinity). Creil and the neighbouring Montataire form an important metallurgical centre. Oise is served by the Northern railway, on which Creil is an important junction, and the Oise and its lateral canal and the Aisne afford about 70 m. of navigable waterway.

There are three arrondissements—Beauvais, Compiègne and Senlis—with 35 cantons and 701 communes. The department forms the diocese of Beauvais (province of Reims) and part of the region of the II. army corps and of the *académie* (educational division) of Paris. Its court of appeal is at Amiens.

OISE, a river of northern France, 187 m. long, flowing south-

west from the Belgian frontier to join the Seine 39 miles below Paris. It drains the north-eastern part of the Paris basin. Rising in Belgium, 5 m. S.E. of Chimay at a height of 980 ft., the river enters France after a course of little more than 9 m. It divides below Guise into several arms and is joined by the Serre (left), near La Fère. Thence as far as the Ailette (left), it flows through well-wooded country to Compiègne, above which it receives the Aisne (left). Skirting the forests of Compiègne, Halatte and Chantilly (all left), and receiving near Creil the Thérain and the Brèche (both right), the river flows past Pontoise to reach the Seine. Its channel is canalized (depth 6 ft. 6 in.) from Janville to its mouth. Above Janville a lateral canal continued by the Sambre-Oise canal accompanies the river to Landrecies. It is connected by canal with the canal system of Flanders and with the Somme and the Eastern canal systems. (See SEINE.)

OISIN (pronounced *Usheen*), reputed to be the son of Finn mac Cumhaill (*q.v.*), a heroic warrior and bard. He figures to but a small extent in the earlier literature of the Finn cycle, being eclipsed by his father and by his son Oscar. But in the later "Ossianic" literature he is prominent as the narrator of the events through which he claims to have lived. According to the legend, he remained alive after the Battle of Gabhra (Garristown, Co. Dublin) in which Cairbre Liffechair, son of Cormac mac Airt, destroyed Finn and his followers (A.D. 283), and survived long enough to meet St. Patrick (who arrived in Ireland in A.D. 432) and to tell him the ancient traditions of his youth. This prolonged existence was accounted for by his having been carried off by a fairy maiden to the Happy Otherworld; a tale not found in any ancient manuscript, but preserved orally, and successfully versified by the 18th-century Irish poet Michael Comyn. In a very valuable prose tract, *Agallamh na Senórach* ("The Colloquy of the Elders"), Patrick is described as making a circuit of Ireland, with Oisín and his old companion in arms, Cíeilt, as *ciceroni*. The same formula was afterwards adopted in verse, but with the difference that whereas in the prose narrative the pagan warriors and the saint treat each other with courtesy, in the verses they argue with a petulance often descending to ribaldry on both sides. The poet's name, in the form "Ossian," was popularized by James Macpherson; but his version of the tales and poems is so much manipulated as to be practically a new work.

Agallamh na Senórach is published with a translation in O'Grady's *Silva Gadelica* (1890). For the chief Ossianic poems see the publications of the Ossianic Society (1856, 1858); also Eoin MacNeill, *Duanaire Finn* (Irish Texts Society, 1908). See also L. C. Stern, *Die Ossianischen Heldenlieder* (English Translation in *Transactions of the Gaelic Society of Inverness*, xxii, p. 257). (R. A. S. M.)

OJIBWA. The Ojibwa or Chippewa form a large, loosely knit group of Algonkin Indians, said to have held originally the northern shores of lakes Huron and Superior, but extending in the historic period also westward across northern Minnesota and into Manitoba as far as Turtle mountain. Their expansion was largely at the expense of the Dakota, whom they bested with firearms obtained from the French. They were friendly to the French, and later to the British against the Americans, but have never been aggressive in warfare, at least not unitedly so, although esteemed brave. They were a timber people, farming only in part, and subsisting largely on game and wild rice. They are a large and widely spread group, numbering 30,000 or more, about equally divided between Canadian and American soil. (A. L. K.)

OKAPI (û-kah'pî), large animal allied to giraffes, inhabiting the Semliki forest between Lakes Albert and Albert Edward in Central Africa. First obtained by Sir H. H. Johnston, in 1900, the okapi (*Ocapia johnstoni*) has shorter legs and neck than the giraffe, standing 5 ft. at the shoulder. In colour it is purplish, with

the sides of the face puce and the limbs barred with black and white. The horns, only present in the males, are capped with a small polished tip which alone penetrates the covering skin. The skull is intermediate between that of the giraffe and that of the extinct *Samotherium* of the Lower Pliocene of Europe. The okapi dwells in the densest parts of the primeval forest, feeding on leaves of trees, shrubs and epiphytes. Its colouring renders it practically invisible at a short distance. It belongs to the family *Giraffidae* (see PECORA).

See for further details Ray Lankester, *Trans. Zool. Soc. of London* (xvi, 6, 1902).

OCKEGHEM, JOANNES (also OCKEGHEM, OCKENHEIM, OKERGAN, JEAN DE) (early 15th cent.-c. 1495), was born early in the 15th century at Termonde, East Flanders. He was a chorister at Antwerp in 1443 and is generally supposed to have been a pupil of Binchois. The latter part of his life was spent at Tours, where he held the coveted post of treasurer to St. Martin's church under Louis XI. He stands out in the early history of music as one of the greatest of teachers and is by common consent regarded as the founder of the second Netherlands school of contrapuntists, covering the latter half of the 15th century. Josquin des Prés and De la Rue were but two among the many famous pupils who carried his teaching into all countries. His skill and ingenuity in counterpoint were considered extraordinary even in that age of elaboration. He wrote, among others, a transposing mass, the *Missa cuiusvis toni*, which could be sung in any of the church modes, and a complicated motet for 36 voices. In fugue he introduced the *stretto*, a now familiar device by which the answer follows the subject at a closer interval than in the original statement, and in addition to the usual form of canon in unison he added the canon at the fourth below. Much of his work was destroyed in the wars, or lost, and he lived too early to see his works in print. The masses and motets were not published till after his death. Two masses (Trent codices) have been published by the *Gesellschaft zur Herausgabe von Denkmälern der Tonkunst in Österreich* (Vienna) and 4 Chansons are in A. W. Ambros, *Geschichte der Musik* (5 vols., Leipzig, 1862-82. The 5th vol. containing examples of music, has not been re-issued).

OKEN, LORENZ (1779-1851), German naturalist, whose real name was Ockenfuss, was born at Bohlsbach, Baden, on Aug. 1, 1779. He studied at Würzburg and Göttingen, where he became *Privatdozent*. In 1870 he was appointed professor extraordinary of medical sciences at Jena. His inaugural discourse on the signification of the bones of the skull, based upon a discovery he had made in the previous year, was delivered in the presence of Goethe, as privy-councillor and rector of the university, and was published in the same year, with the title, *Ueber die Bedeutung der Schädelknochen*. In 1816 he began to publish at Weimar the periodical *Isis, eine encyclopädische Zeitschrift, vorzüglich für Naturgeschichte, vergleichende Anatomie und Physiologie*. Comments on the politics of other German States led to a remonstrance from the court of Weimar, which demanded either the suppression of the *Isis* or resignation. Oken resigned, and continued to publish the *Isis* at Rudolstadt until 1848.

In 1821 Oken promulgated the idea of annual general meetings of German naturalists and medical practitioners, the first meeting being held in Leipzig in 1822. The British Association for the Advancement of Science was first organized after the Okenian model.

In 1828 Oken resumed his duties as privat-docent in the newly-established University of Munich, and soon afterwards was appointed professor in the same university. In 1832, on the proposal by the Bavarian Government to transfer him to a professorship in a provincial university of the State, he resigned his appointments and left the kingdom. He was appointed in 1833 to the professorship of natural history in the then recently-established University of Zurich, where he resided until his death, on Aug. 11, 1851.

All Oken's writings are eminently deductive illustrations of a foregone and assumed principle, which, with other philosophers

MALE OKAPI (*OCAPIA JOHNSTONI*),
FOUND MOSTLY IN THE CONGO DISTRICTS

of the transcendental school, he deemed equal to the explanation of all the mysteries of nature. According to him, the head was a repetition of the trunk—a kind of second trunk, with its limbs and other appendages; this sum of his observations and comparisons—few of which he ever gave in detail—ought always to be borne in mind in comparing the share taken by Oken in homological anatomy with the progress made by other cultivators of that philosophical branch of the science. Oken's axiom that "all the parts of higher animals are made up of an aggregate of infusoria or animated globular nomads" is of the same order as his proposition that the head is a repetition of the trunk. This latter proposition was claimed to have been discovered by Goethe. He stated this in his *Morphologie* in 1820. A controversy followed; Oken replied with an able statement in *Isis* (Part 7, 1847).

The following is a list of Oken's principal works: *Grundriss der Naturphilosophie, der Theorie der Sinne; und der darauf gegründeten Classification der Thiere* (1802); *Die Zeugung* (1805); *Abriss der Biologie* (1805); *Beiträge zur vergleichenden Zoologie, Anatomie und Physiologie* (along with Kieser, 1806-07); *Ueber die Bedeutung der Schädelknochen* (1807); *Ueber das Universum als Fortsetzung des Sinnessystems* (1808); *Erste Ideen zur Theorie des Lichts, der Finsterniss, der Farben und der Wärme* (1808); *Grundzeichnung des natürlichen Systems der Erze* (1809); *Ueber den Werth der Naturgeschichte* (1809) *Lehrbuch der Naturphilosophie* (1809-11; 2nd ed., 1831; 3rd ed., 1843; Eng. trans., *Elements of Physiophilosophy*, 1847); *Lehrbuch der Naturgeschichte* (1813, 1815, 1825); *Handbuch der Naturgeschichte zum Gebrauch bei Vorlesungen* (1816-20); *Naturgeschichte für Schulen* (1821); *Esquisse d'un Système d'Anatomie, de Physiologie, et d'Histoire Naturelle* (1812); *Allgemeine Naturgeschichte* (1833-42, 14 vols.).

OKHOTSK, SEA OF, a part of the western Pacific Ocean, lying between the peninsula of Kamchatka, the Kurile Islands, the Japanese island of Yezo, the island of Sakhalin, and the Amur province of East Siberia. The Sakhalin Gulf and Gulf of Tartary connect it with the Japanese Sea on the west of the island of Sakhalin, and on the south of this island is the La Pérouse Strait.

OKI, a group of islands belonging to Japan, lying due north of the province of Izumo, at the intersection of 36° N. and 133° E. The group consists of one large island called Dogo, and three smaller isles—Chiburi-shima, Nishi-no-shima, and Naka-no-shima—which are collectively known as Dozen. These four islands have a coast-line of 182 m., an area of 130 sq.m., and a population of 63,000. The island of Dogo has two high peaks, Daim-anji-mine (2,185 ft.) and Omine-yama (2,128 ft.). The chief town is Saigo in Dogo, distant about 40 m. from the port of Sakai in Izumo. The name Oki-no-shima signifies "islands in the offing," and the place is celebrated in Japanese history not only because the possession of the islands was much disputed in feudal days, but also because an ex-emperor and an emperor were banished thither by the Hojo regents in the 13th century.

OKLAHOMA is a west south central State of the United States of America, lying between 33° 35' and 37° N. lat. and 94° 20' and 103° W. long. It is bounded north by Colorado and Kansas; east by Missouri and Arkansas; south by Texas, from which it is separated in part by the Red river; and west by Texas and New Mexico. It has a total area of 70,057 sq.m., of which 643 sq.m. are water-surface. Although the extreme western limit of the State is the 103rd meridian, the only portion W. of the 100th meridian is a strip of land about 35 m. wide in the present Beaver, Texas and Cimarron counties, and formerly designated as "No Man's Land." Oklahoma is called the "Sooner State" because those who entered on April 22, 1889, with the rush, found much of the best land taken up by those who had evaded the guards and entered the territory in advance of the official opening. These persons who evaded the regulations and thus secured the best land were known as "Sooners."

Physical Features.—The topographical features of the State exhibit considerable diversity, ranging from wide treeless plains

in the west to rugged and heavily-wooded mountains in the east. Elevations above the sea range from 4,800 ft. (Black Mesa) in the extreme north-west to 300 ft. in McCurtain county in the south-east. The State has a mean elevation of 1,300 ft., with 34,930 sq.m. below 1,000 ft.; 25,400 sq.m. between 1,000 and 2,000 ft.; 6,500 sq.m. between 2,000 and 3,000 ft.; and 3,600 sq.m. between 3,000 and 5,000 feet.

The western portion of the Ozark mountains enters Oklahoma near the centre of the eastern boundary, and extends west-south-west half way across the State in a chain of hills gradually decreasing in height. In the south central part of the State is an elevated table-land known as the Arbuckle mountains. In its western portion this table-land attains an elevation of about 1,350 ft. above the sea and lies about 400 ft. above the bordering plains. At its eastern termination, where it merges with the plains, it has an elevation of about 750 feet. Sixty miles north-west of this plateau lie the Wichita mountains, a straggling range of rugged peaks rising about 1,500 ft. above the plain, but on account of their steep and rugged slopes they are difficult to ascend. A third group of hills, the Chautauqua mountains, lie in the west in Blaine and Canadian counties, their main axis being almost parallel with the North Fork. The north-western part of Oklahoma is a lofty table-land forming part of the Great Plains region east of the Rocky mountains.

The prairies north of the Arkansas and west of the Neosho rivers are deeply carved by small streams, and in the western portion of this area, where the formation consists of alternating shales and sandstones, the easily eroded rocks have been carved into canyons, buttes and mesas. South of the Arkansas river these ledges of sandstone continue as far as Okmulgee, but the evidences of erosion are less noticeable. East of the Neosho river the prairies merge into a hilly woodland. In the north-west four salt plains form a striking physical feature. Of these, the most noted is the Big Salt plain of the Cimarron river, in Woodward county, which varies in width from $\frac{1}{2}$ m. to 2 m. and extends along the river for 8 miles. The plain is almost perfectly level.

Following the slope of the land, the important streams flow from north-west to south-east. The Arkansas river enters the State from the north near the 97th meridian, and after following a general south-easterly course, leaves it near the centre of the eastern boundary. Its tributaries from the north and east—the Verdigris, Grand or Neosho and Illinois—are small and unimportant; but from the south and west it receives the waters of much larger streams—the Salt Fork, Cimarron and the Canadian, with its numerous tributaries. The extreme southern portion of the State is drained by the Red river, which forms the greater part of the southern boundary, and by its tributaries, the North Fork, the Washita and the Kiamichi.

Climate and Soils.—The climate of the State is of a continental type, with light rainfall. The western and central portions of the State are in general cooler and drier than the east. Thus, at Beaver, in the extreme north-west, the mean annual temperature is 57° F and the mean annual rainfall 18.9 in.; while at Lehigh, in the south-east these figures are respectively 62° and 35.1 inches. At Oklahoma City, in the centre of the State, the mean annual temperature is 59.4°; the mean for the summer (June, July and August) is 78.8°, with an extreme recorded of 108°; the mean for the winter (December, January and February) is 38.4°, with an extreme recorded of -17°. At Mangum, in the south-west, the mean annual temperature is 61°; the mean for the summer is 81° and for the winter 41°, while the highest and lowest temperatures ever recorded are respectively 114° and -17°. The mean annual precipitation for the State is 31.7 in.; the variation between the east and the west being about 12 inches.

The prevailing type of soil is a deep dark red loam, sometimes (especially in the east central part of the State) made up of a decomposed sandstone, or (in the north-central part) of shales and decomposed limestone. Not infrequently there are a belt of red sandy loam on uplands north of a river, a rich deposit of black alluvium on valley bottom lands, a belt of red clay loam on uplands south of a river, and a deposit of wind-blown loess

on the water parting.

Population.—The population of the territory now embraced within the State of Oklahoma increased from 258,657 in 1890, when the first census was taken, to 790,391 in 1900, or 205.6%; to 1,657,155 in 1910, or 109.7%; and to 2,028,283 in 1920, or 22.4%. The population on July 1, 1928, was 2,426,000, according to the U.S. census estimate. Of the total population in 1920, 1,821,194 were whites, 149,408 negroes, 57,337 Indians and 344 Mongolians. In the decade 1910–20 the Indian population decreased 16,948, or 22.8%. The only Indians who are natives of this region are a few members of the Kiowa, Comanche and Apache tribes. The others are the remnants of a number of tribes collected here from various parts of the country: Cherokees, Cheyennes, Chickasaws, Choctaws, Foxes, Iowas, Kaws, Kickapoos, Miamis, Osages, Otoes, Ottawas, Pawnees and others. The foreign-born population (40,432) in 1920 constituted 2.2% of the total. Chief among the foreign-born were: Germans, 7,028; Mexicans, 6,884; Russians, 5,005; English, 2,687; Canadians, 2,489; and Italians, 2,122.

The density of population per square mile increased from 2 in 1890 to 29.2 in 1920. The distribution of population then was 1,488,803, rural; 539,480 or 26.6%, urban. The principal cities in 1928 were Oklahoma City (the capital), Tulsa, Muskogee, Okmulgee, Bartlesville, Enid, Ardmore, Shawnee, Ponca, McAlester, Chickasha and Sapulpa.

Government.—The Constitution now in operation was adopted in Sept. 1907, and is that with which the State was admitted into the Union in November of the same year. Amendments may be submitted through a majority of the members elected to both houses of the legislature or through a petition signed by 15% of the electorate, and a proposed amendment becomes a part of the Constitution if the majority of the votes cast at a popular election are in favour of it. The right of suffrage is conferred on all citizens of the United States, 21 years of age or over, who have resided in the State for one year, in the county six months, and in the precinct for the 30 days preceding the election. General elections are held in even-numbered years; party candidates for State, district, county and municipal offices, and U.S. senators and congressmen are chosen at primary elections.

The executive authority of the State is divided among 13 elected officials, including the governor, lieutenant governor, secretary of State, treasurer, auditor, attorney-general, superintendent of public instruction, examiner and inspector, commissioner of labour, commissioner of insurance, chief mine inspector, commissioner of charities and corrections and president of the State board of agriculture. They are elected for a term of four years, and the governor, secretary of State, auditor and treasurer are ineligible for the next succeeding term. Other elected State officials are the three members of the corporation commission (one elected every two years for a six-year term), the clerk of the supreme court and four assistant mine inspectors. Administrative work is also done by more than 60 other officers, commissions, departments and boards. The governor is a member of some important administrative boards, but the number of officers whom he appoints is rather limited and for most of his appointments the confirmation of the senate is required. His right of veto extends to items in appropriation bills, and to pass a bill over his veto a vote of two-thirds of the members elected to each house is required.

The legislative authority is vested in a senate of 44 members and a house of representatives (108 members in 1928), limited to 109 members. Half of the senators and all the representatives are elected every two years, senators by districts and representatives by counties. Sessions are held biennially in odd-numbered years and begin the first Tuesday after the first Monday in January. Oklahoma has put into its Constitution many things which in the older States were left to legislation.

For the administration of justice there have been established a supreme court, composed of nine justices elected for a term of six years; a supreme court commission of nine members appointed by the governor and confirmed by seven members of the supreme court; a criminal court of appeals composed of three

justices elected one each two years, for a term of six years; 31 district courts, each with one or more justices elected for a term of four years; superior courts in certain of the more populous counties, with a judge elected for a term of four years; a county court in each county, with one judge elected for a term of two years; justice of the peace courts held by justices elected for a term of two years; and municipal courts in the cities. The supreme court has appellate jurisdiction in all civil cases, but its original jurisdiction is restricted to a general control of the lower courts. The supreme court commission was created by the legislature in 1927 to assist the supreme court in the adjudication of civil cases appealed from trial courts. The criminal court of appeals has jurisdiction in all criminal cases appealed from the district and county courts. The district courts have exclusive jurisdiction in civil actions for sums exceeding \$1,000, concurrent jurisdiction with the county courts in civil actions for sums greater than \$500, and original or appellate in criminal cases. The superior courts were created to relieve the district courts and have a similar jurisdiction. The county courts have, besides the concurrent jurisdiction above stated, original jurisdiction in all probate matters, original jurisdiction in civil actions for sums greater than \$200 and not exceeding \$500, concurrent jurisdiction with the justices of the peace in misdemeanour cases, and appellate jurisdiction in all cases brought from a justice of the peace or a police court.

Local Government.—The general management of county affairs is entrusted to three commissioners elected by districts. The other county officers are a sheriff, attorney, judge, clerk, court clerk, treasurer, assessor, surveyor, superintendent of public instruction and public weigher. They are chosen for a term of two years at the general elections in November. Since 1919, only 21 counties have township government. The municipalities of Oklahoma may be classified as incorporated towns and as cities (over 2,000 inhabitants).

Finances.—The revenues for State and for local purposes are derived almost wholly from separate sources. The greater part of the State's revenue is derived from a gross production tax on minerals, motor vehicle licences, a gasoline tax, insurance fees, an inheritance tax, an income tax and miscellaneous departmental collections. Revenue for local purposes is obtained chiefly from tax levies on personal and real property. The valuation and assessment of personal and real property and of public service corporations for 1926 was \$1,697,364,263. This, however, did not include mineral property which is taxed on gross production only. The only State levies on property in 1927 were the constitutional taxes of $\frac{1}{4}$ mill on a dollar for common schools and a similar levy for State highway construction. The highway money was returned to the county of source and the school revenue was disbursed on a *per caput* basis. The total revenue receipts for the year ending June 30, 1927, were \$26,334,527; the disbursements \$23,820,322; and the balance \$6,059,141. The total bonded indebtedness of the State on the above date was \$1,543,900.

A feature of the banking system is a fund for the guaranty of deposits in banks operating under State charters. The bank guaranty law was held to be valid by the U.S. Supreme Court in 1908 after the U.S. attorney-general had decided that it was illegal. There were 738 banking institutions operating within the State on June 30, 1926. Their combined resources were \$515,017,000; and their total deposits were \$402,606,000. Of the total number of banks, 370 were national and 368 State banks.

Education.—Oklahoma has an excellent system of public education, and especially is this true for specialized and advanced instruction. The public school system is administered by a State superintendent of public instruction, a State board of education, county superintendents and district boards. The State board, which is composed of the State superintendent and seven appointed members, has administrative control over the six teachers' colleges, the school for the blind and the school for the deaf. It also apportions the various State school-aid funds. The scholastic enumeration in 1925 showed 712,321 children of school age. Of this number 654,742 were enrolled in the public schools and 456,772 were in average daily attendance. The average number of days

attended per enrolled pupil was 115; nearly 63% of the pupils were, however, enrolled in schools which were open 160 days or more. The number of standard four-year high schools was 508; and the number of consolidated rural schools was 389. The total expenditure for schools in 1925 was \$30,187,234. Of the total revenue receipts (\$31,135,715), the State contributed \$2,870,799; the Federal Government \$297,757; county sources \$3,893,098; local sources \$23,578,465; and benevolent sources \$28,090.

The higher educational institutions supported by the State are the University of Oklahoma at Norman; the Agricultural and Mechanical college, a land-grant college with experiment stations, at Stillwater; the Oklahoma College for Women, teaching especially domestic science and the fine arts, at Chickasha; Eastern Oklahoma college (School of Mines) at Wilburton; six teachers' colleges at Durant, Edmond, Ada, Weatherford, Alva and Tahlequah; and the Coloured Agricultural and Normal university at Langston. Among the institutions of higher learning neither maintained nor controlled by the State, are Phillips university at Enid; Oklahoma City university at Oklahoma City; the Catholic College of Oklahoma for Women at Guthrie; the University of Tulsa at Tulsa; and Oklahoma Baptist university at Shawnee.

Charities and Corrections.—Under the Constitution the supervision and inspection of charities and institutions of correction are in the hands of a State commissioner of charities and corrections, elected by the people.

The State-maintained institutions in 1927 were hospitals for the insane at Norman, Vinita and Supply; the University hospital at Oklahoma City; tubercular sanatoriums at Clinton and Tahlequah; a Confederate soldiers' home at Ardmore and a similar institution for Union soldiers at Oklahoma City; orphanages for white children at Pryor and Helena; an institute for the feeble-minded at Enid; and a home for deaf, blind and orphan coloured children at Taft. The State penal institutions consisted of four training schools, for negro girls at Taft, for negro boys at Boley, for white girls at Tecumseh and for white boys at Pauls Valley; the Oklahoma State reformatory at Granite; and the State penitentiary at McAlester.

Agriculture and Stock-raising.—Prior to the first opening to settlement by white men in April 1889, the territory now comprising Oklahoma was a cattle country, and since then, although the opening was piecemeal, the agricultural development has been remarkably rapid. By 1900, 51.1% of the total land surface was included in farms; and by 1920 the farm area was 31,951,934 ac., or approximately 72% of the total. The farm acreage in 1925 had decreased to 30,868,965 ac., or 69.5% of the total land area. The average size per farm then was 156.5 acres. The total number of farmers in 1925 was 197,218 as compared with 191,988 in 1920, and 190,191 in 1910. Of the total number of farm operators (197,218) in 1925, 177,170 were whites and 20,048 coloured. In 1925, 81,226 farms were worked by owners or part owners, 494 by managers, and 115,498 by tenants. The percentage of tenancy then was 58.6 as compared with 54.8 in 1910. The total population residing on farms in 1925 was 925,690, or about 40.3% of the State's total. The value of all farm property in 1920 was \$1,660,423,544; by 1925 it had decreased to \$1,210,134,914. The average value per farm then was \$6,136. The total value of all crops in 1919 was \$550,084,742; but, chiefly because of the decline in prices, the total value in 1926 was \$308,500,000.

In the production of broom corn in 1926, Oklahoma ranked first among the States; in cotton and grain sorghums, second only to Texas; and in wheat third, the State's product being exceeded by Kansas and North Dakota. The 4,912,000 ac. planted in cotton in 1926 had a yield of 1,950,000 bales of lint and 866,000 tons of seed, with a combined value of \$107,911,000. Wheat was the crop second in importance in both acreage (4,214,000) and value (\$87,090,000). Other important cereal crops were Indian corn, 61,176,000 bu.; oats, 38,304,000 bu.; grain sorghums, 24,318,000 bu.; barley, 4,752,000 bu.; and rye 558,000 bushels. The hay crop of 1,258,000 tons, valued at \$13,672,000 was harvested from 551,000 ac. of cultivated hay and 509,000 ac. of wild hay. The potato crop consisted of 2,838,000 bu. of white potatoes valued at \$4,825,000, and 2,520,000 bu. of sweet potatoes valued at \$2,520,000.

The live stock and poultry products of Oklahoma, in 1926, according to the State board of agriculture, had a value of \$145,002,000. Of this total \$47,046,000 represented the value of the live stock slaughtered and sold for slaughter, and \$35,956,000 the poultry and eggs produced. In the production of turkeys, Oklahoma is outdone by Texas only. The live stock in the State on Jan. 1, 1927, consisted of 1,723,000 cattle, of which 581,000 were kept for dairy purposes; 777,000 swine; 84,000 sheep; 565,000 horses; and 365,000 mules. The estimated value was \$105,679,000.

Minerals, Lumber and Timber Products.—Oklahoma, which ranks 17th in size among the States, ranked second in the value of mineral products for 1925. The State then produced 10.07% of the total mineral wealth of the U.S. as compared with 17.40% produced by Pennsylvania. The principal mineral products in the order of value were petroleum, zinc, natural-gas gasoline, natural gas, lead, coal and gypsum. Ranked by value of output, Oklahoma was first among the States in the production of petroleum, natural-gas gasoline, natural gas and zinc; second in chats; and fourth in lead, native asphalt and diatomaceous earth and tripoli. The mineral production of the State in 1925 had a value of \$501,767,118. The petroleum and natural gas producing regions of Oklahoma extend over about 43 counties in the north-central and south-western parts of the State. In 1925 the greater number of Oklahoma's 250 oil and gas fields were still producing. Tulsa, the oil capital of America, is situated in about the centre of the north-central producing area. The petroleum production in 1925 was 176,768,000 bbl. valued at \$348,230,000; in 1926 it was 179,272,000 bbl., valued at \$410,000,000. The 1927 production was estimated at 278,000,000 barrels. The 390,861,000 gal. of natural-gas gasoline produced in 1925 had a value of \$40,973,000; and the 249,285,000 cu.ft. of natural gas was valued at \$36,121,000. The industry second in importance, ranked by value of product, was the mining of zinc ore in Ottawa county. The 1925 production was 283,371 tons, valued at \$43,072,392. The same region produced 79,946 tons of lead, valued at \$13,910,604. The bituminous-coal mining industry was sixth in importance in the State in 1925 on the basis of value of products. The Oklahoma coal-fields lie in the eastern part of the State and extend over a very wide territory from which 11 counties reported production in 1925. The principal mining centres are McAlester, Henryetta, Wilburton, Harts-horne, Coalgate and Phillips.

The merchantable timber is mostly in the eastern part of the State, and consists largely of yellow pine, oak, red gum, elm, cottonwood and other hard woods. In 1925, according to the census of manufactures, there were 72 active saw-mills within the State, and the cut for the year was 157,580,000 board feet. Of this total 152,120,000 bd.ft. were soft woods, chiefly pine, and 5,460,000 bd.ft. were hard woods. Oak (3,287,000 bd.ft.) and red gum (1,023,000 bd. ft.) were chief among the hard woods. The lumber industry in 1925 gave employment to 1,879 persons and had a product valued at \$4,812,763.

Manufactures and Transport.—Oklahoma ranks high among the States of the Union in the production of raw materials; i.e., products of farms, forests and mines, which had in 1925 a value of approximately \$1,000,000,000; the total factory output was valued at \$405,295,440. The table shows the chief industries, the number of wage-earners employed and the value of their product in 1925:—

Industry	Number of establishments	Number of wage-earners	Value of product
			\$
State total	1,282	26,333	403,295,440
Petroleum refining	50	4,500	182,007,288
Flour and grain-mills	68	537	25,880,940
Cotton-seed oil, meal and cake	45	1,104	24,083,436
Smelting and refining zinc	7	1,924	21,047,969
Newspapers and periodicals	197	1,333	11,101,499
Bakery products	140	1,196	9,169,435
Foundry and machine-shops	63	1,255	9,006,214
Butter, cheese and condensed milk	31	191	6,772,948

The chief industrial centres of the State in 1925 were Oklahoma City, Tulsa and Muskogee.

The first railway in Oklahoma was that of the Missouri, Kansas and Texas, which completed a line across the territory to Denison, Texas, in 1872. The railway mileage, however, increased slowly until the territory was opened to white settlement (1889), and then, in a period of decades, increased by more than 4,600 miles. By 1925 the steam railway mileage had increased to 6,621, and had touched every county in the State except Cimarron. The principal lines crossing the State from north to south are the Missouri, Kansas and Texas, the St. Louis and San Francisco, the Atchison, Topeka and Santa Fe, two lines of the Chicago, Rock Island and Pacific, and the Kansas City, Mexico and Orient. The Chicago, Rock Island and Pacific also crosses the middle of the State from east to west. The 13 street and inter-urban electric railway companies operating in the State in 1925 had 371 m. of main track. Oklahoma has over 130,000 m. of public roads. Of this total 5,589 m. are included in the State-maintained highway system. By Jan. 1, 1927, 1,584.5 m. of the State highways had been surfaced.

History.—With the exception of the narrow strip north of the most northern section of Texas the territory comprising the present State of Oklahoma was set apart by Congress in 1834, under the name of Indian Territory, for the possession of the five southern tribes (Cherokees, Creeks, Seminoles, Choctaws and Chickasaws) and the Quapaw Agency. Early in 1809 some Cherokees in the south-eastern States made known to President Jefferson their desire to remove to hunting grounds west of the Mississippi, and at first they were allowed to occupy lands in what is now Arkansas, but by a new arrangement first entered into in 1828 they received instead, in 1838, a patent for a wide strip extending along the entire northern border of Indian Territory with the exception of the small section in the north-eastern corner which was reserved to the Quapaw Agency. By treaties negotiated in 1820, 1825, 1830 and 1842, the Choctaws received for themselves and the Chickasaws a patent for all that portion of the Territory which lies south of the Canadian and Arkansas rivers, and by treaties negotiated in 1824, 1833 and 1851 the Creeks received for themselves and the Seminoles a patent for the remaining or middle portion. Many of the Indians of these tribes brought slaves with them from the Southern States and during the Civil War they supported the Confederacy, but when that war was over the Federal Government demanded not only the liberation of the slaves but new treaties, partly on the ground that the tribal lands must be divided with the freedmen. By these treaties, negotiated in 1866, the Cherokees gave the United States permission to settle other Indians on what was approximately the western half of their domain; the Seminoles, to whom the Creeks in 1855 had granted as their portion the strip between the Canadian river and its North Fork, ceded all of theirs, and the Creeks, Choctaws and Chickasaws ceded the western half of theirs back to the United States for occupancy by freedmen or other Indians. In the eastern portion of the lands thus placed at its disposal by the Cherokees and the Creeks, the Federal Government within the next 17 years made a number of small grants as follows: to the Seminoles in 1866, to the Sacs and Foxes in 1867, to the Osages, Kansas, Pottawatomies, Absentee Shawnees and Wichitas in 1871-72, to the Pawnees in 1876, to the Poncas and Nez Percés in 1878, to the Otoes and Missouris in 1881, and to the Iowas and Kickapoos in 1883; in the south-western quarter of the Territory, also, the Kiowas, Comanches and Apaches were located in 1867 and the Cheyennes and Arapahoes in 1869. There still remained unassigned the greater part of the Cherokee Outlet besides a tract embracing 1,887,800 ac. of choice land in the centre of the Territory, and the agitation for the opening of this to settlement by white people increased until in 1889 a complete title to the central tract was purchased from the Creeks and Seminoles. Soon after the purchase President Benjamin Harrison issued a proclamation announcing that this land would be opened to homestead settlement at 12 o'clock noon, on April 22, 1889. At that hour, no less than 20,000 people were on the border, and when the signal was given there ensued a remark-

ably spectacular race for homes. In the next year that portion of Indian Territory which lay south of the Cherokee Outlet, and west of the lands occupied by the five tribes, together with the narrow strip north of Texas which had been denied to that State in 1850, was organized as the Territory of Oklahoma.

In the meantime negotiations were begun for acquiring a clear title to the unoccupied portion of the Cherokee Outlet for individual allotments to the members of the several small tribes who had received tribal allotments since 1866, and for the purchase of what remained after such individual allotments had been made. As these negotiations were successful most of the land between the tract first opened and that of the Creeks was opened to settlement in 1891, a large tract to the west of the centre was opened in 1892, a tract south of the Canadian river and west of the Chickasaws was opened in 1901, and by 1904 the entire Territory had been opened to settlement with the exception of a tract in the north-east which was occupied by the Osages, Kaws, Poncas and Otoes. By the treaties with the five southern tribes they were to be permitted to make their own laws so long as they preserved their tribal relations, but since the Civil War many whites had mingled with these Indians, gained control for their own selfish ends of such government as there was, and made the country a refuge for fugitives from justice. Consequently, in 1893, Congress appointed the Dawes Commission to induce the tribes to consent to individual allotments as well as to a government administered from Washington, and in 1898 the Curtis Act was passed for making such allotments and for the establishment of a Territorial Government. When the allotments were nearly all made Congress in 1906 authorized Oklahoma and Indian Territories to qualify for admission to the Union as one State. As both Territories approved, a constitutional convention (composed of 100 Democrats and 12 Republicans) met at Guthrie on Nov. 20, 1906. The Constitution framed by this body was approved by the electorate on Sept. 17, 1907, and the State was admitted to the Union on Nov. 16.

In politics Oklahoma has been consistently Democratic, but with a strong Republican minority. In the election of 1920 the Republican Party gained control of the house of representatives, while the senate, with half of its members holding over, remained Democratic. The Republicans were also successful in electing their candidate to the U.S. Senate. Governor Walton's excessive use of martial law in 1923 in suppressing alleged activities of the Ku Klux Klan—a national secret organization which had obtained a large membership in the State—brought about a movement for his impeachment. He was found guilty and removed from office after having served only a few months of the four-year term. Governor Johnston was similarly impeached in Jan., 1929.

The phenomenal progress made by Oklahoma during its few years of statehood is reflected in its excellent system of public education, in the care given to the poorer classes and in the improved State highways. Much of this progress has been made possible by the yield of the State's fertile soil, but in a larger measure by its rich mineral resources.

OKLAHOMA CITY, capital and largest city of Oklahoma, U.S.A., and county seat of Oklahoma county; on the North Cana-

(R. Grr.)

dian river, near the centre of the State. It is on Federal highways 66, 266, and 77, and the airway from Chicago to the Gulf; and is served by the Fort Smith and Western, the Frisco, the Missouri-Kansas-Texas, the Oklahoma, the Oklahoma City-Ada-Atoka, the Rock Island, the Santa Fe, and two belt railways. Pop. (1925) 139,947, estimated locally at 163,000 in 1928. It is one of the newest of the large cities. Only one in four of the population in 1920 had been born in the State, and the frontier characteristic of a predominance of males (104 to 100 females) still prevailed. Home-building was still going on in 1928 at the rate of one completed, on the average, every two hours of each working day. The site covers 19 sq.m. about 1,200 ft. above sea-level. The State Capitol (completed in 1917 at a cost of \$4,500,000) is an impressive colonnaded structure of white limestone, in 100 ac. of gardens and parkland. The large, modern public and business buildings are beautified with borders of turf and shrubbery. The residential streets are tree-lined and most of the houses set in spacious lawns and gardens. The city's parks and playgrounds cover 2,300 acres. Its water is supplied from Lake Overholser (10 m. N.W.), a reservoir of 1,700 ac. with two or three years' supply, built (1917-24) at a cost of \$6,000,000, and planned as the centre of a great park. At the south-east corner of the city are the State Fair Grounds of 160 acres. The city operates under a city-manager form of government, adopted in 1927. It is the seat of Oklahoma City University (Methodist Episcopal; established at Guthrie in 1911, superseding Epworth University) and of the medical school and hospital of the University of Oklahoma, which has its main seat at Norman (q.v.), 18 m. south. Equally accessible is the Central State Teachers' College at Edmond, 15 m. north. The city's public-school system represents an investment of \$9,000,000.

Oklahoma City is the commercial and financial metropolis of the State, the seat of a branch of the Federal Reserve bank, the home of insurance offices writing 75% of the policies in the State, and of wholesale houses distributing 75% of all the goods, 95% of the automobiles, trucks, and tractors, and 100% of the farm machinery and farm implements used throughout the State. It gins and markets a large part of the state's cotton crop ($\frac{1}{3}$ of the total grown in the country), and makes large quantities of cottonseed oil, meal, and cake; is an important market for horses (notably registered Percherons) and mules, and is the home of the South-West American Livestock Show; and has stockyards (at Packingtown, just outside the city limits) with a capacity of 31,000 head daily, and packing-plants with an annual output valued at over \$70,000,000. The nearest producing oilfield is 35 m. from the city, but many large operating companies have their headquarters here, and there are many supply houses doing a large business. The manufacturing industries had an output in 1927 valued at \$125,368,000. Building permits in 1927 represented values totalling \$16,238,714. Bank debits in 1927 aggregated \$1,251,251,000.

The site of Oklahoma City was opened to settlement on April 22, 1889. By night it had a population of 10,000 under tents. The city was chartered in 1890 and became the capital of the State in 1910. In less than 40 years from its birthday it had 51 public-school buildings, 117 churches, 245 m. of paved streets, 253 m. of water mains, over 35,000 telephones, 529 manufacturing plants, an assessed valuation (for 1928) of \$121,975,196; post-office receipts amounting in a year (1927) to \$1,616,346, and bank deposits (January 1, 1928) aggregating \$88,067,134.

OKMULGEE, a city of eastern Oklahoma, U.S.A., on Federal highway 75 and the Frisco and Okmulgee Northern railways; the county seat of Okmulgee county. Pop. (1920) 17,430 (78% native white and 19% negroes); 1928 local estimate 30,000. It is the centre of one of the greatest oil-producing regions of the world. Within an area of 2,123 sq.m. are some 6,000 producing wells, which supply 16% of the total output of the United States. The city has refineries using 20,000 bbl. of crude oil daily, plants making 200,000 gal. of gasoline daily from natural gas, window-glass plants employing 1,000 men and numerous other manufacturing industries. In a square in the heart of the city stands the Council house which was the capital of the Creek nation for half a century.

Okmulgee was settled about 1900. In 1910 it was still a little cattle town of 4,176 inhabitants. In the next decade the population increased more than fourfold and the town developed into a modern city. It was incorporated in 1912 under a commission-manager form of government.

OKU, YASUKATA, MARSHAL, COUNT (1846—), Japanese general, was born in Fukuoka-ken. He commanded the II. army in the Russo-Japanese War. In 1906-1912 he was chief of the general staff, and was made count in 1907 and marshal in 1911.

OKUBO TOSHIMITSU (1830-1878), Japanese statesman, a samurai of Satsuma, was one of the five great nobles who led the revolution in 1868 against the shogunate. He became one of the mikado's principal ministers, and in the Satsuma troubles which followed he was the chief opponent of Saigo Takamori. But the suppression of the Satsuma rebellion brought upon him the personal revenge of Saigo's sympathizers, and in the spring of 1878 he was assassinated by six clansmen. Okubo was one of the leading men of his day, and in 1872 was one of the Japanese mission which was sent round the world to get ideas for organizing the new régime.

OKUMA (SHIGENOBU), MARQUIS (1838-1922), Japanese statesman, was born in the province of Hizen in 1838. His father was an officer in the artillery. He was able to acquire in his youth a knowledge of English and Dutch, and by the help of missionaries he obtained books in those languages on scientific and political subjects. These works effected a complete revolution in his mind. He had been designed by his parents for the military profession, but he was determined to devote his energies to the abolition of the existing feudal system and to the establishment of a constitutional government. Though he took no active part in the revolution of 1868, the weight of his opinions was felt in the struggle. Already he was recognized as a coming man and no sooner was the government reorganized, with the mikado as the sole wielder of power, than he was appointed chief assistant in the department of foreign affairs. In 1869 he succeeded to the post of secretary of the joint departments of the interior and of finance, and for the next fourteen years he devoted himself to politics. In 1870 he was made a councillor of state, and a few months later became president of the commission which represented the Japanese government at the Vienna Exhibition. In 1872 he was again minister of finance, and was president of the commission appointed to supervise the Formosa campaign of 1874. The Japanese nation had supported him up to a certain point, but opinion now turned against him. When Okuma resigned office in the early 'eighties he established the Semmon Gakko, or school for special studies, and subsequently other schools.

In 1896-97 he was a member of the Matsukata cabinet. An attempted assassination by bomb necessitated the amputation of one of his legs. On Ito's retirement in 1898 he took office as premier and minister of foreign affairs. He resigned after a few months and retired into private life, cultivating his beautiful garden at Waseda near Tokyo. He emerged from his retirement in 1914 to become prime minister, in which capacity he guided the country through the opening months of the World War. In 1916, Count Okuma retired from office owing to his failing health. In the same year he was raised to a marquessate. He died at Tokyo on Jan. 10, 1922.

OLAF or **ANLAF** (d. 981), king of the Danish kingdoms of Northumbria and of Dublin, was a son of Sitric, king of Deira, and was related to the English king Aethelstan. He was of Norse descent, and he married a daughter of Constantine II., king of the Scots. When Sitric died about 927 Aethelstan annexed Deira, and Olaf took refuge in Scotland and in Ireland until 937, when he was one of the leaders of the formidable league of princes which was destroyed by Aethelstan at the famous battle of Brunanburh. Again he sought a home among his kinsfolk in Ireland, but just after Aethelstan's death in 940 he or Olaf Godfreyson was recalled to England by the Northumbrians. Both crossed over, and in 941 the new English king, Edmund, gave up Deira to the former. The peace between the English and the Danes did not, however, last long. Wulfstan, archbishop of York, sided with Olaf; but in 944 this king was driven from Northumbria by

Edmund, and crossing to Ireland he ruled over the Danish kingdom of Dublin. From 949 to 952 he was again king of Northumbria, until he was expelled once more, and he passed the remainder of his active life in warfare in Ireland. But in 980 his dominion was shattered by the defeat of the Danes at the battle of Tara. He went to Iona, where he died probably in 981, although one account says he was in Dublin in 994. This, however, is unlikely. In the sagas he is known as Olaf the Red.

This Olaf must not be confused with his kinsman and ally, OLAF (d. 941), also king of Northumbria and of Dublin, who was a son of Godfrey, king of Dublin. The latter Olaf became king of Dublin in 934; but he was in England in 937, as he took part in the fight at Brunanburh. After this event he returned to Ireland, but he appears to have acted for a very short time as joint king of Northumbria with Olaf Sitricsson. It is possible that he was the "Olaf of Ireland" who was called by the Northumbrians after Aethelstan's death, but both the Olafs appear to have accepted the invitation. He was killed in 941 at Tynningham near Dunbar.

See W. F. Skene, *Celtic Scotland* (1876); J. R. Green, *The Conquest of England* (1899).

OLAF I. TRYGGVESSÖN (969–1000), king of Norway, was born in 969, and began his career in exile. It is even said that he was bought as a slave in Estonia. After a boyhood spent in Novgorod under the protection of King Valdemar, Olaf fought for the emperor Otto III. under the Wendish king Burislav, whose daughter he had married. On her death he raided the coasts of France and the British Isles, until he was converted to Christianity by a hermit in the Scilly Islands, and his marauding expeditions ceased since he would not harry those of his new faith. He married Gyda, sister of Olaf Kvaran, king of Dublin, and administered her property in England and Ireland for some time before he sailed for Norway, then restive under its ruler Earl Haakon. He was unanimously accepted as king of Norway (995), and began the conversion of the country to Christianity. Possibly Olaf's ambition was to rule a united, as well as a Christian, Scandinavia. He made overtures of marriage to Sigrid, queen of Sweden, and increased his fleet, but she clung to her heathen faith. He made an enemy of her, and involved himself in a quarrel with King Sveyn of Denmark by marrying his sister Thyre, who had fled from her heathen husband Burislav in defiance of her brother's authority. Both his Wendish and his Irish wife had brought Olaf wealth and good fortune, but Thyre brought him ill luck; in an expedition (1000) to wrest her lands from Burislav he was waylaid off the island Svöld, near Rügen, by the combined Swedish and Danish fleets, together with the ships of Earl Haakon's sons.

The battle ended in the annihilation of the Norwegians. Olaf fought to the last on his great vessel, the "Long Snake," the mightiest ship in the North, and finally leapt overboard and was no more seen. Full of energy and daring, skilled in the use of every kind of weapon, genial and open-handed to his friends, implacable to his enemies, Olaf's personality was the ideal of the heathendom which he repudiated and oppressed. After his death he remained the hero of his people, who looked for his return. "But however that may be," says the story, "Olaf Tryggvesson never came back to his kingdom in Norway."

OLAF (II.) HARALDSSÖN (995–1030), king of Norway from 1016–1029, called during his lifetime "the Fat," and afterwards known as St. Olaf, was born in 995, the year in which Olaf Tryggvesson came to Norway. After some years' absence in England, fighting the Danes, he returned to Norway in 1015 and declared himself king, obtaining the support of the five petty kings of the Uplands. In 1016 he defeated Earl Sveyn, hitherto the virtual ruler of Norway, at the battle of Nesje, and within a few years had won more power than had been enjoyed by any of his predecessors. He had annihilated the petty kings of the South, had crushed the aristocracy, enforced the acceptance of Christianity throughout the kingdom, asserted his suzerainty in the Orkney Islands, had humbled the king of Sweden and married his daughter in his despite, and had conducted a successful raid on Denmark. But in 1029 the Norwegian nobles, seething with

discontent, rallied round the invading Knut the Great, and Olaf fled to Russia. On his return a year later he fell at the battle of Stiklestad, where his own subjects were arrayed against him. After his death his cunning and cruelty which marred his character were forgotten, and his services to his church and country remembered. Miracles were worked at his tomb, and in 1164 he was canonized and was declared the patron saint of Norway, whence his fame spread throughout Scandinavia and even to England, where churches are dedicated to him. The Norwegian order of knighthood of St. Olaf was founded in 1847 by Oscar I., king of Sweden and Norway, in memory of this king.

ÖLAND, an island in the Baltic sea, next to Gotland the largest belonging to Sweden, stretching for 85 m. along the east coast of the southern extremity of that country, from which it is separated by Kalmar Sound which is from 5 to 15 m. broad. The greatest breadth of the island is 10 m., and its area 519 sq.m. The centre of the island is more densely populated than either end. The only large town is Borgholm with about 10,000 inhabitants (1928). For administrative purposes the island is included in the Kalmar län. From the raid of Ragnar Lodbrok's sons in 775 Öland is frequently mentioned in Scandinavian history, and especially as a battleground in the wars between Denmark and the northern kingdoms. In the middle ages it formed a separate legislative and administrative unity. A number of monuments of unknown age exists, including stones (*stensättningar*) arranged in groups to represent ships. Borgholm has one of the finest castle ruins in Sweden. The town was founded in 1817, but the castle, dating at least from the 13th century, was one of the strongest fortresses, and afterwards one of the most stately palaces in the country. The inhabitants were formerly styled Öningar, and show considerable diversity of origin in the matter of speech, local customs and physical appearance.

The island consists for the most part of Silurian limestone, and thus forms a striking contrast to the mainland with its granite and gneiss. Down the west side runs a limestone ridge, rising usually in terraces, but at times in steep cliffs, to a height of 200 ft.; and along the east side there is a parallel ridge of sand, resting on limestone, never exceeding 90 feet. These ridges, known as the Western and Eastern Landborgar, are connected towards the north and the south by belts of sand and heath; and the hollow between them is occupied by a desolate and almost barren tract: the southern portion, or Alfvar (forming fully half of the southern part of the island), presents a surface of bare red limestone characteristically weathered. The northern portion is covered with hazel bushes. Outside the ridges, however, Öland is well wooded, while the narrow strip of alluvial coast-land is good agricultural country. There are a few small streams in the island and one lake, Hornsjö, about 3 m. long.

OLAUS MAGNUS or **MAGNI** (1490–1558) (*Magnus*, i.e., *Stora*, great, being the family name, and not a personal epithet), Swedish ecclesiastic and author, followed his brother, Johannes Magnus, archbishop of Uppsala, to Rome in 1527. Most of his life, after his brother's death, seems to have been spent in the monastery of St. Brigitta in Rome, where he subsisted on a pension assigned him by the pope. He wrote the famous *Historia de Gentibus Septentrionalibus* (Rome, 1555), a work which long remained for the rest of Europe the chief authority on Swedish matters and is still a repository of much curious information.

The *Historia* was translated into Italian (Venice, 1565), German (Strassburg, 1567), English (London, 1658) and Dutch (Amsterdam, 1665); abridgments of the work appeared also at Antwerp (1558 and 1562), Paris (a French abridged version, 1561), Amsterdam (1586), Frankfurt (1618) and Leiden (1652). Olaus also wrote a *Tabula terrarum septentrionalium* . . . (Venice, 1539).

OLBERS, HEINRICH WILHELM MATTHIAS (1758–1840), German astronomer, was born on Oct. 11, 1758, at Arbergen, a village near Bremen, where his father was minister. He studied medicine at Göttingen, 1777–80, attending at the same time Kaestner's mathematical course. In 1779 he devised a new method of calculating cometary orbits. The treatise containing this important invention was made public by Baron von Zach under the title *Ueber die leichteste und bequemste Methode die Bahn eines Cometen zu berechnen* (Weimar, 1797). A table of 87

calculated orbits was appended, enlarged by Encke in the second edition (1847) to 178, and by Galle in the third (1864) to 242. In 1781, Olbers settled as a physician in Bremen, where he practised till his retirement on Jan. 1, 1823. The greater part of each night was meantime devoted to astronomy, the upper portion of his house being fitted up as an observatory. He paid special attention to comets, and that of 1815 (period 74 years) bears his name in commemoration of its detection by him. He also took a leading part in the discovery of the minor planets, rediscovering Ceres on Jan. 1, 1802, and discovering Pallas on March 28 following. His hypothesis of their origin by the disruption of a primitive large planet (*Monatliche Correspondenz*, vi. 88), seemed to gain confirmation by the finding of Juno by Harding, and of Vesta by himself, in regions indicated by the hypothesis. Olbers was deputed by his fellow-citizens to assist at the baptism of the king of Rome on June 9, 1811, and he was a member of the *corps législatif* in Paris (1812-13). He died on March 2, 1840. He was twice married, and one son survived him.

See *Biographische Skizzen verstorbener Bremischer Aerzte*, by Dr. G. Barkhausen (Bremen, 1844); *Allgemeine geographische Ephemeriden*, iv. 283 (1799); *Abstracts Phil. Trans.* iv. 268 (1843); *Astronomische Nachrichten*, xxii. 265 (Bessel), also appended to A. Erman's *Briefwechsel zwischen Olbers und Bessel* (2 vols., Leipzig, 1852); *Allgemeine deutsche Biographie* (S. Günther). The first two volumes of Dr. C. Schilling's exhaustive work, *Wilhelm Olbers, sein Leben und seine Werke*, appeared at Berlin in 1894 and 1900, a third and later volume including his personal correspondence and biography. A list of Olbers's contributions to scientific periodicals is given at p. xxv. of the 3rd ed. of his *Leichteste Methode*, and his unique collection of works relating to comets now forms part of the Pulkowa library.

OLD AGE PENSIONS. The royal commission on the Aged Poor was appointed in 1893 "to consider whether any alterations in the system of poor law relief are desirable, in the case of persons whose destitution is occasioned by incapacity for work resulting from old age, or whether assistance could otherwise be afforded in these cases." The commission considered three main schemes for the provision of old age pensions, viz., pensions paid from imperial taxation, compulsory insurance and the system of state-aided voluntary insurance supported by Joseph Chamberlain. The commission, which reported in 1895, was unable to recommend the adoption of any of these proposals. Several committees were afterward set up to consider the question but little progress was made.

Such was the position when H. H. Asquith (afterwards Lord Oxford) in his budget speech of 1907 pledged the Liberal Government to deal with the question in the following session, fulfilling that pledge in the Old Age Pensions Act of 1908.

The Act of 1908.—Under that act, which was admittedly of an experimental and tentative character, the statutory conditions for the receipt of an old age pension were (a) the person must have attained the age of 70; (b) he must have been a British subject for the last 20 years and have had his residence during that period in the United Kingdom and (c) his yearly means must not exceed £31.10. The following persons were disqualified even if the statutory conditions were fulfilled: (1) persons who were in receipt of Poor Law relief (other than medical or surgical relief); (2) persons who have been convicted of any offence and ordered to be imprisoned without the option of a fine—while in prison and for a further period of 10 years; (3) persons convicted in certain cases under the Inebriates Act, 1898; (4) persons detained in any asylum within the meaning of the Lunacy Act, or maintained in any place as pauper or criminal lunatics; (5) persons who had habitually failed to work according to their ability, opportunity and need for their maintenance and the maintenance of their dependants. The maximum rate of pension was 5/- a week and was payable when the yearly means did not exceed £21. The rate fell by 1/- a week for every £2.12.6. by which the means exceeded £21, the minimum rate of 1/- a week being payable when the means exceeded £28.17.6. but did not exceed £31.10.0. When the claimant was one of a married couple living together in the same house, his means were to be taken as not less than half the total means of the couple.

The abnormal conditions existing during the Great War led to certain administrative modifications in the scheme; an additional

allowance of 2/6d. a week was made to every pensioner and pensions were not subject to adjustment on account of an increase of means arising from (1) separation allowances and allotments, (2) allowances from voluntary sources not exceeding 5/- a week and (3) earnings so long as the total means did not exceed 30/- a week. These emergency arrangements were terminable as soon as legislation could be obtained amending the statutory scheme, and in 1919 a departmental committee, with Sir W. Ryland Adkins, M.P., as chairman, was appointed "to consider and report what alterations, if any, as regards rates of pension or qualification should be made in the existing statutory scheme of old age pensions."

While the committee decided not to recommend any modification of the age at which a pension should become payable, this section of their report is of interest because it involved consideration of the relationship between the old age pensions scheme and the national health insurance scheme which was instituted in 1912. (See NATIONAL INSURANCE: *Health*.) The committee expressed the opinion that on financial and other grounds it was desirable to deal with the problem of lowering the pensionable age by an adaptation of the contributory system of insurance, and in this respect foreshadowed the scheme which was ultimately embodied in the Contributory Pensions Act, 1925. The committee unanimously recommended that the receipt of outdoor relief should not be a disqualification for the receipt of a pension and that the maximum rate of pension should be increased to 10/- a week, so that the pre-war purchasing power of the pension should be restored.

The Act of 1919.—The Old Age Pension Act, 1919, was passed to give effect to such of the recommendations of the committee as were adopted by the Government. The abolition of the means test did not find a place in the act. Apart from the important modifications made by the act of 1924 (see below) the conditions attaching to old age pensions at 70, where title does not arise by virtue of the Contributory Pensions Act, 1925, have remained unchanged up to 1928. These conditions are that the applicant has (1) reached the age of 70; (2) been a British subject for the last 10 years; (3) been resident in the United Kingdom for a period, in the case of natural-born British subjects, of at least 12 years since attaining the age of 50 and, in the case of naturalised British subjects, of 20 years in the aggregate; (4) the yearly means

	£.	s.	d.	
Must not exceed	26	5	0	for a 10- pension
" "	31	10	0	" 8- "
" "	36	15	0	" 6- "
" "	42	0	0	" 4- "
" "	47	5	0	" 2- "
" "	49	17	6	" 1- "

In calculating the means from investments, etc., the first £25 of the value of the investments, etc., is allowed free, the means from the next £375 are calculated at 5%, and from the balance (if any) at 10%.

A person is disqualified for receiving a pension (a) while he is an inmate of a poor law institution, unless he has become an inmate for the purpose of obtaining medical or surgical treatment, when there is no disqualification up to a maximum period of three months from date of admission so long as treatment continues; (b) while he is serving a sentence of imprisonment without the option of a fine or of penal servitude; (c) while he is detained in an asylum within the meaning of the Lunacy Acts or is being maintained in any place as a pauper or criminal lunatic.

The Act of 1924.—A short act passed by the Labour Government in 1924 made an important modification in the means test and was directed to meet certain of the criticisms which had led the Ryland Adkins committee to recommend universal old age pensions. This act provided that from the means of a claimant as calculated under the earlier acts a deduction should be made up to a maximum of £39 of such part as was not derived from earnings. As a result of this act a claimant's means may amount to £65.5.0. without his suffering any reduction of pension provided his earnings do not exceed £26.5.0. while the minimum pension of 1/- a week may be drawn by a person whose means do not

exceed £88.17.6. if not more than £49.17.6. comes from earnings.

The Blind Persons Act, 1920, provided pensions at the age of 50 for persons who are so blind as to be unable to perform any work for which eyesight is essential on the same terms and conditions, apart from age, as are applicable to old age pensions.

Administration.—Claims for old age pensions under the Acts of 1908 to 1924 are decided by local pensions committees appointed for every county and for every borough and urban district. Every claim is investigated by the pension officer, an official of the Customs and Excise department who recommends to the local committee that the claim be admitted or rejected. An aggrieved claimant has a right of appeal to the minister of health.

The pension is paid weekly at the post office selected by the pensioner.

Statistics.—On March 31, 1911, the number of pensioners was 705,678. Three years later this number had grown to 781,929. During the war years the number of pensioners declined slightly as a consequence of the scarcity of civilian labour and the high rates of wages current, but by March 31, 1920, there were 785,833 pensioners. From this year onwards the number increased with regularity, and by March 31, 1924, it had grown to 916,771. As a consequence of the Act of 1924 the increases in the following years were abnormal and by March 31, 1926, the number of pensioners had become 1,071,093. On March 31, 1928, the number of pensions under the Acts of 1908–1924 had fallen to 995,978 (of which 972,621 were at the rate of 10/- a week). The reasons for this decline were the new qualifications embodied in the act of 1925.

The insistent demand for the lowering of the pensionable age, the rapidly mounting cost of old age pensions, and the agitation for the removal of the means test combined to direct attention to the principle of contributory insurance and as a result the Conservative Government in the Widows', Orphans', and Old Age Contributory Pensions Act, 1925 (see NATIONAL INSURANCE: *Widows' and Orphans' Pensions*), adopted that method.

Widows', Orphans' and Old Age Contributory Pensions Act, 1925.—The persons within the scope of the old age pensions scheme embodied in the act are those who are insured, whether as employed or as voluntary contributors under the national health insurance scheme. (See NATIONAL INSURANCE: *Health*.) In addition a certain number of persons whose employment is excepted from health insurance are compulsorily insured for old age pensions, although the majority of persons in "excepted employment" are excepted from insurance for old age pensions. Persons who cease to be compulsorily insurable have the option of continuing to be insured as voluntary contributors provided certain conditions are satisfied.

The normal rate of contribution under the act—9d. for a man and 4½d. for a woman—includes the contribution for widows' and orphans' pensions. Every person who is insured for old age pensions is insurable for widows' and orphans' pensions but certain persons are insured for the latter purposes only and pay a reduced contribution, man 7d. woman 3½d., so that 2d. in the case of a man and 1d. in the case of a woman is the share of the combined contribution which is attributable to old age pensions between the ages of 65 and 70. (The contribution arrangements under the act of 1925 are explained in greater detail in the article NATIONAL INSURANCE: *Widows' and Orphans' Pensions*.)

The act provides old age pensions at the uniform rate of 10/- a week, to insured men and insured women while between the ages of 65 and 70, and to the wives between these ages of insured men who are themselves entitled to pensions. An insured person claiming a pension must show (a) that he has been continuously insured for 5 years at the date when he attained the age of 65; (b) that 104 contributions have been paid; (c) that over the last three "contribution years"—running from July to June—preceding his 65th birthday an average of 39 contributions a year was paid (for this purpose weeks of incapacity and weeks of genuine unemployment are counted as weeks for which contributions were paid; (d) that he has been resident in Great Britain for the two years immediately preceding his 65th birthday and that his last employment (excluding temporary employment) was in Great Britain. Special provision is made for a person who on attaining

the age of 65 has not been continuously insured for five years. He becomes entitled to a pension at the expiration of five years from the date of his entry into insurance if he is then under the age of 70, provided the other conditions, which are applied with reference to the date on which he completes five years of insurance and not to his 65th birthday, are satisfied. Although contributions cease to be paid by him when he attains 65, the employer's contribution continues to be payable so long as he is employed and these contributions will count for the purposes of conditions (b) and (c) above.

The provisions of the act relating to the payment of old age pensions to persons between the ages of 65 and 70 took effect from Jan. 2, 1928, two years after the date when the Act came into operation. The initial group of pensioners consisted of persons who on Jan. 2, 1928, were over the age of 65 and under the age of 70 with certain modifications of the statutory conditions.

The disqualifications for the receipt of a pension are the same as those under the acts of 1908 to 1924. (See p. 760 under act of 1919).

Unrestricted Old Age Pensions at 70.—A person who is entitled under the Act of 1925 to an old age pension while between the ages of 65 and 70 becomes, on attaining 70, entitled by virtue of the act to an old age pension at the rate of 10/- a week without regard to his means. The act also provides an unrestricted old age pension at 70 for a woman who has been receiving a widow's pension.

For insured persons who attained the age of 70 before Jan. 2, 1928, the date when old age pensions to persons between the ages of 65 and 70 began to be payable, the act also granted unrestricted old age pensions at 70. The wife or widow of an insured person entitled to one of these pensions was herself entitled to an unrestricted old age pension on attaining 70. To secure the benefit of this provision, which took effect from July 2, 1926, it had to be shown that the claimant had been insured under the National Health Insurance Act on April 29, 1925, the date of the introduction of the Pensions bill, and remained insured until he attained 70. As a person who was insured on attaining 70, at which age contributions ceased to be payable under the National Health Insurance Act, remained an insured person for life, all persons who attained 70 before April 29, 1925, and were insured on reaching that age possessed the necessary insurance qualification and became entitled to unrestricted old age pensions as from July 2, 1926. Thus one important effect of the act of 1925, in the case of persons within its scope, including the wives and widows of insured men, is to remove the means test imposed by the acts of 1908 to 1924 as regards old age pensions at 70. In the last week of March, 1928, 287,531 persons who had established their title on an insurance basis were in receipt of pensions.

Administration.—In England and Wales the old age pension scheme embodied in the act of 1925 is administered by the minister of health and in Scotland by the Scottish Board of Health. Claim forms are obtainable at all post offices and claims may be made within four months before attaining pensionable age. Unsuccessful applicants have a right of appeal to an independent body of referees. By the end of March, 1928, 524,828 pensions had been awarded to persons between the ages of 65 and 70.

Reciprocal arrangements have been made between Great Britain and Northern Ireland under which qualifications acquired in one country are of equal value in the other on change of residence.

Decennial Increases of Contributions.—The contribution payable under the Act of 1925—9d. for a man and 4½d. for a woman—is based on the amount actuarially required to provide widows' and orphans' pensions and old age pensions between the ages of 65 and 70 in the case of a person entering insurance at the age of 16, the excess cost arising in the case of persons entering at higher ages being borne by the exchequer. The cost of unrestricted old age pensions at 70 to which insured persons become entitled by virtue of the act remains an exchequer charge, but the act contains a provision under which, ultimately, the persons entering into insurance at the age of 16 will, with their employers, pay a contribution of equal value with the benefits provided for them, including the pension at 70. Provision is made

for three decennial increases of contributions. In Jan. 1936, the contribution is to be increased by 2d. a week for a man and 1d. a week for a woman, and similar increases are to be made at the beginning of 1946 and 1956, so that from the latter year the contribution will be 1s. 3d. for a man and 7½d. for a woman.

British Dominions.—In the Irish Free State the non-contributory scheme identical with that of Great Britain which was in existence before the severance was continued but certain modifications were made in 1924 in the rates of pension and in the amount of means entitling to pension. The maximum rate of pension was fixed at 9/- a week and is payable where the yearly means of the pensioner do not exceed £18.5.

As regards the overseas Dominions New Zealand was in advance of the mother country in establishing a scheme of non-contributory old age pensions, her scheme having been inaugurated in 1898. A non-contributory scheme operates also in Australia. In Australia the pensionable age is 65, in New Zealand 65 for men and 60 for women. The maximum rate of pension is £1 a week in Australia and 17/6 a week in New Zealand. In both cases a means test is applied, while in Australia the scheme is combined with a scheme of invalidity pensions. In 1927 the Dominion parliament of Canada passed an Act which provided for the payment by the Dominion Government of one-half of the cost of old age pensions in any province which adopted a scheme in accordance with the provisions of the act. The pensionable age is 70. British Columbia was the first province to establish a scheme and pensions have been paid in that province since Sept. 1927. Saskatchewan and Manitoba have also set up schemes in accordance with the Act. An announcement has been made by the Government of South Africa that it proposes to set up a non-contributory scheme of old age pensions on Jan. 1, 1929, with 65 as the pensionable age.

European Countries.—Non-contributory schemes are in force in Denmark, France and Norway. In Denmark the pensionable age is 65 and in France and Norway 70. Contributory schemes are, however, more prevalent. Germany led the way by establishing a contributory scheme in 1889 under which workman and employer paid the premium, the State adding a subvention. Her example was generally followed by those countries which established schemes after the World War. Separate schemes of old age pensions exist in Belgium and Spain but in the majority of countries the old age pension scheme is combined with a scheme of invalidity pensions. (See NATIONAL INSURANCE: *Invalidity*.) Combined schemes are in operation in Bulgaria, Czechoslovakia, France (which, as stated above, has also a non-contributory scheme), Germany, Holland, Greece, Italy, Luxemburg, Poland, Portugal, Rumania, Serb-Croat-Slovene kingdom, Sweden and in the Canton of Glarus in Switzerland.

The age of 65 has been adopted by many countries as the age at which the old age pension becomes payable but in Bulgaria, France and Poland the pensionable age is 60, in Sweden 67, and in Holland and the Serb-Croat-Slovene kingdom 70.

America.—Of the South American countries, Chile has a contributory scheme of old age pensions combined with invalidity pensions. Old age pension is payable at the age of 65. Uruguay has a non-contributory scheme combining old age and invalidity pensions, the old age pension being payable at 60. (See PENSIONS IN THE UNITED STATES.)

BIBLIOGRAPHY.—The *Report of the Departmental Committee on Old Age Pensions* (Cmd. 410, H.M. Stationery Office) reviews the position from the commencement of the Act of 1908 and considers various suggestions for amendment. The *Report of the Government Actuary on the Financial Provisions of the Contributory Pensions Bill, 1925* (Cmd. 2406, H.M. Stationery Office) contains a detailed explanation of the financial basis and an appendix on the statistical basis of the estimate. *General Problems of Social Insurance* (International Labour Office of League of Nations) reviews the position and principles of social insurance. OLDBURY, an urban district of Worcestershire, England, 5 m. W. of Birmingham served by L.M.S. and by the Birmingham canal. Pop. (1921) 16,609. Coal, iron and limestone abound in the neighbourhood, and the town possesses alkali and chemical works, railway-carriage works, iron and steel works and brick and tile kilns. The urban district includes Langley and Warley.

OLDCASTLE, SIR JOHN (d. 1417), English Lollard leader, son of Sir Richard Oldcastle of Almeley, Herefordshire, served in the expedition to Scotland in 1400. Next year he was in charge of Builth castle in Brecon, and serving all through the Welsh campaigns won the friendship and esteem of Henry, the prince of Wales. Oldcastle represented Herefordshire in the parliament of 1404. Four years later he married Joan, the heiress of Cobham, and was thereon summoned to parliament as Lord Cobham in her right. Oldcastle held a high command in the expedition which the young Henry sent to France in 1411. Oldcastle had adopted Lollard opinions before 1410, when the churches on his wife's estates in Kent were laid under interdict for unlicensed preaching. In the convocation which met in March 1413, shortly before the death of Henry IV., Oldcastle was at once accused of heresy. But his friendship with the new king prevented any decisive action till evidence was found in a book belonging to Oldcastle, which was discovered in a shop in Paternoster row. He was convicted as a heretic Sept. 25. Henry granted a respite of 40 days in the hope of saving his old friend.

Before that time had expired Oldcastle escaped from the Tower by the help of one William Fisher, a parchment-maker of Smithfield (Riley, *Memorials of London*, 1868). He now put himself at the head of a widespread Lollard conspiracy. The design is said to have included the seizure of the king and his brothers during a Twelfth-night mumming at Eltham. Henry, forewarned, removed to London, and when the Lollards assembled in force in St. Giles's Fields on Jan. 10, they were easily dispersed. Oldcastle himself escaped into Herefordshire, and for nearly four years avoided capture. He took part in several conspiracies. In November 1417 he was captured by the Lord Charlton of Powis. On Dec. 14, he was formally condemned, on the record of his previous conviction, was hanged that same day in St. Giles's Fields, and burnt "gallows and all." Oldcastle died a martyr. At the same time his execution can be justified on political grounds. His opinions and early friendship with Henry V. created a traditional scandal which long continued. In the old play *The Famous Victories of Henry V.*, written before 1588, Oldcastle figures as the prince's boon companion. When Shakespeare adapted that play in *Henry IV.*, Oldcastle still appeared; but when the play was printed in 1598 Falstaff's name was substituted, in deference, as it is said, to the then Lord Cobham. Though the fat knight still remains "my old lad of the Castle," the stage character has nothing to do with the Lollard leader.

BIBLIOGRAPHY.—The record of Oldcastle's trial is printed in *Fasciculi Zizaniorum* (Rolls series) and in Wilkins's *Conclia*, iii. 351-357. The chief contemporary notices of his later career are given in *Gesta Henrici Quinti* (Eng. Hist. Soc.) and in Walsingham's *Historia Anglicana*. There have been many lives of Oldcastle, mainly based on *The Actes and Monuments of John Foxe*, who in his turn followed the *Briefe Chronycle* of John Bale, first published in 1544. For notes on Oldcastle's early career, consult J. H. Wylie, *History of England under Henry IV.* For literary history see the Introductions to Richard James's *Iter Lancastrense* (Chetham Soc., 1845) and to Grosart's edition of the *Poems of Richard James* (1880). See also W. Barske, *Oldcastle-Falstaff in der englischen Literatur bis zu Shakespeare* (Palaestra, I. Berlin, 1905); and W. T. Waugh in the *English Historical Review*, vol. xx.

OLD CATHOLICS, the designation assumed by those members of the Roman Catholic Church who refused to accept the decrees of the Vatican Council of 1870 defining the dogma of papal infallibility (see VATICAN COUNCIL and INFALLIBILITY) and ultimately set up a separate ecclesiastical organization on the Episcopal model. The Old Catholic movement, at the outset at least, differed fundamentally from the Protestant Reformation of the 16th century in that it aimed not at any drastic changes in doctrine but at the restoration of the ancient Catholic system, founded on the diocesan episcopate, which under the influence of the ultramontane movement of the 19th century had been finally displaced by the rigidly centralized system of the papal monarchy. In this respect it represented a tendency of old standing within the Church and one which, in the 18th century, had at last gained the upper hand (see FERRONIANISM and GALICANISM).

The proceedings of the Vatican council and their outcome

had at first threatened to lead to a serious schism in the Church. The minority against the decrees included many of the most distinguished prelates and theologians of the Roman communion, but in the end all the recalcitrant bishops gave in their adhesion to the decrees.

Initial Steps.—The universities, being less directly under the control of the Church, were prepared to show a bolder front. Dr. J. F. von Schulte, professor at Prague, was one of the first to publish a formal protest. A meeting of Catholic professors and distinguished scholars convened at Nuremberg (August 1870) recorded a like dissent, and resolved on the adoption of measures for bringing about the assembling of a really free council north of the Alps. The *Appel aux Evêques Catholiques* of M. Hyacinthe Loyson (better known as "Père Hyacinthe") appealed to the Catholic bishops throughout the world to put an end to the schism by declaring whether the recent decrees were or were not binding on the faith of the Church. This appeal, on its appearance in *La Liberté* early in 1871, was suppressed by the order of the king of Italy. On the 28th of March Döllinger, in a letter of some length, set forth the reasons which compelled him also to withhold his submission alike as "a Christian, a theologian, an historical student and a citizen." The publication of this letter was shortly followed by a sentence of excommunication pronounced against Döllinger and Professor Johannes Friedrich and read to the different congregations from the pulpits of Munich. The professors of the university, on the other hand, had shortly before evinced their resolution of affording Döllinger all the moral support in their power by an address (April 3, 1871) in which they denounced the Vatican decrees with unsparing severity. (Friedberg, *Aktenstücke z. ersten vaticanischen Concil*, p. 187.) In the following September the demand for another and a free council was responded to by the assembling of a congress at Munich. It was composed of nearly 500 delegates, convened from almost all parts of the world; but the Teutonic element was now as manifestly predominant as the Latin element had been at Rome. The proceedings were presided over by Professor von Schulte, and lasted three days. Among those who took a prominent part in the deliberations were Döllinger, Reinkens, Maassen (professor of canon law at Vienna), Friedrich and Huber. The arrangements finally agreed upon were mainly provisional; but one of the resolutions plainly declared that it was desirable if possible to effect a reunion with the Oriental Greek and Russian Churches, and also to arrive at an "understanding" with the Protestant Episcopal communions. Döllinger, in delivering his inaugural address as rector of the university of Munich, expressed his conviction that theology had received a fresh impulse and that the religious history of Europe was entering upon a new phase.

Other circumstances contributed to invest Old Catholicism with additional importance. It was evident that the relations between the Roman Curia and the Prussian government were becoming extremely strained. In February, 1872, appeared the first measures of the Falk ministry, having for their object the control of the influence of the clergy in the schools, and in May the pope refused to accept Cardinal Hohenlohe, who during the council had opposed the definition of the dogma, as Prussian minister at the Vatican. Congregations of Old Catholics were formed at numerous towns and villages in Bavaria, Baden, Prussia, German Switzerland, and even in Austria. At Warningsdorf in Bohemia a congregation was collected which still represents one of the most important centres of the movement. In September the second congress was held at Cologne. It was attended by some 500 delegates or visitors from all parts of Europe, and the English Church was represented by the bishops of Ely and Lincoln and other distinguished members.

Organization.—The movement thus entered a new phase, the congress occupying itself mainly with the formation of a more definite organization and with the question of reunion with other Churches. The immediate effect was a fateful divergence of opinion; for many who sympathized with the opposition to the extreme papal claims shrank from the creation of a fresh

schism. Prince Chlodwig Hohenlohe, who as prime minister of Bavaria had attempted to unite the governments against the definition of the dogma, refused to have anything to do with proceedings which could end only in the creation of a fresh sect, and would make the prospect of the reform of the Church from within hopeless; more important still, Döllinger refused to take part in setting up a separate organization, and though he afterwards so far modified his opinion as to help the Old Catholic community with sympathy and advice, he never formally joined it.

Meanwhile, the progress of the quarrel between the Prussian government and the Curia had been highly favourable to the movement. In May, 1873, the celebrated Falk laws were enacted, whereby the articles 15 and 18 of the Prussian constitution were modified, so as to legalize a systematic state supervision over the education of the clergy of all denominations, and also over the appointment and dismissal of all ministers of religion. The measure, which was a direct response to the Vatican decrees, inspired the Old Catholics with a not unreasonable expectation that the moral support of the government would henceforth be enlisted on their side. On the 11th of August Professor J. H. Reinkens of Breslau, having been duly elected bishop of the new community, was consecrated at Rotterdam by Bishop Heykamp of Deventer, the archbishop of Utrecht, who was to have performed the ceremony, having died a few days before. In the meantime the extension of the movement in Switzerland had been proceeding rapidly, and it was resolved to hold the third congress at Constance. The proceedings occupied three days (12th to 14th September), the subjects discussed being chiefly the institution of a synod as the legislative and executive organ of the Church, and schemes of reunion with the Greek, the African and the Protestant communions.

The First Synod.—The following year (1874) was marked by the assembling of the first synod and a conference at Bonn, and of a congress at Freiburg-im-Breisgau. At the congress Bishop Reinkens spoke in hopeful terms of the results of his observations during a recent missionary tour throughout Germany. The conference, held on the 14th, 15th and 16th of September, had for its special object the discussion of the early confessions as a basis of agreement, though not necessarily of fusion, between the different communions above-named. The meetings, which were presided over by Döllinger, successively took into consideration the *Filioque* clause in the Nicene creed, the sacraments, the canon of Scripture, the episcopal succession in the English Church, the confessional, indulgences, prayers for the dead, and the eucharist (see DÖLLINGER). The synod (May 27-29) was the first of a series in which the doctrine and discipline of the new Church were gradually formulated. The tendency was, naturally, to move further and further away from the Roman model; and though the synod expressly renounced any claim to formulate dogma, or any intention of destroying the unity of the faith, the "Catholic Catechism" adopted by it in 1874 contained several articles fundamentally at variance with the teaching of Rome. At the first synod, too, it was decided to make confession and fasting optional, while later synods pronounced in favour of using the vernacular in public worship, allowing the marriage of priests, and permitting them to administer the communion in both kinds to members of the Anglican Church attending their services.

The new alliance between Bismarck and Pope Leo XIII. against revolutionary Socialism, deprived the Old Catholics of the special favour which had been shown them by the Prussian government; they continued, however, to enjoy the legal status of Catholics, and their communities retained the rights and the property secured to them by the law of the 4th of July 1875. In Bavaria, on the other hand, they were in March, 1890, after the death of Döllinger, definitely reduced to the status of a private religious sect, with very narrow rights. When Bishop Reinkens died in January, 1896, his successor Theodor Weber, professor of theology at Breslau, elected bishop on the 4th of March, was recognized only by the governments of Prussia,

Baden and Hesse.

BIBLIOGRAPHY.—An outline of the whole movement up to the year 1875 will be found in *The New Reformation*, by "Theodorus" (J. Bass Mullinger); and an excellent résumé of the main facts in the history of the movement in each European country, as connected with other developments of liberal thought, and with political history, is given in the second volume of Dr. F. Nippold's *Handbuch der neuesten Kirchengeschichte*, vol. ii. (1883). See also A. M. E. Scarth, *The Story of the Old Catholic and Kindred Movements* (London, 1883); Bühler, *Der Altkatholicismus* (Leiden, 1880); J. F. von Schulte, *Der Altkatholicismus* (Giessen, 1887); and article in Herzog-Hauck's *Realencyk. für prot. Theol. und Kirche*, i. 415. For details the following sources may be consulted: (a) For the proceedings of the successive congresses: the *Stenographische Berichte*, published at Munich, Cologne, Constance, etc.; those of the congress of Constance were summarized in an English form, with other elucidatory matter, by Professor John Mayor; (b) the series of the *Catholicque national* (Berne, 1898-1908) and the series of the *Revue Internationale de théologie* (Berne, 1893-1910).

OLDENBARNEVELDT, JOHAN VAN (1547-1619), Dutch statesman, was born at Amersfoort on Sept. 14, 1547. After studying law at Louvain, Bourges and Heidelberg, and travelling in France and Italy, Oldenbarneveldt settled down to practise in the law courts at The Hague. In religion a moderate Calvinist, he became a zealous adherent of William the Silent. He served as a volunteer for the relief of Haarlem (1573) and again at Leiden (1574). In 1576 he became pensionary of Rotterdam. He was active in promoting the Union of Utrecht (1579) and the acceptance of the countship of Holland and Zeeland by William (1584). On the assassination of William it was at the proposal of Oldenbarneveldt that the youthful Maurice of Nassau was at once elected stadtholder, captain-general and admiral of Holland. During the governorship of Leicester he was the leader of the strenuous opposition offered by the States of Holland to the centralizing policy of the governor.

In 1586 he was appointed, in succession to Paul Buys, to the post of Land's Advocate of Holland. Nominally the servant of the States of Holland he made himself politically the personification of the province which bore more than half the entire charge of the union, and as its mouthpiece in the states-general he practically dominated that assembly.

During the two critical years which followed the withdrawal of Leicester, he prevented the disintegration of the United Provinces, which might otherwise have fallen an easy conquest to the army of Alexander of Parma. Fortunately for the Netherlands the attention of Philip of Spain was at that time riveted upon his contemplated invasion of England, and Oldenbarneveldt had time to gather into his own hands the control of administrative affairs. He was wholeheartedly supported by Maurice of Nassau, who, after 1589, held the Stadholderate of five provinces, and was likewise captain-general and admiral of the union. The first rift between them came in 1600, when Maurice was forced against his will by the states-general, under the advocate's influence, to undertake an expedition into Flanders, which was only saved from disaster by desperate efforts which ended in victory at Nieuwport. In 1598 Oldenbarneveldt took part in special embassies to Henry IV. and Elizabeth, and again in 1605 in a special mission sent to congratulate James I. on his accession.

The opening of negotiations by Albert and Isabel in 1606 for a peace or long truce led to a great division of opinion in the Netherlands. The archdukes having consented to treat with the United Provinces "as free provinces and states over which they had no pretensions." Oldenbarneveldt, who had with him the States of Holland and the majority of burgher regents throughout the country, was for peace, provided that liberty of trading was conceded. Maurice and his cousin William Louis, stadtholder of Frisia, with the military and naval leaders and the Calvinist clergy, were opposed to it, on the ground that the Spanish king was merely seeking an interval of repose in which to recuperate his strength for a renewed attack on the independence of the Netherlands. For some three years the negotiations went on, but at last after endless parleying, on April 9, 1609, a truce for twelve years was concluded. All that the Dutch asked was directly or indirectly granted, and Maurice gave a reluctant assent to the favourable conditions obtained by Oldenbarneveldt.

Religious Differences and the Sequel.—The now "free and

independent State" was rent by internal differences between the Remonstrants (Arminians) and Contra-Remonstrants (Gomarists); the States of Holland under the influence of Oldenbarneveldt supported the former, and refused to sanction the summoning of a purely church synod (1613). They likewise (1614) forbade the preachers in the Province of Holland to treat of disputed subjects from their pulpits. Obedience was difficult to enforce without military help, riots broke out in certain towns, and when Maurice was appealed to, as captain-general, he declined to act. He did more, though in no sense a theologian; he declared himself on the side of the Contra-Remonstrants, and established a preacher of that persuasion in a church at The Hague (1617).

The advocate now took a bold step. He proposed that the States of Holland should, on their own authority, as a sovereign province, raise a local force of 4,000 men (*waardgelders*) to keep the peace. The states-general meanwhile by a bare majority (4 provinces to 3) agreed to the summoning of a national church synod. The States of Holland, also by a narrow majority, refused their assent to this, and passed (Aug. 4, 1617) a strong resolution (*Scherpe Resolutie*) by which all magistrates, officials and soldiers in the pay of the province were required to take an oath of obedience to the states on pain of dismissal, and were to be held accountable not to the ordinary tribunals, but to the States of Holland. It was a declaration of sovereign independence on the part of Holland, and the states-general took up the challenge and determined on decisive action. A commission was appointed with Maurice at its head to compel the disbanding of the *waardgelders*. On July 31, 1618 the stadtholder appeared at Utrecht, which had thrown in its lot with Holland, at the head of a body of troops, and at his command the local levies at once laid down their arms. His progress through the towns of Holland met with no opposition. The states party was crushed without a blow being struck. On Aug. 23, by order of the states-general, the advocate and his chief supporters, de Groot and Hoogerbeets, were arrested.

Oldenbarneveldt was with his friends kept in the strictest confinement until November, and then brought for examination before a commission appointed by the states-general. He appeared more than 60 times before the commissioners, and was, most unjustly, allowed neither to consult papers nor to put his defence in writing. On Feb. 20, 1619 he was arraigned before a special court of twenty-four members, only half of whom were Hollanders, and nearly all of them his personal enemies. It was in no sense a legal court, nor had it any jurisdiction over the prisoner, but the protest of the advocate, who claimed his right to be tried by the sovereign province of Holland, whose servant he was, was disregarded. He was allowed no advocates, nor the use of documents, pen or paper. It was in fact not a trial at all, and the packed bench of judges on Sunday, May 12, pronounced sentence of death. On the following day the old statesman, at the age of seventy-one, was beheaded in the Binnenhof at The Hague.

Not a shred of evidence has ever been produced to throw suspicion upon the patriot statesman's conduct. All his private papers fell into the hands of his foes, but not even the bitterest and ablest of his personal enemies, Francis Aarsens (*q.v.*), could extract from them anything to show that Oldenbarneveldt at any time betrayed his country's interests. His high-handed course of action in defence of what he conceived to be the sovereign rights of his own province of Holland to decide upon religious questions within its borders may be challenged on the ground of inexpediency, but not of illegality. The harshness of the treatment meted out by Maurice to his father's old friend, the faithful counsellor and protector of his own early years, leaves a stain upon the stadtholder's memory. That the prince should have felt compelled in the last resort to take up arms for the Union against the attempt of the province of Holland to defy the authority of the Generality may be justified by the plea *reipublicae salus suprema lex*. To eject the advocate from power was one thing, to execute him as a traitor quite another. The condemnation of Oldenbarneveldt was carried out with Maurice's consent and approval, and he cannot be acquitted of a prominent share in what posterity has pronounced to be a judicial murder.

Oldenbarneveldt was married in 1575 to Maria van Utrecht.

He left two sons, the lords of Groeneveld and Stoutenburg, and two daughters. A conspiracy against the life of Maurice, in which the sons of Oldenbarneveldt took part, was discovered in 1623. Stoutenburg, who was the chief accomplice, made his escape and entered the service of Spain; Groeneveld was executed.

OLDENBURG, a republic of Germany, with an area of 2,479 sq.m. It consists of three widely separated provinces—(1) Oldenburg, (2) Lübeck, and (3) Birkenfeld. It has one vote in the German Reichsrat.

Oldenburg proper is bounded on the north by the North sea and on the other three sides by Hanover, with the exception of a small strip on the east, where it is continuous with the territory of the free city of Bremen. It forms part of the north-western German plain lying between the Weser and the Ems. The climate is temperate and humid; the mean temperature of the coldest month at the town of Oldenburg is 26° F, of the warmest 66°. Storms are numerous and fogs and ague are prevalent in the marsh lands. The chief rivers are the Hunte, flowing into the Weser, and the Hase and Leda flowing into the Ems. The Weser itself forms the eastern boundary for 42 m., and internal navigation is facilitated by a canal connecting the Hunte and the Leda. On the north there are several small coast streams conducted through the dikes by sluices. Large tracts of moorland, however, are useful only as producing peat for fuel, or as affording pasture to the flocks of small coarse-woolled Oldenburg sheep. The rich soil of the marsh lands produces good crops of wheat, oats, rye, hemp and rape, but is especially adapted for grazing. The mineral wealth of Oldenburg is very small. Woollen and cotton fabrics, stockings, jute and cigars are made at Varel, Delmenhorst and Lohne; cork-cutting is extensively practised in some districts, and there are a few iron-foundries. Trade is relatively of more importance, chiefly owing to the proximity of Bremen.

Lübeck.—The former principality of Lübeck has an area of 209 sq.m. and shares in the general physical characteristics of east Holstein, within which it lies. On the east it extends to Lübeck bay of the Baltic sea, and on the south-east it is bounded by the Trave. It is dotted with small lakes. Agriculture is practised here even more extensively than in Oldenburg proper, about 75% of the area being cultivated. The population in 1925 was 47,494. The city of Lübeck (*q.v.*) is entirely apart.

Birkenfeld.—The former principality of Birkenfeld, 312 sq.m. in extent, lies in the midst of the Prussian province of the Rhine, about 30 m. W. of the Rhine at Worms and 150 m. S. of the duchy of Oldenburg. The population in 1925 was 55,649. (See **BIRKENFELD**.)

General Features.—The total population of the republic of Oldenburg in 1925 was 545,172. The bulk of the inhabitants are of Saxon stock, but to the north and west of the republic there are numerous descendants of the ancient Frisians. Low German (*Platt-deutsch*) is universally spoken, except in one limited district, where a Frisian dialect has maintained itself.

Oldenburg is mainly a Protestant country, but Roman Catholicism preponderates in the south-western provinces, which formerly belonged to the bishopric of Münster, and Oldenburg Roman Catholics are under the sway of the bishops of Münster.

The constitution of 1919 provides for a single representative chamber (*Landtag*), elected by universal suffrage and exercising rights of legislation and taxation. The chamber which consists of 48 members, is elected every three years.

History.—The descendants of Elimar (d. 1108), the first historical count of Oldenburg, attained the dignity of princes of the empire when the emperor Frederick I. dismembered the Saxon territory in 1180. The free city of Bremen and the bishop of Münster were frequently at war with the counts of Oldenburg.

Count Christian, who in 1448 was chosen king of Denmark as

Christian I., became king of Norway in 1450, and in 1457 king of Sweden. In 1460 he inherited the duchy of Schleswig and the county of Holstein, an event of high importance for the future history of Oldenburg. In 1454 he handed over Oldenburg to his brother Gerhard (c. 1430-99). Count Anton Günther (1583-1667), who succeeded in 1603, proved himself the wisest prince who had yet ruled Oldenburg. By his prudent neutrality during the Thirty Years' War he secured for his dominions an immunity from the terrible devastations to which nearly all the other states of Germany were exposed. He also obtained from the emperor the right to levy tolls on vessels passing along the Weser, a lucrative grant which soon formed a material addition to his resources. From 1702 to 1773 the county was ruled by the kings of Denmark, this period being on the whole one of peaceful development. In the latter year Frederick Augustus, bishop of Lübeck, a kinsman of the Emperor Paul of Russia, became count, and in 1777 the county was raised to the rank of a duchy. In 1815 the title of grand duke was allowed to the reigning duke, in consideration of his services to the allies, but was not taken up till 1829. In 1871 Oldenburg became a state of the new German empire and in 1918 the Grand Ducal family was expelled by the German revolution.

For the history of Oldenburg see Runde, *Oldenburgische Chronik* (Oldenburg, 1863); E. Pleitner, *Oldenburg im 19 Jahrhundert* (Oldenburg, 1899-1900); and *Oldenburgisches Quellenbuch* (Oldenburg, 1903). See also the *Jahrbuch für die Geschichte des Herzogtums Oldenburg* (1892 seq.).

OLDENBURG, a town of Germany, and capital of the republic of Oldenburg, situated 27 m. by rail W. of Bremen, on the navigable Hunte and the Hunte-Ems canal. Pop. (1925), including the suburbs, 33,345. According to popular tradition Oldenburg was founded by Walbert, grandson of the Saxon hero, Widukind, and was named after his wife Altburga, but the first historical mention of it occurs in a document of 1108. It was fortified in 1155, and received a municipal charter in 1345. The Evangelical Lambertikirche, though dating from the 13th century, was transformed in 1874-86. The former palaces of the grand-duke and the old town-hall are Renaissance buildings of the 17th and 18th centuries. The picture gallery includes works by Veronese, Velasquez, Murillo and Rubens.

OLDESLOE: see **BAD OLDESLOE**.

OLDFIELD, ANNE (1683-1730), English actress, was born in London, the daughter of a soldier. She was apprenticed to a sempstress, but, fortunately, she attracted George Farquhar's attention by reciting some lines from a play in his hearing. She was engaged at Drury Lane in 1692, and ten years later she was generally acknowledged as the best actress of her time. Mrs. Oldfield's beauty and generosity found innumerable eulogists, as well as sneering detractors. Alexander Pope, in his *Sober Advice from Horace*, wrote of her—

"Engaging Oldfield, who, with grace and ease,
Could join the arts to ruin and to please."

She died at 47 on Oct. 23, 1730, and was buried in Westminster Abbey.

OLD FORGE, an anthracite-mining borough of Lackawanna county, Pennsylvania, U.S.A., on the Lackawanna river, 6 m. S.W. of Scranton; served by the Erie and the Lackawanna railways. Pop. (1920) 12,237 (33% foreign-born white). Old Forge was settled in 1830 and incorporated as a borough in 1899.

OLDHAM, JOHN (1653-1683), English satirist, son of a Presbyterian minister, was born at Shipton Moyne, near Tetbury, Gloucestershire, on Aug. 9, 1653. He graduated from St. Edmund Hall, Oxford, in 1674, and was for three years an usher in Whitgift's School, at Croydon. In 1681 he became tutor to the grandsons of Sir Edward Thurland, near Reigate. *Garnet's Ghost* was published as a broadside in 1679, but the other *Satires on the Jesuits*, although written at the same time, were not printed until 1681. His undoubted services to the Country Party brought no reward from its leaders. Eventually he became chaplain to William Pierrepont, earl of Kingston. He died at Holme-Pierrepont, near Nottingham, on Dec. 9, 1683.

Oldham took Juvenal for his model, and in breadth of treat-

ment and power of invective surpassed his English predecessors. Thomas Garnet, who suffered for supposed implication in the Gunpowder Plot, rose from the dead to encourage the Jesuits in the first satire, and in the third Ignatius Loyola is represented as dictating his wishes to his disciples from his death-bed. Oldham's verse is rugged, and his rhymes often defective, but he met with a generous appreciation from Dryden.

The best edition of his works is *The Compositions in Prose and Verse of Mr. John Oldham* . . . (1770), with memoir and explanatory notes by Edward Thompson; see also *Poems*, ed. w. memoir by R. Bell (1891).

OLDHAM, THOMAS (1816–1878), British geologist, was born in Dublin on May 4, 1816. He studied at Dublin and Edinburgh, and in 1839 became chief assistant in the geological department of the Ordnance Survey, where he helped to prepare the *Report on the Geology of Londonderry* (1843). Appointed professor of geology in Dublin university in 1845, he became director of the geological survey of Ireland in 1846, and two years later, F.R.S. The fossil named *Oldhamia* was discovered by him in the Cambrian rocks of Bray Head in 1849. In 1850 he was put in charge of the geological survey of India, which led him to publish, in 1864, a report on the coal resources of India. He retired in 1876, and died at Rugby on July 17, 1878.

OLDHAM, municipal, county, and parliamentary borough, Lancashire, England, 7 m. N.E. of Manchester, on the L.M.S. and L.N.E. railways and the Oldham canal. Pop. (1921) 144,983. The principal railway station is called Mumps, but there are several others. The town lies high, near the source of the small river Medlock. Its growth as a manufacturing centre gives it a wholly modern appearance. The oldest church dates from the later 18th century. The principal buildings and institutions include the town-hall, with tetrastyle portico, the reference library, art gallery and museum, the Union street baths, and the county court. The Lyceum contains schools of art and science, and an observatory; the largely endowd blue-coat school was founded in 1808 by Thomas Henshaw. The Alexandra park, opened in 1865, stands on a picturesquely undulating and terraced site. Oldham is one of the most important centres of the cotton manufactures. The principal manufactures are fustians, velvets, cords, shirtings, sheetings and nankeens. There are also large foundries, mill and cotton machinery works and engineering works of various kinds. Oldham, incorporated in 1849, became a county borough in 1888. The parliamentary borough has returned two members since 1832.

A Roman road, of which traces are still left, passes through the township. It is not mentioned in Domesday; but in the reign of Henry III. Alwardus de Aldholme is referred to as holding land in Vernet (Werneth). A daughter of this Alwardus conveyed Werneth hall and its manor to the Cudworths, a branch of the Yorkshire family, with whom it remained till the 18th century. From the Oldhams was descended Hugh Oldham, who died bishop of Exeter in 1519. It appears that linens were manufactured in Oldham as early as 1630. Watermills were introduced in 1770, and with the adoption of Arkwright's inventions the cotton industry grew with great rapidity.

OLDMIXON, JOHN (1673–1742), English historian, was a son of John Oldmixon of Oldmixon, near Bridgwater. He wrote a number of miscellaneous works, but his most important book is his *Critical History of England* (1724–1726) which contains attacks on Clarendon and a defence of Bishop Burnet. Its publication led to a controversy between Dr. Zachary Grey and the author, who replied to Grey in his *Clarendon and Whitlock compared* (1727). In his *History of England during the Reigns of the Royal House of Stuart* (1730) he charged Bishop Atterbury and other of Clarendon's editors, unjustly, with tampering with the text of the *History*. He completed a continuous history of England by writing the *History of England during the Reigns of William and Mary, Anne and George I.* (1735); and the *History of England during the Reigns of Henry VIII., Edward VI., Mary and Elizabeth* (1739). Oldmixon died on July 9, 1742.

OLD OREGON TRAIL, an American highway from Independence, Mo., to Pendleton, Ore., about 1,975 m. long. Its route

was planned by American pioneers and soldiers between 1810 and 1843. It crosses the Rocky mountains and the Great Salt Lake region, passes down the Snake river through the mountain country of Idaho and then down the Columbia river highway (q.v.) to the Pacific ocean. Localities touched between the Missouri border and Pendleton include Kearney and Ogallala (Neb.), Cheyenne and Rawlins (Wyo.), Montpelier, Pocatello and Boise (Ida.) and Baker (Ore.).

OLD POINT COMFORT, a summer and winter resort, in Elizabeth City county, Virginia, U.S.A., at the southern end of a narrow, sandy peninsula projecting into Hampton Roads (at the mouth of the James river), about 12 m. N. by W. of Norfolk. It is served directly by the Chesapeake and Ohio railway, and indirectly by the New York, Philadelphia and Norfolk (Pennsylvania system), passengers and freight being carried by steamer from the terminus at Cape Charles; by steamboat lines connecting with the principal cities along the Atlantic coast, and with cities along the James river; by ferry, connecting with Norfolk and Portsmouth; and by electric railway (3 m.) to Hampton and (12 m.) to Newport News. There is a U.S. garrison at Ft. Monroe, one of the most important fortifications on the Atlantic coast of the United States. The fort lies within a tract of 252 ac. and was first regularly garrisoned in 1823; in 1824 the Artillery School of Practice (now called the U.S. Coast Artillery school) was established to provide commissioned officers of the Coast Artillery with instruction in professional work and to give technical instruction to the non-commissioned staff. During the Civil War the fort was the rendezvous for several military expeditions, notably those of Gen. B. F. Butler to Hatteras inlet, in 1861; of Gen. A. E. Burnside, to North Carolina, in 1862; and of Gen. A. H. Terry, against Ft. Fisher, in 1865. Jefferson Davis was a prisoner here for two years. The expedition which settled Jamestown rounded this peninsula (April 26, 1607), opened its sealed instructions here and named the peninsula "Poynt Comfort," in recognition of the sheltered harbour. The "Old" was added subsequently to distinguish it from a Point Comfort settlement at the mouth of the York river on Chesapeake bay.

OLD SLAVONIC. By the language called Old Bulgarian or Old (Church) Slavonic, and here abbreviated as O.B., is meant that first fixed in writing towards the end of the 9th century, when, at the request of the Moravian prince Rostislav, the Byzantine emperor, Michael III., decided to send emissaries (Constantine, afterwards called Cyril—d. 869—and Methodius, his brother—d. 887) to convert the population of Moravia to Christianity. The term, Old Slavonic, frequently used by French and Czech scholars, is liable to misinterpretation as it may be confused with Common Slavonic, the postulated ancestral form of all the Slav languages, or be taken to refer to the earlier form of any particular Slavonic language. The expression Old Church Slavonic, used by many authorities, has the disadvantage of giving no clue to the area where the language was spoken. Almost all the early manuscripts which are held to represent most accurately the language of the Slavonic apostles or that of their disciples show the phonetic features which we should expect in an earlier form of Bulgarian, more particularly in Macedonian Bulgarian.

The more important of these features are: (1) The Common Slav groups *ij* and *dj* appear as *št* and *žd* respectively, a development which exists in Bulgarian only; (2) the sound transcribed as *š* (derived from I.E. *ś* or a diphthong ending in *i*) was a palatal *a* (probably like that in English "sand"), and it still occurs in the dialects of precisely that neighbourhood from which the brothers came; (3) the affricate *dz*, which in most Slavonic languages has become *z*, was characteristic of O.B. and is still found in Macedonian dialects.

We do not possess the actual translations made by Cyril and Methodius, but only copies, the earliest dating from the end of the 10th century, the work of those disciples who were engaged in spreading the Gospel in the Balkans. Although dialectal modifications betray the linguistic usage of the various scribes, modern research has been able to restore in great part the exact language of the brothers.

This ideal Old Bulgarian has preserved most of the archaic

features of the Slavonic spoken a few hundred years earlier, before the differentiation into several languages had occurred. It offers, however, such characteristically South Slav features as: (1) the change of *or*, *ol* and *er*, *el* between consonants, to *ra*, *la* and *rě*, *lě* respectively, (2) the simplification of *tl* and *dl* to *l*, and (3) the change of *kv* and *gv* before front vowels (still preserved in the Western group) to *cv* and *dzv*. The language is of the synthetic type and contains few foreign elements in its vocabulary. The Christian terminology is mainly Greek; the Latin words which occasionally occur are concessions to the Moravians and Pannonians, to whom they had become known through the proselytizing activity of the Western clergy.

O.B. underwent in course of time considerable modifications, both phonetic and structural, in the various countries in which it had become the liturgical language, and the various mss. are consequently classified as Serbian-Slavonic, Croatian-Slavonic, Russian-Slavonic and Bulgarian-Slavonic, according to the different recensions.

The mss. are preserved in two alphabets. In the older, Glagolitic, alphabet we have:

1. The so-called Kiev Leaves—a fragment of a missal—published in Cyrillic transcription by Jagić, under the title of *Glagolitica: Würdigung neuentdeckter Fragmente* (Vienna, 1900). Linguistically and historically, this monument is of great importance and may go back to the end of the 10th century.

2. Codex Zographensis, published by Jagić under a Latin title (Berlin, 1879).

3. Codex Marianus. The edition by Jagić, Berlin, 1883, contains a full critical apparatus.

4. Codex Assemanianus, published in a Latin transcription by J. Črnčić (Rome, 1878).

5. Psalterium Sinaiticum, published by L. Geitler (Zagreb, 1883).

6. Euchologium Sinaiticum, published by Geitler (Zagreb, 1882).

7. Glagolitica Clozianus, published by V. Vondrák (Prague, 1893).

There are also a few other fragments.

The other monuments are written in the Cyrillic alphabet and are:

1. A short burial inscription, dated 993.

2. The Sava Gospel (*Savvina Kniga*), published by V. Ščepkin (St. Petersburg, 1903).

3. Codex Suprasliensis, published by Severjanov (St. Petersburg, 1904).

BIBLIOGRAPHY.—*Entstehungsgeschichte der kirchenslavischen Sprache*, by V. Jagić (Berlin, 1913), gives a mass of reliable miscellaneous information. The best grammars are: V. Vondrák, *Alt-kirchenslavische Grammatik* (Berlin, 1912); A. Leskien, *Grammatik der albulgarischen (altkirchenslavischen) Sprache* (Heidelberg, 1909), which is more comparative and historical than his *Handbuch d. albk. (altk.) Sprache* (Heidelberg, 1922). There is also an excellent manual in Polish by J. Łoś (Lwów-Warszawa-Kraków, 1922) and a Czech translation (Prague, 1928), by B. Havránek, of S. Kul'bakin's ms. grammar, which will soon appear in French as one of the publications of the Institut d'Etudes slaves of Paris. Vondrák's *Kirchenslavische Chrestomathie* (Göttingen, 1910) is invaluable as a collection of extracts. The dictionary of F. Miklosich, *Lexicon palaeoslovenico-graeco-latinum emendatum auctum* (Vienna, 1862-65), has not been replaced, but it must be used with caution, as many words belonging to the later ecclesiastical language of the Slavs are quoted.

Bulgarian Language.—Out of Old Slavonic emerged the modern Bulgarian language. Most authorities hold that Bulgarian, together with Serbo-Croat and Slovene, belongs to the Southern branch of the Slavonic languages, but its precise affinities are disputed. Leskien, in his *Serbian Grammar* (1914), while admitting certain special affinities with Serbo-Croat, regards it as an independent branch. Belić asserts that it belongs to the Southern branch only because of its geographical position. The most noteworthy South Slav development which it shows, is the change of Common Slavonic (C.S.) *or* and *ol*, either in initial position or between consonants, to *ra* and *la*, and a parallel transposition of consonant and vowel for *er* and *el*; but even this characteristic is not conclusive, as it is also partly shared by Czechoslovak, which belongs to the Western branch. As to phonetics, we may note

the following features of the literary language: C.S. *tj* and *dj* become *št* and *žd* respectively (a development found in no other modern Slav language); the nasal vowels *o* but *e* have become oral, the first having changed into a sound (roughly like that of the vowel in English *but*), which does not occur in any cognate language; the softening of consonants before front vowels has been, as also in Serbo-Croat, largely given up, nor have the old distinctions of quantity and intonation survived. In this last feature Bulgarian agrees with Russian, although the accented syllable often varies in the two languages, and is in marked contrast to Serbo-Croat, where length and intonation are preserved in almost all the dialects of the Kingdom. No less remarkable are the peculiarities in other domains of the grammar, the analytical character of which runs counter to the general trend of Slavonic and shows distinct points of resemblance to the development undergone by the languages of Western Europe. Thus, whereas the cases are retained in every other Slav language and dialect, Bulgarian has discarded them almost as completely as the Romance languages and contents itself with a single case, the nominative, the others being expressed by means of prepositions. Bulgarian has a definite article and has lost the infinitive. Parallels are to be found in the other Balkan languages, both Rumanian and Greek, for example, having fewer cases than the classical languages from which they are descended: Rumanian and Albanian have a post-positive article, the uses of which largely agree with that of Bulgarian; lastly, the infinitive has entirely disappeared in Greek and has nearly gone both in Rumanian and Albanian.

This agreement with other Balkan languages has led many scholars to believe that Bulgarian has received the impress of a specifically Balkan type. This would seem incontrovertible if the modern language only were in question, but once we consider the earlier stages of the language we encounter difficulties. The language of the first translators of the Bible (*see above*), the ancestor of present-day Bulgarian, shows no trace whatever of "balkanization." It has a complete case system, no articles, and makes full use of the infinitive. It is therefore best to regard modern Bulgarian as having undergone a development parallel with, but not dependent on, that of its neighbours. Some of the other Slav languages show in embryo the same tendencies which Bulgarian has so completely carried through. Serbian, the nearest neighbour of Bulgarian, has not only almost entirely abandoned the infinitive in the spoken language, but makes one case in the plural do duty for three (locative, dative and instrumental).

The dialects are numerous, chiefly distinguished by phonetic differences. The most usual division is into an Eastern and a Western group, according to how C.S. *e* is pronounced. In the West, the sound—which in O.B. is thought to have been that of *a* in "sand," with palatalization of the preceding consonant—is *e*, as in Serbian, but in the East the old sound has been maintained before non-palatal consonants. East Bulgarian is further divided into two zones, according to whether the articulated noun ends in *o* or *ъ*. In the main the modern literary language is based on the **Ѣ** dialects of East Bulgarian.

The Slav dialects spoken in Macedonia represent a transitional stage between Bulgarian and Serbo-Croat. None of them is used for literary purposes, but they have been carefully investigated in recent years, with a view to determining to what extent they have preserved characteristics of their lineal ancestor, the old ecclesiastical language (O.B.). A feature shared by many of them, but not occurring in O.B., is the development of C.S. *tj* and *dj* to fronted *k* and *g*, in place of literary Bulgarian *št* and *žd*.

In some Bulgarian dialects, notably those in the neighbourhood of Salonica and Castoria, there are distinct traces of the O.B. nasal vowels, which are not elsewhere preserved except in Polish and, also in traces, in some Slovene dialects.

In the vocabulary of modern Bulgarian there are many foreign elements, chiefly Turkish and Greek, but also some Rumanian and Albanian words. Russian supplied literary models, and its vocabulary has been very freely drawn upon, although there is now a tendency to restrict the loan words to expressions belonging to more abstract thought. The phraseology of Russian, French and German has had considerable influence on the sentence con-

struction.

BIBLIOGRAPHY.—For the linguistic affinities of Bulgarian consult V. Vondrák, *Vergleichende Slavische Grammatik* (Göttingen, 1924) and B. Conev, *History of the Bulgarian Language* (in Bulgarian—Sofia, 1919). G. Weigand's *Balkan-Archiv* (Leipzig, 1925) also is valuable for the comparative study of the Balkan languages. *Das Ostbulgarische* by L. Miletich (Vienna, 1903) and A. Mazon's *Contes slaves de la Macédoine sud-occidentale* (Paris, 1923) are excellent introductions to the study of the dialects.

Dictionaries: N. Gerov, *Rečnik na blgarskyj jazyk* (Dictionary of the Bulgarian Language, 5 vols., Philippopolis, 1895–1904); C. Stephanove, *Complete English-Bulgarian Dictionary* (Sofia, 1914), is the best work for English users. For those able to read Bulgarian the *Sbornik za narodni umotvorenija i narodopis*, published by the Bulgarian Academy, is the standard publication, and the *Bulgarska Reč*, a monthly linguistic periodical published at Sofia since 1921, will prove useful.

There are no scientific grammars, nor annotated and accented texts in English, but beginners able to read German will find G. Weigand's grammar and addition of *Baj Ganja* of great assistance. (N. B. J.)

OLD SPANISH TRAIL, an American highway skirting the southern border of the United States from St. Augustine, Fla., the oldest city in the United States, to San Diego, Calif., a distance of 2,743 miles. It passes through the parts of the United States that were first permanently settled by white men and its historic background therefore affords unusual interest. From the Atlantic to San Antonio, Tex., the roadway is more than half paved and the remainder improved except in a few short stretches. Other cities touched by the highway are Mobile, Ala., New Orleans, La., Houston and El Paso, Texas, and Tucson and Phoenix, Ariz.

OLD TESTAMENT: see BIBLE.

OLD TOWN, a city of Penobscot county, Maine, U.S.A., on the Penobscot river, 12 m. above Bangor. It is served by the Bangor and Aroostook and the Maine Central railways. Pop. (1920), 6,956. The city occupies Marsh island, formed by a tributary of the Penobscot which unites with it at two points 9 m. apart, and considerable land on the west bank of the Penobscot. Opposite, on Indian island, is the principal settlement of the Penobscot Indians, who are wards of the State. The Abbé Louis Pierre Thury was sent here from Quebec about 1687 and built a mission church. Permanent settlement began when John Marsh (about 1774) bought the "island" now occupied by the city. Old Town was incorporated as a town in 1840, and chartered as a city in 1891. The first railroad in Maine was built from Bangor to Old Town in 1836.

OLDYS, WILLIAM (1696–1761), English antiquary and bibliographer, natural son of Dr. William Oldys, chancellor of Lincoln. was born on July 14, 1696, probably in London. He devoted most of his life to the collection of rare books and papers. In 1731 he sold his collections to Edward Harley, earl of Oxford, who appointed him his literary secretary in 1738. Three years later his patron died, and from that time he worked for the booksellers. In April 1755 he was appointed Norroy king-at-arms by the duke of Norfolk. He died on April 15, 1761.

Oldys's chief works are: *The British Librarian*, a review of scarce and valuable books in print and in manuscript (1737–38); the *Harleian Miscellany* (1744–46), a collection of tracts and pamphlets in the earl of Oxford's library, undertaken in conjunction with Dr. Johnson; twenty-two articles contributed to the *Biographia Britannica* (1747–60); an edition of Raleigh's *History of the World*, with a *Life* of the author (1736); *Life of Charles Cotton* prefixed to Sir John Hawkins's edition (1760) of the *Complete Angler*. In 1727 Oldys began to annotate another Langbaine to replace the one he had lost. This valuable book, with a MS. collection of notes by Oldys on bibliographical subjects, is preserved in the British Museum.

OLEACEAE, in botany, the olive family, dicotyledonous shrubs and trees of warm, temperate and tropical regions, especially abundant in the East Indies. *Fraxinus* includes the ash (*q.v.*) and flowering ash (*F. Ornus*). *Olea* includes the olive (*q.v.*) and the black ironwood tree (*O. laurifolia*). The family includes also numerous valuable ornamental trees and shrubs, as privet, jasmine, lilac, golden-bells, and fringe-tree. There are 21 genera and about 500 species, some 40 of which occur in North America.

OLEAN, a city of Cattaraugus county, New York, U.S.A., on the Allegheny river, at the mouth of Olean creek, 70 m. S.S.E. of Buffalo. It is served by the Erie, the Pennsylvania and the Pittsburgh, Shawmut and Northern railways. Pop. (1920) 20,506 (84% native white); 1928 local estimate, 25,500. The city lies

in a valley 1,440 ft. above sea-level, almost encircled by hills. The surrounding country is rich in oil and gas. Six miles S.W. is "Rock City," a group of immense rocks, strangely regular in shape, covering 40 acres. At Allegany, a village 3 m. W., is St. Bonaventure's college (Roman Catholic; 1859). The city has railroad shops, oil refineries and various other manufacturing industries, with an output in 1925 valued at \$23,979,049. It is the headquarters of a "demonstration" in rural public-health work, a ten-year experiment begun in 1923 with financial help from the Milbank Memorial fund. Settlement in this region began in 1804. The city was incorporated in 1893.

OLEANDER, the common name for the shrub known to botanists as *Nerium Oleander*. It is a native of the Mediterranean region, and is characterized by its tall shrubby habit and its thick lance-shaped opposite leaves, which exude a milky juice when punctured. The flowers are borne in terminal clusters, and are of a rose colour, rarely white. The hairy anthers adhere to the thickened stigma. The fruit or seed-vessel consists of two long pods, which liberate a number of seeds, each of which has a tuft of silky hairs. The genus *Nerium* belongs to the family Apocynaceae (*q.v.*). The oleander was known to the Greeks under three names, viz. *rhododendron*, *nerion* and *rhododaphne*, and is well described by Pliny (xvi. 20), who mentions its rose-like flowers and poisonous qualities. The oleander has long been cultivated in greenhouses, being, as Gerard says, "a small shrub of a gallant shew"; numerous varieties, differing in the colour of their flowers, which are often double, have been introduced. In warm countries, as the southern United States, it is grown in gardens.

OLEASTER (*Elaeagnus hortensis* family Elaeagnaceae), a handsome deciduous tree, 15 to 20 ft. high, growing in the Mediterranean region and temperate Asia, where it is commonly cultivated for its edible fruit. The brown smooth branches are more or less spiny; the narrow leaves have a hoary look from the presence of a dense covering of star-shaped hairs; the small fragrant yellow flowers, which are borne in the axils of the leaves, are scaly on the outside. The genus contains other species of ornamental shrubs or small trees.

OLEFINE, in organic chemistry (*q.v.*), the generic name given to a hydrocarbon containing one or more pairs of doubly linked carbon atoms. The simplest olefines or monolefines, containing only one of these pairs, are represented by ethylene (*q.v.*), $\text{CH}_2=\text{CH}_2$, the simplest member of the series, which is prepared by dehydrating ethyl alcohol and is used in manufacturing ethylene glycol (see GLYCOLS) and in producing "mustard gas." (See CHEMICAL WARFARE.) The word olefine is derived from the French *oléfant* (from *oléfer*, to make oil) and was given to ethylene by four Dutch chemists J. R. Deiman, Paets van Troostwyk, N. Bondt and A. Lauwerenburgh in 1795 owing to the fact that the gas yielded an oily liquid when mixed with chlorine.

Simple Olefines (Monolefines).—The simple olefines, which have the general formula C_nH_{2n} , are now produced on a manufacturing scale by the thermal decomposition ("cracking") of petroleum oils. These oils, which are mixtures of saturated hydrocarbons (paraffins), when heated at a temperature higher than the normal boiling points of their constituents (approximately a range of 300° to 550° C.), break up into mixtures of simpler paraffins and olefines. Thus decane breaks up into pentane and amylene

Other similar mixtures arise, and the olefines can be removed by absorption in strong sulphuric acid. The acid is added on to the double linking in such a way as to form a terminal methyl group, the ester from the above example being $\text{CH}_3[\text{CH}_2]_2\text{CH}(\text{HSO}_4)\cdot\text{CH}_3$. The crude liquid, when diluted with water and distilled, gives rise to a series of secondary alcohols, $\text{R}\cdot\text{CH}(\text{OH})\cdot\text{CH}_3$. In this way isopropyl alcohol (2-propanol), $(\text{CH}_3)_2\text{CHOH}$; secondary butyl alcohol (2-butanol), $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\cdot\text{CH}_3$; secondary amyl alcohol (2-pentanol), $\text{CH}_3[\text{CH}_2]_2\text{CH}(\text{OH})\cdot\text{CH}_3$, and higher secondary alcohols are now being produced commercially. From these alcohols the corresponding pure olefines can be regenerated by dehydration with such agents as sulphuric acid, zinc chloride, phosphoric oxide or acid, and anhydrous

oxalic acid.

The higher olefines are found in the tar from bituminous shales, in illuminating gas, and in the products formed by distilling paraffin under pressure (T. E. Thorpe and J. Young, 1873).

Physical Properties.—The lower members of the monolefinic series (carbon content C_2 to C_4) are inflammable gases and the members with carbon content C_5 to C_{14} are liquids insoluble in water. The formulae and boiling points of the series of normal olefines, $R\cdot CH:CH_2$, are shown in the following table:—

Name	Formula	M.p.	Boiling point
		$^{\circ}C$	$^{\circ}C$
Ethylene . . .	$CH_2:CH_2$	-169	-102.7 (757 mm.)
Propylene . . .	$CH_3CH:CH_2$..	-48.2 (749 mm.)
Butylene . . .	$C_2H_5\cdot CH:CH_2$..	-5
Amylene . . .	$C_3H_7\cdot CH:CH_2$..	39-40
Hexylene . . .	$C_4H_9\cdot CH:CH_2$..	68-70
Heptylene . . .	$C_5H_{11}\cdot CH:CH_2$..	95
Octylene . . .	$C_6H_{13}\cdot CH:CH_2$..	122-123
Decylene . . .	$C_8H_{17}\cdot CH:CH_2$..	172
Undecylene . . .	$C_9H_{19}\cdot CH:CH_2$..	84 (18 mm.)
Duodecylene . . .	$C_{10}H_{21}\cdot CH:CH_2$	-31	96 (15 mm.)

Chemical Properties.—In chemical properties the monolefines differ profoundly from the paraffins. Owing to the unsaturation typified in the foregoing table by the double linking, hydrogen is absorbed at the ordinary temperature in the presence of platinum black with formation of paraffins. Chlorine and bromine combine directly with olefines giving dihalogen addition compounds, the halogen hydrides also combine to yield alkyl halides; hydrogen iodide reacts most readily, hydrogen chloride least. With hypochlorous acid the olefines form chlorohydrins. The higher members of the olefines readily polymerize in the presence of dilute sulphuric acid, zinc chloride, etc. For example, gaseous isobutylene, $(CH_3)_2C:CH_2$ (b.p. $-5^{\circ}C$), polymerizes to isodibutylene, C_8H_{16} , and isotributylene, $C_{12}H_{24}$, liquid prod-

OLEN, a legendary poet and prophet, reputed author of certain hymns to Apollo, sung at Delos in historical times (Gr. Ὀλῆν) Boio, a Delphic poetess, made him a Hyperborean (see HYPERBOREANS), founder of the oracular shrine at Delphi, first prophet there, and inventor of the hexameter. Herodotus makes him a Lycian (as follower of Apollo Λύκειος). Whether any real person lies behind these stories is unknown.

See Höfer in Roscher's *Lexikon* (bibl.).

OLÉRON, an island lying off the west coast of France, opposite the mouths of the Charente and Seudre, and included in the department of Charente-Inférieure. In 1926 the population numbered 15,363. Oléron, the *Uliarus Insula* of Pliny, formed part of the duchy of Aquitaine, and came into the possession of the French Crown in 1370. It is about 18 m. in length from north-west to south-east, and 7 m. in extreme breadth; area 66 sq.m.; the strait (*Pertuis de Maumusson*) separating it from the mainland is at one point less than a mile wide. The chief places are St. Pierre (pop. 1,451 in 1926), Le Château d'Oléron (1,430), and the watering-place of St. Trojan-les-Bains.

OLFACTORY SYSTEM. In anatomy, the olfactory system consists of the nose and the nasal cavities which support the olfactory mucous membrane for the perception of smell in their upper parts, and act as respiratory passages below.

The bony framework of the nose is part of the skull (*q.v.*), but the outer nose is only supported by bone above; lower down its shape is kept by cartilaginous plates. The expanded lower part of the side of the nose, the "ala," is only formed of skin, both externally and internally, with fibro-fatty tissue between the layers. The nasal cavities are separated by a septum covered in its lower two-thirds by thick, highly vascular mucous membrane composed of columnar ciliated epithelium with masses of acinous glands embedded in it, while in its upper part it is covered by the less vascular but more specialized olfactory membrane. Near the front of the lower part of the septum a slight opening into a short blind tube, which runs upward and backward, may some-

FIG. 1.—VIEW OF THE OUTER WALL OF THE NOSE, THE TURBINATED BONES HAVING BEEN REMOVED

ucts which boil at $110-113^{\circ}C$ and $178-181^{\circ}C$ respectively.

Diolefines.—The most important of the diolefines, C_nH_{2n-2} , are those containing the two double linkings separated by one single linking (conjugated double linkings). 1,3-Butadiene (Erythrene), $CH_2:CH:CH:CH_2$, the simplest member of this type, is an easily liquefiable gas (b.p. $-5^{\circ}C$) formed by chlorinating *n*-butyl chloride and passing the product over heated soda lime (W. H. Perkin, junr., *J. Soc. Chem. Ind.*, 1912).

(G. T. M.)

OLEIC ACID: see GLYCERIDES.

times be found; this is the vestigial remnant of "Jacobson's organ." The supporting framework of the septum is made up of ethmoid above, vomer below, and the "septal cartilage" in front. The outer wall of each nasal cavity is divided into three meatus by the overhanging turbinated bones (see fig. 2). Above the superior turbinated is a space between it and the roof known as the "recessus sphenothmoidalis," into the back of which the "sphenoidal air sinus" opens. Between the superior and middle turbinated bones is the "superior meatus," containing the openings of the "posterior ethmoidal air cells," while between the

middle and inferior turbinates is the "middle meatus," which is the largest of the three and contains a rounded elevation known as the "bullae ethmoidalis." Above and behind this is often an opening for the "middle ethmoidal cells," while below and in front a deep sickle-shaped gutter runs, the "hiatus semilunaris," which communicates above with the "frontal air sinus" and below with the opening into the "antrum of Highmore" or "maxillary antrum." The "inferior meatus" is below the inferior turbinated bone, and, when that is lifted up, the valvular opening of the nasal duct (*see EYE*) is seen. The roof of the nose is narrow, and here the olfactory nerves pass in through the cribriform plate. The floor is wider so that a coronal section through each nasal cavity has roughly the appearance of a right-angled triangle.

Embryology.—In the third week of intra-uterine life two nasal pits appear on the under side of the front of the head; they are the first appearance of the true olfactory region of the nose, and some of their epithelial lining cells send off axons (*see NERVOUS SYSTEM*) which arborize with the dendrites of the cells of the olfactory lobe of the brain and so form the olfactory nerves. Between the olfactory pits the broad median fronto-nasal process grows down from the forehead region to form the dorsum of the nose (*see fig. 2*), and the anterior part of the nasal septum, while outside them the lateral nasal processes grow down, and later on meet the maxillary processes from the first visceral arch. In this way the nasal cavities are formed, but are separated from the mouth by a thin bucco-nasal membrane which eventually is broken through; after this the mouth and nose are one cavity until the formation of the palate in the third month (*see MOUTH AND SALIVARY GLANDS*). In the third month Jacobson's organ may be seen as a well-marked tube lined with respiratory mucous membrane; no explanation of the function of Jacobson's organ in man is known, and it is probably entirely atavistic. At birth the nasal cavities are shallow from above downward, but rapidly deepen till the age of puberty.

Comparative Anatomy.—In *Amphioxus* among the Acrania there is a ciliated pit above the anterior end of the central nervous system, which is probably a rudiment of an unpaired olfactory organ. In the Cyclostomata (lampreys and hags) the pit is at first ventral, but later becomes dorsal and shares a common opening with the pituitary invagination. It furthermore becomes divided internally into two lateral halves. In fishes there are also two lateral pits, the nostrils of which open sometimes, as in the elasmobranchs (sharks and rays), on to the ventral surface of the snout, and sometimes, as in the higher fishes, on to the dorsal surface. Up to this stage the olfactory organs are mere pits, but in the Dipnoi (mud-fish) an opening is established from them into the front of the roof of the mouth, and so they serve as respiratory passages as well as organs for the sense of smell. In the higher Amphibia the nasal organ becomes included in the skull and respiratory and olfactory parts are distinguished. In this class, too, turbinal ingrowths are found, and the naso-lachrymal duct appears. In the lizards, among the Reptilia, the olfactory and respiratory parts are very distinct, the latter being lined only by stratified epithelium unconnected with the olfactory nerves. There is one true turbinal bone growing from the outer wall, and close to this is a large nasal gland. In crocodiles the hard palate is formed, and there is henceforward a considerable distance between the openings of the external and internal nares. In this order, too (Crocodilia) air sinuses are first found extending from the olfactory cavities into the skull-bones. The birds' arrangement is very like that of the reptiles; olfactory and respiratory chambers are present, and into the latter projects the true turbinal, though there is a pseudo-turbinal in the upper or olfactory chamber. In mammals the olfactory chamber of the nose is variously developed; most of them are "macrosmatic," and have a large area of olfactory mucous membrane; some, like the seals, whalebone whales, monkeys and man are "microsmatic," while the toothed whales have the olfactory region practically suppressed in the adult, and are said to be "anosmatic." There are generally five turbinal bones in macrosmatic mammals, so that man has a reduced number. The lowest of the series or "maxillo-turbinal" is the equivalent of the single true turbinal bone of birds and rep-

tiles, and in most mammals is a double scroll, one leaf turning upward and the other down. Jacobson's organ first appears in amphibians, where it is found as an anteroposterior gutter in the floor of the nasal cavity. In reptiles the roof of the gutter closes in on each side, and a tube is formed lying below and internal to the nasal cavity, opening anteriorly into the mouth and ending by a blind extremity, posteriorly to which branches of the olfac-

tory and tri-geminal nerves are distributed. In the higher reptiles (crocodiles and chelonians) the organ is suppressed in the adult, and the same applies to birds; but in the lower mammals, especially the monotremes, it is very well developed, and is enclosed in a cartilaginous sheath, from which a turbinal process projects into its interior. In other mammals, with the exception of the Primates and perhaps the Chiroptera, the organ is quite distinct, though even in man, as has been shown, its presence can be demonstrated in the embryo.

See J. Symington on the organ of Jacobson in the Ornithorynchus, P. Zool. Soc. (1891), and in the kangaroo, J. Anat. and Phys., vol. 26 (1891); also G. Eliot Smith on Jacobson's organ, Anatom. Anzeiger, xl. Band No. 6 (1895). For general literature on the comparative anatomy of the olfactory system, see R. Wiedersheim's Comparative

Anatomy of Vertebrates, translated and adapted by W. N. Parker (London, 1907). (F. G. P.)

OLGA, wife of Igor, prince of Kiev, and afterwards (from 945) regent for Sviatoslav her son, was baptized at Constantinople about 955 and died about 969. She was canonized in the Russian church; her feast is on July 11.

OLGIERD (d. 1377), grand-duke of Lithuania, was one of the seven sons of Gedymis, grand-duke of Lithuania, among whom on his death in 1341 he divided his domains, leaving the youngest, Yavmuty, in possession of the capital, Vilna, with a nominal priority. With the aid of his brother Kiejstut, Olgiard in 1345 drove out the incapable Yavmuty and declared himself grand-duke. His reign (1345–1377) saw the development and extension of Lithuania to one of the greatest states in Europe of that time. The Teutonic knights in the north and the Tatar hordes in the south were equally bent on the subjection of Lithuania, while Olgiard's eastern and western neighbours, Muscovy and Poland, were far more frequently hostile competitors than serviceable allies. Olgiard not only held his own, but acquired influence and territory at the expense of both Muscovy and the Tatars, and extended the borders of Lithuania to the shores of the Black sea. He desired to establish the Lithuanian power in those Russian lands which had formed part of the ancient grand-duchy of Kiev. He procured the election of his son Andrew as prince of Pskov, and a powerful minority of the citizens of the republic of Novgorod held the balance in his favour against the Muscovite influence, but his ascendancy in both these commercial centres was precarious. But he acquired the principalities of Smolensk and Bryansk in central Russia. His relations with the grand-dukes of Muscovy were friendly, and twice he married orthodox Russian princesses; nevertheless, he besieged Moscow in 1368 and again in 1372, both times unsuccessfully.

Olgiard won a great victory over the Tatars at Siniya Vodui on the Bug in 1362, which practically broke up the great Kipchak horde and compelled the khan to migrate farther south and make his headquarters for the future in the Crimea. Indeed, but for the unceasing simultaneous struggle with the Teutonic knights, the burden of which was heroically borne by Kiejstut, Russian historians frankly admit that Lithuania, not Muscovy, must have become the dominant power of eastern Europe. Olgiard died in 1377, accepting both Christianity and the tonsure shortly before his death. His son Jagiello ultimately ascended the Polish throne, and founded the dynasty which ruled Poland nearly 200 years.

See Kazimierz Stadnicki, *The Sons of Gedymis* (Pol.) (Lemberg, 1849–53); Vladimir Bonifatievich Antonovich, *Monograph on the History of Western Russia* (Rus.), vol. i. (Kiev, 1885).

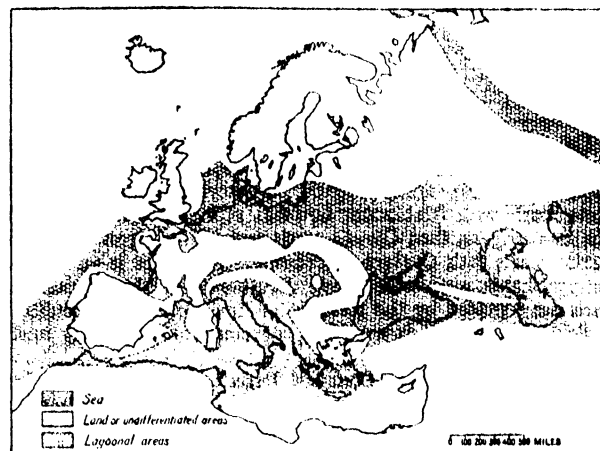

(R. N. B.; X.)

OLIGARCHY, in political philosophy, the term applied to a government exercised by a relatively small number of the members of a community (Gr. *oligoí*, few, *arche*, rule).

OLIGOCENE (Gr. *ὀλίγος*, few, and *καινός*, recent), in geology, the name given to the second period of the Tertiary era. The Oligocene system thus includes those strata which occur above the Eocene and below the Miocene. These rocks were originally classed by Sir Charles Lyell as Older Miocene, the term Oligocene being proposed by H. E. Beyrich in 1854 and again in 1858. The Oligocene is thus the upper division of the older Tertiary period or Palaeogene. (See TERTIARY, EOCENE.)

Conditions During the Oligocene.—The Oligocene deposits are of fresh-water, brackish, marine and terrestrial origin; they include sands, soft sandstones, grits, marls, shales, limestones, conglomerates and lignites. Here and there, as in northern Germany, the sea gained ground that had been unoccupied by Eocene waters, but important changes were in progress, and a general relative uplifting took place which caused much of the Eocene sea-floor to be occupied at this time by lake basins and lagoons. Thus there is a general tendency for marine Oligocene deposits to occupy a more restricted area than the marine Eocene. Amongst the earliest of the Tertiary mountain chains to arise were the Pyrenees and the mountains of Provence (the Alpine chain properly speaking) which were already in existence at the end of the Eocene. Thus relatively unfolded Oligocene sediments are

found on the flanks of belts of folded Eocene strata. In some areas the folding of the margins of Eocene gulfs resulted in the deepening of the centre of the trough and permitted huge thicknesses of Oligocene to be deposited. This, for example, is the case in the Burmese gulf where Oligocene sediments reach a thickness of over 10,000 feet. As in the Eocene period, minor oscillations of level gave rise to cycles of sedimentation. Perhaps

MAP OF THE OLIGOCENE PERIOD

the most striking change from Eocene topography in Europe, shown on the accompanying map, is the extension of the Oligocene sea over north Germany, whence it extended eastward through Poland and Russia to the Aral-Caspian region, communicating thence with Arctic waters by way of a Ural depression. It was later in the period when the widespread emersion set in.

Life of the Period.—In its general features the life of the period resembles that of the Eocene (*q.v.*); foraminifera were abundant; nummulites were still numerous but of smaller size and are characteristically associated with lepidocyclines. Corals and bryozoa were abundant in the clear waters of southern seas but echinoids rather less numerous. Cephalopods were still fewer but gastropods and lamellibranchs assumed more and more their present-day importance, and the genera are those already noted in the Eocene. Amongst vertebrates, rays and dog-fish were the dominant marine fish; tortoises were abundant and the genus *Rana* made its appearance. The most interesting feature of the land fauna is the great variety of mammals, especially from the interior of North America and the continental Oligocene of Europe and Asia. The mammals are the most important fossils for distinguishing subdivisions of the period. Whilst many of the mammals were of mixed types, others are clearly representatives of modern groups and forerunners of existing genera. Thus it is possible to distinguish carnivores (*Canidae* and *Felidae*), insectivores, rodents, ruminants and camels. Forerunners of the rhinoceros, elephant and horse are all clearly separable. An account of the flora will be found in the article dealing with PALAEOBOTANY. The abundance of *Chara*, associated with such molluscan genera as *Limnaea* and *Planorbis* in fresh-water deposits is especially noteworthy.

Oligocene Stratigraphy.—Neither the lower nor the upper limit of the Oligocene is well defined. As mentioned in the article on the Eocene (*q.v.*), the lower limit is usually taken as the top of the Bartonian stage (including the Ludian). The *Aquitanian stage* is classed sometimes with the Oligocene, sometimes with the Miocene. The first opinion is adopted by those who pay first attention to the mammalian faunas—the Aquitanian fauna is an impoverished representative of preceding faunas and is not marked by the appearance of new forms. On the other hand the Aquitanian deposits seem to mark the feeble beginning of the Miocene transgression.

The type areas for Oligocene stratigraphy lie mainly in France—among the lagoons left by the retreat of the Eocene seas. The following is the classification of the Oligocene now generally

adopted (reading downwards):—

Marine stages	Mammalian faunas
Aquitanian	Impoverished Stampian fauna; true <i>Anthracotherium</i> absent.
Stampian { Upper or Chattian	Numerous large <i>Anthracotherium</i> and <i>Aceratherium</i> ; first tapirs. <i>Anthracotherium</i> ; <i>Aceratherium</i> ; the last Palaeotherids.
{ Lower	
Sannoisian	The first <i>Anthracotherium</i> and Rhinocerotids; the last <i>Anoplotherium</i> and <i>Xiphodon</i> .

The *Sannoisian Stage* (Sannois hill, near Argenteuil, north-west of Paris) is represented by the famous series of supra-gypseous marls. At the base are blue marls, laid down in salt lagoons, then white marls with fresh-water horizons represented by beds with *Limnaea strigosa*, then *Cyrena* marls and finally a group of green marine marls with *Cytherea incrassata*. The latter is an horizon distinguishable over wide areas. South-east of the Marne, the marls are replaced by the fresh-water limestones and "meulière" of Brie. "Meulière" is a porous, siliceous rock, formerly much worked for building stone.

The *Stampian Stage* (Étampes, Paris basin) is the most important and most easily recognized of the Oligocene horizons in the Paris basin. At the base are the widespread oyster marls (Marnes à Huîtres) containing especially *Ostrea cyathula* and *O. longirostris*, followed by the well-known Fontainebleau sands with an average thickness of 125 feet. These are the "sables supérieurs" of the older French geologists. They are generally white and very pure, and are exploited as glass-sands. Except at a few points in the neighbourhood of Étampes (Jeurre, Morigny, Pierrefitte, etc.) they are rarely fossiliferous but there contain *Pectunculus obovata*, *Cytherea splendida*. Consolidated blocks (grès de Fontainebleau) comparable with the "sarsens" of the English Eocene are common. After the deposition of the marine Fontainebleau sands, the sea left the Paris basin; a huge lake covered the south-west of the Paris basin. In this were deposited the fresh-water Beauce limestones, representing both the Chattian and Aquitanian. The lower part (Chattian) of this limestone is now usually called the Étampes limestone of which the Meulière de Montmorency is a lateral equivalent.

The *Aquitanian Stage* (Aquitaine, France) owes its name to its development in the great Aquitaine basin of south-western France where there are marine limestones and brackish water intercalations in a series of shelly sands with *Melongena*, the whole passing southwards into a mass of conglomerates (poudingues de Palas-son).

In Britain, if one excepts the possible Oligocene age of the beds of the Bovey Tracey basin in Devonshire and of some of the sediments intercalated with the lavas of the west of Scotland (leaf beds of Mull), Oligocene beds are found only in the Hampshire basin. The classic exposures are in the cliffs of the Isle of Wight. The base is ill-defined and may be taken perhaps at the base of the Middle Headon beds (brackish and marine). These are succeeded by the fresh-water clays, marls and limestones of the upper Headon beds, then the Osborne and Bembridge beds (a series of brackish and fresh-water sands, clays, marls, and limestones) and finally the Hamstead beds, estuarine and fresh-water below and marine above. The correlation of the Hampshire sequence with the French stages is still uncertain; probably the highest marine Hamstead beds are equivalent to the Oyster marls of the lower Stampian. In this case the whole of the Hampshire Oligocene, except the highest beds, is Sannoisian.

In Belgium the Sannoisian sands and clays are important and extensive and known as the Tongrian. The Stampian is represented by a thick series of clays—the Argiles de Boom (Rupelian) whilst the Chattian seems to be absent unless represented by pockets of marine sands in the Ardennes massif. There is no deposit corresponding to the Aquitanian. In northern Germany and Denmark the Oligocene is, in contrast to the Eocene, thick, important, and fossiliferous. The Sannoisian (or Lattorfian) is repre-

sented by marine sands with *Nummulites germanicus*; the Stampian continues the Sannoisian transgression and occurs in the Mainz basin and even as far south as Alsace. The Chattian (or Casselian) derives its name from the Chattes, an ancient tribe of the Cassel country and consists of fine glauconitic sands well developed in the Cassel gulf. In the Mainz basin are *Cyrena* marls and *Cerithium* limestones. The Aquitanian is, probably, represented by the "Littorinellenkalk" of the Mainz basin, difficult to separate from the overlying Miocene. Brown coal is important in the Oligocene of Germany. Continental Oligocene beds are found in several basins of the central European continent, notable in the Rhone basin (deposits of Alais, Aix, Marseille, etc.) and in the trenches of the Loire and Allier.

In the alpine geosyncline it is probable that the only Oligocene are Sannoisian—notably the sandstones with small nummulites above the Priabonian and the higher beds of the Flysch. Oligocene deposits occur in the Carpathian region and the Tirol, in the Spanish Pyrenees and the flanks of the Cantabrian mountains, in Calabria, Dalmatia, Istria, and Bosnia. Glauconitic sands occur in south Russia, Flysch in the Caucasus, marine deposits in the Aral-Caspian region, Armenia, and Persia. Oligocene rocks are known also in north Africa, Algeria, Tunis and Egypt. In general Oligocene beds succeed Eocene in the epicontinental and geosynclinal gulfs around the continents of Asia (including the Nari series of India and the lower Peguan of Burma) and the Americas. Of special interest are the continental Oligocene deposits of North America, including the White River beds of South Dakota. (See references given under Eocene.) (L. D. S.)

OLIGOCHAETA, a class of segmented worms (Annelida *q.v.*), including the earthworms (*q.v.*) and certain small fresh-water forms.

OLIGOCLASE, a rock-forming mineral of the plagioclase (*q.v.*) group of feldspars. (Gr. *ὀλίγος*, little, and *κλᾶν*, to break, in allusion to a supposed less perfect cleavage than that of the related albite.) The name is usually reserved for those mixed crystals of the albite-anorthite series ranging from $Ab_{90}An_{10}$ to $Ab_{20}An_{80}$. The best known specimens of oligoclase are the iridescent, aventurine or "sunstone" crystals occurring in gneiss at Tvedestrand in southern Norway. The mineral is a common constituent of acid and alkaline igneous rocks as granite, syenite, trachyte, etc., and also in metamorphosed felspathic sediments. (C. E. T.)

OLIPHANT, LAURENCE (1829–1888), British author, son of Anthony Oliphant (1793–1859), was born at Cape Town. His father was then attorney-general in Cape Colony, but was soon transferred as chief-justice to Ceylon. The boy's education was of the most desultory kind. In the years 1848 and 1849 he accompanied his parents on a tour on the continent of Europe. In 1851 he accompanied Jung Bahadur from Colombo to Nepal and found material for his first book, *A Journey to Katmandu* (1852). From Nepal he returned to Ceylon, and thence to England, then to Russia, after which he wrote *The Russian Shores of the Black Sea* (1853). Between 1853 and 1861 he was successively secretary to Lord Elgin during the negotiation of the Canada Reciprocity treaty at Washington, the companion of the duke of Newcastle on a visit to the Circassian coast during the Crimean War, and Lord Elgin's private secretary on his expedition to China. Each of these experiences produced a pleasant book of travel. In 1861 he was appointed first secretary in Japan, and might have made a successful diplomatic career if it had not been interrupted, almost at the outset, by a night attack on the legation, in which he nearly lost his life. It seems probable that he never properly recovered from this affair. He returned to England and resigned the service, and was elected to parliament in 1865 for the Stirling Burghs.

Oliphant did not show any conspicuous parliamentary ability, but made a great success by his vivacious and witty novel, *Piccadilly* (1870). He fell, however, under the influence of the spiritualist prophet Thomas Lake Harris, who about 1861 had organized a small community, the Brotherhood of the New Life, which at this time was settled at Brocton on Lake Erie where Oliphant spent many years living as a farm labourer. As late

as December 1878 he continued to believe that Harris was an incarnation of the Deity.

In 1879 he visited Palestine and in 1881 he crossed again to America. On this visit he finally broke with Harris. He and his wife (Miss Alice Le Strange) settled at Haifa in Palestine.

There they wrote together the strange book called *Syneumata: Evolutionary Forces now active in Man* (1884), and in the next year Oliphant produced there his novel *Masollam*, which may be taken to contain its author's latest views with regard to the personage whom he long considered as "a new Avatar." One of his cleverest works, *Altiora peto*, had been published in 1883. In 1886 his wife died of fever. He was persuaded that after death he was in much closer relation with her than when she was still alive, and conceived that it was under her influence that he wrote his *Scientific Religion*. In November 1887 he went to England to publish that book. By the Whitsuntide of 1888 he had completed it and started for America. Oliphant married, as his second wife, a granddaughter of Robert Owen. They were starting for Haifa, when he died, at Twickenham, on Dec. 23, 1888. Oliphant was a brilliant writer and talker, and a notable figure in any society.

See Mrs. (Margaret) Oliphant, *Memoir of the Life of Laurence Oliphant and of Alice Oliphant his Wife* (1892). (M. G. D.; X.)

OLIPHANT, MARGARET OLIPHANT (1828-1897), British novelist and historical writer, daughter of Francis Wilson, was born at Wallyford, near Musselburgh, Midlothian, in 1828. Her childhood was spent at Lasswade (near Dalkeith), Glasgow and Liverpool. She had long been a regular contributor to *Blackwood's* and had written some novels when she married, in 1852, her cousin, Frank Wilson Oliphant. They settled at Harrington Square, in London. Her husband was an artist, principally in stained glass. Two of their children died in infancy, while the father himself developed alarming symptoms of consumption. They moved in Jan. 1859 to Florence, and thence to Rome, where Frank Oliphant died. His wife, left almost entirely without resources, returned to England and worked with amazing industry to maintain her children. She experienced heavy bereavement, losing all three children. After the death of the third, in 1894, her own health declined, and she died at Wimbledon on June 25, 1897. Her *Autobiography* gives a touching picture of her domestic life.

Mrs. Oliphant was one of the most popular writers of her time. She wrote more than 120 books. Among the best known are the novels *Adam Graeme* (1852), *Miss Marjoribanks* (1866) and the short stories collected in the *Chronicles of Earlingford*.

OLIPHANT or **OLIFANT**, the large signal horn of the middle ages, made, as its name indicates, from the tusk of an ele-

FROM HIPKIN, "MUSICAL INSTRUMENTS, HISTORIC, RARE AND UNIQUE"

EARLY 16TH CENTURY OLIPHANT

A large signal horn bearing the arms of Ferdinand and Isabella

phant. The oliphant was the instrument of knights and men of high degree, and its loss in battle was considered as shameful as the loss of sword or banner.

OLIVA, FERNAN PEREZ DE: see PEREZ DE OLIVA, HERNAN.

OLIVARES, GASPARD DE GUZMAN, count of Olivares and duke of San Lucar (1587-1645), Spanish royal favourite and minister, born at Rome, Jan. 6, 1587. He kept his inherited title of count in combination with the new honour of duke granted him by Philip IV.: hence he was commonly spoken of as *el conde-*

duque. During the life of Philip III. he was appointed to a post in the household of the heir-apparent, and obtained such influence over the young prince that Philip IV. on his accession ordered that all papers requiring the royal signature should first be sent to the count-duke. For 22 years Olivares directed the policy of Spain. It was a period of disaster abroad and of rebellion at home. The Spaniards too thoroughly monarchical to blame the king, held his favourite responsible for the country's misfortunes, and the count-duke became the accepted model of a grasping and incapable favourite, but under the inspiration of Canovas, there was a certain reaction in his favour.

It would be unjust to blame Olivares alone for the decadence of Spain. The gross errors of his policy—the renewal of the war with Holland in 1621, the persistence of Spain in taking part in the Thirty Years' War, the lesser wars undertaken in Sicily, and the entire neglect to promote the unification of the different states forming the peninsular kingdom—were shared by him with the king, the Church and the commercial classes. His fall was immediately due to the revolts of Portugal and Catalonia in 1640. The king parted with him reluctantly and only under the pressure of a strong court intrigue headed by Queen Isabella. Driven from office in 1643, Olivares, by the king's order retired to Toro, where he composed the apology *El Nicandro*, written, some say, by an agent, but undeniably inspired by the fallen minister. The *Nicandro* was denounced to the Inquisition, and it is not impossible that Olivares might have ended in the prisons of the Holy Office, if he had not died on July 22, 1645.

See A. Canovas, *Estudios del reinado de Felipe IV.* (Madrid, 1889); F. Silvela, introduction to the *Cartas de Sor Maria de Agreda y del rey Felipe IV.* (Madrid, 1885-86).

OLIVE (*Olea europaea*), the plant that yields the olive oil of commerce, belonging to a section of the family Oleaceae, of which it has been taken as the type. The genus *Olea* includes about 35 species, very widely scattered, chiefly over the Old World, from the Mediterranean basin to South Africa and New Zealand. The wild olive is a small tree or bush of rather straggling growth, with thorny branches and opposite oblong pointed leaves, dark greyish-green above and, in the young state, hoary beneath with whitish scales; the small white flowers, with four-cleft calyx and corolla, two stamens and bifid stigma, are borne on the last year's wood, in racemes springing from the axils of the leaves; the drupeaceous fruit is small in the wild plant, and the fleshy pericarp, which gives the cultivated olive its economic value, is hard and comparatively thin. In the cultivated forms (*O. europaea* var. *Sativa*.) the tree acquires a more compact habit, the branches lose their spinous character, while the young shoots become more or less angular; the leaves are always hoary on the under-side, and are generally lanceolate in shape. The fruit is usually oval or nearly globular, in some sorts it is egg-shaped, in others much elongated; while the dark hue that it commonly assumes when ripe is exchanged in many varieties for violet, green or almost white. At present the wild olive is found in most countries around the Mediterranean, extending its range on the west to Portugal, and eastward to the vicinity of the Caspian, while, locally, it occurs even in Afghanistan. An undoubted native of Syria and the maritime parts of Asia Minor, its abundance in Greece, and the frequent allusions to it by the earliest poets, seem to indicate that it was there also indigenous. It shows a marked preference for calcareous soils and the proximity of the sea.

The varieties of olive known to the modern cultivator are extremely numerous—according to some authorities equalling or exceeding in number those of the vine. In France and Italy at least 30 kinds have been enumerated, but comparatively few are grown to any large extent. The olive tree, even when free increase is unchecked by pruning, is of very slow growth; but, where allowed for ages its natural development, the trunk sometimes attains a considerable diameter. De Candolle records one exceeding 23 ft. in girth, its age being estimated at 700 years. The tree in cultivation rarely exceeds 30 ft. in height, and in France and Italy is generally kept much smaller by frequent pruning. The wood, of a yellow or light greenish-brown hue, is often finely veined with a darker tint, and, being very hard and close grained,

is valued by the cabinetmaker and turner.

Propagation and Cultivation.—The olive is propagated in various ways, but cuttings or layers are generally preferred; the tree roots in favourable soil almost as easily as the willow, and throws up suckers from the stump when cut down. Branches of various thickness are cut into lengths of several feet each, and, planted rather deeply in manured ground, soon vegetate; shorter pieces are sometimes laid horizontally in shallow trenches, when, covered with a few inches of soil, they rapidly throw up suck-like shoots. In Greece and the islands grafting the cultivated tree on the wild form is common. In Italy embryonic buds, which form small swellings on the stems, are carefully excised and planted beneath the surface, where they grow readily, these "uovoli" soon forming a vigorous shoot. Occasionally the larger boughs are in-arched, and young trees thus soon obtained; the olive is also sometimes raised from seed. Where carefully cultivated, the olive is planted in rows at regular intervals, the distance between the trees varying in different "olivettes," according to the variety grown. Careful pruning is practised, the object being to preserve the flower-bearing shoots of the preceding year, while keeping the head of the tree low, so as to allow the easy gathering of the fruit; a dome or rounded form is generally the aim of the pruner. The fruit when ripe is preferably picked by hand and deposited in cloths or baskets for conveyance to the mill where the oil is expressed; but in many parts of Spain and Greece, and generally in Asia, the olives are beaten down by poles or by shaking the boughs, or even allowed to drop naturally, often lying on the ground until the convenience of the owner admits of their removal; much of the inferior oil owes its bad quality to the carelessness of the proprietor of the trees. The amount of oil contained in the fruit differs much in the various sorts; the pericarp usually yields from 60 to 70%. A calcareous soil, however dry or poor, seems best adapted to its healthy development, though the tree will grow in any light soil, and even on clay if well drained; but, as remarked by Pliny, the plant is more liable to disease on rich soils, and the oil is inferior to the produce of the poorer and more rocky ground the species naturally affects.

The unripe fruit of the olive is largely used in modern as in ancient times as dessert, to enhance the flavour of wine, and to renew the sensitiveness of the palate for other viands. For this purpose the fruit is picked while green, soaked for a few hours in an alkaline lye washed well in clean water and then placed in bottles or jars filled with brine.

In England the olive is not hardy, though in the southern counties, it will stand ordinary winters with only the protection of a wall, and will bear fruit in such situations.

The genus *Olea* includes several other species of some economic importance. *O. paniculata* is a larger tree, attaining a height of 50 or 60 ft. in the forests of Queensland, and yielding a hard and tough timber. The yet harder wood of *O. laurifolia*, an inhabitant of Natal, is the black ironwood of the South African colonist.

Distribution.—At what remote period of human progress the wild olive became the fruitful garden olive it is impossible to conjecture. The frequent reference in the Bible to the plant and its produce, its implied abundance in the land of Canaan, the important place it has always held in Syria, lead us to consider that

OLIVE (*OLEA EUROPA*)

country the birthplace of the cultivated olive. An improved variety, possessed at first by some small Semitic sect, it was probably slowly distributed to adjacent tribes; and, yielding profusely, with little labour, a valuable oil, the gift of the fruitful tree became in that primitive age a symbol of peace and goodwill among the warlike barbarians. At a later period, with the development of maritime enterprise, the oil was conveyed, as an article of trade, to the neighbouring Pelasgic and Ionian nations, and the plant, doubtless, soon followed. In the Homeric world as depicted in the *Iliad*, olive oil is known only as a luxury of the wealthy, an exotic product prized chiefly for its value in the heroic toilet, but there is no mention of the cultivation of the tree. Whenever it may have been introduced, tradition points to the limestone hills of Attica as the seat of its first cultivation on the Greek peninsula. By the time of Solon the olive had so spread that he found it necessary to enact laws to regulate the cultivation of the tree in Attica, from which country it was probably distributed gradually to all the Athenian allies and tributary states. To the Ionian coast, where it abounded in the time of Thales, it may have been in an earlier age brought by Phoenician vessels; the olives of Rhodes and Crete had perhaps a similar origin. Samos, if we may judge from the epithet of Aeschylus (*ἐλαιόφυρος*), must have had the fruitful plant long before the Persian wars.

It is not unlikely that the olive was taken to Magna Graecia by the first Achaean colonists, and the assertion of Pliny (quoted from Fenestella), that no olives existed in Italy in the reign of Tarquinius Priscus, must be received with caution. In Latin Italy the cultivation seems to have spread slowly, for it was not until the consulship of Pompey that the production of oil became sufficient to permit of its exportation. In Pliny's time it was already grown abundantly in the two Gallic provinces and in Spain; indeed, in the earlier days of Strabo the Ligurians supplied the Alpine barbarians with oil, in exchange for the wild produce of their mountains. Africa was indebted for the olive mainly to Semitic agencies. Along the southern shore of the Mediterranean the tree was carried by the Phoenicians, at a remote period, to their numerous colonies in Africa. The tree was most likely introduced into southern Spain, and perhaps into Sardinia and the Balearic Islands, by Phoenician merchants.

Yielding a substitute for the butter and animal fats consumed by the races of the north, the olive, among the southern nations of antiquity, became an emblem not only of peace but of national wealth and domestic plenty; the branches borne in the Panathenaea, the wild olive spray of the Olympic victor, the olive crown of the Roman conqueror at ovation, and those of the equites at their imperial review alike typified gifts of peace that, in a barbarous age, could be secured by victory alone. Among the Greeks the oil was valued as an important article of diet, as well as for its external use. The Roman people employed it largely in food and cookery—the wealthy as an indispensable adjunct to the toilet; and in the luxurious days of the later empire it became a favourite axiom that long and pleasant life depended on two fluids, "wine within and oil without." Pliny vaguely describes 15 varieties of olive cultivated in his day. The gourmet of the empire valued the unripe fruit, steeped in brine, no less than his modern representative; and pickled olives have been found among the buried stores of Pompeii.

In modern times the olive has been spread widely over the world; and, though the Mediterranean lands that were its ancient home still yield the chief supply of the oil, the tree is now cultivated successfully in many regions unknown to its early distributors. Soon after the discovery of the American continent it was conveyed thither by the Spanish settlers. In Chile it flourishes as luxuriantly as in its native land, the trunk sometimes becoming of large girth, while oil of fair quality is yielded by the fruit; to Peru it was carried at a later date. Introduced into Mexico by the Jesuit missionaries of the 17th century, it was planted by similar agency in California, where it is now an important crop. Its cultivation is also carried on in the south-eastern states, especially in South Carolina, Florida and Mississippi. In the eastern hemisphere the olive has been established in many inland districts which would have been anciently considered ill-

adapted for its culture. To Armenia and Persia it was known at a comparatively early period of history, and many olive-yards now exist in upper Egypt. The tree has been introduced into Chinese agriculture, and has become an important addition to the resources of the Australian planter. In Queensland the olive has found a climate specially suited to its wants; in South Australia, near Adelaide, it also grows vigorously; it has likewise been successfully introduced into parts of Cape Colony.

OLIVEIRA MARTINS, JOAQUIM PEDRO DE (1845–1894), Portuguese writer, was born in Lisbon, and in 1870 was appointed manager of the mine of St. Eufemia near Cordova. In Spain he wrote *O Socialismo*, and developed that sympathy for the industrial classes of which he gave proof throughout his life. Returning to Portugal in 1874, he became administrator of the railway from Oporto to Pova, residing in Oporto. He entered parliament in 1886, became minister of finance on Jan. 17, 1892, and later vice-president of the Junta do Credito Publico. He died on Aug. 24, 1894. A psychologist, a profound sociologist, a stern moralist and an ardent patriot, Oliveira Martins deserved his European reputation. His *Bibliotheca das sciencias sociaes*, a veritable encyclopaedia, comprises literary criticism, socialism, economics, anthropology, histories of Iberian civilization, of the Roman Republic, Portugal and Brazil. Towards the end of his life he specialized in the 15th century and produced two notable volumes, *Os filhos de D. João I.* (1891) and *A vida de Nun' Alvares* (1893), leaving unfinished *O principe perfeito* (1896), a study on King John II., which was edited by his friend Henrique de Barros Gomes. The chief characteristics of the man—psychological imagination combined with realism and a gentle irony—make his strength as a historian and his charm as a writer. He drew admirable portraits; in his *Historia de Portugal* and *Portugal Contemporaneo* (1881) those of King Pedro I. and Herculano are among the best known.

See Moniz Barreto, *Oliveira Martins, estudo de psychologia* (Paris, 1887), a remarkable study; F. Diniz D'Ayalla, *Os Ideias de Oliveira Martins* (1897), which contains an admirable statement of his ideas, philosophical and otherwise; Anthero de Quental, *Oliveira Martins* (1894) and *Diccionario bibliographico portuguez*, xii. 125.

OLIVENITE, a mineral consisting of basic copper arsenate with the formula $\text{Cu}_2(\text{OH})\text{AsO}_4$. It crystallizes in the orthorhombic system, and is sometimes found in small brilliant crystals of simple prismatic habit terminated by domal faces. More usually, however, it occurs as globular aggregates of acicular crystals, these fibrous forms often having a velvety lustre. A characteristic feature, and one to which the name alludes, is the olive-green colour, which varies in shade from blackish-green in the crystals to almost white in the variety known as "wood-copper."

OLIVE OIL. An oil expressed from the fleshy part (pericarp) of the fruit of the olive tree, which is chiefly cultivated in the countries bordering on the Mediterranean, and recently with some success in California, South Africa and Australia. The ripe fruit contains from 20 to 60% of oil, depending on climatic conditions and on the care exercised in cultivation. Californian and North African olives usually contain less oil than those grown in France or Italy.

The fruit intended for oil production should be gathered just before it is fully ripe. The finest quality oil, termed "virgin oil," is prepared by peeling the hand-picked fruit and gently pressing the pulp after removal of the kernel; this oil is not exported. The apparatus used in expressing the oil from the pulp varies from the most primitive form of press, consisting of two boards weighted with stones, to the most modern types of hydraulic presses (see COCONUT OIL; also COPRA). In order to obtain the best quality edible oil it is essential that the oil be removed from contact with the putrescible marc (pulp) as soon as possible, particularly if the fruit was bruised; otherwise rancidity sets in with consequent formation of free fatty acids. In practice the pulp is pressed twice, yielding first and second grade edible oils; it is then mixed with hot water and subjected to further pressure, yielding technical oils. The press residues are ground up with hot water and run into settling tanks; the oil which rises to the top, termed "huile de ressenne," is skimmed off. A still lower

quality oil, "sulphur olive oil," is obtained by extracting the residue with a volatile solvent, usually carbon disulphide.

The product known as "Tournant oil" is obtained by allowing the expressed marc to ferment, whereby the cells are ruptured and more oil is liberated. As this oil contains a large amount of free fatty acids it forms a stable emulsion with sodium carbonate which is used as a Turkey-red oil.

Olive oil for edible purposes, which should be practically devoid of free fatty acids, varies in colour from water-white to golden yellow, and possesses a smooth bland taste, varying with the district in which the olive is grown and also the degree of ripeness of the fruit. In general the oils from North Africa and Greece have a harsher taste than those from Provence and Tuscany. Olive oils intended for use in cold climates should remain limpid at 10° C, and are prepared by cooling the oil to below that temperature and settling-out the deposited "stearine." Olive oil is extensively adulterated, chiefly with tallow, arachis and sesame oils. The bulk of the oil produced is used for comestible purposes (preserving sardines, etc.); it is also used for oiling wool and for the manufacture of high-class toilet and textile soaps (q.v.), known as Castile soap. The production of oil in the principal olive growing countries for 1926 is given below:—

Country	Tons
Spain	228,000
Italy	200,000
Greece	103,000
Tunis	39,000
Portugal	15,700
Syria	13,700
Algeria	10,800
France	7,800
	618,000

See also OILS.

(E. L.; G. H. W.)

OLIVER, ISAAC (c. 1566–1617), English miniature painter, was probably born in London, as in 1571 a certain Peter Oliver of Rouen was residing in London with his wife and one "chylde" named "Isake." He died in 1617 and lies buried in the church of St. Anne, Blackfriars. He was probably a pupil of Nicholas Hilliard, and connected through his wife, whose name is unknown, with the artists Gheeraerts and De Critz. Examples of his work are at Montagu House, Windsor Castle, Sherborne Castle and in the collections of Mr. J. Pierpont Morgan and the late Baroness Burdett-Coutts, also in the British Museum.

His eldest son, PETER OLIVER (1594–1648), also became a miniature painter and achieved greater fame than his father. He lived at Isleworth and on his death in 1648 was buried beside his father at St. Anne's, Blackfriars. Several of his works were bought from his widow by Charles II. and some of his water-colour copies from old masters are still in Windsor Castle. His most important work is the group of the three grandsons of the 1st Viscount Montacute with their servant, belonging to the marquess of Exeter. His miniatures are found in the private collection of the Queen of Holland and in English collections.

OLIVES, MOUNT OF, the ridge, 2,680ft. above sea-level, facing the Temple mount at Jerusalem on the east and separated from it by the vale of Kidron: Arabic, *Jebel et-Tôr*. Of the four distinct elevations on the ridge the southernmost is the scene of Solomon's idolatrous worship. The mount is referred to four times only in the Old Testament. Jesus crossed it on his entry into Jerusalem. The Ascension took place "over against Bethany" (Lk. xxiv.–50), probably in one of the secluded ravines of the eastern slope. The tradition that the Ascension was from the central eminence of the hill dates from Eusebius Caesarea, and over a sacred cave in that place there has been built a succession of sanctuaries. The chapel at present on the site was built by the crusaders and modified by the Muslims, its present holders, who erected beside the entrance to the *harâm* a minaret. Close by is the grotto of St. Pelagia (d. 457) and a short way down the hill the rock-cut cave with columbaria called the "Tomb of the Prophets." A tradition of the middle ages identified Olivet with

the Mount of Transfiguration. At its foot was the Garden of Gethsemane (*q.v.*).

At the present day there stands on Mt. Scopus, a continuation of the Mt. of Olives, the new Hebrew university opened by Lord Balfour in 1925. The German hospice, opened in 1910, is now used by the British administration in Palestine as Government house. The earthquake of July 11, 1927, was particularly severe in the area of the mount. (E. Ro.)

OLIVETANS, one of the lesser monastic orders following the Benedictine Rule, founded by St. Bernard Tolomei, a Siennese nobleman. At the age of forty, when the leading man in Siena, he retired along with two companions to live a hermit's life at Accona, a desert place fifteen miles to the south of Siena, 1313. Soon others joined them, and in 1324 John XXII. approved of the formation of an order, the Benedictine Rule being taken as the basis of the life. Partly from the olive trees that abound there, and partly out of devotion to the Passion, Accona was christened Monte Oliveto, whence the order received its name. By the end of the 14th century, there were upwards of a hundred monasteries, chiefly in Italy; and in the 18th there still were eighty, one of the most famous being San Miniato at Florence. The Olivetans have a house in Rome and in a few other cities.

OLIVIER OF RAMSDEN, SYDNEY OLIVIER, 1ST BARON, CR. 1924 (1859—), English statesman and writer, was educated at Towbridge at Corpus Christi college, Oxford. He entered the colonial office in 1882 and held a series of important posts, being governor of Jamaica from 1907 to 1913. After his return from Jamaica he was permanent secretary of the board of agriculture (1913–17), and assistant comptroller of the exchequer (1917–20). In 1924 Olivier received a barony, and took office in the Labour Government as Secretary for India. He is a well known writer on colonial questions.

OLIVINE, a rock-forming mineral composed of magnesium and ferrous orthosilicate, the formula being $(\text{Mg}, \text{Fe})_2\text{SiO}_4$. The name alludes to its olive-green colour and is often applied incorrectly by jewellers to various green stones. The transparent varieties, or "precious olivine" used in jewellery, are known as chrysolite (*q.v.*) and peridot.

Olivine crystallizes in the orthorhombic system, but distinctly developed crystals are comparatively rare, the mineral more often occurring as compact or granular masses or as grains and blebs embedded in the igneous rocks of which it forms a constituent part. The hardness is $6\frac{1}{2}$; the sp. gr. 3.27–3.37, but reaching 3.57 in the highly ferruginous variety known as hyaloseridite. The amount of ferrous oxide varies from 5% (about 9% in the gem varieties) to 30% in hyaloseridite. The depth of the green, or yellowish-brown colour, also varies with the amount of iron. The lustre is vitreous. The indices of refraction (1.66 and 1.70) and the double refraction are higher than in many other rock-forming minerals; and these characters, together with the indistinct cleavage, enable it to be readily distinguished in thin rock-sections under the microscope. The mineral is decomposed by hot hydrochloric acid with separation of gelatinous silica; it often contains small amounts of nickel and titanium dioxide; the latter replaces silica, and in the variety known as titan-olivine reaches 5%.

Olivine is a common constituent of many basic and ultrabasic rocks, such as basalt, dolerite, gabbro and peridotite; and the dunite, of Dun mountain near Nelson in New Zealand, is an almost pure olivine-rock. It also occurs as an accessory constituent of some granular dolomitic limestones and crystalline schists. With enstatite it forms the bulk of the material of meteoric stones; and in another type of meteorites large blebs of glassy olivine fill spaces in a cellular mass of metallic iron.

Olivine is especially liable to alteration into serpentine (hydrated magnesium silicate); the alteration proceeds from the outside of the crystals and grains or along irregular cracks in their interior, and gives rise to the separation of iron oxides and an irregular net-work of fibrous serpentine, which in rock-sections presents a very characteristic appearance. Large greenish-yellow crystals from Snarum in Buskerud, Norway, at one time thought to be crystals of serpentine, really consist of serpentine pseudomorphous after olivine. Many of the large rock-masses of serpen-

tine have been derived by the serpentinization of olivine-rocks. Olivine also sometimes alters, especially in crystalline schists, to a fibrous, colourless amphibole, to which the name pilita has been given. By weathering processes it alters to limonite and silica.

Closely related to olivine are several other species, which are included together in the olivine group: they have the orthosilicate formula $\text{R}''_2\text{SiO}_4$, where R'' represents calcium, magnesium, iron, manganese and rarely zinc; they all crystallize in the orthorhombic system, and are isomorphous with olivine. These include: monticellite, CaMgSiO_4 , a rare mineral occurring as yellowish-grey crystals and grains in granular limestone at Monte Somma, Vesuvius; Forsterite, Mg_2SiO_4 , as colourless or yellowish grains embedded in many crystalline limestones; Fayalite, Fe_2SiO_4 , or iron-olivine, a dark brown or black variety occurring as nodules in volcanic rock; Tephroite, Mn_2SiO_4 , a grey (*τεφρός*, ash-coloured), mineral occurring in Sweden and New Jersey. (L. J. S.)

OLLIVIER, OLIVIER ÉMILE (1825–1913), French statesman, was born at Marseilles on July 2, 1825. On the establishment of the Second Republic his father, DEMOSTHENES OLLIVIER (1799–1844), secured for him the position of commissary-general of the department of Bouches-du-Rhône. His repression of a socialist outbreak at Marseilles commended him to General Cavaignac, who made him prefect of the department. His removal to the prefecture of Chaumont (Haute-Marne) he ascribed to his father's enemies. He therefore resigned from the civil service to take up practice at the bar.

He re-entered political life in 1857 as deputy for the 3rd circonscription of the Seine. His candidature had been supported by the *Siècle*, and he joined the constitutional opposition. With Alfred Darimon, Jules Favre, J. L. Hénon and Ernest Picard he formed the group known as *Les Cinq*, which wrung from Napoleon III. some concessions in the direction of constitutional government. The imperial decree of Nov. 24, permitting the insertion of parliamentary reports in the *Moniteur*, and an address from the Corps Législatif in reply to the speech from the throne, were welcomed by him as a first instalment of reform. This acquiescence marked a considerable change of attitude, for only a year previously a violent attack on the imperial government, in the course of a defence of Étienne Vacherot, brought to trial for the publication of *La Démocratie*, had resulted in his suspension from the bar for three months. He gradually separated from his old associates, who grouped themselves around Jules Favre, and during the session of 1866–1867 Ollivier helped to form a third party, which definitely supported the principle of a Liberal Empire. This led to a struggle of personal rivalry between Ollivier and Rouher, the minister of state, who attempted, by the issue of his *Sénatus-consulte* (July 1866), to uphold the constitution of 1852. On Jan. 19, 1867, an imperial decree was issued, restoring the right of interpellation to the deputies. A promise was also inserted in the *Moniteur* of a relaxation of the stringency of the press laws and of concessions in respect of the right of public meeting. On June 28, 1869, the third party, which consisted of 116 members, with the support of the Left, obtained a majority in the chamber for their demand for a responsible ministry "and the right of the Legislative Body to regulate the essential conditions of its own activity." The emperor prorogued the legislative body on July 13, and on the same day appointed Rouher president of the Senate. The *sénatus-consulte* of Sept. 8, 1869, gave the two chambers the ordinary parliamentary rights. On Nov. 29 the chambers again met and on Dec. 28 the emperor was obliged to give in to the Third party's demands. He dismissed Rouher and entrusted Ollivier with the formation of a responsible ministry of which Ollivier was really premier, although that office was not nominally recognized by the constitution. The new cabinet, known as the ministry of the 2nd of January, had a hard task before it, complicated a week after its formation by the hostile manifestation following the shooting of Victor Noir by Prince Pierre Bonaparte. Ollivier immediately summoned the high court of justice for the judgment of Prince Bonaparte and Prince Joachim Murat. His ministry included 4 members of the Right Centre and 4 of the Left Centre. In March his position obliged him to propose a revision of the Constitution, and on April 20, a *sénatus-consulte*

was issued which accomplished the transformation of the Empire into a constitutional monarchy. Ollivier, however, still had to face violent opposition from the Republicans and Socialists. He had arrested Rochefort on Feb. 9 for his presence at the funeral of Victor Noir, and he arrested also the editors of the *Marseillien*. Neither concessions nor firmness sufficed to appease the "Irreconcilables" of the opposition, who since the relaxation of the press laws were able to influence the electorate. On May 8, however, the amended constitution was submitted to a plebiscite, which resulted in a vote of nearly seven to one in favour of the government. The most distinguished members of the Left in his cabinet—L. J. Buffet, Napoléon Daru and Talhouët Roy—resigned in April on the question of the plebiscite. Ollivier himself held the ministry of foreign affairs for a few weeks, until Daru was replaced by the duc de Gramont.

The revival of the candidature of Prince Leopold of Hohenzollern-Sigmaringen for the throne of Spain early in 1870 disconcerted Ollivier's plans. The French government, following Gramont's advice, instructed Benedetti to demand from the king of Prussia a formal disavowal of the Hohenzollern candidature. Ollivier allowed himself to be gained by the war party. The story of Benedetti's reception at Ems and of Bismarck's manipulation of the Ems telegram is told elsewhere. (See BISMARCK.) It is unlikely that Ollivier could have prevented the eventual outbreak of war, but he might perhaps have postponed it at that time, if he had taken time to hear Benedetti's account of the incident. He was outmanoeuvred by Bismarck, and on July 15 he made a hasty declaration in the Chamber that the Prussian government had issued to the powers a note announcing the rebuff received by Benedetti. He obtained a war vote of 500,000,000 francs, and used the fatal words that he accepted the responsibility of the war "with a light heart," saying that the war had been forced on France. On Aug. 9, with the news of the first disaster, the Ollivier cabinet was driven from office, and its chief sought refuge in Italy. He returned to France in 1873, and occupied himself with writing the apology for his government, *L'Empire libéral* (1895 seq.). His first wife, Blandine Liszt, was the daughter of the Abbé Liszt by Mme. d'Agoult (Daniel Stern). She died in 1862, and Ollivier married in 1869 Mlle. Gravier. He died at St. Gervais-les-Bains on Aug. 30, 1913.

His other works include *Démocratie et liberté* (1867), *Le Ministère du 2 janvier, mes discours* (1875), *Principes et conduite* (1875), *L'Eglise et l'État au concile du Vatican* (2 vols., 1879), *Solutions politiques et sociales* (1893), *Nouveau Manuel du droit ecclésiastique français* (1885).

See M. T. Ollivier, *Emile Ollivier; sa jeunesse d'après son journal et sa correspondance* (1918).

OLMEDO, JOSÉ JOAQUÍN DE (1780–1847), Ecuadorian poet and politician, was born in Guayaquil on March 20, 1780. Sent to Europe in 1825 as Peruvian diplomatic representative, he returned in 1828 and in 1830 was elected vice president of the recently created (1830) independent republic of Ecuador, but declined the honour. In 1845 he headed a successful revolt and, having been chosen first member of the provisional government, was a candidate for the presidency, but was not elected. He died in Guayaquil on Feb. 19, 1847. A neo-classicist, Olmedo has been called by a distinguished Spanish critic "one of the three or four great Spanish-American poets, if not the first." He is best known for his ode *La Victoria de Junín, Canto a Bolívar* (1825), commemorating the final overthrow of Spain in America, and the ode *Al General Flores, Vencedor en Miñarica* (1835), written after the defeat of a revolt against the government.

See M. L. Amunátegui, *Juicio crítico de algunos poetas hispano-americanos* (Santiago de Chile, 1861); P. Herrera, *Apuntes biográficos de Don José Joaquín Olmedo* (Quito, 1887); J. L. Mera, *Ojeada histórico-crítica sobre la poesía ecuatoriana* (2nd ed. Barcelona, 1893); J. J. Olmedo, *Poetas* (ed. by C. Ballén, Paris, 1896); V. M. Rendón, *Olmedo* (Paris, 1904); E. Piñeyro, *Biografías americanas* (Paris, 1907); A. Coester, *The Literary History of Spanish-America* (New York, 1916); E. C. Hills, ed., *The Odes of Bello, Olmedo and Heredia* (New York, 1920). The *Enciclopedia Universal Ilustrada* (Barcelona, 1919), has a full bibliography. (W. B. P.)

OLMSTED, FREDERICK LAW (1822–1903), American landscape architect, was born in Hartford (Conn.), on April 27,

1822. He already had an adventurous career when he published his *Journeys and Explorations in the Cotton Kingdom* (1861), which gave a picture of the conditions surrounding American slavery that had great influence on British opinion, and was much quoted in the controversies at the time of the Civil War. During the war he was the untiring secretary of the U.S. sanitary commission.

When Central Park, New York city, was projected, he, in conjunction with Vaux, proposed the plan which, in competition with more than 30 others, won first prize. Olmsted was made superintendent to carry out the plan. This was practically the first attempt in the United States to apply art to the improvement or embellishment of nature in a public park; it attracted great attention, and the work was so satisfactorily done that he was engaged thereafter in most of the important works of a similar nature in America—Prospect park, Brooklyn; Fairmount park, Philadelphia; South park, Chicago; Riverside and Morningside parks, New York; Mount Royal park, Montreal; the grounds surrounding the Capitol at Washington, and at Leland Stanford University at Palo Alto (Calif.), and many others. He developed the bare stretch of lake front at Chicago into the World's Fair grounds, contributing much to the architectural beauty and the success of the exposition. He was greatly interested in the Niagara reservation, made the plans for the park there, and also did much to influence the State of New York to provide the Niagara park.

He was the first commissioner of the national park of the Yosemite and the Mariposa grove, directing the survey and taking charge of the property for the State of California. He also held directing appointments under the cities of New York, Boston, Philadelphia, Baltimore, Wilmington and San Francisco, the joint committee on buildings and grounds of Congress, the Niagara Falls Reservation commission, the trustees of Harvard, Yale, Amherst and other colleges and public institutions. After 1886 he was largely occupied in laying out an extensive system of parks and parkways for the city of Boston and the town of Brookline, and on a scheme of landscape improvement of Boston harbour. He died on August 28, 1903.

OLMÜTZ: see OLOMOUC.

OLNEY, RICHARD (1835–1917), American statesman, was born at Oxford, Mass., on Sept. 15, 1835. He graduated at Brown university in 1856, and at the law school of Harvard university in 1858. In 1859 he began the practice of law at Boston, Mass., and attained a high position at the bar. He served in the State House of Representatives in 1874, and in March 1893 became attorney-general of the United States in the cabinet of President Cleveland. In this position, during the strike of the railway employees in Chicago in 1894, he instructed the district attorneys to secure from the Federal courts writs of injunction restraining the strikers from acts of violence, and thus set a precedent for "government by injunction." He also advised the use of Federal troops to quell the disturbances in the city, on the ground that the Government must prevent interference with its mails and with the general railway transportation between the States. Upon the death of Secretary W. Q. Gresham (1832–95), Olney succeeded him as secretary of State on June 10, 1895. He became specially prominent in the controversy with Great Britain concerning the boundary dispute between the British and Venezuelan Governments (see VENEZUELA), and in his correspondence with Lord Salisbury gave an extended interpretation to the Monroe Doctrine which went considerably beyond previous statements on the subject. In 1897, at the expiration of President Cleveland's term, he returned to the practice of the law. He died in Boston, Mass., on April 8, 1917.

OLNEY, a market town of Buckinghamshire, England, on the Ouse, 59 m. N.W. by N. of London on the L.M.S. railway. Pop. (1921) 2,651. The church of St. Peter and St. Paul is Decorated. William Cowper lived here from 1767 until 1786. John Newton, curate of Olney, had the assistance of Cowper in the production of the Olney hymns. The trade of Olney is principally agricultural; the town also manufactures boots and shoes.

OLNEY, a city of Young county, Texas, U.S.A., 90 m. N.W. of Fort Worth, on the Gulf, Texas and Western and the Wichita Falls and Southern railways. The population was 1,164 in 1920,

and was estimated locally at 6,000 in 1928. A great shallow oil field was discovered here in 1923, and by 1928 there were 3,300 producing wells within a radius of 15 m.

OLOMOUC, a town in Moravia, Czechoslovakia, at the confluence of the Bystrice and the Morava. Pop. (1921) 57,206, of which 15,818 are Germans. Being near the head of a fertile gulf, flooded with sandy loam and loess, and having a sheltered climate, it is important as a market for cereals and cattle and such prepared materials as malt, meal, beer, spirits, starch and sugar.

Until 1640 Olomouc was the recognized capital of Moravia. Originally fortified by Maria Theresa it was, until 1886, one of the strongest fortresses in Central Europe and withstood a seven-weeks' attack of Frederick the Great in 1758, but the site of the fortification is now occupied by park, gardens and promenade. Notable buildings are the 14th century cathedral in Gothic style, with a 328 ft. tower, the 15th century Mauritius church, also Gothic, and the 15th century town-hall and museum. Olomouc was made the see of a bishop in 1073 and in 1777 was raised to the rank of an archbishopric.

OLONA (*Touchardia latifolia*), a shrub of the nettle family (Urticaceae), native to the Hawaiian islands, where it has long been cultivated as a fibre plant. The bast fibre obtained from the young shoots possesses remarkable tensile strength, being three times as strong as that of the finest grades of manila hemp (*q.v.*). Because of its great pliability olona fibre is readily woven into cloth or made into cordage. Another valuable quality is its unusual durability in water, making it especially suitable for fish nets.

OLONETS, a former government of north-western Russia (see KARELIA).

OLORON-SAINTE-MARIE, a town of south-western France, capital of an arrondissement in the department of Basses-Pyrénées, 21 m. S.W. of Pau on a branch of the Southern railway. Pop. (1926) 7,884. It lies at the confluence of the mountain torrents (locally known as *gaves*) Aspe and Ossau, which, after dividing it into three parts, unite to form the Oloron, a tributary of the Pau. A Celtiberian and then a Gallo-Roman town, known as *Iluro*, occupied the hill on which the old feudal town of Sainte-Croix now stands, still surrounded by remnants of its 14th century ramparts, between the two rivers; Sainte-Marie lies on the left bank of the Aspe, and the new town on the right bank of the Ossau. Oloron is the seat of a sub-prefect. The town carries on a thriving trade with Spain by way of the passes of Somport and Anso, chiefly in wool and skins, salt pork and hams, cattle and horses.

OLTEN (1,312 ft.), a town in the canton of Solothurn, Switzerland, at the south foot of the Jura. An important railway centre at the junction of the railways Basle-Luzern (Lucerne), Berne-Zürich and Solothurn-Zürich. Pop. 12,600.

OLUSTEE, a village of Baker county, Fla., U.S.A., in the precinct of Olustee, about 46 m. W. by S. of Jacksonville. Pop. of the precinct (1925) 903. The village is served by the Seaboard Air Line railway. The battle of Olustee, or Ocean Pond (the name of a small body of water in the vicinity), one of the most sanguinary engagements of the Civil War in proportion to the numbers engaged, was fought on Feb. 20, 1864, about 2 m. east of Olustee, between about 5,500 Federal troops, under Gen. Truman Seymour (1824-91), and about 5,400 Confederates, under Gen. Joseph Finegan, the Federal forces being decisively defeated, with a loss, in killed and wounded, of about one-third of their number, including several officers. The Confederate losses, in killed and wounded, were about 940.

OLYBRIUS, Roman emperor of the West from July 11, to Oct. 23, 472, was a member of a noble family and a native of Rome. After the sack of the city by Genseric in 455, he fled to Constantinople, where, about 464, he married Placidia, daughter of Valentinian III. This afforded Geiseric the opportunity of claiming the empire of the West for Olybrius. In 472 Olybrius was sent to Italy by the emperor Leo to assist the emperor Anthemius against his son-in-law Ricimer, but, having entered into negotiations with the latter, was himself proclaimed emperor and on the murder of his rival ascended the throne unopposed.

See Gibbon, *Decline and Fall*, ch. xxxvi.; J. B. Bury, *Later Roman Empire*.

OLYMPIA, the scene of the Olympic games, is in western Peloponnese on the N. bank of the Alpheus (mod. Ruphia), about 11 m. E. of modern Pyrgos, where the ancient Cladeus tributary flows in from the north. Olympia is bounded on the W. by the Cladeus, on the S. by the Alpheus, on the E. by the ancient race-courses and on the N. by low heights. Here a conical hill, about 400 ft. high, cut off from the rest by a cleft, descends abruptly on Olympia. This is the *Cromion* hill sacred to Cronus.

HISTORY

The importance of Olympia in the history of Greece is religious and political. Religious associations date from the prehistoric age, when a centre of worship is attested by house-remains and early votive offerings found beneath the Heraeum. The earliest extant building is the temple of Hera, which may date in its original form from about 1000 B.C. and retained till Pausanias' time one original column of wood. There were various traditions as to the origin of the games. According to one the first race was between Pelops and Oenomaus, who used to challenge the suitors of his daughter Hippodameia and then slay them. Another attributed the festival to Heracles, either the well-known hero or the Idaean Dactyl of that name. In early times the control of the festival belonged to Pisa, but Elis seems to have claimed some share in it. Sixteen women, representing eight towns of Elis and eight of Pisatis, wove the festal robe for the Olympian Hera. Olympia thus became the centre of an amphictyony (*q.v.*), or federal league under religious sanction, for the west coast of Peloponnese. It suited the interests of Sparta to join this amphictyony; and, before the list of Olympic victors begins in 776 B.C., Sparta had formed an alliance with Elis. Aristotle saw in the temple of Hera a bronze disk, recording the traditional laws of the festival, on which the name of Lycurgus of Sparta stood next to that of Iphitus, king of Elis. Whatever may have been the age of this disk, the relation which it indicates is well attested. Elis and Sparta, making common cause, had no difficulty in excluding the Pisatans from their proper share in the management of the Olympian sanctuary. Pisa had, indeed, a brief success, when Pheidon of Argos celebrated the 28th Olympiad under its presidency. But this festival, from which Eleans and Spartans were excluded, was afterwards struck out of the official register. The destruction of Pisa (before 572 B.C.) by Sparta and Elis put an end to the rivalry: Pisatis, and also Triphylia to the south of it, becoming dependent on Elis. On the religious side of the festival the Eleans had unquestioned supremacy. All candidates were tested at Elis, in the gymnasium, before they were admitted to the athletic competitions at Olympia, and training (usually of ten months) at Elis was regarded as the most valuable preparation. Elean officials, who not only adjudged the prizes, but decided who should be admitted to compete, assumed the title of *Hellandidae*.

Long before the overthrow of Pisa the list of contests had been so enlarged as to give the celebration a Panhellenic character. Exercises of Spartan type—testing endurance and strength with an especial view to war—had almost exclusively formed the earlier programme. But as early as the 25th Olympiad the four-horse chariot-race was added, an invitation to wealthy competitors from every part of the Hellenic world, and the recognition of a popular spectacular element, as distinct from athletic or military. Horse-races were added later. For such contests the *hippodrome* was set apart. Meanwhile the list of contests on the old racecourse, the *stadium*, had been enlarged. Besides the original foot-race in which the course was traversed once only, there were the double course (*diaulos*) and the "long" foot-race (*dolichos*). Wrestling and boxing were combined in the *pancratium*; leaping, quoit-throwing, javelin-throwing, running and wrestling in the *pentathlon*. Under the protection of the Spartans, the festival acquired new importance for, having failed in their plans of actual conquest in the Peloponnese, they sought at least acknowledged predominance. While therefore the Eleans were the religious supervisors of Olympia the Spartans constituted

themselves its political protectors, enforcing the sanction which the Olympian Zeus gave to the amphictyones, whose federal bond was symbolized by common worship, and punishing violation of that "sacred truce" which was indispensable if Hellenes from all cities were to have peaceable access to the Olympian festival.

Olympia thus became a recognized Panhellenic institution after the establishment of Elean supremacy in 572 B.C.; and to the last remained a central expression of the Greek ideas that the body of man has a glory as well as his intellect and spirit, that body and mind should alike be disciplined, and that it is by the harmonious discipline of both that men best honour Zeus. The significance of Olympia was larger and higher than the political fortunes of the Greeks who met there, and it survived the overthrow of Greek independence. In the Macedonian and Roman ages the temples and contests of Olympia still interpreted the ideal at which free Greece had aimed. Philip of Macedon and Nero are among those who have record in the Altis. According to Cedrenus, a Greek writer of the 11th century (*Synopsis*, i. 326), the Olympian festival ceased to be held after A.D. 393, the first year of the 293rd Olympiad. The list of Olympian victors, which begins in 776 B.C. with Coroebus of Elis, closes with the name of an Armenian, Varastad, who is said to have belonged to the race of the Arsacidae. In the 5th century desolation had set in. The chryselephantine statue of the Olympian Zeus, by Pheidias, was carried to Constantinople, and perished in a great fire, A.D. 476. The Temple of Zeus was dismantled, either by Goths or by Christian zeal, in the reign of Theodosius II. (A.D. 402-450). The temple of Zeus, probably thrown down by earthquakes in the 6th century A.D., and the region south of it became a fortress, constructed from materials found among the ancient buildings.

Excavations.—The German excavations were begun in 1875, and completed in 1881. The deposit of earth over the Altis from the overflowing of the Cladeus had an average depth of 16 ft.; it was also necessary to excavate, especially on the west, the south and the east, several ancient buildings not included within the sacred precinct. Moreover in many places early Greek work had later Greek on top of it, or late Greek work had been overlaid with Roman.

The form of the Altis is not regularly rectangular. The west side is about 215 yd.; the south side is about equally long; the east side, about 200 yd.; the north side, behind the treasure-houses, about 275 yd.

REMAINS WITHIN THE ALTIS

Within the Altis are three main groups of buildings:—(A) chief centres of religious worship; (B) votive buildings; (C) buildings connected with the administration or with the reception of visitors.

A. Chief Centres of Religious Worship.—1. There are traces of an altar near the Heraeum older than the great altar of Zeus, and probably the original centre of worship. The great altar of Zeus was of elliptic form; imposed on this basis, in two tiers, and also, lozenge-shaped, was the famous "ash-altar" at which the Iamidae, the hereditary family of seers, practised rites of divination by fire in virtue of which Olympia is saluted by Pindar as "mistress of truth."

2. The *Pelopium*, to the west of the Altar of Zeus, was a small walled precinct in which sacrifices were offered to the hero Pelops. In the middle was a low tumulus of elliptic form. A Doric gateway with three doors gave access on the south-west side.

The three temples of the Altis were those of Zeus, Hera and the Mother of the gods. All were Doric and completely surrounded by a colonnade.

3. The *Temple of Zeus*, south of the Pelopium, stood on a high substructure with three steps. It was probably built about 470 B.C. The colonnades at the east and west ends were of six columns, the north and south sides of thirteen. The cella had a prodromos on the east and an opisthodomos on the west. It was itself divided longitudinally by a double row of columns. The central, and widest, partition was in three sections; the western containing the throne and image of the Olympian Zeus; the middle section, a table and stelae, where, probably, the wreaths were presented to the victors; the eastern was open to the public. On the east pedi-

ment was represented in twenty-one colossal figures the moment before the contest between Oenomaus and Pelops; on the western the fight of the Lapithae and Centaurs. The statement of Pausanias that the two pediments were made by Paenonius and Alcamenes is now generally supposed to be an error. On the metopes of the prodromos and opisthodomos were depicted the Twelve Labours of Heracles.

Near this temple was found the statue of a flying goddess of victory—the Nike of Paenonius. (See GREEK ART.)

4. The *Temple of Hera* (Heraeum), north of the Pelopium, was on two steps. It is the oldest of extant Greek temples, and may date from about 1000 B.C. It was smaller than the temple of Zeus, and of unusual length relatively to its breadth. It has colonnades of six columns at east and west, and of sixteen at north and south. When Pausanias saw it, one of the two columns of the opisthodomos was of wood; and for long, probably, all the columns of this temple had been wooden, gradually replaced as they decayed in progressively later styles. Only the lower part of the cella wall was of stone, the rest of unbaked brick; the entablature was of wood covered with terra-cotta. The cella—divided, like that of Zeus, by a double row of columns—had four small screens, projecting at right angles from its north and south walls. In the third niche thus formed, from the east, on the north side, was found the Hermes of Praxiteles still preserved in the local museum. (See GREEK ARCHAEOLOGY.)

5. The *Temple of the Great Mother of the Gods* (Metroum) was smaller than the Heraeum. It stood to the east of it and had a different orientation. It was on three steps, and had six columns east and west by eleven north and south. The cella had prodromos and opisthodomos. It was probably built in the 4th century, and underwent a Roman restoration.

B. Votive Edifices.—These were erected, either by states or by individuals.

1. Twelve *Treasure-houses* on the north side of the Altis, immediately under the Cronion, have the same general character of a Doric temple in antis, facing south. Of several the fragments are sufficient for reconstruction. The 2nd and 3rd from the west had been dismantled early for a roadway winding upward towards the Cronion, which is itself older than A.D. 157. This explains the fact that, though we can trace twelve, Pausanias names only ten. Each treasure-house was erected by a Greek state, either as a thank-offering for Olympian victories gained by its citizens, or as a general mark of homage to Olympian Zeus, and to contain the dedicated gifts in which the wealth of the sanctuary consisted. Temple inventories discovered at Delos and at Lindus in Rhodes illustrate how such possessions accumulated at a shrine of Panhellenic celebrity. The treasure-houses were founded by the following states, in order from the west: 1. Sicyon; 2, 3, unknown; 4, Syracuse (referred by Pausanias to Carthage); 5, Epidamnus; 6, Byzantium; 7, Sybaris; 8, Cyrene; 9, Selinus; 10, Metapontum; 11, Megara; 12, Gela. While the majority are the Greek colonies, from Libya to Sicily, from the Euxine to the Adriatic, Greece proper is represented only by Megara and Sicyon. The dates of the foundations cannot be fixed. The Megarian treasury had pedimental figures of gods fighting with giants; others supplemented stonework with painted terra-cotta.

2. The *Philippeum* near the north-west corner of the Altis was dedicated by Philip of Macedon, after his victory at Chaeronea (338 B.C.), illustrating how his position and power enabled him without risking any revolt of Hellenic feeling to erect a monument of the overthrow of Greek freedom in the very heart of the Panhellenic sanctuary. The building had a circular Ionic colonnade about 15 metres in diameter, raised on three steps enclosing a circular cella, with fourteen Corinthian half-columns. It contained portraits by Leochares of Philip, Alexander and other members of their family, in gold and ivory.

3. The *Exedra of Herodes Atticus* at the north limit of the Altis by the N.E. angle of the Heraeum consisted of a half-dome of brick (54 ft. diam.), containing twenty-one marble statues, representing the family of Antoninus Pius, of Marcus Aurelius and of the founder. In front was a drinking trough, its ends adorned by very small temples with circular colonnade.

C. Official Buildings for the management of the sanctuary or the accommodation of guests.

1. Olympia, besides its religious character, originally was the centre of a political amphictyony. So, like a Greek city, it should have a public hearth, where fire should always burn, and where Olympia should exercise hospitality. The *Prytaneum* was at the N.W. corner of the Altis, close to the Heraeum. It was a square building containing a chapel of Hestia at the front.

2. The *Porch of Echo*, also called the "Painted Porch," extended 100 yd. along the east Altis wall. A single Doric colonnade, on three steps, open towards the Altis, afforded a place from which to view processions and the sacrifices at the great altar. Built in the Macedonian period, it replaced an earlier portico. In front were pedestals for votive offerings.

3. The *Agora* was that part of the Altis which had the Porch of Echo on the E., the Altar of Zeus on the W., the Metroum on the N., and the precinct of the Temple of Zeus on the S.W. Here stood altars of Zeus Agoraios and Artemis Agorais.

4. The *Zanes* were bronze images of Zeus, erected out of the fines exacted for breaches of the rules of the contests. They stood at the N. side of the Agora, in a row, from the Metroum to the gate of the private entrance into the Stadium. Sixteen pedestals were here discovered *in situ*.

REMAINS OUTSIDE THE ALTIS

A. West Side.—The wall bounding the Altis of the time of Nero has two gates, at its N. and S. ends. Each had on the west a portico of four columns. A smaller gate is nearly opposite the Pelopium.

West of this wall, between the Altis and the Cladeus, the following buildings succeed each other from north to south.

1. The *Gymnasium*, a large open space, enclosed on two sides at least by Doric colonnades, on the east by a double portico, more than a stadium in length (220 yd.), served as a racecourse for practice in bad weather. At the south-east corner was a Corinthian doorway, leading to the N.W. gate of the Altis. The gymnasium was used by competitors during the last month's training.

2. The *Palaestra*, for wrestlers and boxers, about 70 yd. square, containing rooms of different sizes, and enclosing a building surrounded by a Doric colonnade.

3. A *Byzantine Church* occupies the site of an older brick building, perhaps the "workshop of Pheidias" seen by Pausanias. Among adjacent structures an inscribed altar marks the *Heroum*, where worship of heroes was practised. The *Theocoleon*, a large building of Roman age, was probably the house of the priests. A long narrow building S. of the church may have been occupied by those alleged "descendants of Pheidias" (Pausanias v. 14) whose privilege it was to keep the statue of Zeus clean. The so-called "workshop of Pheidias" evidently continued to be used for actual work, and a lodging was required for the artists.

4. The *Leonidaean*, dedicated by an Elean in the 4th century B.C., for the reception of distinguished visitors. Its orientation is from W.S.W. to E.N.E. An outer Ionic colonnade encloses suites of rooms, round a small interior Doric peristyle. In Roman times it was altered to distribute the rooms into four suites. The porticos show traces of much carriage traffic.

B. South Side.—The limits of the Altis towards the Alpheus can only be traced approximately, since architectural changes were numerous down to the latest times.

1. The *Council Hall (Bouleuterium)*, nearly at the middle of the south wall, comprised two Doric buildings of different date but identical oblong form, divided by a single row of columns, terminating to W. in an apse. In the space between stood a small square building. In front, on the E. a portico covered the front of all three with a large fore-hall, enclosed by a colonnade.

2. The *South Colonnade*, a late but handsome structure, closed on the north side, with Doric colonnade to S.E. and W., and Corinthian columns within, served as a promenade and to view the processions.

3. A *Triumphal Gateway* of Roman age, with triple entrance, opens on the Altis, a little E. of the *Bouleuterium*.

C. East Side.—The line of the east wall can be followed from the N.E. corner of the Altis till it breaks off at the remains known as Nero's house.

1. *Nero's House* is a building of 4th-century date and uncertain purpose, afterwards absorbed into a Roman house, to make room for which the S. part of the E. Altis wall was destroyed. A leaden water-pipe bears NER. AVG., and since only a Roman master could have dealt thus with a building within the sacred precinct, it cannot be doubted that the Roman house—from which three doors gave access to the Altis—was that occupied by Nero when he visited Olympia. Later the building, further enlarged, may have been occupied by Roman officials.

2. The *Stadium* extends E. of the Altis from W.S.W. to E.N.E., and is entered from the N.E. angle. This position was due simply to the curve of the slopes which bound the valley. The Stadium is only cleared so far as was necessary for ascertainment of essential points. Low embankments had been built on W., E. and S., the N. boundary being formed by the natural slope. The space thus defined was about 234 yd. long by 35 broad. There were no artificial seats. From 40,000 to 45,000 spectators could have found sitting room. The exact length of the Stadium itself—which was primarily the course for the foot-race—was 192.27 metres (about 210 yd.), and consequently the Olympian foot was 0.3204 metre or 1.05 English foot. In the Heraeum, however, the unit adopted was not this Olympian foot, but an older one of 0.297 metre, and in the temple of Zeus an Attic foot of 1.08 English foot. The starting-point and the goal in the Stadium were marked by limestone thresholds. Drainage was by a marginal channel. The Stadium was used not only for foot-races, but for boxing, wrestling, leaping, quoit-throwing and javelin-throwing. The entrance from the N.E. corner of the Altis was reserved for the judges, competitors and heralds. It was a vaulted tunnel, 100 Olympian feet in length, probably constructed in Roman times. To the W. the Altis was entered by a gateway and vestibule.

3. The *Hippodrome*, in which chariot-races and horse-races were held, can no longer be accurately traced, owing to the overflows of the Alpheus. But it is clear that it lay south and south-east of the Stadium, parallel with it, though stretching beyond it to the E. Its length was probably 770 metres or 4 Olympic stadia.

D. North Side.—A wall running E.-W. immediately N. of the Treasuries protects them from landslides off the *Hill of Cronus*, and carries the water channel of Herodes Atticus. Further W. it is doubtful whether the Altis was ever marked off from the "Hill of Cronus," which is associated with the oldest worship here.

See the official *Die Ausgrabungen zu Olympia* (5 vols., 1875-81); Laloux and Monceaux, *Restauration de l'Olympie* (1889); Curtius and Adler, *Olympia die Ergebnisse der Ausgrabungen* (1890-97), I. "Topographie und Geschichte," II. "Baudenkmäler," III. "Bildwerke in Stein und Thon," IV. "Bronzen," V. "Inchriften"; K. Boetticher, *Olympia* (1890); Daremberg-Saglio iv. (1904-05) s.v.; E. N. Gardiner, *Olympia, its History and Remains* (1925).

OLYMPIA, the capital city of Washington, U.S.A., and the county seat of Thurston county, at the extreme southern end of Puget Sound, 50 m. S.S.W. from Seattle. It is on Federal highways 99, 101 and 410; has an airport of 200 ac. on the Pacific Airway, 10 min. drive from the heart of the city; and is served by the Northern Pacific and the Union Pacific railways, motor-coach lines and steamboats. Pop. (1920) 7,795 (88% native white); 1928 local estimate, 14,500. The city occupies 7.07 sq.m., and is surrounded on the landward sides by low green hills. On the south the Deschutes river flows through a rocky canyon to the Sound. The snow-capped Olympics form the northern horizon, and to the east rises Mount Rainier. The streets are wide and straight; the public buildings stately. On a fir-clad promontory jutting into the Sound stands the beautiful group of new State buildings, built of white stone in classic design, at a cost of \$15,000,000. The trade of the port was valued in 1927 at \$5,550,800, consisting largely of floated logs, lumber and lumber products, sand and gravel, oysters and oyster shells. The aggregate output of the factories in 1927 was valued at \$8,945,300. Since 1925 the city has had a commission form of government. The assessed valuation of property in 1928 was \$4,987,082. Olympia is the

gateway to the Olympic peninsula, and is headquarters of the Olympia National Forest service. The first settlement on Puget sound was made in 1846 at the falls of the Deschutes river, on the site of Tumwater, a mile south of Olympia, under the leadership of Michael T. Simmons, from Kentucky, but in 1849 it was practically deserted when the men left for the California goldfields. In 1851 a town (at first called Smithfield) was laid out where Olympia now stands. In 1852 the first newspaper north of the Columbia was established here (the *Columbian*) and in 1853 the town became the capital of the newly created Territory of Washington. It was chartered as a city in 1859. The first governor's mansion still stands and a tablet indicates the site of the first capitol. A monument in Capitol Park marks the terminus of the Old Oregon Trail.

OLYMPIAD, in Greek chronology, a period of four years, used as a method of dating for literary purposes. The four years were reckoned from one celebration of the Olympian games to another, the first Olympiad beginning with 776 B.C., the last with A.D. 304, when they were abolished during the reign of Theodosius the Great. The system was first regularly used by the Sicilian historian Timaeus (352-256 B.C.) (see CHRONOLOGY).

OLYMPIAS, daughter of Neoptolemus, king of Epirus, wife of Philip II. of Macedon, and mother of Alexander the Great. The marriage took place in 359 B.C., shortly after Philip's accession, and Alexander was born in 356. Philip married a new wife, Cleopatra, in 337, and Olympias and Alexander withdrew into Epirus, whence they both returned in the following year, after the assassination of Philip, which Olympias is said to have countenanced. During the absence of Alexander, with whom she regularly corresponded on public as well as domestic affairs, she had great influence, and on Alexander's death in 323 withdrew to Epirus, owing to her hostility to Antipater the regent. In 319 she allied herself with Polyperchon, Antipater's successor, and became ruler of Macedonia. Cassander, Antipater's son, hastened from Peloponnesus, and, after an obstinate siege, compelled the surrender of Pydna, where she had taken refuge. One of the terms of the capitulation had been that her life should be spared; but she was brought to trial for the numerous executions which she had ordered during her reign. Condemned without a hearing, she was put to death in 316 by the friends of those she had slain, the promise to spare her life being disregarded.

See Plutarch, *Alexander*, 9, 39, 68; Justin, vii. 6, ix. 7, xiv. 5, 6; Arrian, *Anab.* vii. 12; Diod. Sic. xviii. 49-65, xix. 11-51; also the articles ALEXANDER III. THE GREAT and MACEDONIAN EMPIRE.

OLYMPIC GAMES (see ATHLETIC SPORTS, STADIUM, and GAMES, CLASSICAL). The modern revival of the Olympic Games is due to a Frenchman, Baron Pierre de Coubertin, who on Jan.

15, 1894, addressed a circular to all the governing bodies of sport in which he observed—"Before all things it is necessary that we should preserve in sport those characteristics of nobility and chivalry which have distinguished it in the past, so that it may continue to play the same part in the education of the peoples of to-day as it played so admirably in the days of ancient Greece. Imperfect humanity has ever tended to transform the Olympic athlete into the paid gladiator. But the two things are incompatible. We must choose between one formula and the other." If Baron de Coubertin's word of warning is heeded and his ideal of amateurism adhered to, the Olympic games will, in all human probability, become a permanent feature in the world's calendar of sport. Unfortunately, however, there appears to be a growing desire among some of the Continental nations to "transform the Olympic athlete into the paid gladiator."

Early Meetings.—It was by the British Olympic committee, headed by Lord Desborough and the late Rev. R. S. de C. Laffan, that the first real organization of these games was successfully carried through in 1908 in London. Previous meetings, though recorded, were neither representative nor properly organized. The third celebration at St. Louis in 1904 had attracted hardly any competitors from outside the United States. The second, in Paris in 1900, had suffered from inadequate preparation and control. The first of the revival, appropriately held in Athens in 1896, where the famous Marathon race was standardized, was made possible by the munificence of a private citizen (M. Averoff); but the marble stadium did not permit of a running-track suitable for the athletic championships of the world.

After the success of the London meeting in 1908, that of Stockholm in 1912 followed. The meeting of 1916, originally fixed for Berlin, was impossible owing to the World War; and it was the opinion of many that neither Belgium nor the rest of the world was ready for the games of 1920 in Antwerp. The 8th and 9th Olympiads (1924, 1928), with the most important results are described below.

Organization.—Of the International Olympic committee Baron Pierre de Coubertin was for many years president, being succeeded by Count Baillet-Latour. It is the central body by which the general policy of the Olympic movement is controlled. Forty-four nations are represented by one or more delegates each. It is hoped that by degrees this influential committee will realize such ideals as a world-wide amateur definition which will cover every sport; an Olympic programme restricted to those first-rate forms of sport in which at least half the competing nations have experience; a universally accepted code of laws to govern every competition in the games; and a body which will appoint juries and officials with power to inflict penalties that cannot be evaded.

TABLE I. *Olympic Records*

Race.	Date.	Place.	Winner.	Country.	Time or distance.
(1) 100 metres	1912	Stockholm	D. F. Lippincott	U.S.A.	10 ³ / ₅ s.
	1924	Paris	H. M. Abrahams	G.B.	10 ³ / ₅ s.
(2) 200 metres	1904	St. Louis	A. Hahn	U.S.A.	21 ³ / ₅ s.
	1924	Paris	J. V. Scholz	U.S.A.	21 ³ / ₅ s.
(3) 400 metres	1924	Paris	E. Liddell	G.B.	47 ³ / ₅ s.
(4) 400 metres relay	1924	Paris	U.S.A.	U.S.A.	41s.
(5) 800 metres	1928	Amsterdam	D. G. A. Lowe	G.B.	1m. 51 ⁴ / ₅ s.
(6) 1,500 m. tres	1928	Amsterdam	H. E. Larva	Finland	3m. 53 ¹ / ₅ s.
(7) 1,600 metres relay	1924	Paris	U.S.A.	U.S.A.	3m. 16s.
(8) 3,000 metres steeplechase	1924	Paris	W. Ritola	Finland	9m. 33 ³ / ₅ s.
(9) 3,000 metres team	1921	Paris	Finland	Finland	8m. 32s.
(10) 5,000 metres	1924	Paris	P. Nurmi	Finland	14m. 31 ¹ / ₅ s.
(11) 10,000 metres	1928	Amsterdam	P. Nurmi	Finland	30m. 18 ¹ / ₅ s.
(12) 10,000 metres walk	1912	Stockholm	G. H. Goulding	Canada	46m. 28 ³ / ₅ s.
(13) Marathon	1920	Antwerp	H. Kolchmainen	Finland	2h. 32m. 35 ³ / ₅ s.
(14) Hurdles (110 metres)	1920	Antwerp	E. J. Thomson	Canada	14 ⁴ / ₅ s.
(15) Hurdles (400 metres)	1924	Paris	F. M. Taylor	U.S.A.	52 ³ / ₅ s.
(16) High jump	1924	Paris	H. M. Osborne	U.S.A.	6ft. 5 ⁹ / ₅ in.
(17) Long jump	1912	Stockholm	A. L. Gutterson	U.S.A.	24ft. 11 ¹ / ₅ in.
(18) Pole vault	1920	Antwerp	H. K. Foss	U.S.A.	13ft. 5in.
(19) Putting the 16 lb. shot	1928	Amsterdam	J. Kuck	U.S.A.	52ft. 0 ¹ / ₅ in.
(20) Hammer (16 lb.)	1912	Stockholm	M. J. McGrath	U.S.A.	170ft. 8 ³ / ₅ in.
(21) Javelin	1928	Amsterdam	E. H. Lundovist	Sweden	218ft. 6in.
(22) Discus	1928	Amsterdam	E. Houser	U.S.A.	155ft. 3in.
(23) Hop, step and jump	1924	Paris	A. W. Winter	Australia	50ft. 11 ¹ / ₅ in.

Besides this central committee, on which all nations are represented, each nation has its own Olympic association and its own Olympic council. The British Olympic council, which may be taken as typical of most of the rest, has one or more members of every association governing the sports in which Great Britain is represented at the games, and a few other co-opted members chosen for their special knowledge or experience in organization.

As regards the American organization, its most important aspect is its continuing character as exemplified in the structure of the American Olympic Association. The American Olympic Committee is created by the American Olympic Association in the second year before each meeting. Of the committee, the initial members are the President of the United States as honorary president; five honorary vice-presidents, the Secretaries of State, of War and of the Navy, the Ambassador or Minister of the United States to the country in which the games are to be held, the Ambassador or representative of such country to the United States; the honorary and regular officers of the Association and the officers of former American Olympic committees. The Executive Committee of the Association adds to the committee from representatives of members of the Association and the public at large. The committee chooses its own active officers, who carry out the details of organization.

Records.—Records obtained at the Olympic games from 1896 to 1928 in the various events to which most popular importance is attached are shown in Table I. and for purposes of comparison the corresponding world records are shown below in Table II.

It should be noted that 100 metres=109.3 yards; 200 metres=218.7 yards; 400 metres=2.6 yards less than a quarter of a mile; 1,500 metres=119.6 yards less than a mile. 110 metres (hurdles) is nearly 11 inches over 120 yards. The Marathon Race is 42.263 kilometres or 26 miles 385 yards.

TABLE II. *World Records*

Race.	Date.	Winner.	Time or distance.
(1) 100 metres	1921	C. W. Paddock	10 ³ / ₁₀ sec.
(2) 200 metres	1921 and 1924	C. W. Paddock	20 ³ / ₁₀ sec.
(3) 400 metres	1924	E. Liddell	47 ³ / ₁₀ sec.
(4) 400 metres relay	1924	U.S.A.	41 sec.
(5) 800 metres	1917	J. E. Meredith	1m. 51 ³ / ₁₀ s.
(6) 1,500 metres	1924	P. Nurmi	3m. 52 ³ / ₁₀ s.
(7) 1,600 metres relay	1924	U.S.A.	3m. 16 sec.
(8) 3,000 metres steeplechase	1924	T. A. Loukola	9m. 21 ³ / ₁₀ s.
(9) 3,000 metres team	1926	Finland (P. Nurmi 1st)	8m. 20 ³ / ₁₀ s.
(10) 5,000 metres	1924	P. Nurmi	14m. 28 ³ / ₁₀ s.
(11) 10,000 metres	1924	P. Nurmi	30m. 6 ³ / ₁₀ sec.
(12) 10,000 metres walk	1918	G. Rasmussen	45m. 20 ³ / ₁₀ s.
(13) Marathon	1926	J. C. Miles	2hr. 25m. 40 ³ / ₁₀ s.
(14) Hurdles (110 metres)	1928	G. C. Weightman-Smith	14 ³ / ₁₀ s.
(15) Hurdles (400 metres)	1924	F. M. Taylor	52 ³ / ₁₀ s.
(16) High jump	1925	H. M. Osborne	6ft. 8 ³ / ₁₀ in.
(17) Long jump	1925	De Hart Hubbard	25ft. 10 ³ / ₁₀ in.
(18) Pole vault	1927	W. Sabin Carr	14ft.
(19) Putting 16 lb. shot	1928	J. Kuck	52ft. 1 ³ / ₁₀ in.
(20) Hammer (16 lb.)	1913	P. Ryan	180ft. 6 ³ / ₁₀ in.
(21) Javelin	1928	S. A. Lay	222ft. 9 in.
(22) Discus	1925	G. Hartranft	157ft. 1 ³ / ₁₀ in.
(23) Hop step and jump	1924	A. W. Winter	50ft. 11 ³ / ₁₀ in.

The 23 events cited above all occur in track and field athletics, which is only one division of the games. In 1908 the United Kingdom, with 839 entries, scored 57 first prizes and five more went to the Dominions; the United States with 160 entries scored 22 first prizes. The remaining 22 first prizes went to the 1,529 entries from all other nations. In 1912 the United Kingdom, with

526 entries, scored ten first prizes and eight more went to the Dominions; the United States with 572 entries scored 24 first prizes; the remaining 36 first prizes went to the 3,651 entries from other nations. In 1920 the United States won 22 first prizes; Great Britain took eight; the Dominions four; Belgium, the organizing country, one; and the remaining 65 first prizes were divided among all the other nations. In 1924, with 424 entries, the United States won 27 first prizes; Great Britain with 443 entries, won six; and the Dominions four; France, the organizing country, won four. The remaining 69 first prizes (without counting winter sports, in which Norway won easily with Finland second) were divided among all the other nations. These figures are not taken from victories in the athletic sections only, but from the full programme.

The Games in 1924.—The 8th Olympiad began with winter sports at Chamonix on Jan. 25, 1924, and 39 entries represented Great Britain. There were 14 events in all, in skating (speed and figure), ice hockey, curling, bobsleighing, ski-racing and ski-jumping. The programme in Paris was opened at Colombes on July 5, 1924, and consisted of athletics (26 events), swimming (ten events for men and seven for women), boxing (eight events), cycling (six events), wrestling (two styles, 13 events), shooting (eight events), lawn tennis (five events, including ladies), gymnastics (two events), fencing (four events), rowing (seven events), weight lifting (five events), the modern pentathlon and polo. Association football was held in Paris from May 15 to June 9, 1924, Uruguay beating Switzerland by three goals to nil in the final. Rugby football was held in Paris from May 3 to 18, the United States defeating France in the final by 17 points to 3. Neither baseball nor cricket has been included in the games. In 1924, in polo, Argentina won four games, the United States three, Great Britain two, Spain one and France none. Many other sports were omitted.

During the six months the games were in progress the United States of America came out top with championships in track and field athletics, rowing, swimming, lawn tennis, boxing, catch-as-catch-can wrestling, target shooting and Rugby football. Norway was next on the list with victories in winter sports, hunting marksmanship and yachting. France and Sweden each claimed two titles, the former taking the fencing and cycling and the latter country the modern pentathlon and the equestrian events. Other championships were won by Finland, Graeco-Roman wrestling; Uruguay, Association football; Argentina, polo; Italy, weight-lifting; while the gymnastic honours were divided between Czechoslovakia and Switzerland. The Norwegians scored heavily in the winter sports, through the proficiency of their ski experts, their representatives, indeed, filling the first four places in two of the tests. Canada secured the ice hockey championship, while the Austrian figure skaters and Skutnab, of Finland, in the speed skating, were in a class almost by themselves. Rugby football was not representative since America, France and Rumania were the only countries taking part. Association football proved very popular and some 60,000 spectators witnessed the final match in which Uruguay defeated Switzerland by 3 goals to nil.

In the important athletic section of the games American supremacy was again hotly contested by Finland. Of the 26 events comprising the programme, America claimed 12 first places, Finland 9, Great Britain 3 and Austria and Italy 1 each. Of the eight new world's records created at the Colombes stadium five must be placed to the credit of America, while the other three were made by representatives of Great Britain, Australia and Finland. Of the Olympic records broken or equalled, however, Finland established five new records, while America broke two records and equalled another and one record was equalled by an English runner.

America, moreover, won all five tennis titles and of the 16 swimming events took 13, the water polo match being won by France. (See ATHLETIC SPORTS.)

The Games in 1928.—The ninth Olympiad began with winter sports at St. Moritz. The 11 events decided included ski-racing and jumping; speed and figure skating; bobsleighing and ice-hockey. The Norwegian skiing experts were again remarkably successful, but found their masters at the longest distance ski-

race in three Swedes, who took the premier places. In speed and ladies' figure-skating, however, they achieved fresh laurels, Norway thus taking the winter games championship with five victories, as against the two each of Sweden and America. Canada again won the ice-hockey, with Sweden second and Switzerland third.

The programme in Amsterdam was opened at the new Olympic Stadium on July 28 and comprised athletics (22 events for men and 5 for women), swimming (9 events for men and 7 for women), boxing (8 events), cycling (6 events), wrestling (13 events), gymnastics (3 events), fencing (3 events for men and 1 for women), rowing (7 events), weight-lifting (5 events), and the modern pentathlon. Field hockey took place between May 17 and May 26, the Indian empire team, which had recently concluded an all-conquering tour in England, defeating Holland by 3 goals to nil in the Olympic final. Association football commenced on May 27, Great Britain not competing, on account of the "broken time" controversy. Uruguay retained the Olympic championship, won in 1924, with a victory over Argentina at Amsterdam by 2 goals to 1, after a draw.

During the period the Games were in progress the United States came out on top only in athletics (9 first places), swimming (10 first places), and rowing (2 first places), a vastly different state of things from 1924, in which year America won championships in no fewer than eight different branches of Olympic sport, as may be seen from the preceding account of the eighth Olympiad. Sweden came next, with first place in the modern pentathlon and equal firsts in wrestling and yachting. The third position was divided jointly by Norway (first winter sports and first equals yachting), Germany (first weight-lifting and first equals horse-riding), and France (first fencing and first equals yachting). Other championships were won by Italy (boxing), Denmark (cycling) and Switzerland (gymnastics). Equal championship honours were obtained by Finland (wrestling) and Holland (horse-riding).

Once again American supremacy was sternly challenged in the all-important athletic section of the games. For the first time in Olympic history America won but one individual track event (the 400 metres), and lost both hurdle races, but good team work and excellent field-events men enabled her to retain the laurels held since the revival of the games, in 1896.

On points, reckoning from 6 to 1, going from the first to the sixth place, America scored 169 points, as against Finland, 80; Germany, 63; Canada, 55; Sweden, 47; Great Britain, 38; France, 26, and Japan, 20. On first places alone the United States won 9, Finland 5, Canada 4, Great Britain 2; while France, Germany, Ireland, Japan, Poland, South Africa and Sweden, each won a single event.

New World's Records.—Of the five new world's records created at Amsterdam, America and Finland each made two and South Africa the other; an American team also equalled the world's record in the 400 metres relay. The Olympic record for 100 metres was equalled by representatives of America, Canada and Great Britain, and that for 200 metres by H. Koernig (Germany) in a preliminary heat. Ten Olympic records were broken—as to U.S.A. 3, Finland 3, Great Britain 2 and South Africa and Sweden 1 each.

The ninth Olympiad, at Amsterdam, was carried through in the best sporting spirit which has yet prevailed at any celebration of the Games since their revival at Athens in 1896, particular credit being due to the Americans for the sporting way in which they accepted their unexpected reverses on the track and in the hurdle races. The much more even distribution of premier honours in all classes of competition, combined with the fact that the ninth Olympiad was almost entirely free from unpleasant or untoward incidents, proves clearly that the Olympic Games are performing admirably their function of spreading the cult of sport and sportsmanship throughout the whole world, while the successes of such countries as Egypt, Japan and the South American republics, previously regarded as non-athletic nations, are entirely satisfactory. The roughness of the water polo matches, the discontent with the boxing decisions and the demand of the Association football players for payment as compensation for broken

time, indicate clearly, however, that all sports involving personal physical contact, or in which the element of professionalism largely prevails, should be expunged from the schedule of Olympic contests.

No fewer than 46 nations were represented in the athletic section of the ninth Olympiad, at Amsterdam, and of such nations 20 succeeded in scoring points.

OLYMPIODORUS, the name of several Greek authors, of whom the chief are: (1) An historical writer (5th century A.D.), born at Thebes in Egypt, who was sent on a mission to Attila by the emperor Honorius in 412, and later lived at the court of Theodosius. He was the author of a history (*Ἱστορικὸν Λόγιον*) in 22 books of the Western Empire from 407 to 425. The original is lost, but an abstract is given by Photius. A MS. on alchemy ascribed to him and preserved in the National Library in Paris, was printed with a translation by P. E. M. Berthelot in his *Collection des alchimistes grecs* (1887-88).

(2) A Neoplatonist philosopher, also of Alexandria, who flourished in the 6th century A.D., during the reign of Justinian. He seems to have carried on the Platonic tradition after the closing of the Athenian School in 529. He is important as a critic and a commentator, and preserved much that was valuable in the writings of Iamblichus, Damascius and Syrianus. He made a close and intelligent study of the dialogues of Plato, and his notes, formulated and collected by his pupils (*ἀπὸ φωνῆς Ὀλυμπιόδωρου τοῦ μεγάλου φιλοσόφου*), are extremely valuable. In one of his commentaries he makes the interesting statement that the Platonic succession had not been interrupted by the numerous confiscations it had suffered. Zeller points out that this refers to the Alexandrian, not to the Athenian, succession; but internal evidence makes it clear that he does not draw a hard line of demarcation between the two schools. The works which have been preserved are a life of Plato, an attack on Strato and Scholia on the *Phaedo*, *Alcibiades I.*, *Philebus* and *Gorgias*.

See Überweg, *Grundriss der Gesch. der Philosophie*, Bd. I. (1926).

OLYMPUS, the name of many mountains in Greece and Asia Minor, and of the fabled home of the gods; also a city name and a personal name.

I. Of the mountains (1) the most famous is the lofty ridge (mod. Gk. *Elympos*) on the borders of Thessaly and Macedonia; nearly 10,000 ft. high, covered with snow for a great part of the year. The great gorge of Tempe close below the south-eastern end separates it from Mount Ossa. Olympus is of massive appearance, rising in precipices broken by ravines, above which is the summit of naked rock concave toward the north-west. The lower parts are densely wooded. (2) The peak of Mount Lycaeus in the south-west of Arcadia. (3) East of Olympia, on the north bank of the Alpheus; (4) beside Sellasia in Laconia. The name was even commoner in Asia Minor: a lofty chain in Mysia (Keshish Dag), a ridge east of Smyrna (Nif Dag), other mountains in Lycia, in Galatia, in Cilicia and in Cyprus.

II. In the *Iliad* the gods are described as dwelling on a lofty peak, rising high above the clouds of the lower atmosphere into the clear ether; in the *Odyssey* Olympus is more remote and less definite; the notions of later poets vary from a definite mountain to a vague conception of heaven. In literary mythology, though each deity had special haunts, all had residence at the court of Zeus on Olympus; here were their assemblies and feasts.

OLYNTHUS, an ancient city at the head of the Gulf of Torone, in Chalcidice, near the neck of the peninsula of Pallene, about 60 stadia (7 or 8 m.) from Potidaea. It may have been a colony of Chalcis, and struck coins early, but the district belonged to a Thracian tribe, the Bottiaean, who held the town

till 479 B.C., when the Persian general Artabazus, on his return from escorting Xerxes to the Hellespont, suspecting that a revolt from the Great King was meditated, slew the inhabitants and handed the town over to Greeks from Chalcidice. Olynthus thus became a Greek *polis*, but it remained insignificant in the lists of the Delian League until 432. King Perdiccas of Macedon added to its population the inhabitants of Chalcidian towns in the neighbourhood (Thucyd. i. 58). Henceforward the chief Hellenic city west of the Strymon, it revolted from Athens, formed a base for Brasidas's expedition (424) and was never again reduced. In the 4th century it was the head of the Chalcidic League which may be traced back to the peace of Nicias (421), when the Chalcidians acted in common and were enrolled as allies of Argos. The motive for its formation is almost certainly to be found in fear of Athens. Coins of the league can be dated as early as 405; one specimen may go back to 415-420. After the Peloponnesian War the league concluded an important treaty, about 390, with Amyntas, king of Macedon (the father of Philip), and by 382 it had absorbed most of the Greek cities west of the Strymon, and even held Pella, the chief city in Macedonia. But in this year Sparta was induced by an embassy from Acanthus and Apollonia, not yet included by the league, to attack; and Olynthus, after three years of indecisive warfare, formally dissolved the confederacy (379). Chalcidians, however, appear among the Athenian naval confederacy of 378-377. Twenty years later, in the reign of Philip, the power of Olynthus is asserted by Demosthenes to have been much greater than before the Spartan expedition, and the league included thirty-two cities. When war broke out between Philip and Athens (357), Olynthus was at first in alliance with Philip. Subsequently, it concluded an alliance with Athens; but in spite of all the efforts of the Athenians and their orator, Demosthenes, Philip razed it in 348.

Excavations by an American mission are in progress.

OLYPHANT, an anthracite-mining borough of Lackawanna county, Pennsylvania, U.S.A., on the Lackawanna river, 6 m. N.N.E. of Scranton; served by the Delaware and Hudson and the New York, Ontario and Western railways, and for freight also by the Erie and the Lackawanna. Pop. (1920) 10,236 (29% foreign-born white).

OMAGH (ó'mah), a market town and the county town of Co. Tyrone, Ireland, on the Strule, 129½ m. N.W. by N. from Dublin by the Great Northern railway. Pop. (1921) 4,836. The town is situated on a steep slope above the river. There are milling and linen industries, and monthly fairs are held. The castle, of which there are scanty remains, was besieged in 1509 and 1641, being rebuilt after its total destruction in the first case.

OMAHA. This Siouan tribe of Nebraska, closely associated with the Ponca, combined agriculture with seasonal buffalo hunting. Since 1829 they have numbered between 1,200 and 1,500. They were organized into moieties and ten patrilineal clans. See J. O. Dorsey, *Bur. Am. Ethn. Rep.* xv., (1897); A. C. Fletcher and F. La Flesche, *ibid.* xxvii. (1911).

OMAHA, the largest city of Nebraska, U.S.A., a port of entry, and the county seat of Douglas county; on the west bank of the Missouri river, 500 m. W. by S. of Chicago. It is on Federal highways 30 (the Lincoln), 38, and 75; is the central station on the main transcontinental airway, and has a municipal airport of 200 ac.; and is served by the Burlington, the Chicago and North Western, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Omaha, the Illinois Central, the Missouri Pacific, the Rock Island, the Union Pacific, the Wabash, and electric railways, and by 15 motor-bus lines. The population was 191,601 in 1920 (18.5% foreign-born white and 5.2% negroes) and was estimated locally at 219,200 in 1928.

The city has an altitude ranging from 940 to 1,123 feet. The original town site of 270 blocks, an elongated terrace above the river, is now entirely a business quarter, and gradually the city has extended over the hills and bluffs beyond, until it covers 39

sq.m. The stockyards and the packing plants are in South Omaha (formerly an independent municipality, with a population in 1910 of 26,259), which was annexed in 1915. There are 30 parks, with an aggregate area of 3,600 acres, connected by 37 m. of boulevard; 17 supervised playgrounds for children, 3 municipal golf courses, 6 country clubs, and a fine tourist camp. The Fontenelle Forest Reserve covers 1,800 acres. Ft. Crook (10 m. S.) and Ft. Omaha, in the northern part of the city, are important military posts. The public school system comprises 58 elementary and 5 high schools, representing an investment of \$20,000,000 and an annual expenditure of \$4,000,000 for salaries and maintenance, and the parochial system adds 29 elementary and 5 high schools. Among the other educational institutions are the State School for the Deaf (1867); the College of Medicine, part of the University of Nebraska; Creighton university (1879; conducted by the Jesuits), comprising seven colleges and a high school; the University of Omaha (Presbyterian; 1908); and the Presbyterian Theological seminary (1891). The principal newspapers are the *Omaha Bee-News*, a merger (1927) of the *Bee* (established in 1871 by Edward Rosewater, who made it one of the influential Republican journals of the Middle West) and the *News* (1899); and the *World-Herald*, formed in 1889 by the combination of papers established in 1865 and 1885, and edited from 1894 to 1896 by William Jennings Bryan. Among the 70 other periodical publications are the *Duroc Journal-Bulletin* and a daily devoted to the livestock industry. The city has a symphony orchestra, a community playhouse, a drama club, and a large musical club. Ak-Sar-Ben (Nebraska spelled backwards) is an organization of 5,000 business men (formed in 1894 to promote interest in the history and progress of the city and the State) which holds an annual carnival attracting hundreds of thousands of visitors and conducts two running race meetings a year at its own track. Omaha is the see of a Roman Catholic and Protestant Episcopal bishoprics and a district headquarters of the Methodist Episcopal Church. There are 183 churches and missions in the city. The 21 hospitals (most of which conduct training schools for nurses) have 400 physicians and surgeons on their staffs, and treat annually about 12,000 patients from outside the city. Thirty of the charitable organizations are financed jointly through a community chest, which has an annual budget of about \$400,000. The proportion of homes owned by their occupants is high and is increasing (39.8% in 1910; 55.5% in 1926). The percentage of illiteracy is low. There is a telephone for every 3.4 persons, and an automobile for every 5. The city operates under a "home rule" charter of 1923, providing for a commission form of government, with biennial elections. The assessed valuation of property for 1927 was \$342,321,905.

Omaha is the headquarters of the air-mail branch of the postal service; the Seventh Corps Area of the U.S. army; the Union Pacific railway system and the western divisions of the Chicago, Burlington and Quincy and the Chicago and North Western Lines; the Northwestern Bell Telephone company and the Central Division of the Western Union Telegraph company; and the Western Newspapers Union. It has the largest Federal land bank in the country (on the basis of loans granted) and is the seat of a branch bank of the Federal Reserve system. It is one of the principal railroad centres of the country. The ten trunk-line roads entering the city have 62,547 m. of track. Over 9,000,000 tons of freight is received and forwarded annually. In volume of business as measured by debits to individual banking accounts (\$2,386,855,000 in 1926) Omaha ranks 20th among the cities of the United States, though 34th (1920) in population. It is the largest retail centre between Chicago and Denver; an important insurance centre, with 33 home-office companies and branches of many others, receiving \$50,000,000 annually in premium income; and one of the leading manufacturing and wholesale distributing centres of the country. The total output of its 706 manufacturing firms in 1926 was valued at \$406,866,090 (about three-fourths of the total for the State), of which \$210,795,250 represented packing-house products. Its 550 wholesale and jobbing houses distributed merchandise valued at \$486,357,570 in 1926. It ranks first in the production of butter and pig lead, as a primary grain market and a

feeder sheep market, and disputes with Kansas City for second place as a general livestock market and meat-packing centre.

History.—In 1804 Meriwether Lewis and William Clark camped on the Omaha plateau, and in 1825 a licensed Indian trading post was established here. Fur traders and trappers frequented the region through the first half of the 19th century. In 1846 the Mormons settled at "Winter Quarters" (called Florence after 1854, and annexed to Omaha in 1917), but in 1848 they were obliged to move, as it was within the Indian reservation. Some 12,000 of them built camps in this vicinity, on both sides of the Missouri, in 1846 and 1847, from which gradually they emigrated to Utah, but their local influence was strong for nearly a decade. Speculative "squatters" intruded on the Indian lands in 1853, and a rush of settlers followed the opening of Nebraska Territory in 1854. Omaha (named from the Omaha Indians) was laid out in 1854 and chartered as a city in 1867. Prairie freighting and river traffic were important before the construction of the Union Pacific railroad, which was begun in Dec. 1863. The city was an important outfitting point during the rush to the Colorado gold-fields. Connection by telegraph was established with San Francisco in 1861, with Chicago and St. Louis in 1863. The Union Pacific Railroad bridge across the Missouri was completed in 1869. The Rock Island, the Burlington, and the North Western railways entered the city in 1867 and 1868. Meat packing began as early as 1871, and grew rapidly after 1884, when the Union Stock Yards company was formed and yards established in South Omaha. In 1860 the population was 1,883; 16,083 in 1870; and 30,518 in 1880. In the next 20 years it increased 236%, and between 1900 and 1920, 87%. In the first quarter of the 20th century receipts of grain increased about threefold, the value of the manufactures almost fourfold; the volume of the wholesale business was multiplied (roughly) by 8; bank clearings by 7; and the city's assessed valuation by 43.

OMALIUS D'HALLOY, JEAN BAPTISTE JULIEN D' (1783–1875), Belgian geologist, was born on Feb. 16, 1783, at Liège, and educated in Liège and Paris. He became *maire* of Skeuvre in 1807, governor of the province of Namur in 1815, and from 1848 senator. He died on Jan. 15, 1875. His chief works were: *Mémoires pour servir à la description géologique des Pays-Bas, de la France et de quelques contrées voisines* (1828); *Eléments de géologie* (1831, 3rd ed. 1839); *Abrégé de géologie* (1853, 7th ed. 1862); *Des races humaines, ou éléments d'ethnographie* (5th ed., 1869).

OMAN, SIR CHARLES WILLIAM CHADWICK (1860–), British historian, was born at Mozufferpore, India, the son of a tea planter, on Jan. 12, 1860. Educated at Winchester and at New College, Oxford, he was made a fellow of All Souls in 1883. In 1905 he became Chichele professor of modern history at Oxford and he was chosen a fellow of the British Academy in the same year. He was president of the Royal Historical Society 1917–21. In 1919 he was elected M.P. for the University of Oxford and in 1920 he was knighted. His most important work was done in military history. His works include: *History of the Art of War in the Middle Ages* (1898, new ed. 1924); *History of Greece* (1890); *A Short History of England* (1895, new ed. 1920); and a *History of the Peninsular War 1807–13* (6 vols., 1902–22).

OMAN, a nominally independent State in south-eastern Arabia, extending from Ras Musandam, on the Gulf of Oman, to the eastern limits of Hadhramaut at Ras Sajar (lat. 16° 8' N.) on the Indian ocean. Inland the State is bounded by the great desert of Arabia. The population is given as 500,000, chiefly Arabs, with a strong negro element in the coastal regions. Area (roughly), 82,000 sq. miles.

Oman is a mountainous district forming part of the ancient land mass of Arabia, granite and limestone rocks being most in evidence. The high ground culminates in Jeb. Akhdar (9,900 ft.), coast. In this way access from the harbours (of which that of which is flanked by steps of the old mountain block down to the Muscat [q.v.] is alone important) to the interior is very difficult. The lateral valleys between the various steps are often fertile and cultivated, especially where a good supply of water is available.

The oasis of Tyin is the most important. The wadis of Oman, which cut across the mountainous area to the coast, are merely torrential channels, dry for the greater part of the year, often flowing in narrow precipitous gorges, the only means of entering the interior. Of these ways, always difficult, the best known are those by the Wadi Kahza, from the port of Matrah; by the Wadi Hail from the port of Kuryat, and by the Semail valley, leading into the Wadi Munsab from a point 50 m. N.W. of Muscat. All routes give access to Wadi Tyin, the garden of Oman.

The climate is tropical, with a mean annual rainfall of under 10 in., and a mean annual temperature of 80° or more. The vegetation is, however, tolerably abundant; tamarisks, oleanders, kafas, euphorbias, the milk-bush, rhamus and acacias being the most common.

Muscat, the capital, was in Portuguese hands from 1508 to the middle of the 17th century. In 1741 it was recovered by Ahmed bin Sa'id, a descendant of those Yemenite imams who consolidated Arab power in Zanzibar and on the East African coast. His family has ruled Oman ever since. It was the most powerful State in Arabia during the first half of the 19th century, but subsequent raids by the nomadic tribes of the interior, as in 1913–14, and the opportunities for foreign intervention, particularly on the part of Britain, afforded by these occurrences, have now reduced the country to a dependency of the Government of India. The ruling sultan of Oman resides in India for the greater part of his time, and takes no active part in the government of his State.

The State is best known for its date cultivation, which has reached a high level in the interior. It is cultivated alongside of cereals and vegetables, as well as vines, peaches, apricots, oranges, mangoes and melons. Cultivation would be extended if the water supply were assured. The trade of Oman is mainly to and from India. Dates, pomegranates and dried fish are exported, while rice, coffee and cotton goods are the chief imports. The little port of Gwadar, on the coast of Baluchistan, the outlet for most of the trade of Makran, is still a dependency of Oman.

OMAR (c. 581–644), in full 'OMAR IBN AL-KHATTAB, the second of the Mohammedan caliphs. (See CALIPHATE.) Originally opposed to Mohammed, he became later one of the ablest advisers both of him and of the first caliph, Abu Bekr. His own reign (634–644) saw Islam's transformation from a religious sect to an imperial power. The chief events were the defeat of the Persians at Kadişiya (637) and the conquest of Syria and Palestine. The conquest of Egypt followed (see EGYPT and AMR IBN EL-ASS) and the final rout of the Persians at Nehāwend (641) brought Iran under Arab rule. Omar was assassinated by a Persian slave in 644, and though he lingered several days after the attack, he appointed no successor, but only a body of six Muhajirun who should select a new caliph. Omar was a wise and far-sighted ruler and rendered great service to Islam. He is said to have built the so-called "Mosque of Omar" ("the Dome of the Rock") in Jerusalem, which contains the rock regarded by Mohammedans as the scene of Mohammed's ascent to heaven, and by the Jews as that of the proposed sacrifice of Isaac.

'OMAR KHAYYĀM [GHİYĀTHUDDĪN ABULFATH 'OMAR BIN IBRĀHĪM AL-KHAYYĀM], the great Persian mathematician, astronomer, free thinker and epigrammatist, who derived the epithet Khayyām (the tentmaker) most likely from his father's trade, was born in or near Nishāpūr, where he is said to have died in A.H. 517 (A.D. 1123). His standard work on algebra, written in Arabic, and other treatises of a similar character raised him at once to the foremost rank among the mathematicians of that age, and induced Sultān Malik-Shāh to summon him in A.H. 467 (A.D. 1074) to institute astronomical observations on a larger scale, and to aid him in his great enterprise of a thorough reform of the calendar. The results of 'Omar's research were—a revised edition of the *Zij* or astronomical tables, and the introduction of the Ta'rikh-i-Malikshāhi or Jalāli, that is, the so-called Jalālian or Seljūk era, which commences in A.H. 471 (A.D. 1079, 15th March).

'Omar's great scientific fame, however, is eclipsed in the West, by his still greater poetical renown, which he owes to his *rubā'is* (made famous in the west by FitzGerald's translation, *The Rubā'iyāt*) or quatrains, a collection of about 500 epigrams. Although

some of his quatrains are purely mystic and pantheistic, most of them bear quite another stamp; they are the breviary of a radical freethinker, who protests in the most forcible manner both against the narrowness, bigotry and uncompromising austerity of the orthodox ulemā and the eccentricity, hypocrisy and ravings of advanced Sūfīs.

BIBLIOGRAPHY.—The Leyden copy of 'Omar Khayyām's work on algebra was noticed as far back as 1742 by Gerald Meerman in the preface to his *Specimen calculi fluxionalis*; further notices of the same work by Sédillot appeared in the *Nouv. Jour. As.* (1834) and in vol. xiii. of the *Notices et extraits des MSS. de la Bibl. roy.* The complete text, together with a French translation (on the basis of the Leyden and Paris copies, the latter first discovered by M. Libri, see his *Histoire des sciences mathématiques en Italie*, i. 300), was edited by F. Woepcke, *L'Algèbre d'Omar Alkhaïyāmī* (Paris, 1851). Articles on 'Omar's life and works are found in Reinaud's *Géographie d'Aboulféda*, pref., p. 101; *Notices et extraits*, ix. 143 seq.; Garcin de Tassy, *Note sur les Rubā'iyāt de 'Omar Hhaïyām* (Paris, 1857); Rieu, *Cat. Pers. MSS. in the Br. Mus.*, ii. 546; A. Christensen, *Recherches sur les Rubā'iyāt de 'Omar Hayyām* (Heldelberg, 1905); V. Zhukovski's *'Umar Khayyām and the "Wandering" Quatrains*, translated from the Russian by E. D. Ross in the *Journal of the Royal Asiatic Society*, xxx. (1898); E. G. Browne, *Literary History of Persia*, ii. 246. The quatrains have been edited at Calcutta (1836) and Teheran (1857 and 1862); in English verse, by Edward FitzGerald (London, 1859, 1872 and 1879). FitzGerald's translation has been edited with commentary by H. M. Batson (1900), and the 2nd ed. of the same (1868) by E. Heron Allen (1908). A new English version was published in Trübner's "Oriental" series (1882) by E. H. Whinfield, and the first critical edition of the text, with translations, by the same (1883). Important later works are N. H. Dole's variorum edition (1896), J. Payne's translation (1898), E. Heron Allen's edition (1898) and the Life by J. K. M. Shirazi (1905); but the literature in new translations and imitations has recently multiplied exceedingly. See A. G. Potter, *A bibliography of printed editions of the quatrains of Omar Khayyām in foreign languages* (Needham, Mass., 1923).

OMBRE, a card game, very fashionable at the end of the 18th century, but now practically obsolete. It was played with a pack of 40 cards (8, 9, 10 being omitted) and bore some similarity to whist.

See T. Palmer, *The Royal game of the Ombre, written at the request of divers Honorable Persons* (1665).

OMDURMAN, a town of the Anglo-Egyptian Sudan, opposite Khartum on the west bank of the Nile and immediately north

of the junction of the White and Blue Niles. Pop. (1926 census) 78,624 Europeans. The town covers a large area, being over 5 m. long and 2 broad. It consists for the most part of mud-huts, but there are some houses built of sun-dried bricks. Save for two or three wide streets which traverse it from end to end the town is a network of narrow lanes. In the centre facing an open space are the ruins of the tomb of the Mahdi and behind is the house in which he lived. The Khalifa's house (a two-storeyed building), the mosque, the Beit el Amana (arsenal) and other houses famed in the history of the town also face the central square. Omdurman is the headquarters of the native traders in the Anglo-Egyptian Sudan, the chief articles of commerce being ivory, ostrich feathers and gum arabic from Darfur and Kordofan. There is also an important camel and cattle market. The town is connected with Khartum by a bridge and an electric tramway. The government maintains elementary and technical schools. Mission work is undertaken by various Protestant and Roman Catholic societies.

Omdurman, then an insignificant village, was chosen in 1884 by the Mahdi Mahommed Ahmed as his capital and so continued after the fall of Khartum in January 1885. Its growth was rapid, the Khalifa (who succeeded the Mahdi) compelling large numbers

of disaffected tribesmen to live in the town under the eye of his soldiery. Here also were imprisoned the European captives of the Mahdists—notably Slatin Pasha and Father Ohrwalder. On Sept. 2, 1898 the Anglo-Egyptian army under Lord Kitchener totally defeated the forces of the Khalifa at Kerreri, 7 m. N. of the town. A marble obelisk marks the spot where the 21st Lancers made a charge. See EGYPT AND SUDAN, CAMPAIGNS IN.

OMELETTE: see EGG COOKERY.

OMEN, a sign in divination, favourable or unfavourable as the case may be (see DIVINATION, AUGURS and ORACLE).

OMICUND (d. 1767), an Indian whose name is indelibly associated with the treaty negotiated by Clive before the battle of Plassey in 1757. His real name was Amir Chand; and he was not a Bengali, as stated by Macaulay, but a Sikh from the Punjab. It is impossible now to unravel the intrigues in which he may have been engaged, but some facts about his career can be stated. He had long been resident at Calcutta, where he had acquired a large fortune by providing the "investment" for the Company, and also by acting as intermediary between the English and the native court at Murshidabad. Several houses owned by him in Calcutta are mentioned in connection with the fighting that preceded the tragedy of the Black Hole in 1756, and it is on record that he suffered heavy losses at that time. He had been arrested by the English on suspicion of treachery, but afterwards he was forward in giving help to the fugitives and also valuable advice. On the recapture of Calcutta he was sent by Clive to accompany Mr. Watts as agent at Murshidabad. It seems to have been through his influence that the nawab gave reluctant consent to Clive's attack on Chandernagore. Later, when the treaty with Mir Jafar was being negotiated, he put in a claim for 5% on all the treasure to be recovered, under threat of disclosing the plot. To defeat him, two copies of the treaty were drawn up: the one, the true treaty, omitting his claim; the other containing it, to be shown to him, which Admiral Watson refused to sign, but Clive directed the admiral's signature to be appended. When the truth was revealed to Omichund after Plassey, Macaulay states (following Orme) that he sank gradually into idiocy, languished a few months, and then died. As a matter of fact, he survived for ten years, till 1767; and by his will he bequeathed £2,000 to the Foundling Hospital (where his name may be seen in the list of benefactors as "a black merchant of Calcutta") and also to the Magdalen Hospital in London.

(J. S. Co.)

OMNIBUS. A term often shortened to "bus," signifying a public passenger-carrying vehicle of large seating capacity. It has become synonymous in popular use with the word "motorbus." Horse drawn and steam driven omnibuses have been superseded by motor propelled omnibuses.

In several particulars an omnibus must conform with regulations laid down by public authorities, especially in connection with dimensions and weights. The carried load, consisting of the passengers and the omnibus body, will at most be less than the regulation weight by a figure termed the chassis weight. The proportion borne by the carried load to the total weight, is largely determined by the speed, hill climbing and other performances characteristic of the omnibus and such proportion is always made as large as possible to obtain the maximum earning power. For any specified purpose, designers have in recent years been able to increase this proportion without prejudicing either the reliability of the vehicles or the lowness of their running costs.

Body design aims at making the proportion borne by the passenger load to the carried load as great as possible, and is influenced very greatly by public requirements in the matter of comfort and safety. This proportion tends to become less as more exacting conditions have to be met in the provision of seating, shelter, ventilation and lighting. Passengers may be taken to weigh on an average one sixteenth of a ton each, but so soon as an omnibus body is provided to carry them, the weight that must be credited to each passenger becomes much greater.

The almost universal practice in omnibus design in 1928 was to employ two axles, the rear wheels being used for driving and braking, and the front wheels being used for steering. The weight

PLAN OF THE BATTLE OF OMDURMAN. SEPT. 2, 1898

AMERICAN AND ENGLISH MOTOR COACHES FOR PUBLIC TRANSPORT

1. Fifth Avenue omnibus in New York city. This vehicle is a double-decked model, the upper deck having windshield in front to protect passengers while the omnibus is in motion. Entrance platform and winding stair are at the rear
- 2 and 4. Safety coach, Fifth avenue system, New York; designed to aid in an educational campaign for increased carefulness in city traffic
3. London six-wheeler omnibus, capacity 68 passengers; equipped with two driving axles, six cylinder engine, and pneumatic tyres all round
5. Stability test of a large London omnibus. The vehicle is tilted by means of an inclined platform and pulley blocks; wheels are prevented by ledges from slipping. Under the conditions shown, the safety ropes are quite slack with the vehicle tilted at 30 degrees
6. Double-decked omnibus, New York city, similar to the coach shown in fig. 1 but having upper deck roofed over and the sides enclosed with adjustable windows which slide into the partition below. These coaches have sleeve-valve motors and solid tyres all round

distribution, as indicated by the front and rear axle weights, must be such as to give the adhesion necessary for rapid acceleration and good braking on normal road surfaces. Skidding and inferior performance are the natural consequences of bad weight distribution. The limit is set to front axle weight by the consideration that the driver must be able to turn the front wheels easily in order to steer the vehicle. This limit is reached before the other, which otherwise would affect both axles alike (but which, in consequence of the earlier limit on the front axle, affects the rear axle alone), viz. the limiting axle weight tolerated by local authorities.

Low Centre of Gravity.—In the complete omnibus, under all conditions of loading, the centre of gravity must be so low in relation to the width of the vehicle as to render exceedingly remote the possibilities of over-turning. Where conditions permit, the centre of gravity should occupy a position even lower than that which gives the desired stability. All deviations of a 'bus from uniform motion in a straight line will bring about changes in the loading of every wheel, and these changes become smaller as the centre of gravity approaches the plane of the road. With a low centre of gravity, it will be usual to work very close to the adhesion figures calculated for the stationary omnibus, since the greatest acceleration and braking effects that these figures allow, can be actually approached in practice under all conditions. Where the centre of gravity is high, braking is liable to promote skidding at corners, and on cambered surfaces; rapid acceleration will give rise to the same tendency. Since the carried load in a modern omnibus forms the large proportion of the total weight, and since the carried load comprises very nearly everything which is above floor level, it follows that the problem of making further reductions in the height of the centre of gravity, resolves itself simply into the problem of reducing the floor height.

To obtain the lowest possible floor height, omnibus designers have developed the double reduction driving axle. In this axle, the driving shafts do not transmit the torque direct to the road wheels, but communicate their motion to them through gearing. Each wheel bears a drum coaxial with the brake drum, but of smaller diameter, on which teeth are cut internally. Pinions on the ends of the driving shafts engage with these drums at their lowest points. This arrangement permits the use of full size driving wheels with an axle whose height is considerably less than that of the wheel centres. It permits, moreover, the use of a smaller housing for the right angled drive in the centre of the axle. This drive no longer effects the whole torque multiplication, but only a part of it; whereas the whole multiplication may be nearly 10 to 1, the right angled drive may be called upon to give a multiplication of only 2 to 1, and may therefore be much more compact than one giving the full multiplication.

The centre of gravity is lower in the "N.S." omnibus than in other types. Under the worst conditions, when the upper deck is laden and the lower deck is unladen, the ground may tilt to the extent of 28° beneath the car before over-turning can occur. The best figure obtained with the more usual construction, and without a top cover, was 25°. With the advent of cross seating, omnibus axle weights became so great as to approach the limit tolerated by road authorities. Rear axle weights, reaching that limit, could no longer be increased, and the need arose, as bigger omnibus weights were required, for throwing the weight forward. To this end the forward drive omnibus was introduced in London, and subsequently in all parts of the world.

The modern 'bus body is continued forward to a point only an inch or two behind the rear cylinder block. The driver sits forward alongside the engine, and is actually in a much more favourable position to steer his vehicle round blind corners than formerly. The drawbacks to the forward drive omnibus, are, firstly, the heaviness of steering consequent upon the increased front axle loading, and secondly, the difficulty of access to the engine on the off-side. Neither of these drawbacks has, however, proved serious. There is a tendency among vehicle builders of six wheelers to return to the conventional driving position of many years ago, but the day cannot long be postponed when forward

drive will be forced upon designers of six wheelers, as it has been forced upon designers of four wheelers.

Transmission Problem.—Common to all road vehicles employing the internal combustion engine, is the problem of transmitting the power developed by a relatively inflexible prime mover to the road wheels. In the omnibus, above all other vehicles, this problem is one of great difficulty to which no entirely satisfactory solution has yet been found. The high power weight ratio of an ordinary car makes possible the employment of a lightly constructed clutch and gearbox, since the car will normally run in top or direct gear. Only motoring enthusiasts care for driving on the gears and obtaining thereby a splendid performance out of a small capacity engine. Nevertheless, the omnibus driver is called upon to do this, and in consequence, the transmission must be of great robustness and be simple to manipulate. In addition to the need for gear changing, ever present on undulating roads, with the relatively low powered omnibus there is the constant stopping to let down and take up passengers which also calls for gear manipulation. With the very heavy omnibus used in services necessitating a great many stops, it has become impossible to achieve, without high maintenance costs, the propulsion of the load through the agency of the clutch and gearbox. It is probably only a matter of a year or two before other forms of transmission—electric transmission in particular—will live down their many drawbacks, and show on the whole a saving in costs.

For the right angled drive in an omnibus rear axle, bevel, and other forms of gearing have yet to be proved superior to worm gearing. Within recent years, the old fashioned motion communicating screw and wheel has been developed to meet modern automobile and industrial requirements, and in its original form it can scarcely claim a relationship with the highly efficient reversible worm gearing of the present day. The difficulties inherent in the many forms of bevel drive are to make them compact and also silent.

Suspension.—The suspension of an omnibus is effected through longitudinally disposed semi-elliptic leaf springs mounted on the axles, supplemented by rubber buffers, steel volute springs, or other energy absorbing devices over the axles. The latter augment the stiffness of the suspension to meet exceptional load or road conditions.

Rear springs are often allowed to take the driving and braking torque reactions of the rear axle. Where this is not permissible, a torque arm is provided, and the rear springs are shackled at both ends. Tractive effects are often communicated to the vehicle through the rear springs also, though, where a torque arm is provided, the springs must, in view of their being shackled at both ends be relieved of this duty. Where it is provided, the torque arm usually swings from a well braced frame cross-member that has sufficient strength to withstand the pushing and tugging in a horizontal plane to which it will be subjected by the driving and braking exertions of the rear axle. Some vehicles are made with a torque tube surrounding the propeller shaft.

No effort is made by designers to produce completely rigid chassis frames for omnibuses. All things carried on the frame are mounted so as to flex with it or be able to take up a new position without strain. Such rigid structures as engine, gearbox and radiator, are mounted on frame attachments or bearers with rubber or other resilient pads interposing and permitting small relative movements. Where severe conditions must be met, the engine and gearbox are mounted on three such bearers only. Three points of support, however, situated, remain always in a plane, and there can be no distortion from twisting with three point suspension. The drive between units, disposed none too rigidly in relation to one another, is effected by means of shafts bearing flexible couplings or universal joints at their extremities.

The enormous mileages accomplished by the omnibus as compared with the light car, prohibit the adoption by omnibus engineers of light car greasing methods. There is no part of an omnibus which can be packed with grease and left to itself from one year's end to another. Grease nipples and filler caps are provided everywhere in accessible positions, and positive action grease feeding guns which can be relied upon to urge lubricant where

lubrication is necessary, are used under service conditions at frequent intervals.

Tyre-makers, anticipating the call for higher omnibus speeds which had been heard for some considerable time, developed the pneumatic tyre that will carry heavy loads. With higher running speed, better braking must be provided on all vehicles. Rear wheel adhesion becomes insufficient and all four wheels must be fitted with drums and brake shoes. Four wheel braking is, in any event, often forced upon designers by the difficulty of accommodating two sets of brake drums on the very small wheel centres that accompany these deep section tyres.

OMRI, an Israelite general, chosen by the army as ruler when, during a campaign against the Philistines, reports came that Zimri, a captain of the chariots, had murdered the king, Elah, in the royal city of Tirzah and proclaimed himself king. Omri promptly marched against Zimri, and captured Tirzah; Zimri, recognizing the hopelessness of his position, set fire to the palace and perished in the flames. A rival party set up Tibni—with whom the Greek versions associate his brother Joram—as king, but Omri defeated this faction and became undisputed king of Israel c. 884 B.C. The one deed of his reign recorded in I Kings xvi. 24 is his purchase of the hill of Samaria, upon which he founded a new royal city. But Mesha of Moab mentions him as "having afflicted Moab many days." In spite of the fact that he suffered some reverses at the hand of Syria (I Kings xx. 34), he must have been an accomplished statesman who consolidated his kingdom and made it respected, because for generations after his death Israel is known to the cuneiform writers as "House (or Land) of Omri," and the Israelite Jehu as a "son of Omri." He reigned twelve years and was succeeded by his son AHAAB (q.v.).

OMSK, a town in the Siberian area of Asiatic Russia, in lat. 55° N., long. 73° 38' E., on the right bank of the Irtysh, where the Om joins it. It is in the midst of a treeless steppe; violent winds bring snow, often to a depth of 6 ft., in winter, and sandstorms in summer. Average January temperature 5° F, July 68° F; annual rainfall 12.4 in.; altitude 285 ft. It is on the trans-Siberian railway, and has a branch linking with Sverdlovsk through Ishim and Tyumen. Steamer routes connect it with the Ob northwards along the Irtysh, and southwards with the Altai towns and Lake Zaisan, and caravan routes from the Central Asiatic republics and Kazakhstan converge upon it. Its population has grown from 37,376 in 1897 to 115,523 in 1926, but its appearance is still that of a frontier town, with one-storeyed wooden huts and unpaved streets, through which Kirghiz ponies and camel caravans thread their way. Stone buildings are being constructed and the cathedral is built of stone; there is a municipal electricity, water and bus service. Its industries include the making of agricultural and other machinery, distilling, brewing, cloth manufacture and foodstuffs, especially sausage. It is a centre for the collection and export of meat, butter, hides and skins. The Russian Geographical society has a museum here and there is much educational and dramatic activity.

A fort was established here in 1716 to protect the Russian settlers from Kirghiz raids. Later, with the increasing colonization of the area and the coming of the railway, the town developed rapidly and became a military centre, with large barracks. After the 1917 revolution, it was the nucleus of Siberian political activity and various governments rapidly succeeded one another; Admiral Kolchak declared himself Dictator of Siberia at Omsk. With the advance of the Bolshevik army, refugees from the west crowded into the town and the insanitary conditions resulted in a plague of spotted fever and typhus. On the capture of the town the refugees fled further eastwards carrying infection with them, though many died of cold, hunger and disease.

ONA, an Indian tribe who once occupied the interior of Tierra del Fuego except the south-western corner, which was uninhabited, and the south-eastern corner, where dwelt a related tribe known as the Haush. The Ona in speech, physique and culture were similar to the giant Tehuelche of Patagonia. They subsisted by hunting and were expert archers. Their chief food was the flesh of the guanaco, a wild camel related to the llama. In addition they ate birds, fish, shellfish, berries and fungi. Ona culture was very primi-

tive. Their dress was a large robe of guanaco fur, moccasins, a petticoat for the women and a fur diadem for the men. In spite of their cold environment they rarely used houses, and habitually slept behind a windbreak of hides. Their manufactures included bows and arrows, short fishing spears, slings, baskets, braided necklaces, wristlets and anklets and a few simple tools. Ona society was organized into hunting groups of relatives. Each group controlled a well-defined territory which it vigorously defended from poachers. As a result blood feuds were common. At times each hunting group assembled to perform initiation ceremonies. Candidates were taught tribal lore, were terrified by masked apparitions and were forced to live in solitude for two years that they might become strong and self-reliant. Ona religion consisted in a fear of certain malevolent spirits and belief in a supreme deity. Ona mythology is rich. The tribe has almost died out.

See S. K. Lothrop, "The Indians of Tierra del Fuego" (Museum of the American Indian, Heye Foundation, *Contributions*, vol. x. 1928); J. M. Cooper, *Analytical and Critical Bibliography—of Tierra del Fuego* (Bureau of American Ethnology, Bulletin 63, 1917).

(S. K. L.)

ONAGRACEAE, in botany, a family of dicotyledons belonging to the order Myrtiliflorae, to which belongs also the myrtle family, Myrtaceae. It contains about 40 genera and 500 species, and occurs chiefly in the temperate zone of the New World, especially on the Pacific side. It is represented in Britain by several species of *Epilobium* (willow-herb), *Circaea* (enchanter's nightshade), and *Ludwigia*, a small perennial herb very rare in boggy pools in Sussex and Hampshire. In the United States, especially in the Pacific States, the family is well represented, the principal genera being *Oenothera* (containing as a native the evening primrose, now naturalized in certain parts of Europe), *Epilobium* (willow herb), and *Ludwigia* (false loosestrife). The plants are generally herbaceous, sometimes annual, as species of *Epilobium*, *Clarkia*, *Godetia*, or biennial, as *Oenothera biennis*—evening primrose—or sometimes become shrubby or arborescent, as *Fuchsia* (q.v.). The simple leaves are generally entire or inconspicuously toothed, and are alternate, opposite or whorled in arrangement; they are generally exstipulate. The flowers are often solitary in the leaf-axils, as in many *Fuchsias*, *Clarkia*, etc., or associated, as in *Epilobium* and *Oenothera*, in large showy terminal spikes or racemes; in *Circaea* the small white or red flowers are borne in terminal and lateral racemes. The regular flowers have the parts in fours, the typical arrangement as illustrated by *Epilobium*, *Oenothera* and *Fuchsia* being as follows: 4 sepals, 4 petals, two alternating whorls of 4 stamens, and 4 inferior carpels. The floral receptacle is produced above the ovary into the so-called calyx-tube, which is often petaloid, as in *Fuchsia*, and is sharply distinguished from the ovary, from which it separates after flowering.

GREAT HAIRY WILLOWHERB (*EPILOBIUM HIRSUTUM*)

In *Clarkia* the inner whorl of stamens is often barren, and in *Eucharidium* it is absent. In *Circaea* the flower has its parts in two's. Both sepals and petals are free; the former are valvate in bud, and reflexed in the flower; in *Fuchsia* they are petaloid. The petals are generally convolute in bud; they are entire (*Fuchsia*) or bilobed (*Epilobium*); in some species of *Fuchsia* they are small and scale-like, or absent (*F. apetala*). The stamens are free, and those of the inner whorl are generally shorter than those of the outer whorl. The flowers of *Lopczia* (Central

America) have only one fertile stamen. The large spherical pollen grains are connected by viscid threads. The typically quadrilocular ovary contains numerous ovules on axile placentas; the 1-to-2-celled ovary of *Circaea* has a single ovule in each loculus. The long slender style has a capitate (*Fuchsia*), 4-rayed (*Oenothera*, *Epilobium*) or 4-notched (*Circaea*) stigma. The flowers, which have generally an attractive corolla and honey secreted by a swollen disk at the base of the style or on the lower part of the "calyx-tube," are adapted for pollination by insects, chiefly bees and lepidoptera; sometimes by night-flying insects when the flowers are pale and open towards evening, as in evening primrose. The fruit is generally a capsule splitting into four valves and leaving a central column on which the seeds are borne as in *Epilobium* and *Oenothera*—in the former the seeds are scattered by aid of a long tuft of silky hairs on the broader end. In *Fuchsia* the fruit is a berry, which is sometimes edible, and in *Circaea* a nut bearing recurved bristles. The seeds are exalbuminous. Several of the genera are well known as garden plants, e.g., *Fuchsia*, *Oenothera*, *Clarkia* and *Godezia*. Evening primrose (*Oenothera biennis*), a native of North America, occurs apparently wild as a garden escape in Britain. *Jussieuia*, a tropical genus of 50 species of water- and marsh-herbs, shows a development of well-developed aerating tissue.

ONATAS, a Greek sculptor of the time of the Persian wars, a member of the flourishing school of Aegina. Many of his works are mentioned by Pausanias; they included a Hermes carrying the ram, and a strange image of the Black Demeter made for the people of Phigaleia; also some groups in bronze at Olympia and Delphi, including a bronze chariot for Hieron I. of Syracuse. From Pausanias' descriptions we may assume that the figures on the pediments of Aegina represent his style. They are manly, vigorous, athletic, showing great knowledge of the human form, but somewhat stiff and automaton-like.

ON-COSTS: see OVERHEAD CHARGES.

ONEGA (ôn'e-gah), the largest lake in Europe next to Ladoga, area, 3,764 sq.m. and coast line 870 m. in length. It lies mostly in the Karelian A.S.S.R., though its southern portion is in the province of Leningrad. The lake basin extends north-west and south-east, the direction characteristic of the lakes of Finland and the line of glacier-scoring observed in that region. The southern coast is comparatively regular and has few islands, but the north is broken into inlets, the largest being Povenets bay, and is crowded with islands (e.g., Klimetsk) and submerged rocks. The north-western shore between Petrozavodsk and the mouth of the river Lumbosha consists of dark clay slates, generally arranged in horizontal strata and broken by protruding, parallel ridges of diorite, which extend far into the lake. The eastern shore, as far as the mouth of the Andoma, is for the most part alluvial, with outcroppings of red granite and in one place (the mouth of the Pyalma) diorite and dolomite. To the south-east are sedimentary Devonian rocks, and the general level of the coast is broken by Mt. Andoma and Cape Petropavlovskiy (160 ft. above the lake); to the south-west a quartz sandstone (used as a building and monumental stone in Leningrad) forms a fairly bold rim. Lake Onega lies 125 ft. above the sea. The greatest depths, 318 to 408 ft., occur at the entrance to the double bay of Lihemsk and Unitsk. On the continuation of this line the depth exceeds 240 ft. in several places. In the middle of the lake the depth is 120 to 282 ft., and less than 120 ft. in the south. The lake is 145 m. long, with an average breadth of 50 m. The most important affluents, the Vodka, the Andoma and the Vytegra, come from the east. The Kumsa, a northern tributary, is sometimes represented as if it connected the lake with Lake Seg, but at the present time the latter drains to the White sea. The Onega canal (45 m. long) was constructed in 1818-51 along the southern shore in order to connect the Svir (and hence Lake Ladoga and the Baltic) with the Vytegra, which connects with the Volga. In 1928 an electric station was constructed on the Svir river. Lake Onega remains free from ice for 209 days in the year (middle of May to second week of December). The water is at its lowest level in the beginning of March; by June it has risen 2 ft. A considerable population is scattered along the shores of the lake, mainly occupied in

the timber trade, fisheries and mining industries. The opening of the Murmansk railway along the western shore in 1917 is developing settlement. Salmon, *palya* (a kind of trout), burbot, pike, pike perch and perch are among the fish caught in the lake.

The River Onega rises in Lake Vozhe, and is navigable for boats and rafts to Kargopol on Lake Lacha to the Gulf of Onega, an inlet of the White sea. It flows through the provinces of Volodga and Archangel and has no connection with Lake Onega. At the mouth of this river (on the right bank) in 63° 55' N., 38° 55' E., in the province of Archangel, stands the town and port of Onega. Pop. (1926) 5,254. It dates from settlements made by the people of Novgorod in the 15th century, known in history as Ustenskaya or Ustyanskaya. It has a saw-milling industry, and has summer steamer routes to Soroka, Kem and Archangel, but the season is short owing to the persistence of land floes and loose pack. Telegraphic communication is by the Archangel railway.

ONEIDA, the only city of Madison county, New York, U.S.A., on Oneida creek, 6 m. S.E. of Oneida lake, midway between Utica and Syracuse. It is served by the New York Central, the New York, Ontario and Western and electric railways. Pop. (1920), 10,541 (89% native white). Adjoining Oneida on the west is the village of Wampsville (pop. 272 in 1925), the county seat. Across the creek, to the south-east, is the village of Oneida Castle (pop. 463 in 1925), formerly the gathering-place of the Oneida Indians. Oneida is the headquarters of the Oneida Community (q.v.), which controls important industries (notably the manufacture of silver-plated ware) here and elsewhere. The city also manufactures caskets and furniture. The aggregate factory output in 1925 was valued at \$5,302,380. Oneida was founded by Sands Higinbotham, who bought the site in 1829-30. It was incorporated as a village in 1848 and as a city in 1901.

ONEIDA (a corruption of their proper name *Oneyotka-ono*, "people of the stone," in allusion to the Oneida stone, a granite boulder near their former village, which was held sacred by them), a tribe of North American Indians of Iroquoian stock, forming one of the Six Nations. They lived around Oneida Lake in New York state, in the region southward to the Susquehanna. They were not loyal to the League's policy of friendliness to the English, but inclined towards the French, and were practically the only Iroquois who fought for the Americans in the War of Independence. As a consequence they were attacked by others of the Iroquois under Joseph Brant and took refuge within the American settlements till the war ended, when the majority returned to their former home, while some migrated to the Thames river district, Ontario. Early in the 19th century they sold their lands, and most of them settled on a reservation at Green Bay, Wisconsin, a few remaining in New York state. In 1926 the Oneidas in the United States numbered 3,238 persons, of whom 2,976 were in Wisconsin and 262 in New York state. They are civilized and prosperous. See NORTH AMERICA: *Ethnology*.

ONEIDA COMMUNITY, an American communistic society at Oneida, New York. It was founded at Putney, Vt., in 1842, by John Humphrey Noyes (1811-86), a graduate of Dartmouth college and a former Congregationalist minister. Having received a second conversion at a revival he announced himself a "perfectionist," or one who, believing that Christ had come again in A.D. 70, was absolved of all past and future sin. On this tenet he and his followers established a commune, eventually pooling all their property, renouncing all religious observances and allegiance to the United States and instituting a "complex marriage" system, any desire toward monogamy being frowned upon as naturally antagonistic to communistic ideals. In 1847, dissension having brought them before the courts and their theories and practices before the public, they were forced to leave Putney. They purchased, near Oneida, N.Y., 600ac. of forest-land which proved extremely productive. They planted orchards, lumbered, blacksmithed, farmed and made steel traps—their most profitable industry. In Jan., 1847, their first annual inventory revealed them to be worth about \$67,000.

They were mostly New England farmers and mechanics. They had the reputation of being excellent citizens only remarkable for

their earnest interest in eugenics. They sought to make practical application of what scientific information they possessed endeavouring by change and experiment to produce the best possible offspring.

Owing to increasing pressure of public sentiment, which had been anticipated though for 25 years it was unexpressed, Noyes, with a few adherents, removed to Canada in 1880 and the community at Oneida voluntarily dissolved as a communistic experiment and formed a stock company known as the Oneida Community, Limited. At that time it manufactured sewing and embroidery silk, steel traps and silverware, and canned large quantities of fruits and vegetables, but has gradually confined itself to the manufacturing of silverware. The present company has "no connection with the old beyond the personnel and traditions which it inherited from its 40 years' experience as a community."

Among the chief writings of J. H. Noyes dealing with the origin, principles and history of the Oneida Community are *The Berean* (1847), a manual for the use of members; *Salvation from Sin the End of Christian Faith* (1869); *History of American Socialisms* (1870); *Home-Talks* (1875); and *Essay on Scientific Propagation* (c. 1875). See also *Bible Communism* (1853), a compilation summarizing the community's religious and social theories; Allan Estlake, *The Oneida Community* (1900); and George Wallingford Noyes, comp. and ed., *Religious Experiences of John Humphrey Noyes* (1923).

O'NEILL, the name of an Irish family descended from Niall, king of Ireland in the 5th century, and known as Niall of the Nine Hostages. He is said to have made war against rulers in Ireland, Britain and Gaul, stories of his exploits being related in the *Book of Leinster* and the *Book of Ballymote*. This king had 14 sons, one of whom was Eoghan (Owen), from whom the O'Neills were descended. The descendants of Niall were divided into two main branches, the northern and the southern Hy Neill, to one or other of which nearly all the high-kings (ard-ri) of Ireland from the 5th to the 12th century belonged; the descendants of Eoghan being the chief of the northern Hy Neill¹. Eoghan was grandfather of Murkertagh (Muircheartach) (d. 533), said to have been the first Christian king of Ireland, whose mother, Eirc or Erca, became by a subsequent marriage the grandmother of St. Columba. Of this monarch, known as Murkertagh MacNeill (Niall), and sometimes by reference to his mother as Murkertagh Mac Erca, the story is told, illustrating an ancient Celtic custom, that he emphasized the inviolability of a treaty with a tribe in Meath by having it written with the blood of both clans mixed in one vessel. Murkertagh was chief of the great north Irish clan, the Cinel Eoghain, and after becoming king of Ireland in 517, he seized a tract in the modern Co. Derry, which remained till the 17th century in the possession of the Cinel Eoghain. The inauguration stone of the Irish kings, the Lia Fail, or Stone of Destiny, fabled to have been the pillow of the patriarch Jacob when he dreamed of the heavenly ladder, was said to have been presented by Murkertagh to the king of Dalriada, by whom it was conveyed to Dunstaffnage castle in Scotland. (See SCONE.) A lineal descendant of Murkertagh was Niall Frassach (i.e., of the showers), who became king of Ireland in 763. His grandson, Niall (791-845), drove back the Vikings who began to infest the coast of Donegal. Niall's son, Aedh (Hugh) Finnlaith, was father of Niall Glundubh (i.e., Niall of the black knee), one of the most famous of the early Irish kings, from whom the family surname of the O'Neills was derived. His brother Domhnall (Donnell) was king of Ailech, a district in Donegal and Derry; the ruined masonry of the royal palace is still to be seen on a hill overlooking loughs Foyle and Swilly. On the death of Domhnall in 911 Niall Glundubh became king of Ailech, and, after defeating the kings of Dalriada and Ulidia he became king of Ireland in 915. To him is attributed the revival of the ancient meeting of Irish clans known as the Fair of Teltown. He fought many battles against the Norsemen, in one of which he was killed in 919 at Kilmashoge, where his place of burial is still to be seen.

His son Murkertagh, who gained a victory over the Norse in 926, is celebrated for his triumphant march round Ireland, the

¹A list of these kings will be found in P. W. Joyce's *A Social History of Ancient Ireland* (London, 1903), vol. I., pp. 70, 71.

Moirthimchell Eiream, when he captured many kings and chieftains. From the dress of his followers in this expedition he was called "Murkertagh of the Leather Cloaks." The exploit was celebrated by Cormacan, the king's bard, and a number of Murkertagh's other exploits are related in the *Book of Leinster*. He was killed in battle against the Norse in 943, and was succeeded as king of Ailech by his son, Donnell Ua Niall (i.e., O'Neill, grandson of Neill, or Niall, the name O'Neill becoming about this time an hereditary family surname), whose grandson, Flaherty, made a pilgrimage to Rome in 1030.

Aedh (Hugh) O'Neill, chief of the Cinel Eoghain, or lord of Tir-Eoghain (Tir-Owen, Tyrone) at the end of the 12th century, came into conflict with the Anglo-Norman monarchy, whose pretensions he disputed in Ulster. His son (or nephew), Hugh O'Neill, lord of Tyrone, was styled "Head of the liberality and valour of the Irish." Hugh's son, Brian, was inaugurated prince, or lord, of Tyrone in 1291; and his son Henry became lord of the *Clann Aodha Buádhe* (Clanaboy or Clandeboye) early in the 14th century. Henry's son Murkertagh the Strongminded, and his great-grandson Hugh, greatly consolidated the power of the O'Neills. Niall Og O'Neill, one of the four kings of Ireland, accepted knighthood from Richard II.; and his son Eoghan formally acknowledged the supremacy of the English crown, though he afterwards ravaged the Pale, and was inaugurated "the O'Neill" (i.e., chief of the clan) on the death of his kinsman Domhnall Boy O'Neill. He was deposed (1455) by his son Henry, who in 1463 was acknowledged as chief of the Irish kings by Henry VII. Contemporary with him was Neill Mor O'Neill, lord of Clanaboy. From Neill Mor O'Neill's son Brian was descended the branch of the O'Neills who, settling in Portugal in the 18th century, became Portuguese nobles. This branch represents the male line of the ancient Irish kings of the house of O'Neill.

CONN O'NEILL (c. 1480-1559), 1st earl of Tyrone, surnamed Bacach (the Lame), grandson of Henry O'Neill mentioned above, was the first of the O'Neills to come to the front as a leader of the Irish against the English in the 16th century. Conn became chief of the Tyrone branch of the O'Neills (Cinel Eoghain) about 1520. Tyrone having been invaded in 1541 by Sir Anthony St. Leger, the lord deputy, Conn delivered up his son as a hostage, attended a parliament held at Trim, and, crossing to England, made his submission at Greenwich to Henry VIII., who created him earl of Tyrone for life. He was also made a privy councillor in Ireland, and received a grant of lands within the Pale. O'Neill's submission to the English king, and his acceptance of an English title were resented by his clansmen and dependents. The earl maintained a feud with his son Shane (John), arising out of his transaction with Henry VIII. The nomination of O'Neill's reputed son Matthew as his heir with the title of baron of Dungannon by the English king conflicted with the Irish custom of tanistry (q.v.), which regulated the chieftainship of the Irish clans; moreover, Matthew, if indeed he was O'Neill's son at all, was illegitimate, and Shane, Conn's eldest legitimate son, would not permit any invasion of his rights. The fierce family feud ended in the murder of Matthew by agents of Shane in 1558; Conn dying about a year later. Conn was twice married, Shane being the son of his first wife, a daughter of Hugh Boy O'Neill of Clanaboy. An illegitimate daughter of Conn married the celebrated Sorley Boy MacDonnell (q.v.).

SHANE O'NEILL (c. 1530-1567), rejected overtures from the earl of Sussex, the lord deputy, and refused to help the English against the Scottish settlers on the coast of Antrim, allying himself instead with the MacDonnells, the most powerful of these immigrants. Nevertheless Queen Elizabeth was disposed to come to terms with Shane, who after his father's death was *de facto* chief of the O'Neill clan. She recognized his claims to the chieftainship, thus throwing over Brian O'Neill, son of the murdered Matthew, baron of Dungannon, on terms. O'Neill, however, refused to put himself in the power of Sussex without a guarantee for his safety; and his claims were so exacting that Elizabeth determined to restore Brian. An attempt to incite the O'Donnells against him was frustrated by Shane's capture of Calvagh O'Donnell, whom he

kept a prisoner for nearly three years. Elizabeth, who was not prepared to undertake the subjugation of the Irish chieftain, urgently desired peace with him, especially when the devastation of his territory by Sussex brought him no nearer to submission. Sussex was not supported by the queen, who sent the earl of Kildare to arrange terms with O'Neill. The latter agreed to present himself before Elizabeth. Accompanied by Ormonde and Kildare he reached London on Jan. 4, 1562. Elizabeth temporized; but finding that O'Neill was in danger of becoming a tool in the hands of Spanish intriguers, she permitted him to return to Ireland, recognizing him as "the O'Neill," and chieftain of Tyrone; though a reservation was made of the rights of Hugh O'Neill, who had succeeded his brother Brian as baron of Dungannon, Brian having been murdered in April 1562 by his kinsman Turlough Luineach O'Neill.

There were at this time three powerful contemporary members of the O'Neill family in Ireland—Shane, Turlough and Hugh, 2nd earl of Tyrone. Turlough had been elected *tanist* (*see* *TANISTRY*) when his cousin Shane was inaugurated the O'Neill, and he schemed to supplant him during Shane's absence in London. The feud did not long survive Shane's return to Ireland, where he re-established his authority, and renewed his turbulent tribal warfare. Elizabeth at last authorized Sussex to take the field against Shane, but two expeditions failed. Shane now laid the whole blame for his lawless conduct on the lord deputy's repeated alleged attempts on his life. Elizabeth consented to treat, and practically all O'Neill's demands were conceded. O'Neill now turned his hand against the MacDonnells, claiming that he was serving the queen of England in harrying the Scots. He fought an indecisive battle with Sorley Boy MacDonnell near Coleraine in 1564, and in 1565 routed the MacDonnells and took Sorley Boy prisoner near Ballycastle. This victory strengthened Shane O'Neill's position, and preparations were made for his subjugation. O'Neill ravaged the Pale, failed in an attempt on Dundalk, made a truce with the MacDonnells, and sought help from the earl of Desmond. The English, on the other hand, invaded Donegal and restored O'Donnell. O'Neill was routed by the O'Donnells at Letterkenny; and seeking safety in flight, he threw himself on the mercy of his enemies, the MacDonnells. Attended by a small body of gallowglasses, and taking his prisoner Sorley Boy with him, he presented himself among the MacDonnells near Cushendun, on the Antrim coast. Here, on June 2, 1567, he was slain by the MacDonnells. In his private character Shane O'Neill was a brutal, uneducated savage.

TURLOUGH LUINEACH O'NEILL (c. 1530–1595), earl of Clanconnell, was inaugurated chief of Tyrone on Shane's death. He sought to strengthen his position by alliance with the O'Donnells, MacDonnells and MacQuillans. An expedition under the earl of Essex was sent against him, which effected little, and in 1575 O'Neill received by treaty extensive grants of lands and permission to employ 300 Scottish mercenaries. In 1578 he was created baron of Clogher and earl of Clanconnell for life; but for the next few years he continued to intrigue against the English authorities. The latter, as a counterpoise to Turlough, supported his cousin Hugh, brother of Brian, whom Turlough had murdered. Eventually Turlough resigned the headship of the clan in favour of Hugh, who was inaugurated O'Neill in 1593. Turlough died in 1595.

HUGH O'NEILL (c. 1540–1616), 2nd earl (known as the great earl) of Tyrone, was the second son of Matthew, reputed illegitimate son of Conn, 1st earl of Tyrone. He succeeded his brother, Brian, when the latter was murdered by Turlough in 1562, as baron of Dungannon. He was brought up in London, but returned to Ireland in 1567 after the death of Shane, under the protection of Sir Henry Sidney. He served with the English against Desmond in Munster in 1580, and assisted Sir John Perrot against the Scots of Ulster in 1584. In the following year he attended parliament as earl of Tyrone, though Conn's title had been for life only, and had not been assumed by Brian. Hugh's constant disputes with Turlough were fomented by the English, but after Hugh's inauguration as the O'Neill on Turlough's resignation in 1593, he was supreme in the north. Having roused the

ire of Sir Henry Bagnal (or Bagenal) by eloping with his sister in 1591, he afterwards assisted him in defeating Hugh Maguire at Belleek in 1593; and then again went into opposition and sought aid from Spain and Scotland. Sir John Norris was ordered to Ireland to subdue him in 1595, but Tyrone took the Blackwater fort and Sligo castle before Norris was prepared; he was thereupon proclaimed a traitor of Dundalk. In spite of the traditional enmity between the O'Neills and the O'Donnells, Tyrone allied himself with Hugh Roe O'Donnell, nephew of Shane's former enemy Calvagh O'Donnell, and the two chieftains opened communications with Philip II. of Spain, their letters to whom were intercepted by the viceroy, Sir William Russell. They presented themselves as champions of the Catholic religion, claiming religious and political liberty for the Irish. In April 1596 Tyrone received promises of help from Spain. He temporized successfully for more than two years, making professions of loyalty which deceived Sir John Norris and the earl of Ormonde. In 1598 a formal pardon was granted to Tyrone by Elizabeth. Within two months he was again in the field, and on Aug. 14, he destroyed an English force under Bagnal at the Yellow ford on the Blackwater. If the earl had known how to profit by this victory, he might now have successfully withstood the English power in Ireland; for in every part of Ireland—and especially in the south, where James Fitzthomas Fitzgerald, with O'Neill's support, was asserting his claim to the earldom of Desmond at the head of the Geraldine clansmen—discontent broke into flame. But Tyrone procrastinated. Eight months after the battle of the Yellow ford, the earl of Essex landed in Ireland. He met Tyrone at a ford on the Lagan on Sept. 7, 1599, when a truce was arranged; but Elizabeth objected to the conditions allowed to the O'Neill and to Essex's treatment of him as an equal. Tyrone then issued a manifesto to the Catholics of Ireland summoning them to join his standard. After an inconclusive campaign in Munster in January 1600, he returned to Donegal, where he received supplies from Spain and a token of encouragement from Pope Clement VIII. In May of the same year armies under Sir Henry Docwra and Mountjoy compelled O'Neill to retire to Armagh, a large reward having been offered for his capture alive or dead.

The appearance of a Spanish force at Kinsale drew Mountjoy to Munster in 1601; Tyrone followed him, and at Bandon joined forces with O'Donnell and with the Spaniards under Don John D'Aquila. The attack failed. O'Donnell went to Spain, where he died and Tyrone with a shattered force went to the north, where he renewed his temporizing policy. Early in 1603 Elizabeth instructed Mountjoy to open negotiations; and in April, Tyrone, in ignorance of Elizabeth's death, made his submission. In Dublin he heard of the accession of King James, at whose court he presented himself in June accompanied by Rory O'Donnell, who had become chief of the O'Donnells after the departure of his brother Hugh Roe. James confirmed Tyrone in his title and estates, but new disputes arose on his rights over certain of his feudatories, of whom Donnal O'Cahan was the most important. This dispute dragged on till 1607, when Tyrone arranged to go to London to submit the matter to the king. Warned, however, that his arrest was imminent, and possibly persuaded by Rory O'Donnell (created earl of Tyrconnel in 1603), Tyrone resolved to fly from the country.

"The flight of the earls," one of the most celebrated episodes in Irish history, occurred on Sept. 14, 1607, when Tyrone and Tyrconnel embarked at midnight at Rathmullen on Lough Swilly, with their wives, families and retainers, numbering 99 and sailed for Spain. Driven by contrary winds to take shelter in the Seine, the refugees passed the winter in the Netherlands, and in 1608 went to Rome, where they were entertained by Pope Paul V., and where Tyrconnel died the same year. In 1613 Tyrone was outlawed and attainted by the Irish parliament, and he died in Rome on July 20, 1616. He was four times married, and had a large number both of legitimate and illegitimate children.

SIR PHELIM O'NEILL (c. 1603–1653), a kinsman and younger contemporary of the earl of Tyrone, took a prominent part in the rebellion of 1641. In that year he was elected member of the

Irish parliament for Dungannon, and joined the earl of Antrim and other lords in supporting Charles I. against the parliament. On Oct. 22, 1641, he surprised and captured Charlemont castle; and having been chosen commander-in-chief of the Irish in the north, he forged and issued a pretended commission from Charles I. sanctioning his proceedings. Phelim and his followers ravaged Ulster on the pretext of reducing the Scots, but failed to take Drogheda, being compelled by Ormonde to raise the siege in April 1642. During the summer his fortunes ebbed, and he was superseded by his kinsman Owen Roe O'Neill.

OWEN ROE O'NEILL (c. 1590–1649), one of the most celebrated of the O'Neills, the subject of the well-known ballad "The Lament for Owen Roe," was the son of Art O'Neill, a younger brother of Hugh, 2nd earl of Tyrone. Having served with distinction in the Spanish army he was immediately recognized on his return to Ireland as the leading representative of the O'Neills. Phelim resigned the northern command in his favour, and escorted him from Lough Swilly to Charlemont. But jealousy between the kinsmen was complicated by differences between Owen Roe and the Catholic council which met at Kilkenny in 1642. Owen Roe's real aim was the complete independence of Ireland, while the Anglo-Norman Catholics represented by the council desired to secure religious liberty and an Irish constitution under the English crown. In 1646 a cessation of hostilities was arranged between Ormonde and the Catholics; and O'Neill, furnished with supplies by the papal nuncio, Rinuccini, turned against the Scottish parliamentary army under General Monro. On June 5, 1646, O'Neill routed Monro at Benburb, on the Blackwater; but, being summoned to the south by Rinuccini, he had to leave Monro unmolested at Carrickfergus. For the next two years confusion reigned, O'Neill supporting the party led by Rinuccini, though continuing to profess loyalty to Ormonde as the king of England's representative. Isolated by the departure of the papal nuncio from Ireland in 1649, he made overtures to Ormonde, and to Monk, who had superseded Monro in command of the parliamentarians in the north. O'Neill's chief need was supplies, and failing to obtain them from Monk he turned once more to Ormonde and the Catholic confederates, with whom he prepared to co-operate more earnestly when Cromwell's arrival in Ireland in August 1649 brought the Catholic party face to face with serious danger. Before anything was accomplished by this combination, however, Owen Roe died on Nov. 6, 1649.

The alliance between Owen Roe and Ormonde had been opposed by Phelim O'Neill, who after his kinsman's death expected to be restored to his former command. In this he was disappointed; but he continued to fight against the parliamentarians till 1652, when a reward was offered for his apprehension. Betrayed by a kinsman while hiding in Tyrone, he was tried for high treason, and executed on March 10, 1653. Phelim married a daughter of the marquis of Huntly, by whom he had a son Gordon O'Neill, who was member of parliament for Tyrone in 1689; fought for the king at the siege of Derry and at the battles of Aughrim and the Boyne; and afterwards commanded an Irish regiment in the French service, and died in 1704.

DANIEL O'NEILL (c. 1612–1664), a member of the Clanaboy branch of the family, spent much of his early life at the court of Charles I., and became a Protestant. He commanded a troop of horse in Scotland in 1639; was involved in army plots in 1641, for which he was committed to the Tower, but escaped; and on the outbreak of the Civil War returned to England and served with Prince Rupert, being present at Marston moor, the second battle of Newbury and Naseby. He then went to Ireland to negotiate between Ormonde and his uncle, Owen Roe O'Neill. He was made a major-general in 1649, and but for his Protestantism would have succeeded Owen Roe as chief of the O'Neills. He joined Charles II. at the Hague, and took part in the expedition to Scotland and the Scottish invasion of England in 1652.

HUGH O'NEILL (d. c. 1660), son of Owen Roe's brother Art Oge, and therefore known as Hugh Mac Art, had served with distinction in Spain before he accompanied his uncle, Owen Roe, to Ireland in 1642. After the death of Owen he defended Clonmel in 1650 against Cromwell, on whom he inflicted the latter's most

severe defeat in Ireland. In 1647 he so stubbornly resisted Ireton's attack on Limerick that he was excepted from the benefit of the capitulation, and, after being condemned to death and reprieved, was sent as a prisoner to the Tower. He was released in 1652, and died, some time after 1660, probably in Spain.

The Clanaboy (or Clandeboye) branch of the O'Neills descended from the ancient kings through Neill Mor O'Neill, lord of Clanaboy in the time of Henry VIII., ancestor (as mentioned above) of the Portuguese O'Neills. Neill Mor's great-great-grandson, Henry O'Neill, was created baronet of Killeleagh in 1666. His son, Sir Neill O'Neill fought for James II. in Ireland, and died of wounds received at the battle of the Boyne. Through an elder line from Neill Mor was descended Brian Mac Phelim O'Neill, who was treacherously seized in 1573 by the earl of Essex, whom he was entertaining, and executed together with his wife and brother, some 200 of his clan being at the same time massacred by the orders of Essex. (See ESSEX, WALTER DEVEREUX, 1st earl of.) Brian Mac Phelim's son, Shane Mac Brian O'Neill, was the last lord of Clanaboy, and from him the family castle of Edenduffcarrick, on the shore of Lough Neagh in Co. Antrim, was named Shane's Castle. He joined the rebellion of his kinsman Hugh, earl of Tyrone, but submitted in 1586.

In the 18th century the commanding importance of the O'Neills in Irish history had come to an end. But John O'Neill (1740–1798), took an active part in debate in the Irish parliament, being a strong supporter of Catholic emancipation. He was one of the delegates in 1789 from the Irish parliament to George, prince of Wales, requesting him to assume the regency. In 1793 he was raised to the peerage of Ireland as Baron O'Neill of Shane's Castle, and in 1795 was created a viscount. In defending the town of Antrim against the rebels in 1798 O'Neill received wounds from which he died on June 18, being succeeded as Viscount O'Neill by his son Charles Henry St. John (1779–1841), who in 1800 was created Earl O'Neill. Dying unmarried, when the earldom therefore became extinct, Charles was succeeded as Viscount O'Neill by his brother John Bruce Richard (1780–1855), a general in the British army; on whose death without issue in 1855 the male line in the United Kingdom became extinct. The estates then devolved on William Chichester, great-grandson of Arthur Chichester and his wife Mary, only child and heiress of Henry (d. 1721), eldest son of John O'Neill of Shane's Castle.

WILLIAM CHICHESTER (1813–1883), 1st Baron O'Neill, a clergyman, on succeeding to the estates as heir-general, assumed by royal licence the surname and arms of O'Neill; and in 1868 was created Baron O'Neill of Shane's Castle. On his death in 1883 he was succeeded by his son Edward, 2nd Baron O'Neill, who was member of parliament for Co. Antrim 1863–80, and who married in 1873, Louisa, daughter of the 11th earl of Dundonald.

For the history of the ancient Irish kings of the Hy Neill see *The Book of Leinster*, edited with introduction by R. Atkinson (Royal Irish Academy, Dublin, 1880); *The Annals of Ulster*, edited by W. M. Hennessy and B. MacCarthy (4 vols., Dublin, 1887–1901); *The Annals of Loch Cé*, edited by W. M. Hennessy (Rolls Series, London, 1871). For the later period see P. W. Joyce, *A Short History of Ireland* (London, 1893), and *A Social History of Ancient Ireland* (2 vols., London, 1903); *The Annals of Ireland by the Four Masters*, edited by J. O'Donovan (7 vols., Dublin, 1851); Sir J. T. Gilbert, *History of the Viceroy of Ireland* (Dublin, 1865), and especially for Owen Roe O'Neill, *Contemporary History of Affairs in Ireland, 1641–1652* (Irish Archaeol. Soc., 3 vols., Dublin, 1879); also *History of the Irish Confederation and the War in Ireland* (Dublin, 1882); John O'Hart, *Irish Pedigrees* (Dublin, 1881); *The Montgomery MSS. "The Flight of the Earls, 1607"* (p. 767), edited by George Hill (Belfast, 1878); Thomas Carte, *History of the Life of James, Duke of Ormonde* (3 vols., London, 1735); C. P. Meehan, *Fate and Fortunes of Hugh O'Neill, Earl of Tyrone, and Rory O'Donel, Earl of Tyrconnel* (Dublin, 1886); Richard Bagwell, *Ireland under the Tudors, with an Account of the Earlier History* (3 vols., London, 1885–90); J. F. Taylor, *Owen Roe O'Neill* (London, 1896); John Mitchell, *Life and Times of Hugh, Earl of Tyrone, with an Account of his Predecessors, Con. Shane, Turlough* (Dublin, 1846); L. O'Clery, *Life of Hugh Roe O'Donnell* (Dublin, 1801). For the O'Neills of the 18th century, and especially the 1st Viscount O'Neill, see *The Charlemont Papers*, and F. Hardy, *Memoirs of J. Caulfield, Earl of Charlemont* (2 vols., London, 1812). *The O'Neills of Ulster: Their History and Genealogy*, by Thomas Mathews (3 vols., Dublin, 1907), an ill-arranged and

uncritical work has little historical value, but contains a mass of traditional and legendary lore, and a number of translations of ancient poems, and genealogical tables of doubtful authority.

O'NEILL, EUGENE GLADSTONE (1888–), American dramatist, was born in New York city, Oct. 16, 1888, the son of the well-known actor James O'Neill. His early education was received at Roman Catholic schools and at the Betts academy. He went to Princeton university for one year. He worked as sailor before the mast, actor, reporter, and in other capacities. He began assimilating his crowded experiences and impressions at a sanatorium to which he was ordered because of tuberculosis; in 1914–15 attended Harvard university; and in 1916 spent the summer at Provincetown, thus making contact with the group who produced nearly all his short plays. He rapidly became the most conspicuous of the younger American dramatists, and thrice was awarded the Pulitzer prize: in 1920 for his play, *Beyond the Horizon*, in 1922 for *Anna Christie*; and in 1928 for his *Strange Interlude*.

Among his works are: *Thirst and Other One-Act Plays* (1914); *The Moon of the Caribbees and Six Other Plays of the Sea* (1919); *Gold* (1920); *Emperor Jones* (1921); *The Hairy Ape* (1922); *All God's Chillun's Got Wings and Welded* (1924). An edition of his plays in two volumes, which included *Desire under the Elms*, was published in 1924, and in four volumes in 1925. His *Fountain* was produced in 1925 and *The Great God Brown*, one of the most mystical of his plays, in 1926. Other plays by O'Neill are *Marco Millions* and *Lazarus Laughed*.

See Barrett H. Clark, *Eugene O'Neill* (1926).

ONEONTA, the only city of Otsego county, New York, U.S.A., on the Appalachian highway and the Susquehanna river, 80 m. S.W. of Albany. It is served by the Delaware and Hudson and the Ulster and Delaware railways. Pop. (1920), 11,582 (92% native white); 1928 local estimate, 12,500. Oneonta is beautifully situated among the western foothills of the Catskills, at an altitude of 1,150 ft., in a fertile farming and dairying region. It is the seat of a State normal school (1889), a State armory and Hartwick college (United Lutheran; 1928). The manufacturing industries include extensive railroad shops, silk and flour mills, shirt and glove factories and had an output in 1925 valued at \$4,963,673. Oneonta was founded about 1780, and until 1830 was known as Milfordville. It was incorporated as a village in 1848 and as a city in 1908. The name is derived from the Indian name for the creek flowing through the city.

ONION, *Allium Cepa* (family Liliaceae), a hardy bulbous biennial, which has been cultivated from time immemorial. It is one of the earliest of cultivated plants; it is represented on Egyptian monuments, and one variety cultivated in Egypt was accorded divine honours. It is commonly cultivated in India, China and Japan. A. de Candolle regards it as a native of western Asia.

In Great Britain the onion should be grown in an open situation, and on a light, rich, well-worked soil, which has not been recently manured. The principal crop may be sown at any time from the middle of February to the middle of March, if the weather is fine and the ground sufficiently dry. The seed should be sown in shallow drills, 10 in. apart, the ground being made as level and firm as possible, and the plants should be regularly thinned, hoed and kept free from weeds. At the final thinning they should be set from 3 to 6 in. apart, the latter distance in very rich soil. About the beginning of September the crop is ripe; the bulbs are then to be pulled, and exposed on the ground till well dried, and they are then to be stored in a cool, dry place.

About the end of August a crop is sown to afford a supply of young onions in the spring months. Those which are not required for the kitchen, if allowed to stand, and if the flower-bud is picked out on its first appearance, and the earth stirred about them, produce bulbs of large size. A crop of very large bulbs may also be secured by sowing about the beginning of September, and transplanting early in spring to very rich soil. Another plan is to sow in May on dry poor soil, when a crop of small bulbs will be produced; these are to be stored in the usual way, and planted in rich soil about February.

To obtain a crop of bulbs for pickling, seed should be sown thickly in March, in rather poor soil, the seeds being very thinly covered, and the surface well rolled; these are not to be thinned, but should be pulled and harvested when ripe.

Onions may be forced like mustard and cress if required for winter salads, the seeds being sown thickly in boxes which are to be placed in a warm house or frame. The young onions are pulled while quite small.

For growing onions in the United States see under VEGETABLES.

ONNES, HEIKE KAMERLINGH (1853–1926), Dutch physicist, was born in Groningen on Sept. 21, 1853. He studied mathematics and physics in his native town. In 1871 he went to Heidelberg, where he studied under Bunsen and Kirchhoff (*qq.v.*). Later he returned to Groningen, where in 1879 he took his doctor's degree on presenting a dissertation entitled *New Proofs of the Earth's Rotation*. He became professor of experimental physics at Leyden in 1882. Here he founded and developed the famous Cryogenic Laboratory. Stimulated by van der Waals, Onnes became interested in the equations of state and the general thermodynamic properties of liquids and gases. (See THERMODYNAMICS.) He appreciated that the need for exact measurements was greater than that for fresh theoretical developments.

Onnes set himself the task of making measurements over a large range of pressure and temperature. His name is associated particularly with the measurement and attainment of low temperatures; in this direction Onnes showed himself a master of experimental physics. In 1908 he succeeded in liquefying helium, but was unable to solidify it; this was subsequently done by his successor Keesom. Onnes obtained the isothermals for a number of gases and mixtures of gases at low temperatures; he also studied the optical, magnetic and magneto-optical properties of bodies. He carried out important investigations on the influence of low temperatures on nickel and manganese iron alloys. He also demonstrated that the resistance of electric conductors disappeared suddenly at a temperature near the absolute zero, and termed this phenomenon "super-conductivity." His systematic researches on super-conductivity (started in 1914) are of extreme importance on account of their bearing on the theory of electrical conduction in solids (see ELECTRICITY, CONDUCTION OF: SOLIDS), and also because the facilities offered by the Cryogenic Laboratory for investigating this subject are practically unique.

In 1913 the Nobel Prize for physics was conferred on him. He became a foreign member of the Royal Society in 1916, and a corresponding member of the Prussian Academy of Sciences at Berlin in 1923, the year in which he resigned his chair at Leyden. He was the recipient of a number of honorary degrees, medals and other honours. His published work includes *Algemeine Theorie der Vloestoffen* (*General Theory of the Fluids*, 1881). He died at Leyden on Feb. 21, 1926.

See J. P. Kuenen, *De Toekenning van den Nobelprijs aan H. Kamerlingh Onnes* (*Chemisch Weekblad*, 1913).

ONOMACRITUS (c. 530–480 B.C.), seer, priest and poet of Attica. He had great influence on the development of the Orphic religion and mysteries, and was said to have composed a poem on initiatory rites. The works of Musaeus, the legendary founder of Orphism in Attica, are said to have been reduced to order (if not actually written) by him (Clem. Alex. *Stromata*, i. p. 143 [397]; Pausanias i. 22, 7). He was in high favour at the court of the Peisistratidae till he was banished by Hipparchus for making additions of his own in an oracle of Musaeus. When the Peisistratidae were themselves expelled and were living in Persia, he furnished them with oracles encouraging Xerxes to invade Greece and restore the tyrants in Athens (Herod. vii. 6).

See F. W. Ritschl, "Onomakritos von Athen," in his *Opuscula*, i. (1866), and p. 35 of the same volume: Smith, *Dict. of Gk. and Roman Biography s.v.* (bibl.).

ONONDAGA, a tribe of North American Indians of Iroquoian stock, forming one of the Six Nations. The tribal headquarters was about the lake and creek of the same name in New York state. Their territory extended northward to Lake Ontario and southward to the Susquehanna river. They were the official guardians of the council-fire of the Iroquois. Their chief town,

near the site of the present Onondaga, consisted of some 140 houses in the middle of the 17th century, when the tribe was estimated as numbering between 1,500 and 1,700. During the 18th century the tribe divided, part loyally supporting the Iroquois league, while part, having come under the influence of French missionaries, migrated to the Catholic Iroquois settlements in Canada. Of those who supported the league, the majority, after the War of Independence, settled on a reservation on Grand river, Ontario, where their descendants still are. In 1926 there were 568 upon the Onondaga reservation in New York state.

For Onondaga cosmology see *21st Ann. Report Bureau Amer. Ethnol.* (1899-1900). See also *NORTH AMERICA: Ethnology*.

ONTARIO, a province of Canada, having the province of Quebec to the east, the states of New York, Ohio, Michigan, Wisconsin, and Minnesota to the south, Manitoba to the west, and part of Hudson Bay with James Bay to the north. In most cases the actual boundary consists of rivers or lakes, the Ottawa to the north-east, the St. Lawrence and its chain of lakes and rivers to the south as far as Pigeon river, which separates Ontario from Minnesota. From this it follows small rivers and lakes to the Lake-of-the-Woods, which lies between Ontario, Minnesota and Manitoba. From Lake Temiscaming northwards the eastern boundary is the meridian of 79° 30'.

Physical Geography.—Ontario extends 1,000 m. from east to west and 1,050 from north to south, between latitudes 57° and 42°, including the most southerly point in Canada. Its area is 407,262 sq.m. (41,382 water), and it is the most populous of the provinces, nine-tenths of its inhabitants living, however, in one-tenth of its area, between the Great Lakes, the Ottawa and the St. Lawrence. This forms part of the plain of the St. Lawrence, underlain by Palaeozoic limestones and shales, forming a good soil.

The south-western part is naturally divided into two tracts by the Niagara escarpment, a line of cliffs capped by hard Silurian limestones, running from Queenston Heights near the falls of Niagara west to the head of Lake Ontario near Hamilton, and then north-west to the Bruce Peninsula on Georgian Bay. The tract north-east of the escarpment has an area of 9,000 sq.m. and an altitude of 250 to 1,000 ft., and the south-western tract includes 15,000 sq.m. with an elevation of 600 to 1,700 feet. In the last petroleum, natural gas, salt and gypsum are obtained, but elsewhere in southern Ontario there are no economic minerals except building materials. Covering the higher parts there are rolling hills of boulder clay or moraines; while the lower levels are plains gently sloping toward the nearest of the Great Lakes and sheeted with silt deposited in more ancient lakes when the St. Lawrence outlet was blocked with ice at the end of the glacial period. The old shore cliffs and gravel bars of these glacial lakes are still well-marked topographical features, and provide favourite sites for roads, towns and cities. St. Catharines, Hamilton and Toronto are on the old shore of Lake Iroquois, the lowest. The Niagara escarpment mentioned above is the cause of waterfalls on all the rivers which plunge over it, Niagara Falls being, of course, the most important. Between the Palaeozoic area near Ottawa, and Georgian Bay to the north of the region just referred to, there is a southward projection of the Archaean protaxis consisting of granite and gneiss of the Laurentian, enclosing bands of crystalline limestone and schists, which are of interest as furnishing the only mines of "Old Ontario." From these rocks in the Ottawa valley are quarried or mined granite, marble, felspar, talc, mica and graphite.

While all the larger cities and most of the manufacturing and farming districts of the province belong to southern Ontario, there is in process of development a "New Ontario," stretching for hundreds of miles to the north and north-west of the region just described and covering a far larger area, chiefly made up of ancient rocks forming the Archaean protaxis. The rocky hills of the tableland to the north long repelled settlement, the region being looked on as a wilderness useless except for its forests and its furs, but the finding of great ore deposits, the opening up of farming areas and the development of the wood pulp industry are constantly extending settlement toward the north. The building of the Canadian Pacific Railway led to the discovery of the Sudbury nickel region, where segregations of nickel-copper ores

which occur round the edge of a sheet of norite supply 90 per cent. of the world's nickel, large amounts of copper and thousands of ounces of gold, silver, platinum and palladium. The Frood mine is known to contain 200,000,000 tons of ore.

The building of the Temiskaming and Northern Ontario Railway led to the discovery of the cobalt mines, from which silver to the value of \$240,000,000 has been obtained; and still farther north are the gold fields of Kirkland Lake and Porcupine, whose output gives Ontario third place in the production of gold, only South Africa and the United States surpassing it. In 1926 the value of the metals produced in Ontario reached \$59,218,297, almost wholly derived from the northern mines.

Lakes and Rivers.—All parts of Ontario are well provided with lakes and rivers, the most important chain being that of the St. Lawrence and the Great Lakes with their tributaries, which drain the more populous southern districts, and, with the aid of canals, furnish communication by fairly large vessels between the lower St. Lawrence river and Lake Superior. Lake Nipigon, a beautiful body of water 852 ft. above the sea, 70 m. long and 50 m. wide, may be looked upon as the headwaters of the St. Lawrence, since Nipigon river is the largest tributary of Lake Superior, though several other important rivers, such as the Kaministiquia, the Pic and the Michipicoten, enter it from the north. All these rivers have high falls not far from Lake Superior, and several of them supply power for industries of the region. The twin cities of Fort William and Port Arthur are the great shipping ports for western wheat during the summer. The north shore of Lake Superior is bold and rugged with many islands, such as Ignace and Michipicoten, but with very few settlements, except fishing stations, owing to its rocky character. At the south-eastern end St. Mary's river carries its waters to Lake Huron, with a fall from 602 to 581 ft., most of which takes place at Sault Sainte Marie, where locks permit vessels of 10,000 tons to pass from one lake to the other, and where water-power has been greatly developed for use in the rolling mills and wood pulp industry. The north-east shores of Lake Huron and its large expansion Georgian Bay are fringed with thousands of islands, mostly small, but one of them, Manitoulin Island, is 80 m. long and 30 m. broad. French river, the outlet of Lake Nipissing, and Severn river, draining Lake Simcoe, come into Georgian Bay from the east, and the Trent canal connects Lake Huron with Lake Ontario.

Georgian Bay is cut off from the main lake by Manitoulin Island and the long promontory of Bruce Peninsula. Lakes Superior and Huron both reach depths hundreds of feet below sea-level, but the next lake in the series, St. Clair, towards which Lake Huron drains southward through St. Clair river, is very shallow and marshy. Detroit river connects Lake St. Clair with Lake Erie at an elevation of 570 ft.; and this comparatively shallow lake, running for 240 m. east and west, empties northwards by Niagara river into Lake Ontario, which is only 246 ft. above the sea. Niagara Falls, with rapids above and below, carry the waters of the upper lakes over the Niagara escarpment. Power from the falls supplies the needs of a region within 150 m. Welland canal, between Port Colborne on Lake Erie and Dalhousie on Lake Ontario, carries vessels of 14 ft. draught from one lake to the other. A new canal with a depth of 27 ft. is nearly finished. From Lake Ontario the St. Lawrence emerges through the meshes of the Thousand Islands, where it crosses Archaean rocks, after which follow several rapids separated by quieter stretches before Montreal is reached at the head of ocean navigation. Steamers not of too great draught can run the rapids going down, but must come up through the canals. All the other rivers in southern Ontario are tributaries of the lakes or of the St. Lawrence, the Ottawa, navigable in many parts, being the largest, and the Trent next in importance. In northern Ontario lakes are innumerable and often very picturesque, forming favourite summer resorts, such as Lake Temagami, the Muskoka Lakes and Lake-of-the-Woods. The latter lake, Rainy Lake and other connected bodies of water belong to the Hudson Bay system of waters, their outlet being by Winnipeg river to Lake Winnipeg, from which flows Nelson river. In Ontario the Albany, Moose, Missanabi and

Abitibi flow into Hudson Bay, but none of these rivers is navigable except for canoes.

Climate.—The climate of Ontario varies greatly, as might be expected from its wide range in latitude and the relationships of the Great Lakes to the southern peninsula of the province. The northern parts as far south as the north shore of Lake Superior have long and cold but bright winters, sometimes with temperatures reaching 50° F below zero; while their summers are delightful, with much sunshine and some hot days but pleasantly cool nights. Between Georgian Bay and Ottawa the winters are less cold, but usually with a plentiful snowfall; while the summers are warm. The south-west peninsula of Ontario has its climate greatly modified by the lakes which almost enclose it. As they never freeze, the prevalent cold north-west winds of North America are warmed in their passage over them, and often much of the winter precipitation is in the form of rain, so that the weather has much less certainty than in the north. The summers are often sultry, though the presence of the lakes prevents the intense heat experienced in the states to the west and south. Owing to the mildness of its winters, the south-west peninsula is a famous fruit country with many vineyards and orchards of apples, plums and peaches. Indian corn (maize) is an important field crop, and tobacco is cultivated on a large scale. Small fruits and tomatoes are widely grown for the city markets and for canning, giving rise to an important industry.

Population.—The province is divided into two sections, the older and more thoroughly settled portion, Southern Ontario, with an area of some 77,000 square miles, and Northern Ontario, with an area of 330,000. Of the total area, water forms 10·16 per cent. The approximate population of the province in 1925 was 3,103,000, and the growth since 1900 is reflected in the decennial census of the Dominion:

	1901	1911	1921
Population of Province	2,182,947	2,527,292	2,933,662
Percentage of the Dominion's population	40·64	35·07	33·38

The percentage increase of the population in fifty years (1871-1921) was 80·99. In 1921 the density of population (number of persons per square mile of land area) was 8·02, whereas the average for Canada was 2·41. An increasing percentage of people live in cities, towns or villages, as is illustrated in the following figures:

	1901	1921
Percentage of population rural	57·12	41·83
Percentage of population urban	42·88	58·17

The smallest urban unit, the village, must by provincial law have a population of 750 in an area not exceeding 500 acres. Some 160 municipalities have populations between 1,000 and 5,000 inhabitants. The largest city and capital of the province is Toronto, with a population over 560,000. Hamilton, a manufacturing centre, comes next with 127,000, and Ottawa, the federal capital, follows Hamilton with over 110,000. Another important and handsome city—but with a population under 100,000—is London, situated in the rich agricultural area of western Ontario. Racially the population of the province is dominantly of Anglo-Saxon stock. In the last census (1921) seventy per cent. of the people were of British origin; about nine per cent. French, and four per cent. German. The French settlements are largely in that portion of the province bordering on the St. Lawrence, and in the newer areas of the north. Over 26,000 Indians dwell within Ontario, mainly on reservations long ago set apart for them. The numerically strongest sectarian group is the United Church, which as in other provinces resulted from union of the Methodists, Congregationalists and Presbyterians. Its influence has given a puritan tone to social life, instanced in the legislation for the strict observance of the Sabbath. The Roman Catholic Church followed by the Anglican ranks next in strength of membership.

Government.—The government of Ontario differs little from

that of the other Canadian provinces. Executive power is vested in a lieutenant-governor appointed for five years by the federal administration and assisted by an executive council, the members of which have seats in and are responsible to the local legislature. This consists of one house, 112 members, elected by a wide suffrage that places women on the same footing as men. The legislature has the right only of direct taxation, and the principal taxes are those on corporations, succession duties, licences, permits of various kinds, etc. A goodly income is derived from the sale or lease of crown lands, timber and minerals, and an annual subsidy from the federal government. A popular system of municipal administration has existed since 1849. The act of that year has been the Magna Charta of municipal institutions, not only for Ontario, but for the more recent provinces that have largely copied Ontario's institutions. It has undergone amendments, but the essentials of a popular system of local government with elected councils have been maintained and strengthened. There are in the province over 900 local self-governing units, embracing townships, counties, villages, towns and cities.

Education.—The inhabitants of Ontario have been distinguished by special devotion to the maintenance of an educational system. In the early years of provincial history, the legislature made considerable grants of land for such purposes, and to-day few departments of government are deemed so important as that of education. A minister in the executive council is nominally responsible to the legislature for policy, and his departmental deputy exercises scarcely less influence on the educational system. School inspectors seek to uphold throughout the province uniform and high standards, while in every district a body of trustees levies taxes, appoints the teachers, and in general provides for the maintenance of the local school. Attendance is compulsory between the ages of eight and sixteen. The primary or public schools are free and undenominational, but not secular, as prayer and Bible reading hold a place in the daily programme. Since 1863 the Roman Catholics have exercised the right to separate schools, which may be set up in any district upon the request of not less than five heads of families. Taxes levied on the supporters of these institutions are devoted wholly to their maintenance. Under prescribed conditions, Protestants and coloured persons may also claim the right to separate schools, but the right is rarely exercised.

Secondary education is provided in high schools and collegiate institutes, of which 186 existed in 1925. These institutions may require fees or give free education at the option of the local trustees. There are also many incorporated private schools, exempt from municipal taxation. They are grouped principally in Toronto and its neighbourhood, the most distinguished being Upper Canada College, founded in 1829.

Higher education is provided by the provincial university in Toronto and four other universities: Queen's in Kingston, Western in London, McMaster (Baptist) in Toronto, and the University of Ottawa (Roman Catholic) in the federal capital. The provincial institution, known as the University of Toronto, had in 1926 a total staff of 672, including junior instructors and demonstrators, and a student body of 5,466. It is a federation of colleges, and boasts of scholars no less distinguished than those in the finest universities of the United States and Great Britain. In all the universities women are admitted on the same terms as men, and generally form about two-fifths of the whole student body. In addition to the universities, model and normal schools exist for the training of teachers, while the cause of scientific agriculture is promoted by the Ontario Agricultural College at Guelph, founded and endowed by the government.

Agriculture.—Ontario is the richest agricultural province in the Dominion. Her agricultural wealth in 1927 was estimated to be \$2,265,000,000 (c. £453,000,000). Yet the percentage of the value of the net production in the industry to the total net output of production of all industries is overtopped by that of manufactures, agriculture representing 27 per cent. and manufactures 40 per cent. Field crops are responsible for more than half of the annual revenue from the farms, while dairy products come next in importance. Wheat production has ceased to hold

the dominant sway that it still retains in the three prairie provinces, with the consequence that farmers are not subjected to rapid changes of good or ill fortune, so common to their compatriots further west, who depend upon the fickle wheat crop. In the number of milch cows, cattle, sheep and swine, Ontario leads the other Canadian provinces, and the valuation placed on its live stock (\$261,673,000, or *c.* £52,334,600) is more than one-third of that on all live stock in Canada. Rich fruit growing areas extend throughout the Niagara peninsula and along the shores of lakes Erie and Ontario. Apples, peaches, pears, plums, cherries and grapes are the principal commercial fruits, and fruit canning is a local industry of some importance. Over 33,000 acres in the south-western part of the province are devoted to the production of tobacco. The average farm varies from 100 to 200 acres, and the majority of farms are worked by their owners.

Manufactures.—The manufactures of Ontario steadily increase in importance, and the province has little difficulty in maintaining supremacy among the provinces of the Dominion in gross value of manufactured products, which in 1925 represented nearly 52 per cent. of those of the whole Dominion. At that date there were 9,386 establishments with an annual production of \$1,527,154,660 (*c.* £305,430,932). Some of the chief manufacturing industries and industrial products are: automobiles; flour and grist-mill products; slaughtering and meat-packing; pulp and paper; rubber goods; butter and cheese; electric light and power; castings and forgings; sawmills; hosiery, knit goods and gloves; bread and other bakery products; non-ferrous metal smelting; printing and publishing; agricultural implements; planing mills, and steel and rolling mill products. Most of Ontario's leading manufactures are dependent upon the primary products of forest or farm, but the automobile industry is a striking exception, since the largest quantity of its materials is imported from the United States. The province has no coal, a disadvantage offset by the presence of immense water power.

Water Power.—Among Canadian provinces Ontario ranks second to Quebec in the amount of horse power developed and in potential power resources. The estimated amount of power developed in the province in January, 1928, was 1,816,000 h.p. (turbine installation), while the undeveloped amounted to 5,330,000 h.p. This power is developed principally in central electric stations, but a considerable amount is produced by pulp and paper mills and other industries. Ontario was the pioneer province in the public ownership of hydro power. In 1906 it formed the Hydro-Electric Power Commission, which bought power generated at Niagara and transmitted it at cost to the municipalities, the initial capital being provided by issues of bonds, guaranteed by the Government of Ontario. Since then the Commission has become much more than a merchant purchasing power. It has extended its control over the generation of power on the Niagara river, and retains for public ownership the most vital force in the industry of the province. In 1926, 249 municipalities with 420,590 consumers were supplied by the Commission.

Mining.—In mineral production Ontario has the largest output and the greatest variety of products of any Canadian province, and she dominates the world's nickel market. Judged by value, gold is the most important metal, with nickel, silver, and copper following in the order named. The production by quantity of these metals in three succeeding years was as follows:

	1924	1925	1926
Gold, fine, oz. . . .	1,241,728	1,461,039	1,497,215
Nickel, lb.	69,536,350	73,857,114	65,714,294
Silver, fine, oz. . . .	11,272,567	10,520,131	9,274,065
Copper, lb.	37,113,103	39,718,777	41,312,867

Practically all the commercial non-metallic minerals except coal are produced within the province, the principal ones being corundum, graphite, mica and talc, felspar, petroleum, and salt. The richest mining territories are in Northern Ontario, where pre-Cambrian rock stretches for hundreds of miles to James Bay. Petroleum and salt are found, however, in south-western Ontario.

Lumber.—In lumber production Ontario ranks second to British Columbia. Twenty-five different woods are commercially produced, of which eight are softwoods and seventeen are hardwoods. White pine proves to have the widest market, with red pine, spruce, jack pine and hemlock ranking next in importance. Although the forest area steadily contracts with the spread of settlement, the province makes efforts at reforestation, and distributes at least 7,000,000 trees annually from its six nurseries. In the Algonquin National Park the ancient forest and its life are preserved intact, affording opportunity for a study of the problems of scientific forestry and providing in addition an excellent retreat for the tourist and sportsman. Due to her resources of timber—covering some 240,000 square miles—Ontario is a leading province in pulp and paper production. In 1926 there were 45 mills in operation, of which 12 were pulp, 17 paper and 16 combined pulp and paper.

Communications.—Ontario is richly dowered with numerous lakes and rivers, which have the double value of fresh water fishing grounds and natural avenues of communication. The obstacles on these natural waterways have been largely overcome by the construction of canals. The most important canal system is that connecting the grain ports of Fort William and Port Arthur with Montreal through the chain of great lakes, a total sailing distance by canal and lake of 1,000 miles. The populated areas are well supplied with railways. The province has one-fourth of the total single track mileage of the Dominion, some 10,870 miles. The construction of the railways was at the outset aided by municipal and provincial subsidies, and gradually the various lines were consolidated into the great rail systems of the country. Very important in opening up the mining areas of Northern Ontario has been the publicly owned line, known as the Temiskaming and Northern Ontario Railway, which now extends almost to James Bay. Ontario also boasts of some 63,000 miles of roads, which in Southern Ontario radiate in every direction, facilitating the movement of more than 400,000 automobiles owned by citizens of the province. As a consequence of the good roads—gravel, macadam, concrete and cement—the traffic of American tourists has become a substantial source of provincial income. No other province has drawn so many tourists and obtained from them so large a revenue. (A. Br.)

HISTORY

Champlain was the first European to record anything about the present Ontario. In 1613 he went up the Ottawa in a vain search for the Northern Ocean; and in 1615 he pushed westward and reached the eastern shores of Lake Huron, the first to tell of the Great Lakes with their vast stretches of fresh water.

Missions to the natives were a chief interest of the French pioneers in Canada and within Ontario is found their earliest important effort. Huronia, on the borders of Lake Simcoe and the Georgian Bay, the scene of a promising Jesuit mission, was devastated by the Iroquois in 1649 with the martyrdom of Fathers Brébeuf, Lalemant and others, making one of the most tragic stories in Jesuit annals. Meanwhile, the fur trade expanded and, before the British conquest, the French had trading posts at strategic points; Fort Frontenac, where now is Kingston—a defiance of the Iroquois—on the south side of Lake Ontario; Toronto, on its north shore, near the west end; Niagara; Detroit; Michilimackinac at the entrance to Lake Michigan; Sault Ste. Marie and on the greatest and farthest lake, Superior, a fort where now stands the city of Fort William.

They did, however, little settlement and, apart from such posts, Ontario was virgin wilderness when in 1763 it became British. In 1774, by the Quebec Act, it became a part of the Province of Quebec ruled from Quebec. The American Revolution began in the next year and for the first time, came serious settlement by exiled loyalists from the United States, bitterly hostile to that country. The Quebec Act entrenched the civil law of France; but the loyalists wished English law and a representative assembly, and in 1792 two Canadas were created; Lower Canada, east of the Ottawa River; Upper Canada, west; each with its own legislature. At once Upper Canada adopted English law. The first

governor, John Graves Simcoe, considered the seat of Government at Niagara was too near the American frontier; and it was quickly changed to York, the present Toronto.

The mind of Simcoe, a soldier, appointed later commander-in-chief in India, was, with justice, alert on problems of defence. When war with the United States broke out in 1812, the Americans captured and burned York, for which later the British retaliated by burning the Capitol at Washington. Only after peace in 1814 and the fall of Napoleon in 1815 was there adequate opening for development. English, Scots and Irish arrived in considerable numbers, until, by 1837, there were 350,000 people in Upper Canada. Political differences became acute; one extreme wing, composed chiefly of the loyalist elements, was reactionary; the other, led in the end by a Scot, William Lyon Mackenzie, was radical. In Lower Canada there was a similar issue with Papineau as the radical leader. Holding the middle ground, on clear-cut principles of constitutional right, was Robert Baldwin. He claimed that in Upper Canada as in England the head of the State must govern through advisers who had the confidence of the people. After abortive rebellion in both provinces in 1837-38 a striking political evolution took place. Upper and Lower Canada were united in 1842 under a parliament in which they had equal representation. Sectionalism as between French and English endured and the solution was found in 1867 in a federal system. (See CANADA: History.)

Apart from its few burning issues about self-government, Ontario has a quiet history. With a population chiefly British in political traditions, it has played an important part in solving problems of self-government of moment for the whole British empire. When in 1792 Upper Canada was created, the Protestant religion was endowed with public lands. First the Church of England alone benefited. But its members were a minority of the population; other religious bodies protested angrily; and, in the end, the principle of the state endowment of religion was abandoned in Upper Canada. Baldwin's clear cut teaching made also inevitable cabinet government on the model developed in England.

The federal constitution of 1867 gave Ontario a legislature, and cabinet government on this developed model. There was the new feature in Ontario of the abolition of the second chamber. The legislature might, indeed, at its discretion create one but this has not been done. The most populous of the Canadian provinces has still but one chamber; and so far has this been from involving capricious change that one prime minister remained in office for a quarter of a century. The system has worked so well as now to be accepted in all the Canadian provinces except Quebec. While Sir Oliver Mowat was prime minister of Ontario from 1871 to 1896 disputes arose as to the limits of federal and provincial authority. Mowat was a strenuous supporter of the rights of the provinces; and appeals to the privy council and experience have united to establish the principle that, within their defined rights, the provinces are supreme, and not under the supervision of the federal authority. By a curious paradox they have, in some respects, fuller powers, for they can alter their own constitutions.

The long Liberal ministry of Mowat was followed by a decline of the party's prestige and in 1905 the Conservatives, led by Sir James Whitney, came into power. In 1916 during the World War, Whitney's successor, Sir William Hearst, passed a drastic Prohibition law relating to the sale of intoxicating liquors. They could be bought only at Government stores and on a medical certificate of illness; and all public drinking places were closed. An election in 1919 gave the new Farmers' party a larger number of members than had either the Conservatives or the Liberals and they took office under C. A. Drury. They showed a lack of experience, and in 1923, while the Liberal party made a poor showing, the Conservatives under G. Howard Ferguson came into power with a large majority. There was discontent with the rigour of the Prohibition law and in 1926 Ferguson carried his second election by securing a large majority for the system now in effect in Ontario of State control of the liquor traffic. Drinking places remain closed; but, under individual licenses and strict supervision, purchase is permitted and the Government gets a considerable revenue from its monopoly of the trade. Apart from

this there has been recently no acute division on provincial policy. The powers of the province are so limited that issues relate chiefly to the details of administration.

BIBLIOGRAPHY.—J. E. Middleton and F. Landon, *The Province of Ontario, A History* (4 Vols. Toronto, 1927-28) with much unimportant local material, covers the salient history adequately. There are many county histories. For general political development see the authorities cited under CANADA. C. R. W. Biggar, *Sir Oliver Mowat* (2 vols. Toronto, 1905) is in effect, a history of Ontario for the 30 critical years after federation. (G. M. W.)

ONTARIO, a city of San Bernardino county, California, U.S.A., 38 m. E. of Los Angeles, at an altitude of 1,000 feet. It is served by the Pacific Electric, the Santa Fe, the Southern Pacific and the Union Pacific railways. Pop. 7,280 in 1920 (86% native white); estimated locally at over 15,000 in 1928. Ontario lies on a sloping plateau at the foot of Mt. San Antonio ("Old Baldy," 10,080 ft. high). Through the heart of the city and on up to the foot-hills runs a straight avenue 8 m. long and 200 ft. wide, with tree-shaded roadways on either side of a central strip. Citrus fruits, peaches, apricots, grapes, walnuts, dairy and poultry products and rabbits are conspicuous among the diversified products of the region. The city has packing plants, canneries and nurseries, and its manufactures include pectin, orange juice and citric acid, and electric irons and other household appliances. Ontario was founded in 1882 by George and William B. Chaffey, and was incorporated in 1891. It is governed by a board of trustees. In 1900 the population was only 722.

ONTARIO, LAKE, the smallest and most easterly of the Great Lakes of North America, is bounded on the north by the Province of Ontario and on the south by the State of New York. It is roughly elliptical, its major axis, 180 m. long, lies nearly east and west, and its greatest breadth is 53 miles. The area of its water surface is 7,540 sq.m. and the total area of its basin 34,630 sq. miles. Its greatest depth is 738 ft., its average depth much in excess of that of Lake Erie, and it is, as a general rule, free from outlying shoals or dangers.

Physiography.—On the north side of the lake the land rises gradually from the shore, and spreads out into broad plains, which are thickly settled by farmers. A marked feature of the topography of the south shore is what is known as the Lake ridge, or, as it approaches the Niagara river, the Mountain ridge. This ridge extends, with breaks, from Sodus to the Niagara river, and is distant from the lake 3 to 8 miles. The low ground between it and the shore is a celebrated fruit-growing district, covered with vineyards, peach, apple and pear orchards and fruit farms. The Niagara river is the main feeder of the lake; the other largest rivers emptying into the lake are the Genesee, Oswego and Black from the south side, and the Trent, which discharges into the upper end of the bay of Quinte, a picturesque inlet 70 m. long, on the north shore, between the peninsula of Prince Edward, near the eastern extremity of the lake, and the mainland. The east end of the lake, where it is 30 m. wide, is crossed by a chain of five islands, and the lake has its outlet near Kingston, where it discharges into the head of the St. Lawrence river between a group of islands. Elsewhere the lake is practically free from islands. There is a general surface current down the lake towards the eastward of about 8 m. a day, strongest along the south shore, but no noticeable return current. As a result of its relatively great depth there are seldom any great fluctuations of level in this lake due to wind disturbance, but the lake follows the general rule of the Great Lakes of seasonal and annual variation. Its mean surface elevation above mean sea-level, for a period of 68 years, is 246.09 ft., which is some 326.33 ft. below the level of Lake Erie. The lake never freezes over except near land, but the harbours are closed by ice from about mid-December to mid-April.

Ports.—The principal Canadian ports are Kingston, at the head of the St. Lawrence river; Toronto, where the harbour is formed by an island with improved entrance channels constructed both east and west of it; and Hamilton, at the head of the lake, situated on a land-locked lagoon, connected with the main lake by Burlington channel, an artificial cut. The principal U.S. port is Oswego, where a breakwater has been built, making an outer harbour.

Commerce.—The commerce of Lake Ontario is limited in comparison with that of the lakes above Niagara Falls, and is in general confined to vessels which can pass the Welland canal and the St. Lawrence canals; the harbours on the lake are planned to accommodate vessels limited to the size determined by the dimensions of the smallest locks, which are: length 270 ft., width 45 ft. and depth 14 ft. on sills. The commerce on the lake is generally confined to coal shipped from Rochester, Sodus bay, Little Sodus bay and Oswego to Canadian ports on the lake and U.S. and Canadian ports on the St. Lawrence river; to coal from Oswego to upper lake ports; to grain and other products shipped from upper lake ports through the Welland canal to the St. Lawrence; to lumber from Canadian ports; and to pleasure traffic.

Canals.—The completion, about 1930, of the New Welland canal by the Canadian Government (see NIAGARA RIVER) will permit the large lake vessels now operating on the upper Great Lakes to enter Lake Ontario. Negotiations under way in 1928 between the United States and the Canadian Governments will undoubtedly result in the improvement of the St. Lawrence river for power and navigation, thereby providing a navigable channel to the sea, suitable for ocean-going vessels. For a century, the Erie and Oswego canals, built and operated by the State of New York, have been important water outlets from Lake Erie and Lake Ontario to the Hudson river and to New York city. The present canal is 12 ft. deep and is designed for use by boats drawing 10½ feet. The canal distance from Oswego to New York city is 338 miles. The Murray canal extends from Presqu'île bay, on the north of the lake, to the head of the bay of Quinte, and enables vessels to avoid 70 m. of open navigation. It is 11 ft. deep below the lowest lake level and has no locks.

Trent canal is the term applied to a series of rivers and lakes connected by short canals, designed to form a continuous system of light-draught navigation between Lake Ontario and Georgian bay, Lake Huron. Six-foot navigation is now available for 224 m. from Lake Ontario to Swift Rapids on the Severn river and, upon completion of the Severn division at the Georgian bay end, will be possible for the entire route. Even now facilities are provided whereby small motor boats proceed through from Lake Ontario to Lake Huron. At Kingston the Rideau canal, extending 128 m. to Ottawa, enters the St. Lawrence river at the foot of the lake. This canal has 47 locks, with minimum dimensions of 134 ft. by 33 ft., and a depth of 5 feet.

ONTENIENTE, a town of eastern Spain, in the province of Valencia; on the right bank of the Clariano or Onteniente, a tributary of the Júcar, and on the Játiva-Villena railway. Pop. (1920) 12,470. Onteniente has a parish church remarkable for its lofty square tower, and a palace of the dukes of Almodovar. Linen and woollen cloth, paper, brandy, furniture and earthenware are manufactured.

ONTOLOGY, the name given to that branch of philosophy which deals specially with the nature of being, i.e., reality in the abstract. The idea, denoted in modern philosophy by the term "ontology" in contrast to the broader "metaphysics" and the correlative "epistemology," goes back to such phrases as *ὄντως ὄντα*, which Plato uses to describe the absolute reality of ideas; Plato, however, uses the term "dialectic" for this particular branch of metaphysics. Aristotle, likewise, holding that the separate sciences have each their own subject matter, postulates a prior science of existence in general which he describes as "first philosophy." So far, therefore, the science of being is distinguished not from that of knowing but from that of the special forms of being: as to the possibility of objective reality there is no question. A new distinction arises in the philosophy of Wolff who first made "ontology" a technical term. Theoretical philosophy (metaphysics) is by him divided into that which deals with being in general whether objective or subjective, as contrasted with the particular entities, the soul, the world and God. The former is ontology. This inter-

mediate stage in the evolution of the science of being gave place to the modern view that the first duty of the philosopher is to consider knowledge itself (see EPISTEMOLOGY), and that only in the light of conclusion as to this primary problem is it possible to consider the nature of being. The evolution of metaphysics has thus relegated ontology to a secondary place. On the other hand it remains true that the science of knowing is inseparable from, and in a sense identical with that of being. Epistemological conclusions cannot be expressed ultimately without the aid of ontological terms.

See METAPHYSICS; PHILOSOPHY; and KNOWLEDGE, THEORY OF. **ONYCHOPHORA**, a small but unusually interesting group of animals of the phylum Arthropoda (*q.v.*), differing in so many important respects from all other Arthropoda that a special class has been created for them. The class Prototracheata or Onychophora, containing only about 50 species, is equivalent in rank to the classes Crustacea, Insecta, Myriapoda and Arachnida, although these groups contain many thousands of genera and species.

A small group of genera which necessitates the creation of a separate class is usually the recipient of particular interest, for it will present highly important indications of the evolutionary relations between other groups of the animal kingdom. It is often to be regarded as the survivor of a group more extensive in range and more numerous in species and individuals in past times.

The Onychophora is such a case. It presents features which are typically arthropod. At the same time it possesses many features which recall the segmented worms (Annelida, *q.v.*), the group to which the Arthropoda are structurally most closely related. It might be regarded as a relic of the evolutionary transition between these big groups, the representative of an ancient group although probably it has evolved along its own special line.

The Onychophora contains only seven genera but these are so much alike that it is still common to use the term *Peripatus* as the generic name for all. The different species resemble each other externally so closely that, but for the differences in the number of legs, a picture in black and white like fig. 1 would stand for any of them. Notwithstanding this resemblance it appears necessary to restrict the use of the old generic name *Peripatus* to a few species.

AFTER SEDGWICK
FIG. 1.—PERIPATOPSIS CAPENSIS.
DRAWN FROM LIFE, LIFE SIZE

The geographical distribution of the group is very wide but discontinuous and very local. Specimens have been found in the West Indies, Central America and Chile, the Congo region of West Africa, South Africa, Malaya, India, Melanesia and Australasia. Specimens are only met with here and there, even where favourable conditions exist over a wider area. This discontinuity of occurrence coupled with the obviously poor powers of distribution of these creatures is strong evidence of a more continuous range in the past and of a group now on the way to extinction. The distribution of the genera is as follows:—*Peripatus*—America and Africa; *Eoperipatus*—Indo-Malaya; *Peripatoides* and *Ooperipatus*—Australia; *Opisthopatus*—Chile and South Africa; *Paraperipatus*—New Britain; *Peripatopsis*—Central Africa.

Since the present account is a short general summary we shall continue to use the term "Peripatus" to include all species of the group. It will be understood, however, that this is for convenience only.

The animal is always found in moist situations (although the district itself may not be moist during the whole year). It is generally found under rotting branches lying on the ground, under stones, under bark and in the crevices of tree stumps. It is extremely sensitive to a dry atmosphere (specimens frequently will not withstand 24 hours in a dry cardboard box, whereas they will be happy for twice this time in a small glass tube containing moist soil although the tube may be tightly corked). It never comes out into day-light and specimens in captivity are much more active at night. It is probably entirely carnivorous, feeding on small insects and other small animals.

Peripatus is a segmented animal, and at a first glance looks

somewhat like a caterpillar; but the long antennae, the peculiar body-surface and the legs soon dispel that view. The actual segmentation is only shown externally by the occurrence of paired legs, one pair to each segment. The surface of the body is marked by ring-like ridges far more numerous than the segments. Some of these are almost continuous round the circumference of the animal (they are all broken by a fine groove down the middle of the dorsal surface), others are less complete and arise between the former. The skin and body wall is highly characteristic, the superficial cuticle being very thin (as in the worms, in contrast

FROM SEDGWICK IN "TEXTBOOK OF ZOOLOGY" (C. ALLEN & UNWIN)

FIG. 2.—VENTRAL VIEW OF HEAD OF *P. CAPENSIS*

and raised everywhere on the ridges into delicate microscopic papillae. These close papillae give the skin a velvety appearance and their presence makes it difficult to wet the creature.

The colours of these animals are dark grey, olive green, or brown to brick red on the dorsal surface and light, often almost white on the under surface. Different species present slightly different colour-patterns, but in more than one locality the same species ranges from black through olive green to reddish brown.

Both head- and tail-ends taper and there is no distinct head. The anterior end bears two characteristic antennae, very mobile and extensible. In fact the whole animal is remarkably extensible and there is a great difference in length between a living specimen in motion (especially if this is rapid) and one in spirit.

Slightly posterior and ventral to the antennae are two small blunt oral papillae, and between these the buccal cavity is situated (fig. 2). An anal aperture is found at the extreme posterior end of the animal and further forward on the ventral surface between the last pair of legs is the reproductive aperture in both sexes. The males may sometimes be distinguished from the females by slight differences in the appearance of the genital opening. In many cases, however, the only difference, not always distinct, is the presence of little apertures of crural glands on the legs of the male (fig. 3).

The other apertures on the surface of the body are those of the tracheae (respiratory organs—see below) and the excretory organs. None of the former can be seen with the naked eye and only four of the latter, on the 4th and 5th pairs of legs (fig. 3).

The limbs of *Peripatus* are characteristic. Each consists of a cone-like stumpy leg bearing distally a narrower foot which carries two sickle-shaped claws. The skin of the legs bears rings of tiny papillae like those of the body and near the apex there may be spinous pads. The structure of the appendages is thus quite unlike the jointed arthropod leg.

FIG. 4.—DIAGRAM OF TRANSVERSE SECTION THROUGH MIDDLE OF BODY OF *PERIPATUS*

A transverse section through an adult shows clearly how the body cavity, which is a haemocoel, is subdivided by delicate sheets of tissue (fig. 4) into (I.) a large central space extending the whole length and containing the gut (A), slime glands (B) and reproductive organs (C); (II.) a shallow dorsal space above the central cavity, containing the heart (D); (III.) two lateral spaces each with a nerve cord (E), nephridia (F), and salivary glands (S). The excretory organs are also found in these compartments, especially in the extensions which exist in the legs.

to the usual arthropod condition) and raised everywhere on the ridges into delicate microscopic papillae. These close papillae give the skin a velvety appearance and their presence makes it difficult to wet the creature.

The colours of these animals are dark grey, olive green, or brown to brick red on the dorsal surface and light, often almost white on the under surface. Different species present slightly different colour-patterns, but in more than one locality the same species ranges from black through olive green to reddish brown.

Both head- and tail-ends taper and there is no distinct head. The anterior end bears two characteristic antennae, very mobile and extensible. In fact the whole animal is remarkably extensible and there is a great difference in length between a living specimen in motion (especially if this is rapid) and one in spirit.

Slightly posterior and ventral to the antennae are two small blunt oral papillae, and between these the buccal cavity is situated (fig. 2). An anal aperture is found at the extreme posterior end of the animal and further forward on the ventral surface between the last pair of legs is the reproductive aperture in both sexes. The males may sometimes be distinguished from the females by slight differences in the appearance of the genital opening. In many cases, however, the only difference, not always distinct, is the presence of little apertures of crural glands on the legs of the male (fig. 3).

FIG. 3.—FOURTH LEG OF *PERIPATOIDES OCCIDENTALIS* (MALE)

The other apertures on the surface of the body are those of the tracheae (respiratory organs—see below) and the excretory organs. None of the former can be seen with the naked eye and only four of the latter, on the 4th and 5th pairs of legs (fig. 3).

The limbs of *Peripatus* are characteristic. Each consists of a cone-like stumpy leg bearing distally a narrower foot which carries two sickle-shaped claws. The skin of the legs bears rings of tiny papillae like those of the body and near the apex there may be spinous pads. The structure of the appendages is thus quite unlike the jointed arthropod leg.

A transverse section through an adult shows clearly how the body cavity, which is a haemocoel, is subdivided by delicate sheets of tissue (fig. 4) into (I.) a large central space extending the whole length and containing the gut (A), slime glands (B) and reproductive organs (C); (II.) a shallow dorsal space above the central cavity, containing the heart (D); (III.) two lateral spaces each with a nerve cord (E), nephridia (F), and salivary glands (S). The excretory organs are also found in these compartments, especially in the extensions which exist in the legs.

The Alimentary Canal. The buccal cavity contains a pair of horny jaws (fig. 5) which may just be seen from the exterior. Each consists of two cutting plates lying in contact. These jaws are the only mouth appendages present. The mouth at the posterior end of the buccal cavity leads into a short muscular pharynx and from this a short oesophagus opens into the stomach (fig. 5). This forms the greater part of the alimentary canal. It is a straight and wide tube leading almost to the posterior end where a short, narrow rectum opens at the terminal anus.

BY COURTESY OF THE ZOOLOGICAL SOCIETY
FIG. 5.—*PERIPATOIDES OCCIDENTALIS*, SHOWING PARTS

The only glands connected with the alimentary canal are two salivary glands (fig. 5) which open by a common duct into the buccal cavity. Each gland is a long tubular structure lying in a lateral cavity close to the nerve cord.

The *Slime Glands* (fig. 5) are another peculiar feature. There are two of these, each opening on an oral papilla. Each consists of a long dilated tube which acts as a reservoir and lies over the stomach in the central cavity of the body. This reservoir extends back a considerable distance and then gives off numerous diverticula in which the slime is secreted. These diverticula lie around the posterior part of the stomach, often entangled in the coils of the reproductive organs. When a living specimen is touched the slime is shot out from the oral papillae to a distance of several inches. Contact with the air causes it to congeal into white, sticky threads. It is supposed that the substance is used for offence or defence.

The *tracheae* are amongst the most noteworthy features of the Onychophora because so characteristic of certain other Arthropoda. They arise in bunches from the bottom of little epidermal pockets, tracheal pits. It is impossible, however, to see these pits externally. From each pit a large or small bunch of parallel tracheae start off, without branching; then they separate and finally branch, when they reach the organs they supply. Since the small single tubes require a high magnification to see them, one can only see readily the little rosettes of tubes where they are bunched at the tracheal pits and then only by examining the internal surface of the body-wall in fresh specimens.

The tracheal pits are numerous and arranged in definite positions. In the West Australian species there are two main rows, one on each side, between the mid-dorsal line and the level of the legs. There are also four longitudinal series on the ventral surface. E. Gafron stated that there were about 75 openings to a segment in *P. edwardsi*. The present author has counted 32 without difficulty in *Peripatoides occidentalis*. The tracheal tubes have a spiral thickening in the walls similar to that in other Arthropoda.

The *excretory organs* are probably the most surprising of all the structures found in this animal and at once call to mind the

FIG. 6.—DIAGRAM OF NEPHRIDIUM OF *PERIPATOIDES OCCIDENTALIS*

annelid worms, being not at all like the excretory organs of the arthropod groups. They are paired structures, one pair to each pair of legs. With the exception of those of the 4th and 5th pairs, each excretory tube opens on the ventral surface at about the point where its corresponding leg joins the body. The 4th and 5th pairs open on papillae near the distal end of the corresponding legs (fig. 3). It is a striking fact that this distinction should be found constantly in the different species.

The excretory organs have been termed *nephridia* and there is some evidence from embryology in support of this. Anatomical study, however, is insufficient to indicate the exact homologies of

these organs and the embryological evidence requires confirmation. Each "nephridium" (fig. 6) consists of a tube with an enlargement, the collecting vesicle, near its aperture and another, corresponding to a coelomic cavity, at its internal blind end. In the West Australian *Peripatoides* the author discovered that cilia were present in that part of the tube leading out from the coelomic vesicle. This is the second part of the body where cilia have been found in these animals and since cilia are characteristically absent in the Arthropoda, it is a point of importance. Their other site is the reproductive organs of the female.

The blood system appears to consist only of a feebly developed dorsal tubular heart.

The nervous system consists of a pair of large supraoesophageal ganglia completely united in the middle line and occupying most of the head space, and a pair of cords which run backward. These latter, instead of being close together in the mid-ventral line, are situated at the sides in the lateral cavities of the haemocoel. Numerous commissures, 8-10 between successive pairs of legs, connect the lateral cords. There are indications of ganglia, corresponding to the legs in number, where the lateral cords are slightly thickened. Nerves pass out from the supraoesophageal ganglia to the tentacles, eyes and skin sense organs and also leave the lateral nerve cords.

The only sense-organs are the eyes and numerous skin sense-organs all of which look alike in structure.

The eyes are moderately well-developed, situated on the head near the base of the antennae. They are simple eyes, not compound like those so characteristic of the Arthropoda. They differ also fundamentally from the arthropod type of simple eye, the ocellus. It is sufficient here to point out that on the whole the visual organ presents features of a simple type met with in both annelid worms and arthropods, but it has followed its own line of evolution.

The skin sense-organs consist of little packets of cells associated with a projecting spine. They look like and are usually regarded as tactile organs. *Peripatus* is, however, extremely sensitive to chemical stimuli as well as to vibrations and the presence of a very little chloroform vapour or acetic acid in the air produces a quick reaction.

Reproduction.—The sexes are separate. The reproductive organs consist of a pair of tubular testes in the male and a pair of ovaries in the female. In both sexes the reproductive organs are continuous with the tubes which lead their products to the exterior, opening at the single aperture already described. In the female, part of each duct is differentiated to form a uterus in which the young develop. Slight differences in the arrangement occur in the different species. Almost all produce living young.

One feature of special note is the varying amount of yolk in the eggs and its result. The Australian species have large yolk-laden eggs, and all species come near to laying eggs. At least one species of eastern Australia is actually oviparous and eggs are laid in sculptured shells. In all others the eggs are retained within the female and after a period of several months the young are born.

The South African and Australian species give birth to the young in April-June. Fertilization in one of the latter species takes place in the preceding August or September and the period of gestation would thus be 8-9 months. It has been given as 13 months for the Cape species.

The eggs are fertilized internally and it has been stated that the male of the Cape species deposits its spermatozoa on the surface of the female. Since the uterus is said never to contain spermatozoa, the mode of entrance into the body would be a complete mystery. There can be no doubt that in the Australian species copulation of the two sexes takes place and the spermatozoa pass up the vagina of the female.

The embryology of the Cape species has been worked out and reference should be made to A. Sedgwick (see below) for details. Further work is required in this direction and would be of undoubted interest and importance.

ONYX, a striped agate in which white layers alternate with black. When brown or red bands occur instead of black the stone is termed sardonyx (*q.v.*). The Romans applied this name originally to a species of marble, now called onyx-marble, because of a resemblance between its well-defined white and yellow veins and the shades in the finger-nail (*ὄνυξ*). When this marble became less important the name was transferred to the striped agate. Onyx has always been largely employed in cameo-work because the design and background could be cut so as to occur in differently coloured layers. The best cameos are those produced by the ancients, though a revival of the art was occasioned by the discovery in the middle of the last century of the South American sources of onyx. Many inferior agates are now made suitable for the cutting of cameos by artificially dyeing the layers (see AGATE) and glass imitations are also extensively produced. Beads, brooches, ring-stones and other small ornaments are frequently made of onyx and larger pieces are fashioned into cups and vases.

Onyx-marble is much softer and less precious than true onyx and includes the following ornamental stones; Mexican onyx or Tecali marble, which is often of a delicate green shade, Algerian onyx and Gibraltar-stone.

The chief localities for onyx are South America and India.

See C. W. King, *Precious Stones, Gems and Precious Metals* (London, 1865); A. Eppler, *Die Schmuck und Edelsteine* (Stuttgart, 1912). For onyx-marbles see G. P. Merrill, *Rep. U.S. Nat. Mus.* for 1893 (1895). (W. A. W.)

OOLITE, a geological term used in two senses; the commonest use refers to a particular type of structure common in limestones and ironstones, where the rock is composed of small rounded grains, resembling the roe of a fish (Gr. *ὄον*, an egg, *λίθος*, a stone). This structure is apparently produced in more than one way, most commonly perhaps by accretion of CaCO₃ from solution in water around tiny sand grains or shell-fragments in moving water, where the grains are kept in constant motion. Grains formed in this way show radial or concentric crystalline structure when cut open. In some instances the grains are merely minute rounded pebbles of an older limestone, and such may show no particular structure. Many fine examples of oolitic deposits are formed by calcareous algae in hot springs, as at Carlsbad and Vichy. Such grains consist of aragonite, not calcite. Oolitic ironstones are apparently formed in a way similar to that first described, but the exact manner of precipitation of the iron is still somewhat doubtful. Bacteria may play a part.

The second use of the term is stratigraphical, to indicate the British rocks forming the middle and upper divisions of the Jurassic system (*q.v.*) where oolitic rocks are common. This usage is now out of date. (R. H. RA.)

OLOGY, the science of eggs, especially birds' eggs. See EGG; BRD; NEST AND NIDIFICATION; REPRODUCTION; ORNITHOLOGY.

OOTACAMUND, town, British India, headquarters of the Nilgiris district in Madras, approached by a rack railway from Mettupalaiyam station on the Madras railway. Pop. (1921) 19,467. It is the principal sanatorium of southern India and summer residence of the governor of Madras and is noted for hunting, fishing and shooting. It is placed on a plateau 7,220 ft. above the sea, with a fine artificial lake, and mountains rising above 8,000 ft. The mean annual temperature is 58° F, with a minimum of 38° in January and a maximum of 76° in May; mean annual rainfall, 49 in. The houses are scattered on the hillsides amid luxuriant gardens. In the neighbourhood are plantations of coffee, tea and cinchona. The Lawrence Memorial school for the children of European soldiers was founded in 1858.

OPAH (*Lampris luma*), a pelagic fish of the order *Allotriognathi*. The body is compressed and deep, with minute scales. A dorsal fin, high anteriorly, runs along nearly the whole length of the back; the caudal is strong and deeply cleft, for rapid swim-

ming. The pelvic fins contain numerous (15-17) rays. In its gorgeous colours the opah surpasses even the dolphin. The fins are bright scarlet, and the sides bluish-green above, violet in the middle, red beneath, variegated with oval spots of brilliant silver. Its home is the Atlantic, especially near Madeira and the Azores. It is rare in the Mediterranean. It grows to a length of 4 to 5 ft. and a weight exceeding 100 lb., and its flesh is excellent.

OPAL, a mineral, in chemical composition an amorphous hydrated silica, some forms of which are highly prized as gems. Many varieties of opal (Lat. *opallus*, Gr. *ὀπάλλιον*), are recognised but of these few have any value as gem stones. The most beautiful is precious opal which displays a wonderful scintillating coloured brilliance, known as opalescence. In early times it excited the keenest admiration, witnessed by Pliny's enthusiastic description, "For in them you shall see the living fire of the ruby, the glorious purple of the amethyst, the green sea of the emerald, all glittering together in an incredible mixture of light." Orange or yellow stones which exhibit opalescence are called fire opals. Black opals are stones in which the background is extremely dark. Really black stones are extremely valuable and rather rare. Common opal is a term applied to the varieties which do not exhibit opalescence. Most of the names applied are self-explanatory, e.g., milk opal, resin opal, liver opal, agate opal, etc. Prase and jasper opals are green and red respectively. A curious, very porous variety, which can absorb surprising quantities of water is called hydrophane. It will adhere to the tongue. It is almost opaque when dry, but becomes practically transparent when saturated with water. Another porous variety is cacholong, which has a lustre like mother of pearl.

Opal is the silicious material of the tests of radiolaria and the frustules of diatoms. These may accumulate as deposits of tripoli or kieselguhr, used for polishing. Opal is often found as pseudomorphs after gypsum, glauberite, calcite and other minerals. Pseudomorphic aggregates are sometimes known as pineapple opal. Opal has been discovered in a fibrous form much like asbestos, from which it may be distinguished by its harsh touch.

Occurrence.—Opal is widely distributed as nodules and stalactitic masses in the cavities of volcanic rocks, deposits from hot springs, etc. It is deposited as a gel or sol. Precious opal is found only in a few places. Cserwenitsa in Hungary was for long the only source; probably all the ancient stones were found there. Since the discovery of the rich fields in Australia, the Hungarian mines have lost most of their importance. The discovery of opals at White Cliff, New South Wales, was followed in a few years by the field on the boundary between New South Wales and Queensland. Many "black opals" are found there, but truly black stones are found at Lightning Ridge. The black opal has been thus described:—"It combines the iridescence of the dewdrop with the colour of the rainbow, set in the blackness of night. It is a smothered mass of hidden fire." Precious opals have been found in Hōsako, Japan, which are nearly colourless and transparent with a bluish tint, and show a change rather than a play of colours, from emerald green to apple red. Esperanza, Queretana and Timapan in Mexico are noted particularly for fire opals. A fine mass of precious opal was found recently in Nevada.

Coloration.—Pure opal, which is colourless, is rarely found. It is usually stained dull colours by ferric oxide, alumina, lime or magnesia. That the coloration is not ordinary absorption is shown by the fact that the transmitted light is complementary to the reflected. If for example a blue stone is held up to the light, it appears yellow. The opalescence is not due to any pigmentation, but to the fact that as the original gel dried and cooled it became riddled with cracks, which were subsequently filled up by another gel containing a different amount of water. The resulting heterogeneity of the opal gives it a varying refractive index, which affects the light in the same way as a soap bubble. The thinner and more uniform the cracks the greater the splendour of the colours, the shade depending on the direction in which it is viewed. In the variety known as harlequin opal the rainbow colours are flashed from little angular surfaces forming a mosaic.

Opals are usually cut *en cabochon*. If they are too thin for this, they are used for inlay work, and if scattered in small pieces

throughout the matrix, they are sold as such, under the name "root of opal." Fire opal shows to best advantage if faceted. Opal is not placed among the most precious of stones because of its softness, but Pliny placed it after the emerald. He relates that Mark Antony exiled a rich senator, Nonius, for the sake of an opal the size of a hazel nut. Many superstitions have centred round opal, and even in modern times it has been regarded as unlucky.

Properties.—Opal contains from 3-13% of water, precious opal between 6 and 10%. It is soluble in caustic alkalis, and when mixed with soda easily fusible. It is soft, 5.5-6 on Mohs' scale and is therefore easily scratched. It is brittle and has a conchoidal fracture. Opals are porous, and it is dangerous to immerse them in liquids. Normally opal is isotropic, but owing to internal strains it is sometimes doubly refracting. The refractive index ranges from 1.444-1.464. They are said to be more brilliant on warm days, but a high temperature, by withdrawing water, destroys their value. Recently milk opal has been coloured by oils and pigments to imitate the rare blue and dark red stones. The colour is fixed with Canada balsam.

OPAVA, the capital of Silesia, Czechoslovakia, lies on the Opava, a tributary of the Oder, in the middle of a wide fertile plain. The old town, founded in the 13th century, is girdled by parkland beyond which stretch extensive suburbs of the new town, in which are centred the industries. These comprise brewing, sugar refining, the manufacture of cloth and industrial machinery. Pop. (1921), 33,457 of whom 22,008 were Germans.

OPELIKA, a city of eastern Alabama, U.S.A., the county seat of Lee county; on Federal highway 29, and served by the Central of Georgia and the Western of Alabama railways. Pop. 4,960 in 1920 (46% negroes); estimated locally at 6,500 in 1928. It is a trade centre and shipping point for a rich agricultural region. It was founded in 1773, incorporated 1858.

OPELOUSAS, a city of southern Louisiana, U.S.A., capital of St. Landry parish; 130 m. W.N.W. of New Orleans, on the Missouri Pacific, the Southern Pacific and the Texas and Pacific railways. Pop. (1920) 4,437 (46% negroes). It is a shipping point for cotton, corn, rice, live stock, and the products of its own saw and shingle mills and other manufacturing plants.

OPEN BILL. A curious stork (*q.v.*) of the genus *Anastomus* so called from the formation of the lower mandible, which is hollowed out so as to meet the maxilla at the base and tip. There is an African and an Indian species.

OPEN-FIELD SYSTEM. The "open," or "common" field was a characteristic feature of manorial agriculture (see **LAND TENURE**). It had its origin, however, in primitive conditions long antecedent to the development of feudalism. Three or four centuries before the Roman occupation the Celtic inhabitants of Britain had evolved a system of co-operative tribal husbandry on the open-field system. The cultivated, or arable, land occupied by the kindred, or tribe, was divided into narrow strips separated by balks of turf. The strips were about a furlong in length and of varying widths. It may be surmised that the length of the strips became more or less standardised at an early date, as the disadvantage of irregular lengths for adjoining strips was obvious. The furlong—clearly "furrow-long"—is generally agreed to have represented the distance which oxen would conveniently plough at a stretch, and the ploughman could keep a fairly straight line. In due course persistent trial and error would result in the general acceptance of the most suitable length which when once adopted would become the standard enforced by tradition. The width of the ordinary strip was, in like manner, gradually fixed at four times the length of an ox-goad, which was 5½ yards. Land measurements were no doubt not very exact in those days but the result was eventually to establish the standard size of the strip at approximately 220×22 yd., or in other words an acre.

In the Celtic open-field each free tribesman was allotted five strips. The allocation of the strips was made in accordance with strict tribal regulations, and the cultivation of the land was carried out co-operatively. The plough was common property but the oxen appear to have been individually owned.

This system fitted very readily into the manorial organisation introduced by the Normans. The status of the cultivators was changed, but the open-field with its separate acre or half-acre strips and its co-operative methods of husbandry continued. The administration of the manor became in form autocratic and the land was held in servile tenure, but in practice the rules governing the allocation of the strips and the cultivation of the land

DIAGRAM ILLUSTRATING THE OPEN-HEARTH PROCESS

were settled by the tenants. Gradually the rigidity of the manorial organisation broke down, the relations of lord and tenants were changed and only the forms of feudalism lingered. But the open-field system survived in thousands of parishes until the wholesale enclosures of the end of the 18th and early part of the 19th centuries abolished it generally, although it lingered in isolated cases until the beginning of the 20th century. Indeed at least two open-fields—at Laxton in Nottinghamshire and Braunton in Devon—still existed in 1928. (R. H. R.)

OPEN-HEARTH STEEL PROCESS. In recent years two distinct modifications of steel making process have been included under this common title: (1) the Siemens process, in which pig-iron and ore are the materials used, and (2) the Siemens-Martin process, which uses a mixture of pig-iron and scrap steel. A combination of the two is also in general use.

Steel-making by this process was not a success until the brothers Siemens perfected their system of regenerative gas heating. The principle involved is simple and consists in utilizing the waste heat of the products of combustion to raise the temperature of the gas and air employed in heating the furnace, and so increasing very considerably the temperature obtained. The furnace is of the reverberatory type but instead of having a fire-box at one end and a chimney flue at the other both ends are built with ports for gas and air; the latter are generally arranged above the former in order to promote mixing of the gas and air and at the same time to afford some protection for the roof against the intense heat of the furnace. The ports are connected by flues with chambers filled with brickwork—called regenerators—which in turn are connected with the gas and air supply through a system of valves; these last named allow the direction of the gas and air through the furnace to be reversed from time to time. The roof of the furnace must be built with very refractory bricks, generally silica, and the hearth made of sand or dolomite according to the process for which the furnace is to be used.

A diagrammatic sketch of the furnace is given above. Gas from a producer and atmospheric air are admitted to the furnace through the valves A and B, from which they pass to the reversing valves C and D and from them through the regenerators

E and F into the hearth where combustion takes place; from here through the hearth of the furnace the waste gases pass into the regenerators G and H and then through flues to the chimney via the reversing valves. The gas and air are reversed in direction every 20 to 30 min., by which means it is possible to maintain the high temperature required in the furnace.

Two methods of working the process are in general use—acid and basic. In the former the hearth is made of silica sand mixed with a small quantity of oxide of iron, in the latter it is of dolomite mixed with a small amount of tar; in both cases the hearth is fritted together under the intense heat of the furnace before any melting is done.

In the acid process no elimination of sulphur and phosphorus is possible during the working of the charge, and it is necessary to start with pig-iron and scrap which are low in these elements. The amount of silicon admissible depends upon the amount of scrap in the charge; when the amount is high, pig-iron containing a higher percentage of silicon can be used than when the quantity of scrap is small, but the total amount of silicon present should be about 1.5%. Assuming the furnace already hot from previous working, the pig-iron and scrap are charged into it in the order given; during the melting down the greater part of the silicon and manganese is oxidised and unites with the oxide of iron derived from the scrap to form a slag consisting mainly of silicates of iron and manganese. From time to time additions of iron ore are made to the slag in order to render it oxidising and so capable of removing by oxidation the impurities in the charge. Of these, silicon and manganese are the first to go, and carbon in the form of gaseous carbon monoxide follows, the gas liberated causing the bath to boil vigorously. Towards the close of the operation great care must be taken to avoid the addition of more ore than is necessary to make the carbon sufficiently low, otherwise steel of poor quality will be produced. Ferro-manganese and ferro-silicon are now added to deoxidise the metal and the charge tapped into a ladle and then cast into ingots.

In the basic process the procedure is somewhat different. In this case the elimination of the phosphorus and sulphur is possible on account of the nature of the slag, which consists of phosphate and silicate of calcium containing a large quantity of lime in suspension; additions of iron ore are made as in the acid process, and small quantities of lime must also be added from time to time to maintain the basicity of the slag; excess, however, must be prevented, otherwise the slag will become pasty and incapable of carrying on its work. Precautions must also be taken to secure the removal of the phosphorus and carbon in the order mentioned; otherwise the bath will go off the boil, and great difficulty will be experienced in getting rid of the phosphorus. The nature of the slag also necessitates the postponement of the deoxidation of the bath until the charge is in the ladle; should the ferro-manganese necessary be added in the furnace, there is great risk of the phosphorus being reduced from the slag and passing back into the metal. Pig-iron for use in the basic process may contain from 1 to 2% of phosphorus and should be low in both sulphur and silicon but fairly high in manganese. (See also IRON AND STEEL.)

OPERA, a drama set to music, as distinguished from plays in which music is merely incidental.

Italian Beginnings.—The historian, Doni, tells us that in the last years of the 16th century a group of amateurs held meetings at the house of the Bardi in Florence with the object of trying experiments in musical declamation by solo voices supported by instruments. Hitherto the only high musical art was unaccompanied choral music; its expression was perfect within such limits that dramatic music within those limits was as inconceivable as dramatic architecture. But the literary *dilettanti* who met at the house of the Bardi were not mature musical artists; and no technical scruples interfered with their glorious project of restor-

HEATING, REFINING AND MOULDING OF OPEN-HEARTH STEEL

1. Ladle filled with liquid steel being poured into ingot moulds
2. Removing moulds when liquid steel has "frozen" to a solid
3. Refining process, molten iron being poured into an open hearth furnace for refining into steel
4. Battery of furnaces, to the left, being charged with scrap iron and other raw materials
5. Discharging process. Liquid steel being poured into huge ladle. Steel being heavy stays at the bottom and the impurities which rest on top are poured into small ladle in the form of slag, which is used in cement manufacture
6. Tilting process. Open hearth furnaces so designed as to tilt for discharging of liquid metal

ing the musical glories of the Greek tragedy. Vincenzo Galilei, the father of Galileo, warbled the story of Ugolino to the accompaniment of the lute, much to the amusement of expert musicians; but he gained the respectful sympathy of literary listeners.

The first public production in this "monodic" style was Jacopo Peri's *Euridice* (1600), which was followed by a less successful effort of Caccini's on the same subject. Feeble as were these efforts, they impressed contemporary imagination as infinitely more suggestive of life and passion than the forlorn attempts then in vogue, to provide good music for a music-drama by means of a polyphonic chorus behind the scene, with actors in dumb-show on the stage. As Parry happily points out in this connection, the laying of a foundation stone suggests a future so inspiring as to exclude all sense of the triviality of the present achievement. A great master of pure polyphony, Orazio Vecchi, had already, in 1594, the year of Palestrina's death, laughed the madrigal-opera to extinction in his *Amfiparnasso*. The woodcuts which adorn its first edition show how the actors sang or mimed in front, while the other singers completed the harmony behind the stage.

With the decadence of the madrigal, Monteverdi (*q.v.*) brought a real musical power to bear on the new style. At the beginning of the 17th century no impressionable young musician could fail to be profoundly stirred by Monteverdi's *Orfeo* (1602), *Arianna* (1608) and *Il Combattimento di Tancredi e Clorinda* (1624), works in which instruments were used with the same archaic boldness, the same rhetorical force and the same lack of artistic organization as vocal style and harmonic resources. So explosive was the spark of Monteverdi's genius that the next step necessary for the progress of opera was a development of forms, not only non-dramatic but anti-dramatic.

The types of monody conceivable by the pioneers of opera were codified in the system of free musical declamation known as *recitative*. This is said to have been used by Emilio del Cavaliere as early as 1588. Formal melody, such as that of popular songs, was as much beneath the dignity of monody as it had been beneath that of the highest forms of polyphony; but in the absence of any harmonic system but that of the church modes, which was ruined by the new unprepared discords, formal melody proved a godsend as the novelty of recitative faded. Tunes were soon legalized at moments of dramatic repose; it was in the tunes that the strong harmonic system of Neapolitan tonality took shape; and by the early days of Alessandro Scarlatti, before the end of the 17th century, the art of tune-making had blossomed into the musically safe and effective form of the *aria* (*q.v.*).

The poet Metastasio realized that there was nothing unnatural in a scheme of drama which allowed each stage of the action to culminate in a tableau marked by a burst of lyric poetry and lyric music. Some 30 such tableaux would give occasion for 30 arias (including a few duets, rarely a trio and only once in Handel's 42 operas a quartet) while the connecting action and dialogue was set in recitative. Metastasio devoted his whole life to opera-libretti on this plan, which he executed with consummate skill. He was far from satisfied with the way in which most composers set his texts. The scheme was fatally easy for small musicians and did not stimulate the higher faculties of great ones; while great and small were equally at the mercy of singers.

Before this stagnation of baroque opera there was a provincial outburst of life in the wonderful patchwork of Purcell's art (1658-95). In the early *Dido and Aeneas* he and the humble Nahum Tate (of Tate and Brady) produced, perhaps, the most perfect opera before Gluck. Dryden was less accommodating. He had been so disgusted by the stupid vanity of the fashionable Monsieur Grabu that when he wrote *King Arthur* he insisted on arranging that the musical characters should be quite independent of the main action, and with the infliction of this condition upon Purcell, English opera was relegated to a permanent musical squalor which even endured to ruin Weber's last work, *Oberon*, in 1826.

Gluck.—Another sign of life was present in the farcical operas and intermezzi or comic entre-actes of certain Neapolitan composers (*see* LEO, PERGOLESI, LOCROSCINO), one of which (Pergolesi's *La Serva Padrona*) occasioned the war of Buffonistes and

Antibuffonistes in Paris (*see* MUSIC, sec. 6).

The forms of music known before 1750 were architectural or decorative, but essentially non-dramatic. Baroque opera required something more than reform, and the opportunity for progress came with the rise of the sonata style. The music of Gluck's time was too firmly organized to be upset by new discoveries; in fact the chief need for opera was retrenchment in rhetorical forms. Gluck, as Handel had remarked of his early works, was no contrapuntist, and to the end of his life this hampered him in "jining his flats." But he had a genius for phrasing (*see* RHYTHM), which went far to promote dramatic movement, and another aspect of this was a sense of symphonic form as vigorous as could find scope in opera at all; while his melodic power was of the kind which Matthew Arnold calls "touchstones of poetry."

The lasting effect of his work on French music left the course of Italian *opera seria* unchecked. Mozart's *Idomeneo* is the grave of some of his greatest music, including many genuinely dramatic strokes, and his perfunctory *Clemenza di Tito* is the last *opera seria* that contains any music worth extracting. The unmistakable influence of Gluck could not save *Idomeneo*; and Mozart's triumphs belong to the comedy of manners, until he entered the transcendental world of *Die Zauberflöte*. His first impulse was inveterately musical, and his power of dramatic movement and characterization grew steadily without always preventing him from yielding to singers and indulging himself in dramatically vicious musical luxuries. But after his first exuberant German opera, *Die Entführung aus dem Serail*, it is not so easy as it seems to catch Mozart napping. He is a dangerously subtle parodist, and in *Costi fan tutte* the heroic coloratura arias of the virtuous Fiordiligi and Dorabella are the arias of ladies who do protest too much; and in *Die Zauberflöte* the vocal fire works of the Queen of Night are the rhetoric of a formidable person who, we are told, "hopes to cajole the people with illusions."

Mozart.—The article MOZART contains further remarks on his operas. They are organized so thoroughly on the basis of their libretti that it is a serious mistake, not made by scholars like Jahn, to underrate the wits of his literary collaborator, Da Ponte. Goethe did not even underrate the rapsallion Schikaneder, but took the symbolical aspects of *Die Zauberflöte* so seriously as to sketch a sequel to it. Since boyhood Mozart never wrote an opera without thoroughly controlling its dramatic movement. Where he relaxes the relaxation is complete. The movement in *Die Entführung* is intermittent and the static elements excessively favoured, but the movement exists and is powerful. In *Figaro*, the fourth act, with its tangle of assignations in the garden, has five arias in succession which would make a mere concert on the stage if they were all performed; but there is an ironic dramatic tension behind the last of them (*Deh vieni, non tardar*); and when the librettist provides action Wagner is not as quick as Mozart in his timing of the details and the whole. One of Wagner's English propagandists, Hueffer, cited the duet in which Cherubino and Susanna are trying to find a way out of the locked room before the Count returns, and accused Mozart of keeping the Count waiting at the door until this effective piece of music had run its formal course. But every stage manager finds that Mozart has barely given Cherubino time for a natural hesitation before jumping out of the window, in spite of Susanna's terrified protest.

The Qualities of Opera.—And here we may profitably consider what are the qualities necessary for success in opera. It is notorious that the absolute value of the music comes last, if it is a factor of success at all. Unquestionably it is a factor in immortality; and the music of *Idomeneo* is immortal, though that opera is revived only in Mozart festivals. But operas cannot wait for immortality, and can manage on quite flimsy music to achieve as much immortality as musical history has given time for. It might be thought that success depends on dramatic power; and this is nearer the truth. But dramatic power comes only third in the conditions, and coherence is not necessary at all.

Two qualities take precedence of dramatic power as conditions for success in opera; one is the theatrical sense, and the other the histrionic sense. They are inseparable but not identical. The theatrical sense can thrill the listener before the curtain rises.

as in the modulation to F major at the end of the overture to *Don Giovanni*; the histrionic sense can save the stage-manager the trouble of telling the actors what to do with their hands. The beginning of Rossini's *Barbiere* is an excellent example, especially when compared with that of Paisiello's setting, which dominated the stage until Rossini's ousted it. Paisiello's opening is good music for any moderately cheerful situation, Rossini's opening consists of a scale rising for nine notes and descending again, with long halts and water-beetle glides. Actors may be defied to walk on during this music with any steps but those of conspirators! And the scoring (which is so perfunctory that literally half of the bulk of the opera is expressed by abbreviations) gives in perfection the theatrical atmosphere of a night scene. The same ridiculous scale in another ridiculous rhythm hisses up and down in thirds *sul ponticello* (close to the violin bridge) while Basilio describes the destructive effects of a well managed calumny. Poor Paisiello's famous duet between two stammerers was no asset wherewith to outbid Rossini's ubiquitous histrionic sense in the contest for popularity.

But when brilliant writers tell us that Rossini is superior to Mozart in the sense of pace, it is high time to study the elements of Mozart's art. Three senses of pace enter into music. There is that of the athlete, relying on his own limbs, the limbs of his horse or the wheels which he directly controls. There is that of the passenger reclining in his car; and there is the cosmic motion of the stars among which our own humble earth moves hundreds of times faster than a cannon ball, yet takes several minutes to traverse its own diameter. Of these three senses of movement that of the passenger in his car is equivalent to repose, and to nothing else; while cosmic movement, discernible in Bach, Beethoven and Wagner must be related to human measurements before it means anything at all. The one directly exhilarating sense of movement is that of the athlete; and we are asked to believe that Rossini exemplifies this when Figaro rattles his "Largo al factotum" at some nine syllables a second, immovable for six minutes except for semaphore gestures once in 12 bars, to the right when the music halts on the dominant, to the left when it halts on the tonic. No, let us be accurate; there is another tradition which identifies the tonic with the right and the dominant with the left. Mozart's Figaro contains one piece of patter-singing even faster than "Largo al factotum," but he pronounces judgment on this kind of movement by giving it to the decrepit Dr. Bartolo ("se tutto il codice dovesse leggere," etc.).

The decline of *opera seria* and *opera buffa* led to an approximation between tragic and comic styles till the distinction became too subtle to be distinguished by any but experts. Dance rhythms became the only Italian forms of accompaniment, and vocal scale exercises remained the last resource of the dying Desdemona. Yet Rossini retained so much histrionic force that an English spectator of his *Otello* is recorded to have started out of his seat at the catastrophe, exclaiming "Good Heavens! the tenor is murdering the soprano!" And in times of political unrest more than one opera became as dangerous as censorship could make it. An historical case is brilliantly described in George Meredith's *Vittoria*. But what has this to do with the progress of music? The history of Italian opera from after its culmination in Mozart to its subsidence on the big drum and cymbals of the Rossinians is the history of "star" singers.

Verdi's art, both in its burly youth and in its shrewd old age, changed all that. He reformed nothing except by slow experience; but he gradually found a meaning for everything. Even the vile Italian brass is used in his last works in just the same style as in his earliest, with the enormous difference that he appreciates its brutality and uses it only where brutality is wanted. Verdi's development belongs to a later stage of operatic history.

France.—After Mozart the next forward step in operatic art was again made in France. The French histrionic atmosphere had a stimulating effect upon every foreign composer who visited Paris. Rossini himself, in *Guillaume Tell*, was electrified into a higher dramatic and orchestral life than the rollicking rattle of his serious and comic Italian operas. The grave defects of its libretto were overcome by unprecedented efforts at the cost of an entire

act. Anywhere but in Paris Rossini's music would have pulled a worse drama through or else failed outright; but in Paris the composer found it worth while to learn how to rescue his best music from failure.

The French contribution to musical history between Gluck and Rossini is of austere nobility worthy of a better crown than Meyerbeer's music. If Cherubini and Méhul had had Gluck's melodic power, the classics of French opera would have been the greatest achievements in semi-tragic music-drama before Wagner. As it is, their austerity is negative, failing to achieve beauty rather than rejecting what is irrelevant. The histrionic sense is good, but the sense of movement rejects patter-singing without achieving anything more real. Cherubini's *Medée*, *Les Deux Journées* and *Faniska*, however, did achieve grand musical forms and had a great influence on Beethoven.

Beethoven's *Fidelio* gives occasion to consider the function of the librettist, who obviously has the composer at his mercy unless the composer is prompt to get the upper hand. Mozart (*q.v.*) learnt betimes to bully his librettist. Beethoven did not; and the expansion of Bouilly's pretty *opéra comique*, *Fidelio ou l'amour conjugal* into the powerful *Leonore* (afterwards renamed *Fidelio*), was executed according to Beethoven's general intentions but with many blunders as to the *mise-en-scène*. French *opéra-comique* is not comic opera, but opera with spoken dialogue. It thus includes Cherubini's tragic *Medée* and Méhul's biblical *Joseph*. It has a tendency (which culminates in Bizet's *Carmen*) to arrange that much of the music should happen more or less as it might occur in an ordinary play. For instance, necessary antecedents may be told in "that dear old song which I am never tired of hearing," whereupon the family history follows in a ballad. Other occasions for music are the plighting of troth in a little private ceremony, the entry of a company of soldiers, and, less realistically, ordinary entries and tableau-situations in general, until we recapture the Metastasio scheme. Opera, viewed from this point, lacks opportunity for great musical forms, which can deal with more than one action; but the influence of Mozart's wonderful concerted finales was not to be resisted, and Cherubini's librettists arranged that the second act in *Les deux Journées*, *Lodoiska*, and one or two other operas, should end with continuous music for something like 20 minutes, with various changes of action. The last act French taste did not allow to expand, and in all French operas the end is perfunctory; whereas Mozart and Beethoven love to expatiate on the final happiness.

It is not known where the concerted finale originated, since its reputed invention by Logroscino (*q.v.*) is not borne out by his extant works; but it is already fully developed in the second act of Mozart's *La finta Giardiniera* (written at the age of 18). In his first *Singspiel*, *Die Entführung*, Mozart ends the second act with a highly developed quartet, while the whole opera ends with a vaudeville, *i.e.*, a series of verses delivered by each character in turn, with a burden in chorus; followed by a short movement for full chorus. But in his other *Singspiel*, *Die Zauberflöte*, the finales to both acts, like those in *Figaro*, *Don Giovanni* and *Così fan tutte*, cover so much action within their half-hour's extent that it would evidently cost Mozart little effort to extend the finale backwards over the whole act and so to achieve, without transcending his own musical language, the perfect continuity of Verdi's *Falstaff*. This would have suited neither his singers nor his public; but we do not know how he might have crushed opposition if he had lived longer and had seen the possibilities of French opera, with its thrilling tales of heroic adventure.

Fidelio.—As fate befell, Beethoven took the problem in hand too late. The original libretto of *Fidelio* was by the author of *Les Deux Journées*, and was on the usual French lines with (as Brahms once put it) vaudeville turns for each person in succession. Two acts were occupied with the love of the jailor's daughter, Marceline, for *Fidelio*, the mysterious new assistant who is really the disguised wife of the hero, who has been secretly imprisoned by the villain, and whom she has been seeking for two years. She reluctantly uses Marceline's delusion in order to further her design of penetrating to the lowest dungeons of this jail, where a mysterious prisoner is being starved to death. In the

original libretto a trio begins on the occasion of the father's giving his blessing on their engagement. And on the operatic vaudeville scale this is well enough timed. But *Fidelio*-Leonora's heroic project and the martyrdom of her Florestan in Pizarro's dungeon are themes too sublime for this light style of opera, which was all very well for the adventures of the hero of *Les Deux Journées*, carted out of Paris in his humble friend's water cart. It was the sublime themes that attracted Beethoven; and in *Leonore* (as his opera was first named) his librettist, Sonnleithner, tried to expand them without the necessary recasting of the whole action. So the trio of plighted troth was begun earlier, so as to take in half of the previous conversation, which dealt with the project of getting permission for Fidelio to assist in the work of the dungeons, and with Fidelio's imperfectly suppressed excitement thereat. We thus have the music bursting into the conversation in an inexplicable way; and two revisions barely saved the first two acts even when an experienced dramatist named Treitsche compressed them into the first act of *Fidelio*.

The rest, from the rise of the curtain on Florestan in the dungeon, was not beyond mending; and spectators who are insensible to its power should confine their criticisms to the customs of the box-holders. *Fidelio* is one of the most important works in the history of opera; and *The Messiah* has not a firmer hold of the British public than *Fidelio* has of every class of unspoilt music-lover in Germany. The story is one of the finest ever put on the stage, and everybody in Germany knows it; which is fortunate, since nobody could ever make it out from the action, until it begins to explain itself in the dungeon scene. But in the first act the mystery is a mere puzzle, and even if Fidelio's disguise is as transparent as most operatic male parts for female voices, the spectator has no evidence beyond the playbill, that she is other than the strangely embarrassed lover of the adoring jailor's daughter.

The difficulties of *Fidelio* are thus very instructive. Turn back from it to the almost nonsensical *Zauberflöte* and observe how perfectly the comings and goings of Mozart's music explain themselves. Music begins naturally on the rise of the curtain, and stops naturally with the exits of all the characters except the youth who is lying unconscious. He revives, wonders where he is, hears a distant piping; and the approach of the bird catcher, Papageno, explains the piping and is accompanied by the orchestral introduction to his song. Later on, three veiled ladies give the hero a miniature portrait of the princess he is to rescue. He gazes at the portrait and falls in love; the orchestra heaves two sighs and Tamino's love-song begins. The scene darkens, the Queen of Night appears, enthroned among stars, pours out her woes and promises her daughter to the hero. She vanishes. Daylight returns. Tamino, wondering whether it was all a dream, is encountered by poor Papageno who, punished for his lies with a padlock on his mouth, can only sing *hm, hm, hmm*; another perfect occasion for music, worked up in a quintet in which the three veiled ladies remove his padlock and instruct him and Tamino how to set forth on their quest. And so from point to point the happy nonsense proceeds, always right and effective in matters the mishandling of which may ruin the finest story.

Co-ordination.—These are the matters in which Sullivan, with his Gilbert, is as right as Wagner. It makes little difference whether the opera be with spoken dialogue, with dialogue in the secco-recitative of *opera buffa*, with the accompanied recitative of Gluck and of Weber's *Euryanthe*, or in absolute Wagnerian continuity. The composer will always have to demand from his librettist an effective timing of the chief musical opportunities, and from himself a royal punctuality in the relation of his music to the drama. Wagner's advice to young opera writers was to begin with *Singspiele*. The *a priori* critic complains that spoken dialogue and music are on irreconcilably different planes; and so they are when the transitions are mishandled. But Mahler, one of the greatest opera conductors of all time, did not think the planes incompatible. He insisted on being his own stage manager (which laudable example has been followed by Sir Thomas Beecham), and he rehearsed every word and every pose in the dialogue of *Fidelio*.

Secco-recitative, *i.e.*, recitative accompanied on the pianoforte

(or harpsichord) is no bad medium when it is properly done, *viz.*, at the pace of spoken dialogue and, on the part of the conductor (who takes the pianoforte), with a light touch and some discreetly humorous "gagging." Modern composers, of course, might as well attempt prehistoric Chinese as try to revive this convention. With accompanied recitative and other more highly organized music the composer begins to lose the clear outlines of the problem of timing his chief musical events; and the wisdom of Wagner's advice appears. For only in the *Singspiele*, with *Freischütz* and *Zauberflöte* as examples, and with *Fidelio*, as both an inspiration and a warning, do we see the bones of opera laid bare.

These principles are more important than any details of chronological operatic history. The reader who has grasped them can afford to ignore most of the patriotic and political aspects that have made this or that opera famous. *Der Freischütz* was the first German opera that had a truly German subject; and Wagner, speaking at a reburial of Weber's remains, said that there never was a more German composer. Very true, but that did not prevent Weber from following *Freischütz* by *Euryanthe*, his greatest effort, on a subject of chivalry ruined by an incompetent librettist; nor from contributing his swan song, *Oberon*, to the English stage and the English operatic tradition which, ever since the time of Dryden and Purcell, inculcated an utter incoherence in the musical scheme. Weber's distress at being made to compose separate numbers as Planché sent them to him, with no information as to their order or context, was surpassed only by his disgust at finding that Planché was quite right in thinking that such information did not matter.

Euryanthe, with its elaborate accompanied recitative and its 13 distinct *Leitmotive* (to anticipate the Wagnerian term) is an opera on lines hardly less advanced than those of Wagner's *Lohengrin*. Weber retains the outward appearance of the division into separate numbers, as arias, duets, finales and so on; but the division is becoming artificial, and some vestiges of its real purport are useless. For example, the condemnation of *Euryanthe* at the end of the second act is expanded by Weber into a longish movement merely because he does not realize that a short outburst would suffice to round off the whole act far more grandly than a self-contained finale.

Wagner.—With Wagner's *Der Fliegende Holländer* extremes meet. It purports to be divided into nine "numbers," but the musical traces of such divisions are only a nuisance, and the formal expansion of the Dutchman's duet with Senta is as out of place as a Punch and Judy show, besides being very poor music. On the other hand, the division into three acts is a grudging concession to the brutal necessities of the first performances, for Wagner conceived and executed *Der Fliegende Holländer* as a one-act opera, with continuous music during its changes of scene. It has been divided into three as if by a butcher's chopper, cutting off the curtain music at the first available tonic chord, and restarting it at the cut or a little earlier. The opera ought always to be performed in one act. Spohr's comment on it was that it had too few full-closes and rounded off forms. This shows how far it still seemed recognizable to him as a classical opera.

Wagner's mature work solves the problem of a music on the same time-scale as the drama. Every other feature of Wagner's art results naturally from this. Musical dialogue becomes completely realistic, to such an extent that Wagner could not at first (in *Die Walküre*) make up his mind to let his lovers sing together. He overcame this scruple in *Tristan*, and so recovered the classical art of making a composite emotional tableau. This he developed to unprecedented heights in *Die Meistersinger von Nürnberg*. The continuity of such highly organized music demanded a rational organization of recognizable themes. What more inevitable principle could organize them but that of association with personal and dramatic ideas? Thus Wagner's system of *Leitmotiv* grew up as naturally as the thematic organization of sonatas. The illustrations at the end of the article MELODY give a typical example of his handling of a theme in various contexts. Other aspects of his music are illustrated in HARMONY and INSTRUMENTATION.

Not only was Wagner his own librettist, but he succeeded in

making clear and cogent upon the stage stories and ideas that no dramatist, musical or non-musical, had thought possible before. It is always a mistake to suppose that the libretto, however contemptible as literature, can be neglected in the enjoyment of an opera, however great as music. But Wagner's dramas, with all their affectations and amateurishnesses of style, are pieces of epoch making stage-craft and overwhelming tragic powers, except *Meistersinger*, which achieves the yet higher mark of a comedy full of kindly wisdom and bathed in sunshine, with no shadows deeper than moonshine; for even its poor little villain, Beckmesser, is only a critic.

It was not Wagner's fault that so many of his epigoni neglected his advice and, instead of writing *Singspiele*, refused to tackle anything smaller than continuations of the sorrows of Wotan. Lighter forms of opera prospered, nevertheless. Bizet first wrote *Carmen* as an *opéra comique*. It is doubtful whether it has been improved by the compression of its spoken dialogue into accompanied recitative, though this is well done and the recitatives have their points. It carries to an extreme the device of rationalizing the musical occasions; for if it were performed as a play an enormous amount of the music would still remain as songs or dances. *Meistersinger* is almost as full of songs and choruses on the same realistic basis.

The last works of Verdi have a complete Wagnerian continuity, but they reveal that unless the music is inveterately polyphonic the *Leitmotiv* system is Wagner's private affair, which need concern nobody else.

Modern Opera.—Space fails for anything like a complete review of modern opera; but it may be noted that the prevalence of Wagnerian continuity eventually enabled composers to take extant dramas and set them without any extensive remodelling at all. If the operas *Pelléas et Mélisande*, *Salome* and *Elektra* are compared with the original plays by Maeterlinck, Wilde and Hofmannsthal, it will be found that the poets have suffered less from Debussy and Strauss than dramatic authors usually suffer from actor-managers. Debussy has omitted Maeterlinck's difficult and not musical first scene of the servants who, having heard of the prince's approaching return with a strange bride, must be speaking after the following scene, in which Golaud first meets Mélisande in the forest. By omitting the first scene Debussy secures an opening in the right atmosphere but loses the basis of the entry of the servants in the last scene of all. Here history repeats itself, for Weber offended the librettist of *Freischütz* by refusing to compose an opening scene with the hermit who appears as *deus ex machina* at the end. In both cases the composers are right, though the sacrifice is serious.

Debussy and Strauss have so treated these three plays that they are better acted when given as operas than when given without music. No actress except an opera singer ever has her declamation and movements so superbly timed, and timed permanently to the tenth of a second, as in these wonderful pieces of musical stage-craft. The methods of the two composers are poles asunder, and Debussy's language is, as has been said elsewhere, the exact opposite of Maeterlinck's. Yet from his opposite direction Debussy reaches the Maeterlinckian world. He has no *Leitmotiv*, hardly even a recurring figure. Strauss uses the whole Wagnerian system, together with his own *al fresco* technique (the term is also his own, see INSTRUMENTATION, sec. 6).

In later works Strauss and Hofmannsthal have shown that they accept no limits to the number of different kinds of opera that one composer may write. An annotated catalogue would be required to keep pace with the various types of modern opera from the parodistic to the tragic and the symbolical.

A few final definitions may serve to fill up lacunae in an account which has deliberately sacrificed historical order to the laying down of a few broad aesthetic criteria. Besides the matters already defined the following particulars should be noted:

1. *Singspiel* originated in farces, such as *Dittersdorf's Doktor und Apotheker*. But in France the *opéra comique*, which corresponds to *Singspiel*, had no comic origin at all, but arose from the refusal of the *Académie de Musique* to allow rival companies to infringe its monopoly of *Grand Opéra*, or opera in which every

word is sung and even the recitatives have orchestral accompaniments.

2. French *Grand Opéra* has had a continuous history from the foundation of the *Académie de Musique* in 1669 to the present day. It absorbed the works of Meyerbeer, which so infuriated Wagner by producing "effects" without assuming any responsibility for causes. And this is all that can be said of Meyerbeer here.

3. *Opéra bouffe* has no historic connection with *opera buffa* but is the offshoot of vaudeville music in the early classical sense described above. Its chief representative on the Continent is Offenbach, and it is the ancestor of the Savoy operas of Gilbert and Sullivan.

4. *Melodrama* is the use of an orchestral accompaniment to spoken dialogue (see BENDA). It is promising in theory, but generally disappointing in effect, because the speaking voice becomes dragged by the music into an out-of-tune sing-song. Benda never lets the voice speak during any notes except a long-sustained chord. Mozart, after one example in an unfinished opera, *Zaide*, dropped this form, though he admired Benda's essays so much that he put them under his pillow during his travels. Other classical examples are significantly short and cautious. There is one in *Fidelio* which quotes from earlier movements in a thoroughly Wagnerian way. But the device is more prominent in incidental music to plays, as in Beethoven's music for Goethe's *Egmont*. Mendelssohn's music for *A Midsummer Night's Dream* contains the most brilliant and resourceful examples yet achieved; but they are beyond the musical capacity of the English non-operatic theatre, which, however, has practised the worst style of the method, till it has become a disease spreading an operatic continuity of bad music over large tracts of our drama.

In every period of musical fermentation the art of opera, while it has failed to sift good composers from bad, has instantly sifted the men of real ideas from the aesthetes and faddists; Monteverdi from the prince of Venosa, Gluck from Gossec, Wagner from Bruckner on the one hand and Liszt on the other. As the ferment subsides laziness levels opera sooner than anything else; but every revolutionary principle that enters into music to destroy and expand must, first or finally, seek its ratification on the stage.

See also ARIA, BALLET, OVERTURE, INSTRUMENTATION and the articles on individual opera composers. (D. F. T.)

OPHICLEIDE, a brass wind instrument, now almost obsolete, having a cup-shaped mouthpiece and keys, in fact a bass keyed-bugle. The name (from Gr. *ὄφis* serpent, and *κλείδες* keys), applied to it by Halary, the patentee of the instrument, is hardly a happy one, for there is nothing of the serpent about the ophicleide. The ophicleide is almost perfect theoretically, for it combines the natural harmonic scale of the brass wind instruments having cup-shaped mouthpieces, such as the trumpet, with a system of keys, twelve in number, one for each chromatic semitone of the scale and it is capable of absolutely accurate intonation. Unfortunately its timbre is not satisfactory, the lower register being rough, the medium coarse and the upper wild and unmusical, and it has been superseded by the bass tuba.

The invention of the ophicleide is frequently but falsely attributed to Alexandre Frichot, a professor of music at Lisieux, department of Calvados, France. Actually the first idea of adding keys to instruments with cupped mouthpieces, unprovided with lateral holes, with the aim of filling up some of the gaps between the notes of the harmonic scale, goes back, according to Gerber, to Köbel, a hornplayer in the Russian imperial band, about 1760. Anton Weidinger, trumpeter in the Austrian imperial band, improved upon this first attempt, and applied it in 1800 to the trumpet. But the honour belongs to Joseph Halliday, bandmaster of the Cavan militia, of being the first to conceive, in 1810, the disposition of a certain number of keys along the tube, setting out from its lower extremity, with the idea of producing by their successive or simultaneous opening a chromatic scale throughout the extent of the instrument. Later, in 1817, Jean Hilaire Asté, known as Halary, a professor of music and musical instrument maker of Paris, extended the same principle with complete success to other instruments of the same family.

OPHIR, an unidentified region famous in Old Testament times for its fine gold. Solomon's Tyrian sailors brought its gold for that monarch. The geographical list of Genesis X. associates it with Sheba and Havilah, the latter also being a recognized gold bearing region (Gen. ii. 11). Solomon's ships set forth from Ezion-Geber at the head of the Gulf of Akaba. Presumably then it lay somewhat to the south of Suez, but where?

(1) *East Africa*.—The extensive and imposing ruins discovered at Zimbabwe in Mashonaland, about 200m. inland from Sofala, have been acclaimed as marking the site of long lost Ophir. But careful investigation has resulted in depriving the ruins of any claim to great antiquity. An identification with Zanzibar has been suggested.

(2) *The Far East*.—The fact that three years were occupied in the voyage to Ophir (1 Ki. x. 22) as well as the nature of the cargoes (gold, silver, ivory, apes and peacocks) suggests a distant voyage, although attempts have been made to minimize these arguments. The Indus delta; Johore; Supara in Goa; Farther India; Malabar; Malacca; Sumatra have all been adduced.

(3) *Abyssinia*.—The territory on the Abyssinian coast from ancient Adulis to Bab-el-Mandeb whose inhabitants call themselves Aphaar.

(4) *Arabia*.—The most common and, indeed, the most plausible view is that Ophir was somewhere in Arabia. It has been sought in West Arabia at Asyr between the Hejāz and Yemen; but the view that it is some district on the southern coast appears the most attractive.

The lack of sufficient data for identification has given and no doubt will continue to give scope for imagination. There have not been wanting wild and fanciful surmisings. Spain, Armenia, Phrygia and even Peru have had their advocates. (E. Ro.)

OPHITES. Strictly speaking, this is the name given to an obscure sect of Gnostics, of which our knowledge is derived mainly from Origen (*Contra Celsum*, vi. 25) supplemented by Irenaeus (*Adv. Haer.*, i. 30) and Epiphanius (*Haer.*, xxxviii); but the more important use of the term is as the comprehensive name for a group of Gnostic sects which resemble one another, first, because no name of any personal founder or leading teacher is associated with any of them; and further, because they attach religious importance to the serpent. The type of mythology may be illustrated from the account of Irenaeus. It begins with a triad, the highest deity, described as "primal Man"; intellect or reason, his Son, the "second Man"; and the Spirit, introduced as a female principle. Through her the Christ is begotten as "third Man." Christ ascended, with the Spirit, but in their ascent a ray of light fell on the waters. This was Sophia (prudence or wisdom) and from this contact came Ialdabaoth the "demiurge." He in turn produced six powers, and (from the dregs of matter) the serpent. Ialdabaoth then announced himself as the supreme Being; and when man (created by the six powers) gave thanks not to Ialdabaoth but to the primal Man, the former created a woman (Eve) to destroy him. Then Sophia sent the serpent (as benefactor) to persuade Adam and Eve to eat of the tree of knowledge and so break the commandment of Ialdabaoth, who banished them from paradise to earth. After a long war between mankind, aided by Sophia, and Ialdabaoth (this is the inner meaning of the Old Testament story), the Spirit sent the Christ to earth to enter the pure vessel, the virgin-born Jesus. Jesus Christ worked miracles and declared himself the Son of the primal Man. Ialdabaoth instigated the Jews to kill him, but only Jesus died on the cross, for Christ had departed from him. Christ then raised the spiritual body of Jesus, which remained on earth for 18 months, initiating a small circle of elect disciples.

This form of Ophitism is Christianized to a larger extent than others of the kindred sects, in most of which the Christian element is slighter and less essential. They are also far less impregnated with Greek philosophy than the "classic systems of Gnosticism"; and the early sources warrant the inference that the mythology itself is only a covering for observances (ritual, initiation, secret pass-words, incantations) characteristic of mystery-religions.

Notwithstanding the conclusion based by De Faye on his instructive investigations, the prevalent view holds the field, namely,

that Ophitism represents a primitive phase of Gnosticism, which was gradually developed and transformed into various great speculative systems by a series of historic teachers.

See E. F. Scott, art. "Ophitism" in Hastings, *Encyclopaedia of Religion and Ethics*; Lichtenhahn, art. "Ophiten" in Herzog-Hauck, *Realencyclopädie*; E. de Faye, *Gnostiques et Gnosticisme* (1913); Reitzenstein, *Peimandres* (1904). See also art. GNOSTICISM. (S. H. M.)

OPHIUCHUS, in astronomy, a constellation of the northern hemisphere, anciently named Aesculapius, and mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.). According to the Greek fables, it variously represents: Carnabon (or Charnabon), king of the Getae, killing one of the dragons of Triptolemus, or Heracles killing the serpent at the river Sangarius (or Sagaris), or the physician Asclepius (Aesculapius), to denote his skill in curing snake bites. Like Sagittarius (which it adjoins) it includes a region of the sky rich in globular clusters and diffuse nebulae.

OPHIUROIDEA, a class of the Echinoderma (*q.v.*), comprising the brittle stars (*q.v.*). It is sometimes united with the Asteroidea as the class Stelleroidea.

OPHRYS, a genus of plants of the orchid family (*Orchidaceae*), comprising about 30 species native to Europe, western Asia and North Africa, including the bee-orchis (*O. apifera*), the spider-orchis (*O. aranifera*) and the fly-orchis (*O. muscifera*), the second of which is one of the few orchids that are self-fertilized. (See ORCHIDS; also C. Darwin, *The Fertilisation of Orchids*.)

OPHTHALMOLOGY (see EYE, ANATOMY OF; EYE, DISEASES OF). The science of ophthalmology deals with the processes by means of which the images of external objects are brought to our consciousness. It is therefore concerned with:

(a) the eye itself; (b) the nerve paths and tracts which convey visual impulses originating in the eye, through the different parts of the brain to the brain cortex, where these impulses are converted into conscious impressions; (c) the eyelids which cover and protect the eyes; (d) the tear glands and ducts; (e) the muscles that bring about the movements of the eyes and keep them trained in the desired direction; (f) the nerves and their complicated cerebral connections which supply these muscles; (g) the bony walls of the orbit; (h) the blood-vessels and lymph paths which maintain the nutrition of all these structures.

It treats of disease in these parts and derives importance from the fact that many diseases of the central nervous system and many general diseases manifest themselves by some derangement of function or structure which can be detected by the ophthalmic surgeon.

The eye is unique in the body in that its retina, which is available to minute examination by means of the ophthalmoscope, is the only portion of the brain available to inspection during life. Similarly, the arteries and veins which supply the retina can also be minutely examined during life, the diseases of them observed and followed in all their changes. The value of these observations is enhanced by the fact that the eye itself acts as a low-power microscope, providing a magnification of about 15 diameters for the examination of these structures. The eyes are the subject of a number of hereditary diseases, and form one of the most convenient media for the study of transmission of such diseases.

Affections of the Eye.—The function of the eyeball is to provide that a clear image of external objects shall be formed upon the retina, but in certain cases it departs from the normal and the acuity of sight is lowered. It may be too long, so that the retina lies behind the point at which the images of external objects are formed; this is myopia or short-sightedness, and may be compensated by the wearing of concave lenses in the form of spectacles. In other cases, the eyeball is too short and the retina lies in front of the point at which the image of external objects is formed. This is hypermetropia or long-sightedness; it can be compensated by the focusing muscle of the eye, making the lens more convex; or, preferably, by the wearing of appropriate convex lenses in the form of spectacles. In astigmatism the refractive power of the eye varies in different axes, so that, for instance, in an extreme case the verticle axis may be myopic whilst the horizontal axis is hypermetropic.

Normally the visual axes of the two eyes are parallel and images of external objects are formed upon corresponding points of each retina. This arrangement is largely responsible for stereoscopic vision, which enables us to judge the position of objects in space with accuracy. Should it be upset *e.g.* by paralysis of some of the muscles, stereoscopic vision is lost and double vision usually arises.

Eyeball and Camera Compared.—The eyeball may be likened to a photographic camera. Roughly speaking it is globular in shape and is an inch long in all dimensions. The front part, or cornea is curved, is perfectly transparent and functions as a lens. Behind it is a chamber filled by the aqueous humour—little more than water. Further back is the iris—the coloured part of the eye. The hole in its centre forms the pupil, and by contraction or dilation of the tissues of the iris the pupil can be varied in size through a wide range; it may be compared to the stop in the camera. In bright lights the pupil is small, and it becomes large in dull illumination. The iris rests behind upon the lens.

The lens is bi-convex, its back surface having the greater curvature. It is perfectly transparent, and the focusing of the eye for near or distant objects is brought about by alteration in its curvatures by contraction of the ciliary muscle. Here is an essential difference between the eye and the photographic camera, whose focus is adjusted by shifting the position of the lens. As age proceeds, opacities frequently develop in the lens; almost everyone at the age of 60 or over may be said to have the beginnings of cataract, though the sight is quite unaffected thereby. When, however, these opacities involve the centre of the lens, and render sight very imperfect, the term of cataract becomes applicable; in such a case the cataract can be removed by operation and the sight restored.

Vitreous Chamber and Retina.—Behind the lens is the vitreous chamber, which is occupied by a perfectly transparent, colourless substance, much like white of egg. Clothing the back of the eye, and extending forward some distance in front of its equator, is the retina. It rests upon a highly vascular membrane which is responsible for the nutrition of the greater part of it, namely the choroid; in man, however, the retina has its own blood vessels clearly visible with the ophthalmoscope. The retina may be likened to the sensitive plate of the camera for upon it images are formed which initiate impulses which, when conveyed to the cortex of the brain, give rise to the sensations of sight. Its sensitive layer is placed posteriorly, and is composed of delicate structures known as the rods and cones.

At the central spot or yellow spot of the retina, the point of distinct vision, cones alone are present. The rods are believed to be concerned with lights of lower intensities, and in accordance with this they alone are present in night-flying birds (*see COLOUR VISION*).

Optic Nerves and the Cerebral Cortex.—The nerve fibres from the retina converge upon the optic disk, and leave the eye as the optic nerve, which traverses the orbit to enter the skull. Inside the skull the two optic nerves meet and each is divided into two parts, one part continuing to the mid-brain on the same side, the other part crossing over to the opposite side. This crossing forms the chiasma; in many animals, the birds for instance, the whole of each optic nerve crosses over in this way. Beyond the chiasma the nerve fibres are again collected into a compact bundle known as the optic tract, which terminates in the mid-brain. From here nervous impulses are relayed in two chief directions; some connect up with the nerves which control the movements of the eyes and others, forming the so-called optic radiations, make a long sweep backwards to reach the cerebral cortex, where, as already stated, the impulses are transformed to sensations of sight.

The exact area of the cerebral cortex, in which these fibres end, is known with great accuracy and forms the visual cortex. It is placed at the extreme hind end of the brain, and the adjoining mesial surface of each hemisphere, in the region of the calcarine fissure (*see BRAIN*). Should a minute portion of this cortex be cut out as the result of injury or blocking of its blood supply, the precise area of the defect which will be found in the vision can be stated with certainty. This accurate localisation was much

advanced as a result of observations made during the War.

General Diseases and the Eye.—Amongst the general diseases of the body in which important manifestations occur in connection with the eye a few may be mentioned.

In brain tumours or abscesses, swelling of the optic disk is seldom absent, and forms perhaps the most important sign in the diagnosis of the condition. In addition the ocular nerves may have their functions interrupted, so that the movements of the eyes are interfered with, they no longer move in unison and double vision occurs. If nothing can be done for the brain tumour the optic nerve atrophies and blindness ensues. In advanced renal disease changes in the retina develop and convey a particularly grave prognosis, for patients seldom live so long as two years after their discovery. In diabetes a similar change may also arise, which may greatly spoil the sight, and although of less serious import than in renal cases, it must be considered a bad omen. Venereal disease frequently attacks the eye, whether in the early or late stages, and is perhaps the most prolific source of blindness. Tuberculous disease occasionally occurs. In diseases of the blood in general, eye signs are very common, and there are many other diseases where the diagnosis may be greatly assisted by the discovery of changes in some part of the ocular apparatus. The introduction of the "slit lamp" has made many investigations possible which previously were quite outside our scope.

OPIE, AMELIA (1769–1853), English author, daughter of James Alderson, a physician in Norwich, where she was born on Nov. 12, 1769. Miss Alderson had inherited radical principles and was an ardent admirer of Horne Tooke. She was intimate with the Kembles and with Mrs. Siddons, with Godwin and Mary Wollstonecraft. In 1798 she married John Opie, the painter. In 1801 she produced a novel entitled *Father and Daughter*, which showed genuine fancy and pathos. She published a volume of graceful verse in 1802; *Adeline Moubray* followed in 1804, *Simple Tales* in 1806, *Temper* in 1812, *Tales of Real Life* in 1813, *Valentine's Eve* in 1816, *Tales of the Heart* in 1818, and *Madeline* in 1822. In 1825 she joined the Society of Friends. She died at Norwich on Dec. 2, 1853.

A Life, by Miss C. L. Brightwell, was published in 1854.

OPIE, JOHN (1761–1807), English historical and portrait painter, was born at St. Agnes near Truro in May 1761. While quite young he won some local reputation by portrait-painting; and in 1780 he started for London, under the patronage of Dr. Wolcot (Peter Pindar), and was introduced to the town as "The Cornish Wonder," a self-taught genius. He became a fashionable portrait painter, but after a period of prosperity fell into neglect. He then set himself to make good the defects of his early education by studying Latin, French and the English classics as well as the technique of his art.

In 1786 he exhibited his first important historical subject, the "Assassination of James I.," and in the following year the "Murder of Rizzio," which secured his immediate election as associate of the Academy, of which he became a full member in 1788. He was employed on five subjects for Boydell's "Shakespeare Gallery"; and until his death on April 9, 1807, his practice alternated between portraiture and historical work. His painting shows breadth of handling and a certain rude vigour, individuality and freshness, but lacks grace and poetic feeling.

Opie's portraits of Mary Wollstonecraft, of himself, and the "Portrait of a Boy" are in the national collections. He also wrote a *Life of Reynolds* in Wolcot's edition of Pilkington and a *Letter on the Cultivation of the Fine Arts in England*, in which he advocated the formation of a national gallery. His *Academy Lectures* were published in 1809 with a memoir by his widow (*see above*). *See also* Claude Phillips,

"John Opie" (*Gazette des Beaux-Arts*, 1892, i. 299).

OPISTHOCOMIDAE: see HOATZIN.

OPISTHODOMUS, in architecture, a small room at the rear of the cella (*q.v.*) or enclosed portion of a classic temple, usually opening only upon the rear portico; sometimes called epinaos. It was used frequently as a temple treasury.

OPITZ VON BOBERFELD, MARTIN (1597–1639), German poet, was born at Bunzlau, Silesia, on Dec. 23, 1597, and studied at Frankfurt-on-Oder, Heidelberg and Leyden. He led a wandering life in the service of various territorial nobles. In 1624 he was appointed councillor to duke George Rudolf of Liegnitz and Brieg in Silesia, and in 1625, as reward for a requiem poem composed on the death of archduke Charles of Austria, was crowned laureate by the emperor Ferdinand II. who a few years later ennobled him under the title "von Boberfeld." He was elected a member of the *Fruchtbringende Gesellschaft* in 1629, and in 1630 went to Paris, where he made the acquaintance of Hugo Grotius. He settled in 1635 at Danzig, where Ladislaus IV. of Poland made him his historiographer and secretary. Here he died of the plague on Aug. 20, 1639.

Opitz was the head of the so-called First Silesian School of poets. His *Buch von der deutschen Poeterey* (1624) put an end to the hybridism that had until then prevailed, and established rules for the "purity" of language, style, verse and rhyme. Opitz's own poems are mostly a formal and sober elaboration of carefully considered themes, and contain little beauty and less feeling. To this didactic and descriptive category belong his best poems.

Collected editions of Opitz's works appeared in 1625, 1629, 1637, 1641, 1690 and 1746. His *Ausgewählte Dichtungen* have been edited by J. Tittmann (1869) and by H. Oesterley (*Kürschner's Deutsche Nationalliteratur*, vol. xxvii. 1889). There are modern reprints of the *Buch von der deutschen Poeterey* by W. Braune (2nd ed., 1832), and, together with *Aristarchus*, by G. Witkowski (1888), and also of the *Teutsche Poemata*, of 1624, by G. Witkowski (1902). See H. Palm, *Beiträge zur Geschichte der deutschen Literatur des 16ten und 17ten Jahrhunderts* (1877); K. Borinski, *Die Poetik der Renaissance* (1886); R. Beckherrn, *Opitz, Ronsard und Heinsius* (1888). Bibliography by H. Oesterley in the *Zentralblatt für Bibliothekswesen* for 1885.

OPIUM. The drug known in commerce as opium is derived from the immature fruits of *Papaver somniferum* (fig. 1), family *Papaveraceae*, by slightly incising the fruits and collecting and drying the exuded milky juice.

There are several forms of the plant in cultivation for yielding opium. The truly wild plant (*var. setigerum*) is found on the northern coast of the Mediterranean. It has acutely toothed leaves, the lobes sharp-pointed, each ending in a bristle. The leaves, flower stalks and sepals are covered with scattered bristly hairs, and the stigmata are seven or eight in number.

The variety of the plant chiefly cultivated in Asia Minor and Egypt is distinguished by having a sub-globular fruit and 10 to 12 stigmata. It is glabrous and is known as *var. glabrum*.

The one cultivated in Persia is *var. album*, which has a fruit more or less egg-shaped; the pores below the stigmata do not open when the fruits are ripe. It varies in the colour and shape of the petals. Those (the majority) with white petals have usually white seeds, those with reddish or purple petals have usually slate-coloured seeds.

Cultivation.—The successful cultivation of the plant is only possible where there is not an excessive rainfall and where the climate is tropical or sub-tropical. The yield of opium is smaller in temperate than in tropical regions and the industry can only be profitably carried on where labour and land are sufficiently cheap and abundant.

FIG. 1.—OPIUM POPPY (*PAPAVER SOMNIFERUM*)

The mode of cultivation adopted varies. In Turkey, from which the chief supplies of medicinal opium are obtained, the cultivation is carried on by peasant proprietors. A naturally light and rich soil is chosen, improved by manure and irrigation where necessary, and the land should be sloping and well drained, moisture in excess being injurious. The ground is ploughed twice, the second time crosswise. The seed is mixed with four times its weight of sand to prevent it being sown too thickly, $\frac{1}{4}$ to 1 lb.

FIG. 2.—OPIUM POPPY CAPSULES, SHOWING (A) NUSHTUR, OR INSTRUMENT USED IN INDIA FOR MAKING THE INCISIONS, DRAWN FROM SPECIMENS IN THE MUSEUM OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN. (B) CAPSULE AS INCISED IN INDIA. (C) MODE OF INCISION PRACTISED IN TURKEY

being used to every toloom (1,600 sq.yd.). The crop is very uncertain owing to droughts, ground-frosts and locusts. To avoid failure, and to allow time for collecting the produce, every toloom has three sowings from October to March, the crops thus coming to perfection in succession. In localities where there is hoar frost in spring, the seed is sown in September, or at latest in the beginning of October. The yield of opium and seed is then greater than if sown later. After sowing, the land is harrowed and young plants are hoed and weeded, chiefly by women and children, from early spring until the time of flowering. In the plains the flowers expand at the end of May, and on the uplands in July. At this period gentle showers are of great value, as they cause an increase in the subsequent yield of opium. The petals fall in a few hours, and the capsules grow so rapidly that in a short time—generally from nine to 15 days—the opium is fit for collection. This period is known by the capsules yielding to pressure from the fingers, by assuming a lighter green tint, and by exhibiting a kind of bloom called "cougak," easily rubbed off with the fingers; they are then about $1\frac{1}{2}$ in. in diameter. The incisions are made by holding the capsule in the left hand and drawing a knife two-thirds round it, or spirally beyond the starting point (fig. 2), great care being taken not to let the incisions penetrate to the interior, lest the juice should flow inside and be lost; in this case also it is said that the seeds will not ripen, and that no oil can be obtained from them. The operation is usually performed after the heat of the day, commencing early in the afternoon and continuing to nightfall, the exuded juice being collected next morning. This is done by scraping the capsule with a knife, transferring the concreted juice to a poppy-leaf held in the left hand, the edges of the leaf being turned up to avoid spilling the juice; the knife-blade is moistened with saliva by drawing through the mouth after every alternate scraping to prevent the juice from adhering to it. When as much opium has been collected as the size of the leaf will allow, another leaf or more is wrapped over the top of the lump, which is then placed in the shade to dry for several days. The pieces vary in size from about 2 oz. to 2 lb., being made larger in some districts than in others. The capsules are generally incised only once, but the fields are visited a second or even a third time to collect the opium from the poppy-heads subsequently developed by the branching of the stem. The yield of opium varies, even on the

same piece of land, from one-third to $7\frac{1}{2}$ *chequis* (or 1.62 lb.) per *toloom*, the average being $1\frac{1}{2}$ *chequis* of opium and 4 bushels (50 lb.) of seed. The seed, which yields 35 to 42% of oil, is worth about two-thirds the value of the opium. The whole of the operation must, of course, be completed in the few days, usually from five to ten, during which the capsules are capable of yielding the drug.

Macedonian Opium.—Four varieties of poppy are cultivated—two with white flowers and large oval capsules without holes under their “combs” (stigmata), and bearing respectively yellowish and white seed, and the other two having red or purple flowers and seeds of a slate colour with a reddish layer under the surface, one bearing small capsules perforated just below the top and the other larger capsules not perforated. The white varieties are recommended as bearing more abundant opium of superior quality. The yellow seed is said to yield the best oil; that obtained by hot pressure is used for lamps and for paint and the cold-pressed oil for culinary purposes.

Indian Opium.—The poppy grown in India is usually the white-flowered variety, but in the Himalayas a red-flowered poppy with dark seeds is cultivated. The land intended for poppy culture is usually near villages, in order that it may be more easily manured and irrigated. On a rich soil a crop of maize or vegetables is grown during the rainy season, and after its removal in September the ground is prepared for poppies. Under less favourable circumstances the land is prepared from July till October by ploughing, weeding and manuring. The seed is sown between Nov. 1 and 15, and germinates in 10 or 15 days. The fields are divided for purposes of irrigation into beds about 10 ft. square, which usually are irrigated between November and February; but if the season be cold, with hardly any rain, the operation is repeated five or six times. When the seedlings are 2 or 3 in. high, they are thinned out and weeded. The plants during growth are liable to injury by severe frost, excessive rain, insects, fungi and the growth of a root-parasite (*Orobancha indica*). The poppy flowers about the middle of February, and the petals, when about to fall, are collected for the purpose of making “leaves” for the spherical coverings of the balls of provision opium, or cannon ball opium as it is popularly called.

Persian Opium.—The variety grown in Persia appears to be *var. album*, having roundish ovate capsules. Several forms of this variety are grown. The best quality of Persian opium is said to be derived from the white-flowered form, which is the earliest to flower and most widely grown; a second quality from a bizarre flower with deeply cut petals and a central band of bluish-purple flanked with rich magenta; a third quality from a white flower with broad margins and an apex of salmon pink and magenta; a fourth from a dark scarlet flower with a central band of bluish purple to within a fifth of the apex of the petals; a fifth from a dark bluish purple flower; a sixth from a lilac flower suffused with faint purple colour, which is considered to yield a very poor quality indeed. The more fully exposed the plants are to the sun the finer the crop.

European Opium.—Experiments made in England, France, Italy, Switzerland, Greece, Spain, Germany, and even in Sweden prove that opium as rich in morphia as that of Eastern countries can be produced in Europe. In 1830, Young, a surgeon at Edinburgh, succeeded in obtaining 56 lb. of opium from an acre of poppies, and sold it at 36s. a pound. In France, the cultivation has been carried on since 1844 at Clermont-Ferrand by Aubergier. The juice, of which a workman is able to collect about 9.64 troy oz. in a day, is evaporated by artificial heat immediately after collection. The juice yields about one-fourth of its weight of opium, and the percentage of morphia varies according to the variety of poppy used, the purple one giving the best results. By mixing assayed samples he is able to produce an opium containing uniformly 10% of morphia. It is made up in cakes of 50 grammes but is not produced in sufficient quantity to become an article of wholesale commerce. Some specimens of French opium have been found by Guibourt to yield 22.8% of morphia, being the highest percentage observed as yet in any opium. Experiments made in Germany by Karsten, Jobst, and Vulpius have shown

that it is possible to obtain in that country opium of excellent quality, containing 8 to 13% of morphia. It was found that the method yielding the best results was to make incisions in the poppy-heads soon after sunrise, to collect the juice with the finger immediately after incision, and evaporate it as speedily as possible, the colour of the opium being lighter and the percentage of morphia greater than when the juice was allowed to dry on the plant. Cutting through the poppy-heads caused the shrivelling up of the young fruit, but the heads which had been carefully incised yielded more seed than those which had not been cut at all. Newly manured soil was found to act prejudicially on the poppy. The giant variety of poppy yielded most morphia.

Medicine.—Of the opium alkaloids only morphine and codeine are used to any extent in medicine. Thebaine is not so used, but is an important and sometimes very dangerous constituent of the various opium preparations, which are still largely employed, despite the complexity and inconstant composition of the drug. Of the other alkaloids narceine is hypnotic, whilst thebaine, papaverine and narcotine have an action which resembles that of strychnine. So complex a drug as opium is necessarily incompatible with a large number of substances. Tannic acid, for instance, precipitates codeine as a tannate, salts of many of the heavy metals form precipitates of meconates and sulphates, whilst the various alkalis, alkaline carbonates and ammonia precipitate the important alkaloids.

The pharmacology of opium differs from that of morphine (*q.v.*) in a few particulars. The chief difference is due to the presence in opium of thebaine, which readily affects the more irritable spinal cord of very young children. In infants especially opium acts markedly upon the spinal cord, and, just as strychnine is dangerous when given to young children, so opium, because of the strychnine-like alkaloid it contains, should never be administered, under any circumstances or in any dose, to children under one year of age.

When given by the mouth, opium has a somewhat different action from that of morphine. It often relieves hunger, by arresting the secretion of gastric juice and the movements of the stomach and bowel, and it frequently upsets digestion from the same cause. Often it relieves vomiting, though in a few persons it may cause vomiting, but in far less degree than apomorphine, which is a powerful emetic. Opium has a more marked diaphoretic action than morphine, and is much less certain as a hypnotic and analgesic.

Toxicology. (See also DRUG ADDICTION and POISONS).—Under this heading must be considered acute poisoning by opium, and the chronic poisoning seen in those who eat or smoke the drug. Chronic opium poisoning by the taking of laudanum—as in the familiar case of De Quincey—need not be considered here, as the hypodermic injection of morphine has almost entirely supplanted it.

The acute poisoning presents symptoms not easily distinguished from those produced by alcohol, by cerebral haemorrhage and by several other morbid conditions. The differential diagnosis is of the highest importance, but very frequently time alone will furnish a sufficient criterion. The patient who has swallowed a toxic or lethal dose of laudanum, for instance, usually passes at once into the narcotic state, without any prior excitement. Intense drowsiness yields to sleep and coma which ends in death from failure of the respiration. This last is the cardinal fact in determining treatment. The comatose patient has a cold and clammy skin, livid lips and ear-tips—a grave sign—and “pin-point pupils.” The heart’s action is feeble, the pulse being small, irregular and

often abnormally slow. The action on the circulation is largely secondary, however, to the all-important action of opium on the respiratory centre in the medulla oblongata. The centre is directly poisoned by the circulation through it of opium-containing blood, and the patient's breathing becomes progressively slower, shallower and more irregular until finally it ceases altogether.

Treatment.—In treating acute opium poisoning the first proceeding is to empty the stomach. The best emetic is apomorphine, which may be injected subcutaneously in a dose of about one-tenth of a grain. But the gastric wall is often paralysed in opium poisoning, so that no emetic can act. It is therefore better to wash out the stomach, at half-hour intervals, with a solution containing about ten grains of salt to each ounce of water. If apomorphine is obtainable, both of these measures may be employed. Potassium permanganate decomposes morphine by oxidation, the action being facilitated by the addition of a small quantity of mineral acid to the solution. The physiological as well as the chemical antidotes must be employed. The chief of these are coffee or caffeine and atropine. A pint of hot strong coffee may be introduced into the rectum, and caffeine in large doses—ten or twenty grains of the carbonate—may be given by the mouth. A twentieth, even a tenth of a grain of atropine sulphate should be injected subcutaneously, the drug being a direct stimulant of the respiratory centre. Every means must be taken to keep the patient awake. He must be walked about, have smelling salts constantly applied to the nose, or be stimulated by the faradic battery. But the final resort in cases of opium poisoning is artificial respiration, which should be persevered with as long as the heart continues to beat.

OPIUM-EATING AND OPIUM-SMOKING. *Opium-eating.*—Opium, like many other poisons, produces after a time a less effect if frequently administered as a medicine, or as a stimulant. According to the experimental work of Faust, the toleration towards the use of large quantities of opium is due to the gradually increasing power of the tissues to destroy the drug. Opium-eating is chiefly practised in Asia Minor, Persia and India. Opinions differ widely as to the injurious effect of the habit; the weight of evidence appears, however, to indicate that it is much more deleterious than opium-smoking.

Vincent Richards has collected some statistics regarding Balasor in Orissa which throw some light on the influence of this practice on the health. He examined about 600 opium-eaters who took, on an average, 5 to 7 grains daily. The diseases for which it was chiefly taken were malarial fever, dysentery, diarrhoea, spitting of blood, rheumatism and elephantiasis. Richards concluded that its moderate use may be and is indulged in for years without producing any decided or appreciable ill effect, except weakening the reproductive powers. Dr. W. Dymock of Bombay, speaking of Western India, concurs in Richards' opinion regarding the moderate use of the drug. Dr. Moore's experience of Rajputana strongly supports the same view. Among the Rajputs infused opium has long been a drink both of reconciliation and of ordinary greeting.

Opium-smoking.—This is chiefly practised by the inhabitants of China and the islands of the Indian Archipelago, and in countries where Chinese are largely employed. Opium-smoking began in China in the 17th century. Foreign opium was first imported by the Portuguese (early 18th century). In 1906 it was estimated that about 27% of the adult males in China smoked opium.

For smoking, the Chinese use an extract of opium known as prepared opium or *chandoo*, containing about 8% of morphine, and a cheaper preparation known as dross opium extract, containing about 7% of morphine. This latter is used chiefly by the poorer classes.

Prepared opium is made by a lengthy process of digestion of opium in water, boiling, evaporating, beating, followed by a peculiar toasting process which is very important and is very carefully done. The opium at this stage resembles dark coloured ginger-nut crackers. There is more boiling of this in water, straining, evaporating, filtering and further evaporating until the prepared opium results as a black treacly substance, having the fragrant opium-like odour which is characteristic.

Opium-smoking is performed by the smoker lying on his side. Then he takes a thin metal dipper and puts the sharp end into the opium. Twisting it round and round, he brings a drop over the flame of a lamp until it is sufficiently roasted. There is further manipulation of the opium, and eventually a little piece of opium, about the size of a grain of hemp-seed, is left adhering to the bowl of the pipe immediately over the orifice. The smoker then holds the bowl over the lamp. The heat causes the opium to frizzle, and the smoker takes three or four long inhalations which are exhaled through both the mouth and the nose. Moissan has shown that the smoke of chandoo contained only a very small quantity of morphine. F. Dent and also H. Fraser and B. J. Eaton found that the smoke from 100 grams of chandoo yielded 0.100 gram of morphine in two independent experiments. Frank Browne examined the smoke of dross opium extract which is very largely smoked in the East. Dross opium extract is prepared by boiling together opium dross or residues from the smoking of chandoo and residues from the smoking of dross opium extract, with a small quantity of demorphinated opium, and filtering and evaporating to a proper consistence. His results are shown in the table with an analysis of tobacco smoke by Pontag. The results are expressed in percentages.

	Carbon monoxide	Morphine	Nicotine	Ammonia	Pyridine	Hydrocyanic acid
	c.c.	Gram	Gram	Gram	Gram	Gram
Dross opium extract	0	0.016	..	0.395	0.147	0.0103
Tobacco	4 to 5	..	1.16	0.36	0.15	0.004 to 0.010

The following shows the nature of the dross opium extract used—expressed in percentages on the extract:—

Water	8.61	Morphine	7.35
Ash	28.45	Insoluble in water	3.84

A smoker of this extract would use from five to six grams daily. He is considered to smoke in excess when he burns about double this quantity.

This dross opium extract is admitted by smokers to be stronger in effect than chandoo. This strength must be attributed to the pyridine bases, ammonia, hydrocyanic acid, and other substances rather than to the morphine, which is present in much less amount than in the smoke of chandoo.

So far as can be gathered from the conflicting statements published on the subject, opium-smoking may be regarded much in the same light as the use of alcoholic stimulants. To the great majority of smokers who use it moderately it appears to act as a stimulant, and to enable them to undergo great fatigue and to go for a considerable time with little or no food. According to the reports on the subject, when the smoker has plenty of active work it appears to be no more injurious than smoking tobacco. In a large dock company in the Far East where 5,000 labourers were employed, the managers were unable to pick out any opium-smokers who, by any difference in physique, capacity for work or in behaviour, were different from the non-smokers.

When carried to excess, opium-smoking becomes an inveterate habit; but this happens chiefly in individuals of weak will power who would just as easily become the victims of intoxicating drinks, and who are practically moral imbeciles, often addicted also to other forms of depravity. The effect in bad cases is to cause loss of appetite, a leaden pallor of the skin and a degree of leanness so excessive as to make its victims appear like living skeletons. All inclination for exertion gradually becomes lost, business is neglected, and certain ruin to the smoker follows. By its Charter or Covenant, the regulation of the traffic of opium was expressly delegated to the League of Nations, whose efforts in endeavouring to secure the strictly legitimate use of the drug may be seen in the pamphlet mentioned in the references below.

OPIUM TRAFFIC. The use of the poppy and the coca leaf goes back to time immemorial. However, its organized use for the purposes of commerce and revenue seems to have developed in the last 200 years, in spite of protests against its use for other than medical and scientific purposes.

In 1783 Warren Hastings pronounced opium to be "a pernicious article of luxury which ought not to be permitted but for the purpose of foreign commerce only!" A few years later the directors of the East India company wrote: "If it were possible to prevent the use of the drug altogether except strictly for the purpose of medicine we would gladly do it in compassion to mankind," and Lord Ashley in 1843 proposed a resolution in the British parliament to the effect that the continuance of the opium monopoly and opium trade "was utterly inconsistent with the honour and duty of a Christian kingdom." Yet to-day there are still countries whose colonies obtain large revenues from such monopolies.

The importation of opium into China by foreign traders led to the war of 1840 between Great Britain and China. The Chinese, in spite of the fact that they were not the victors and despite any pressure brought to bear upon them, still refused to legalize the opium trade. China was now open to the world and a huge smuggling trade in opium sprang up which has given rise to endless difficulties ever since, both to the Chinese and to the British Governments.

The second war broke out between China and Great Britain, with France as her ally, 15 years later, and, after its close, not only was the cultivation of opium in China itself permitted, but the import of opium from India was also legalized. Yet the Chinese Government still continued to regard the use of opium as an important moral and economic question, and, in the year 1906, she decided to put an end to the use of the drug within ten years. For this reason, in the following year, she entered into what is known as the "Ten Years' Agreement with India," by which China should cease the cultivation of the poppy and forbid the consumption of opium on the understanding that the export of Indian opium to China should be reduced *pari passu* and cease altogether in ten years. At first this undertaking was carried out faithfully by both parties concerned, and according to a statement made by Sir John Jordan at one of the meetings of the opium advisory committee, China in 1917 had almost freed herself from the curse of the poppy. Political troubles, however, broke out, effective government in China was suspended, and to-day the production of opium in China is not only a great national but an international problem.

International Action.—It was first realized in 1906 that if the Chinese Government were able to suppress the opium evil, she must be assisted by other nations. In 1909 President Roosevelt proposed that an international investigation should be made. As a result, an international opium commission met that year at Shanghai, at which 13 Powers were represented. The recommendations made at this meeting formed the basis of the first Opium Convention, which was drawn up at The Hague in 1912. The articles of this convention may be summarized as follows:—

1. The distribution of raw opium to be controlled and the use of prepared opium to be gradually suppressed.

2. The export of raw opium to countries prohibiting its entry to be stopped and its export to countries restricting its import to be controlled.

3. The export and import of prepared opium to be prohibited

except to those countries not yet ready to suppress its use.

4. The use of alkaloids of opium and its derivatives to be confined to medical and legitimate purposes; a Government licence to be obtained by all persons engaged in the manufacture, sale, distribution, import and export of the drugs.

5. The last chapter of the convention consisted of clauses dealing with assistance to China and with certain obligations undertaken by China herself.

6. Before the convention came into effect the adherence of the 34 non-signatory Powers in Europe and America was required.

International opium conferences were held at The Hague in July 1913 and June 1914, at which a number of Powers ratified the convention. During the World War all action in this connection was suspended until the Paris Peace Conference in 1919. In the peace treaties of 1919–20 the signatory Powers agreed that the ratification of these treaties should constitute a ratification of the convention of 1912 and the protocol adopted by the third Opium Conference of 1914 (according to which the convention should come into effect upon its ratification regardless of the non-signatory Powers).

The Advisory Committee and the League of Nations.—Under the Covenant (Article 23 c), the duty of supervising the execution of agreements with regard to the traffic in opium and other dangerous drugs devolved upon the League of Nations. In order to carry out this obligation, the first Assembly of the League constituted an advisory committee on opium and other dangerous drugs.

The committee, which sits once a year except in special circumstances, has obtained certain important and definite results, such as additional ratifications to The Hague Convention (56 States have now ratified, 50 of these States being members of the League) and the adoption by a very large number of countries of an important certificate system. Under this system no Government may allow the export from its territories of any dangerous drugs covered by The Hague Convention, except on the production by the exporter of a licence from the importing country, certifying that the drugs in question are required for legitimate purposes.

The Import Certificate.—The Council, on the recommendation of the advisory committee, invited the Governments and members of the League to prepare an estimate of total annual requirements for the inhabitants of their territories for medical, scientific and other uses, with a view to proposing at some future date to the States concerned a new distribution of production which would limit the total output of raw material to the amount required for legitimate medical and scientific purposes. Subsequently two conferences met during the latter part of 1924 and the early months of 1925.

The 1924 conference did not find it possible to recommend the immediate complete suppression of the use of prepared opium, but drew up an agreement which embodied the substitution of government monopoly for other systems in force. No general agreement could be reached regarding any provisions for registering or rationing addicts, nor was it found possible to embody in the agreement provisions for uniform prices or uniform penalties for the infraction of law, or to limit imports. It was held by the majority of members of the conference that no rationing could be enforced or total suppression imposed so long as a large illicit supply of opium remained uncontrolled. To this the representative of China objected, protesting against the refusal of the majority to take immediate steps to suppress opium-smoking until producing countries should find it possible to control smuggling. The conference, in a protocol to the agreement, decided to take any necessary measures not already taken for the entire suppression within a period of 15 years of the consumption of prepared opium in the territories under their authority, this period to begin so soon as the effective execution of the measures required to prevent illicit exportation of raw opium from their territories had been undertaken by the poppy-growing countries. Provision under the agreement is made for a League commission to decide when these measures have been effectively executed. The agreements reached took the form of an agreement, a protocol and a final act. Instruments of ratification have been deposited by all States

represented at the conference, other than China and Japan. The agreement is therefore now in force.

The Convention of 1925.—The result of the deliberations and discussions of the conference of 1925 was a convention providing for the more effective restriction of the production and manufacture of narcotics, and establishing stricter control and supervision of the international trade. It is not, however, in force as of the ten signatures required to bring the convention into effect seven must be deposited by members of the council, whereas on Jan. 1, 1928 only four members had ratified their signatures.

Among the suggestions made in the convention was the creation of a central board, whose task it would be to follow the course of international trade and the general acceptance of the export and import certificate system. The conference also drew up a protocol by which the signatory States, recognizing their obligations to establish such control over the production, distribution and exportation of raw opium as would put a stop to illicit traffic, agreed to take within five years of the date of the coming into force of the protocol such measures as might be required to prevent the smuggling of opium seriously interfering with the effective suppression of the use of prepared opium in those territories where such use is temporarily authorized. A final act, containing further recommendations, was drawn up. Among these special mention may be made of a request to the council to consider the possibility of sending a commission to various opium-producing countries to study the difficulties connected with the limitation of the production of opium, and to advise as to what measures should be taken to make it possible to limit the production of opium in those countries to the quantities required for medical and scientific purposes.

The result of this final act is shown in the League of Nations commission of enquiry sent to Persia to report on the possible substitution of crops for the existing opium crops. This commission, which consisted of one American, one Italian, and one French expert, presented its report to the Council of the League of Nations at its meeting in March 1927.

As a result of this report the representative of Persia made the following proposals on behalf of his Government. The programme which he undertook to submit to the Majlis, with recommendation for its enactment into law, is as follows:—

1. The approval of the recommendation of reduction in area under poppy cultivation of 10% per annum after three years on the plan proposed by the commission of enquiry. The annual reduction to continue for three years, after which time the Persian Government will reconsider its position, taking into account the effect the reduction has had on the welfare of the cultivator, the trade balance, the budget and the general economic condition of the country, and what action has been taken by other producing and manufacturing countries to curtail the production of the raw material and the manufacture and distribution of habit-forming drugs.
2. Acceptance of the opium export certificate system with an annual reduction beginning not later than the third year after the present, of 10% of the quantity annually permitted to leave the country without production of import certificates (subject to reservations indicated elsewhere).

3. The exemption of land taxes for a period of five years in the case of areas diverted from the cultivation of the poppy to that of substitute crops.

4. Preference in the granting of agricultural loans to be given by the State bank of Persia, when established, to cultivators who divert part or all of their land under opium cultivation to that of substitute crops.

Since the conference of 1925 discussed the possibility of limitation of the growth of the poppy and its export, India has also undertaken to reduce her export of opium 10% a year until all export ceases. Thus a material advancement has been made in two out of the four great countries of production.

With regard to the stricter control of manufactured drugs, two interesting schemes are, at the present time, receiving detailed examination by the opium advisory committee. One, submitted by the American assessor on the committee, proposes the nationalization of all factories manufacturing narcotic drugs; the other is a proposal made by the German member of the committee for the internationalization of manufacture by the formation of an international trust which should acquire a controlling interest in all the factories involved and with which the League of Nations itself should be closely associated.

A small expert body of the main committee was appointed to study the methods of drug control as enforced in the chief manufacturing countries, including the consideration of an interesting memorandum put forward by M. Cavazzoni, the Italian member of the committee on how such control might best be effected.

Whyte, *China and Foreign Powers* (1926). (R. E. C.)

OPON, a municipality (with administration centre and 29 barrios or districts), on the small island of Mactan (area about 45 sq.m.), province of Cebu, Philippine Islands. The island of Mactan, where Magellan was slain by the natives in March 1521, is separated from Cebu by a channel only about one mile wide. Pop. (1918), 20,988, of whom 42 were whites. Opon is a shipping and commercial suburb of the municipality of Cebu, the harbour of which is sheltered by Mactan island. It has large groves of coco-nut trees; other industries are the cultivation of corn and maguey, and fishing. In 1918, it had 202 household industry establishments with output valued at 49,300 pesos. Of the nine schools, eight were public. The language is Cebu-Bisayan. A monument to Magellan was erected during the Spanish régime.

OPOPONAX. A gum-resin obtained from the root of *Pastinaca opoponax*, formerly used as an anti-spasmodic medicine. The perfume known as opoponax is distilled from a *commiphora*.

OPORTO, the second city of Portugal, about 3 m. from the mouth of the Douro, in 41° 8' N. and 8° 37' W. Pop. (1920) 203,091. The part of the city south of the Douro is known as Villa Nova de Gaia. Oporto is the see of a bishop. It is the true capital of northern Portugal, and the commercial and political rival of Lisbon, in much the same way as Barcelona (*q.v.*) is the rival of Madrid. Three main railway lines meet here—from Lisbon, from Valença do Minho on the northern frontier, and from Barca d'Alva on the north-western frontier. Oporto is built chiefly on the north or right bank of the Douro; its principal suburbs are Bomfim on the east, Monte Pedral and Paranhos on the north, Villar Bicalho, Lordello and São João da Foz on the west, Ramalde, Vilarinha, Matosinhos, Leça da Palmeira and the port of Leixões on the north-west. The mouth of the river is obstructed by a sandy spit of land which has been enlarged by the deposits of silt constantly washed down by the swift current; on the north side of this bar is a narrow channel varying in depth from 16 ft. to 19 ft. A fort in São João da Foz protects the entrance, and there is a lighthouse on a rock outside the bar. As large vessels cannot enter the river, a harbour has been made at Leixões (*q.v.*).

The approach to Oporto up the winding and fjord-like estuary is one of singular beauty. On the north the streets rise in terraces up the steep bank, built in many cases of granite overlaid with plaster, so that white is the prevailing colour of the city; on the south are the hamlets of Gaia and Furada, and the red-tiled wine lodges of Villa Nova de Gaia, in which vast quantities of port are manufactured and stored. The architecture of the houses and public buildings is often rather Oriental than European in appearance. Palms, oranges and aloes grow side by side with the flowers and fruits of northern Europe, for the climate is mild and very equable, the mean temperatures for January and July—the coldest and the hottest months—being respectively about 50° and 70°. The design of some of the native river craft is peculiar—among them may be mentioned the *caicos*, high-prowed canoe-like fishing boats, the *rascas* with their three lateen sails, and the *barcos rabello*, flat-bottomed barges with huge rudders, used for the conveyance of wine down stream. Two remarkable iron bridges, the Maria Pia and the Dom Luiz I., span the river. The first was built by Messrs. Eiffel and Company of Paris in 1876–77; it rests on a granite substructure and carries the Lisbon railway line across the Douro ravine at a height of 200 ft. The second was constructed in 1881–85 by a Belgian firm; its arch, one of the largest in Europe, has a span of 560 ft. The Douro is liable in winter to sudden and violent floods; in 1909–10 the water rose 40 ft. at Oporto, where it is confined in a deep and narrow bed.

The older quarters in the east are extremely picturesque, with their steep and narrow lanes overshadowed by lofty balconied houses. Overcrowding and dirt are common, for the density of population is nearly 13,000 per sq.m., or greater than in any other city of Portugal. The completion of the tramway system was long delayed. Ox-carts are used for the conveyance of heavy goods, and until late in the 19th century sedan-chairs were still occasionally used. As a rule the natives of Oporto are strong and of fine physique; they also show fewer signs of negro descent than the people of Lisbon. Their numbers tend to increase very rapidly; in 1864 the population of Oporto was 86,751, but in 1878 it rose to 105,838 and nearly doubled in the next half century. Many of the men emigrate to South America, where their industry usually enables them to prosper, and to return with considerable savings.

The cathedral, which stands at the highest point of eastern Oporto, on the site of the Visigothic citadel, was originally a Romanesque building of the 12th century; its cloisters are Gothic of the 14th century, but the greater part of the fabric was modernized in the 17th and 18th centuries. The interior of the cloisters is adorned with blue and white tiles, painted to represent scenes from the Song of Solomon. The Romanesque and early Gothic church of São Martinho de Cedó Feita is the most interesting ecclesiastical building in Oporto, especially noteworthy being the curiously carved capitals of its pillars. Though the present structure is not older, except in details, than the 12th century, the church is said to have been "hastily built" (*cedo feita, cito facta*) by Theodomir, king of the Visigoths, in 559, to receive the relics of St. Martin of Tours, which were then on their way hither from France. The Torre dos Clerigos is a granite tower 246 ft. high, built in the middle of the 18th century at the expense of the local clergy (*clerigos*); it stands on a hill and forms a conspicuous landmark for sailors. Nossa Senhora da Lapa is a fine 18th-century church, Corinthian in style; São Francisco is a Gothic basilica dating from 1410; Nossa Senhora da Serra do Pilar is a secularized Augustinian convent used as artillery barracks, and marks the spot at which Wellington forced the passage of the Douro in 1809. The exchange (*lonja*) is another secularized convent, decorated with coloured marbles. Parts of the interior are floored and panelled with polished native-coloured woods from Brazil, which are inlaid in elaborate patterns; there is a very handsome staircase, and the fittings of one large room are an excellent modern copy of Moorish ornamentation.

Other noteworthy public buildings are the museum, library, opera-house, bull-ring, hospital and quarantine station. The crystal palace is a large glass and iron structure built for the industrial exhibition of 1865. The English factory, built in 1790, has been converted into a club for the British residents—a large and important community whose members are chiefly connected with the wine and shipping trades. The English club gave its name to the Rua Nova dos Ingleses, one of the busiest streets, which contains many banks, warehouses and steamship offices. The Rua da Alfândega, skirting the right bank of the Douro and passing the custom house (*alfândega*), is of similar character; here may be seen characteristic types of the fishermen and peasants of northern Portugal. The Rua das Flores contains, on its eastern side, the shops of the cloth-dealers; on the west are the jewellers' shops, with a remarkable display of gold and silver filigree-work and enamelled gold. These ornaments are often very artistic, and are largely worn on holidays by women of the poorer classes.

Oporto is chiefly famous for the export of the wine which bears its name. An act passed on Jan. 29, 1906 defined "port" as a wine grown in the Douro district, exported from Oporto, and containing more than 16.5% of alcoholic strength. The vines from which it is made grow in the Paiz do Vinho, a hilly region about 60 m. up the river, and having an area of 27 m. in length by 5 or 6 in breadth. The trade was established in 1673, but the shipments for some years did not exceed 600 pipes (of 115 gallons each). In 1703 the British government concluded the Methuen treaty with Portugal, under which Portuguese wines were admitted on easier terms than French or German, and henceforward "port" began to be drunk (see PORTUGAL: History). In 1747 the export reached 17,000 pipes. In 1754 the great wine monopoly company of

Oporto originated, under which the shipments rose to 33,000 pipes. At the beginning of the 19th century the policy of the government more and more favoured port wine, besides which the vintages from 1802 to 1815 were splendid both in Portugal and in Madeira—that of 1815 has, in fact, never been excelled. For the next few years the grape crop was not at all good, but the 1820 vintage was the most remarkable of any. It was singularly sweet and black, besides being equal in quality to that of 1815. In 1852 the *Oidium* which spread over Europe destroyed many of the Portuguese vineyards. In 1865 *Phylloxera* did much damage, and in 1867 the second monopoly company was abolished. From this time the exports again increased. (See WINE.)

A third of the population is engaged in the manufacture of cottons, woollens, leather, silk, gloves, hats, pottery, corks, tobacco, spirits, beer, aerated waters, preserved foods, soap or jewellery. The fisheries—chiefly of hake, bream and sardines—are extensive. Many tourists land at Oporto and visit Braga (*q.v.*), Bussaco (*q.v.*) and other places of interest, on their way to Lisbon. There is also a large tourist traffic from Germany.

The history of Oporto dates from an early period. Before the Roman invasion, under the name of Portus Cale, it was a town on the south bank of the Douro with a good trade; the Alani subsequently founded a city on the north bank, calling it *Castrum Novum*. About A.D. 540 the Visigoths under Leovigild obtained possession, but yielded place in 716 to the Moors. The Christians, however, recaptured Oporto in 997, and it became the capital of the counts of *Portucalia* for part of the period during which the Moors ruled in the southern provinces of Portugal. (See PORTUGAL: History.) The Moors once more became its masters for a short period, till in 1092 it was brought finally under Christian domination. The citizens rebelled in 1628 against an unpopular tax, in 1661 for a similar reason, in 1757 against the wine monopoly, and in 1808 against the French. The town is renowned in British military annals from the duke of Wellington's passage of the Douro, by which he surprised and put to flight the French army under Marshal Soult, capturing the city on the 12th of May 1809. Oporto sustained a severe siege in 1832–33, being bravely defended against the Miguelites by Dom Pedro with 7,000 soldiers;

16,000 of its inhabitants perished. In the constitutional crises of 1820, 1826, 1836, 1842, 1846–47, 1891 and 1908–10 the action of Oporto, as the capital of northern Portugal, was always of the utmost importance. In 1919 the monarchy was proclaimed at Oporto and lasted for three weeks. In Feb. 1927, having been chosen by disaffected regiments, in touch with political and communist elements, as the scene of their rising, it was bombarded during three days by Government troops and suffered heavily.

OPOSSUM (*DIDELPHYS VIRGINIANA*), HANGING FROM A TREE WITH YOUNG

OPOSSUM, the name of several American marsupials, also applied in Australia to the phalangiers (*q.v.*). True opossums are found almost throughout America (see MARSUPIALIA). They form the family *Didelphyidae*, distinguished by the opposable first hind-toe and by the dentition. They are small, nocturnal animals, with long noses, ears and tails, the latter being usually naked and prehensile. The opposable first hind-toe is clawless and the tip is expanded into a flat pad. The other digits all bear claws. Mainly arboreal, they feed on birds, insects and fruit. The best known species of the type-genus is *Didelphys virginiana*, which is very common in the United States. It is nearly the size of a cat, grey in colour, the fur being woolly. When caught, it feigns death (hence the expression "playing possum"). The ova of opossums have a thin horny shell, and many more are produced

than can survive. The female produces 6 to 16 young, after a period of gestation of 14 to 17 days. There is no pouch, and the offspring, first clinging to the nipples by their mouths, later hold on to the tail of the mother by their own prehensile tails. In another wide-ranging North American species, *D. marsupialia*, a pouch is present. The young reach this by their own unaided efforts, though born naked, blind and fingerless.

The water-opossum (*Chironectes minimus*) has webbed feet (see WATER-OPOSSUM). Numerous other species inhabit various parts of America, being especially numerous in the tropical parts.

OPOSSUM-RAT (*Coenolestes*), a small South American marsupial of great morphological interest, since it is held by some authorities to belong to the polyprotodont division of that class. As the polyprotodonts are otherwise entirely Australian, the presence of a member in South America caused much discussion. Most zoologists now hold, however, that *Coenolestes* is a peculiarly modified diprotodont. (See also MARSUPIALIA, ZOOLOGICAL DISTRIBUTION.)

See O. Thomas, *Proc. Zool. Soc. Lond.* (1895).

OPPELN, a town in the Prussian province of Silesia, on the right bank of the Oder, 51 m. S.E. of Breslau, on the railway to Kattowitz, and at the junction of lines to Ratibor. Neisse and Tarnowitz. Pop. (1925) 41,458. Oppeln was a flourishing place at the beginning of the 11th century, and became a town in 1228. It was the capital of the duchy of Oppeln and the residence of the duke from 1163 to 1532, when the ruling family became extinct. Then it passed to Austria, and with the rest of Silesia was ceded to Prussia in 1742. In the partition of Upper Silesia between Germany and Poland in 1921 (see SILESIA) Oppeln was retained by Germany. It is the seat of the provincial administration of Upper Silesia, and contains the oldest Christian church in the district, that of St. Adalbert, founded at the close of the 10th century. It has a 15th-century palace on an island in the Oder. The industries of Oppeln include the manufacture of Portland cement, beer, soap, cigars, chemicals, clogs and lime; trade is carried on by rail and river in cattle, grain and the vast mineral output of the district, of which Oppeln is the chief centre. The upper classes speak German, the lower Polish.

OPPENHEIM, a town of Germany, in the republic of Hesse, on the left bank of the Rhine, 20 m. S. of Mainz, on the railway to Worms. Pop. (1925) 3,928. Oppenheim, which occupies the site of the Roman Bauconica, appears in 1226 as a free town of the Empire. It lost its independence in 1375, when it was given in pledge to the elector palatine of the Rhine. The Evangelical church of St. Catherine, a beautiful Gothic edifice of the 13th and 14th centuries, has been recently restored. Industries and commerce are principally concerned with wine.

OPPERT, JULIUS (1825-1905), German Assyriologist, was born at Hamburg, of Jewish parents, on July 9, 1825. He studied at Heidelberg, Bonn and Kiel and afterwards taught German in France. His leisure was given to oriental studies, and in 1852 he joined Fresnel's archaeological expedition to Mesopotamia. He published the results in his *Déchiffrement des inscriptions cunéiformes* (1861). He held posts as professor of Sanskrit in the language school of the National library in Paris (1857), and professor of Assyrian philology and archaeology at the Collège de France (1869). He died in Paris on Aug. 21, 1905. Oppert's chief study was Assyrian and cognate subjects. His works include: *Hist. des empires de Chaldée et d'Assyrie* (1865); *Le peuple et la langue des Mèdes* (1879), and a Sanskrit grammar.

OPPIAN (Gr. Ὀππιανός), the name of the authors of two (or three) didactic poems in Greek hexameters, formerly identified, but now generally regarded as two different persons. (1) Oppian of Corycus (or Anabazus) in Cilicia, who flourished in the reign of Marcus Aurelius (emperor A.D. 161-180). According to an anonymous biographer, his father was banished to Malta by Verus. Oppian, who had accompanied his father into exile, returned after the death of Verus (169) and went on a visit to Rome. Here he presented his poems to Aurelius and regained the imperial favour for his family. Oppian subsequently returned to his native country, but died of the plague at the age of 30. His poem on fishing (*Halieutica*), of about 3,500 lines,

dedicated to Aurelius and his son Commodus, is still extant. (2) Oppian of Apamea (or Pella) in Syria. His extant poem on hunting (*Cynegetica*) is dedicated to the emperor Caracalla, so that it must have been written after 211. It consists of about 2,150 lines, and is divided into four books, the last of which seems incomplete. It is inferior to the *Halieutica*.

A third poem on bird-catching (*Ixeutica*, from ἰξός, bird-lime), also formerly attributed to an Oppian, is lost; a paraphrase in Greek prose by a certain Eutecnus is extant.

The chief modern editions are J. G. Schneider (1776); F. S. Lehrs (1846); U. C. Bussemaker (Scholia, 1849); (*Cynegetica*) P. Boudreaux (1908). The anonymous biography referred to above will be found in A. Westermann's *Biographi Graeci* (1845). On the subject generally see A. Martin, *Études sur la vie et les œuvres d'Oppien de Cilicie* (1863); A. Ausfeld, *De Oppiano et scriptis sub eius nomine traditis* (1876). There are translations of the *Halieutica*, in English by Diaper and Jones (1722), and in French by E. J. Bourquin (1877).

OPPIUS, GAIUS, an intimate friend of Julius Caesar. He managed the dictator's private affairs during his absence from Rome. According to Suetonius (*Caesar*, 56), many authorities considered Oppius to have written the histories of the Spanish, African and Alexandrian wars which are printed among the works of Caesar. It is now generally held that he may possibly be the author of the last (although the claims of Hirtius are considered stronger), but certainly not of the two first. He also wrote a life of Caesar and the elder Scipio.

For a discussion of the whole question, see M. Schanz, *Geschichte der römischen Literatur* (2nd ed., 1898); Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans., 1900); see also Cicero, *Letters*, ed. Tyrrell and Purser, iv. introd. p. 69.

OPPOSITION, in logic, means the various relations which can exist between judgments or propositions having the same subject and predicate but differing in quality or quantity. See LOGIC.

OPTICS. The study of Optics is usually divided into three parts: *Physical Optics*, *Physiological Optics* and *Geometrical Optics*. *Physical Optics* is primarily concerned with the nature and properties of light itself and is treated under LIGHT. *Physiological Optics* deals with the mechanism of vision, and is treated under VISION.

Geometrical Optics, which is the subject of this article, is the name applied to that part of Optics which deals with the properties of optical instruments such as telescopes, microscopes, photographic lenses, spectroscopes and the elementary lenses, mirrors and prisms from which they are constructed. As geometrical methods have been widely employed in inquiries concerning optical instruments, the name is not without historical justification. Nevertheless we shall have occasion to take exception to the validity of these methods in this field. They are in fact only admissible to an extent which deprives the historical theory of much of its utility. A brief account of this theory can, however, hardly be omitted here both on account of its historical importance and because even at the present day the majority of the literature on the subject is still couched in geometrical terms.

The basic conception of geometrical optics in this theory is the ray of light. The fact that light travels in straight paths was well known to the Greek mathematicians and the transition from optics to pure geometry was thus simple. More precisely in geometrical optics we assume that the ray of light continues in the same straight line while it travels in the same homogeneous medium. When it encounters a surface separating this medium from another, for example the surface between air and water, the ray proceeds in another direction from the point in which it meets this surface, and again continues to follow a straight path until another surface is reached. The new path may be in either the original or the new medium. In the former event the ray is said to be reflected, and in the latter refracted, at the surface of separation. We regard the whole continuous path of the light as a single ray, but distinguish the original and final portions as the incident ray and the emergent ray respectively. We may also apply the terms reflected ray or refracted ray as the case may be

to the latter.

The new directions are determined by simple geometrical laws. The law of reflection states (1) the incident ray, the reflected ray, and the normal to the surface at the point of reflection lie in one plane; (2) the incident and reflected rays lie on opposite sides of the normal; (3) the angles made by the incident and reflected rays with the normal are equal. The law of refraction states (1)

FIG. 1.—ANGULAR-SIGN CONVENTIONS. SHOWING (LEFT) REFRACTION: ANGLES OF INCIDENCE AND REFRACTION BOTH POSITIVE; AND (RIGHT) ANGLE OF INCIDENCE POSITIVE, ANGLE OF REFLECTION NEGATIVE

the incident ray, the refracted ray, and the normal to the surface at the point of refraction lie in the same plane; (2) the incident ray and the refracted ray lie on opposite sides of the normal; (3) the sine of the angle made by the incident ray with the normal bears a constant ratio to the sine of the angle made by the refracted ray with the normal. This ratio depends only on the composition of the two media separated by the surface, and is known as the relative index of refraction.

From a comparison of these two laws it will be seen that the law of reflection may be considered as a special case of the law of refraction, the relative refractive index being equal to either $+1$ or -1 . Let us adopt the convention that angles are to be measured by the value of the anti-clockwise rotation needed to reach the ray position from the onward drawn normal. Thus in fig. 1a, the angles of incidence and refraction ϕ and ϕ' are positive, and if μ is the relative refractive index $\sin\phi = \mu\sin\phi'$. When reflection occurs the angle of reflection is opposed in sign to the angle of incidence (see fig. 1, right), and μ should therefore receive the value -1 . It will be noted also that the reflected ray travels in the opposite direction to that contemplated in the law of refraction. As we shall see later all lengths entering into optical equations are either multiplied or divided by a refractive index and the double reversal of sign frees us from all difficulties regarding the signs of the quantities we employ. We are therefore enabled to dispense with any detailed consideration of reflecting instruments and can proceed to deal with refraction as an inclusive process.

For a reason which will become apparent later it is necessary for the reflecting and refracting surfaces used in optical instruments to approach very closely to ideal geometrical forms. The manufacturing processes by which the necessary degree of perfection can be reached impose severe limitations on the types of surface which may be employed, and in practice any surface but a portion of a sphere—with the plane as a special case—is rarely employed. We will therefore consider the refraction of light at a spherical surface.

In fig. 2 let a ray passing through the point P be refracted at Q , a point on a spherical surface whose centre is at C . The refracted ray lies in the plane PQC containing the incident ray PQ and the normal QC , and it will therefore in general meet PC at some point P' . Let PC meet the surface in R and make an angle α with QC , and let ϕ and ϕ' be the angles of incidence and refraction. Then

FIG. 2.—REFRACTION AT A SPHERICAL SURFACE

from the triangles PQC , $P'QC$

$$\frac{\sin\alpha}{\sin\phi} = \frac{PQ}{PC}, \quad \frac{\sin\alpha}{\sin\phi'} = \frac{QP'}{CP'}$$

and therefore by the law of refraction

$$\mu \frac{PQ}{PC} = \frac{QP'}{CP'}$$

If now Q is near R , PQ and QP' differ from PR and RP' by small quantities of the second order, and the equation becomes

$$\mu \frac{PC-r}{PC} = \frac{r+CP'}{CP'}$$

or

$$\frac{\mu-1}{r} = \frac{\mu}{PC} + \frac{1}{CP'}$$

where r is the radius of the surface. It follows from this expression that all rays which, before refraction in the neighbourhood of R , pass through P , will afterwards pass through P' . Physically this means that light energy diverging from a particle of matter placed at P will converge to P' or alternatively will diverge in the new medium as though it were liberated at P' . The reunion of the rays at P' is thus of the greatest significance, and P' is called the image of the object P . If P' is so situated that the rays can actually pass through it the image is called real, but if it is so placed that they may merely be regarded as having originated there the image is called virtual. It should be observed that there is no need for the rays to have actually passed through the point P , that is to say we may deal with virtual objects as well as virtual images.

Consider now a succession of spherical surfaces which are all met by rays under the conditions just described. Corresponding to an object point P , real or virtual, the first surface forms an image at a definite point P_1 . The point P_1 may be regarded as a source of rays falling upon the second surface, which forms an image P_2 of P_1 . Each surface in turn forms a point image of that due to the preceding surfaces, and we conclude that the whole series of surfaces will form at a definite point P' in the final medium, an image, either real or virtual, of an arbitrary point P in the object space. The relation connecting P and P' may be shown to be unique and reversible, so that it is a matter of convention which of the spaces external to the system is regarded as the object space and which as the image space. It will be observed that we have not assumed axial symmetry in the system, so that this conclusion holds whether the centres of curvature of the various refracting surfaces are collinear or not.

Symmetrical Optical Instruments.—The refracting surfaces in a great majority of optical instruments are surfaces of

FIG. 3.—IMAGE SURFACES IN AN IDEAL INSTRUMENT
Determination of surfaces in which object and image are equal to one another, and also equal but inverted

revolution with a common axis of symmetry. In consequence of this rotational symmetry the theory of these instruments is particularly simple. Rays which lie initially in a plane containing the axis remain in that plane, and the general one-one correspondence between the points of the two spaces degenerates to a one-one correspondence between points of a plane.

The theory of the symmetrical instrument has been treated very comprehensively by Maxwell and later by Abbe on the assumption that this two dimensional point to point correspondence

holds. From symmetry it is clear that the image of each point on the axis is itself a point on the axis. Thus the axis is a self-conjugate ray for the system, that is to say the axis, regarded as a whole is its own image. Corresponding to the point at infinity on the axis in the object space there corresponds a point F' (see fig. 3), usually at a finite distance, in the image space. This is named the second principal focus of the system. Then all rays which in the object space are parallel to the axis will be refracted so as to pass through F' in the image space, and conversely all rays in the image space which pass through F' correspond to rays which are parallel to axis in the object space. Similarly there is a point F on the axis in the object space such that all rays passing through F emerge in the image space as rays parallel to the axis. This point is called the first principal focus of the system. Since the incident portion of any ray refracted parallel to the axis lies in the same axial plane as the emergent portion, the two will meet if produced in some point H . The point thus determined on the incident ray is at the same distance from the axis as the whole of the emergent portion of the ray, and the height of the image of an object extending from H to the axis is equal to the height of the object itself, a fact usually expressed by saying that the transverse magnification is 1. The locus of points H determined in this manner is therefore called the first unit surface. It is to be considered as situated entirely in the object space.

In a similar way by considering the intersections of the incident and emergent portions of rays which pass through F' in the image space we determine the second unit surface situated in the image space. Clearly these two surfaces have rotational symmetry about the axis and are conjugate to one another, that is, the one surface is the image of the other, and any ray striking the first unit surface in the point H will follow a path in the image space passing through H' in the second unit surface where HH' is parallel to the axis. Now let $PIHH'F'P'$ and $PFKK'P'$ be two rays meeting in P and P' , the former being parallel to the axis in the object space and the latter in the image space. Let these two parallel portions be at equal distances from the axis and on opposite sides of it. The image extending from P' to the axis is of equal height to an object lying between P and the axis, and is inverted. P and P' therefore trace out conjugate surfaces corresponding to the transverse magnification -1 . F and F' are the mid-points of PK and $H'P'$ and the new surfaces are therefore precisely equal to the corresponding unit surfaces but face opposite ways. Now let $phh'F'p'$ be another ray parallel to the axis in the object space meeting the unit surfaces in h and h' and the negative unit surfaces in p and p' . From symmetry Ph and pH intersect in a point f situated in the plane through F normal to the axis of the system, and from the congruent triangles $h'F'P'$, $H'F'P'$, $h'P'$ and $H'P'$ are parallel. In other words the normal plane through F is conjugate to the surface at infinity in the image space, and similarly the normal plane through F' is conjugate to the infinitely distant surface in the object space. By taking a pair of rays whose distances from the axis are in any assigned ratio we can construct the conjugate surfaces for this magnification.

It is a simple matter to show that the object space surfaces are all similar and similarly situated about F , and the image space surfaces also similar and similarly situated about F' . Since we have taken the ratio of the distances of corresponding points from the axis as the measure of the magnification, any corresponding secondary elements of length (that is elements normal to the plane through the axis of symmetry) in the image and object surfaces are in this ratio. Now consider two parallel incident rays inclined to the axis, not intersecting it but situated symmetrically with respect to it, the separation between them being small. They determine on every constant magnification object surface a secondary element of unvarying length. In the image space these rays intersect in a point f' in the focal plane through F' . The lengths of the secondary elements intercepted on the constant magnification surfaces in the image space are therefore proportional to the distances of the points of intersection from f' . In other words these surfaces must be similarly situated with respect to any point f' in the focal plane.

It follows that all the constant magnification surfaces are planes normal to the axis, and that the magnification in every such plane is uniform in all directions. All the properties of the system may therefore be related to the points in which these planes meet the axis of symmetry. With the aid of rays passing through F and F' (fig. 4) we readily prove, if U and U' are the

FIG. 4.—COLLINEAR IMAGERY SHOWING THAT ANY RAY THROUGH THE NODAL POINT N EMERGES IN A PARALLEL DIRECTION THROUGH N'

unit points, that is the points in which the unit planes meet the axis, and P and P' are any pair of conjugate axial points

$$\text{transverse magnification} = \frac{FU}{FP} = \frac{P'F'}{U'F'}$$

so that conjugate points are determined by $FP \cdot P'F' = FU \cdot U'F'$. If we draw through f a straight line fN , parallel to the direction of the emergent rays arising from f , to meet the axis in N , we have $fN = U'F'$. The conjugate point N' by the above relation is given by $N'F' = FU$. These points, from the circumstance that the incident and emergent rays through them are parallel to one another, are called the nodal points of the system. FU and $U'F'$ are named the first and second focal lengths of the system. When these two focal lengths are equal the unit points coincide with the nodal points and are frequently called the principal points.

It is easy to show with a system consisting of a single surface that if an object point is moved along the axis, the image moves in the same direction. It follows that this holds also for any compound instrument, and hence FU and $U'F'$ are always measured in the same direction. There are thus only two types of system—positive systems, illustrated in fig. 4, in which the principal foci F and F' are reached by proceeding from U and U' towards the real distant part of the corresponding space (the focal lengths thus being positive), and negative systems in which all these signs are reversed. The unit planes are usually situated close to or between the extreme refracting surfaces of the lens, and in a negative instrument all the real portions of the object space and of the image space are thus on a single side of the respective focal planes. It follows that such a negative system cannot yield a real image of a real object, and since the focal planes separate upright from inverted images, there is no inversion if either object or image is real. With a positive lens we can obtain a real inverted image of a real object, but if there is no inversion either the object or the image or both are virtual.

As we have based this discussion on the general correspondence of object and image points, the conclusions hold whenever the initial assumptions are satisfied irrespective of the way in which the system is constructed. Had we first considered the properties of a single spherical surface and extended the result to a combination of several such surfaces, our conclusions would not necessarily have applied to a system in which aspherical surfaces are employed.

Formulae are frequently used in which measurements are made from the unit points instead of from the principal foci. If we denote the transverse magnification by m , we have

$$\frac{PU}{FU} = 1 - \frac{1}{m}, \quad \frac{U'P'}{U'F'} = 1 - m, \quad \frac{U'P'}{PU} = -m \frac{U'F'}{FU}$$

and $\frac{FU}{PU} + \frac{U'F'}{U'P'} = 1$. When the two focal lengths have the common value f the last two equations become

$$m = -\frac{U'P'}{PU}, \quad \text{and} \quad \frac{1}{PU} + \frac{1}{U'P'} = \frac{1}{f}$$

Systems which yield on a uniform scale a plane image of a plane object (and incidentally a plane image of every plane object) are admirably fitted for many practical purposes, for example the photographic reproduction of maps. The scheme we have just described, which is known as *collinear imagery*, has therefore been widely used as a standard with which the performance of real instruments may be compared. It is of value as an artificial reference frame, rather than as a scheme to which real instruments tend to conform.

The Wave Theory and Lenses.—We will now consider the properties of lenses according to the wave theory of light. The postulates of this theory, which have been justified by the most varied experiments, are that monochromatic light may be regarded as an undulatory disturbance of unvarying period which spreads out in all directions from the source at a uniform speed which depends only on the medium in which it is travelling. In common with other forms of wave motion the disturbance at a given instant at any point may be obtained by replacing the actual wave system by a system of secondary sources of proper intensities and phases distributed over a surface. The statistical distribution of light energy is assumed to be that of the energy distribution of the wave system on the assumption that a long train of waves is involved. On this basis the phenomena observed in the neighbourhood of an optical image—that is the point where the energy of the wave motion has its greatest value through the contributions of the secondary sources arriving in the same phase—have been very satisfactorily accounted for. It is shown in treatises on Physical Optics (see LIGHT) that these assumptions involve the propagation of light in straight paths normal to the wavefront (so that the rays of the geometrical theory are to be regarded as normals to the wavefront), and changes in the directions of these paths in agreement with the laws of reflection and refraction provided the relative refractive index is made equal to the ratio of the times taken by light to travel equal distances in the new and old media. It would therefore appear that we should find agreement between the deductions to which we are led by the geometrical and the wave theories. This conclusion however is incorrect. An essential condition in deducing the law of rectilinear propagation is that the wavefront should be of considerable lateral extent. When light approaches a real focus this condition is violated, with the result that the direction of propagation in fact is not constrained to the straight paths assumed in the geometrical theory. It is therefore not surprising to find that while the geometrical theory indicates correctly the positions in which images are formed and the conditions which should be satisfied if an instrument is to yield images of the highest quality, it is misleading in the character of the image it leads us to expect, and the effects to be observed in the neighbourhood of the image. The two theories also differ in the course they would lead us to adopt when any of the conditions corresponding to perfect imagery are not satisfied.

Since the relative refractive index depends only on the relative speed with which light travels in the two media we may, by assigning the value unity arbitrarily as the refractive index of a suitable substance under specified physical conditions, obtain an absolute refractive index for any other substance. As an absolute standard medium empty space is taken, but for practical purposes the refractive index of air at standard temperature and pressure is adopted. We shall hereafter, when we speak of refractive index, imply the absolute refractive index of a substance on one or other of these conventions. We will now show that the two focal lengths of any symmetrical optical system are in the ratio of the refractive indices of the two external media.

Let a plane wave normal to the lens axis in the object space of refractive index μ travel from the position PF , fig. 5, until, after being converted by the instrument into the spherical wave $U'J$, in the image space of refractive index μ' , it reaches the prin-

cipal focus at F' . Let another plane wave in the image space travel in the reverse direction from $F'Q$ to F . As different parts of the same wavefront take equal times to reach the focus, the time taken by the light to travel by the path $PHH'JF'$ is equal to that taken along the axial path $FUU'F'$, and similarly the paths $QK'KIF$ and $F'U'UF$ take equal times. The time taken to traverse the same axial path $FUU'F'$ is independent of the direction, and the times for all these paths are thus equal. Now the times taken along PH and FU are equal, and the times along the equal distances $U'F'$ and JF' in the same medium are equal. It follows that the time taken to travel from U to U' exceeds that between H and H' by the time needed to traverse the distance $H'J$. Similarly the time for the journey UU' exceeds that between K and K' by the time taken to cover the distance IK . Now if H and K are at equal distances y from the axis the time taken to travel between H and H' , from the symmetry of the instrument, is equal to that taken between K and K' . It follows that $\mu \cdot IK = \mu' \cdot H'J$, or

$$\mu \{ (FU)^2 + y^2 \}^{\frac{1}{2}} - FU = \mu' \{ (U'F')^2 + y^2 \}^{\frac{1}{2}} - U'F';$$

that is, if the terms in y^4 and higher powers of y are negligible,

$$\frac{1}{2} \mu \frac{y^2}{FU} = \frac{1}{2} \mu' \frac{y^2}{U'F'},$$

and since this holds for finite values of y we must have

$$FU : U'F' = \mu : \mu'.$$

In particular if the two external media are composed of the same kind of matter the two focal lengths are equal to one another.

Let us now consider the possibility, according to the physical criterion of equality of time along the geometrical rays, of collinear imagery. Let $PQRS$ be four object points and $P'Q'R'S'$ their images. Denote by $\{AB\}$ the distance light would travel in the medium of refractive index unity in the time taken to travel from A through the instrument to B' . Then since with geometrically perfect imagery the time between two conjugate points is equal by all paths,

$$\{PP'\} = \mu PQ + \{QP'\} = \mu PS + \{SP'\}$$

$$\{QQ'\} = \{QR'\} + \mu' R'Q' = \{Q'P'\} + \mu' P'Q'$$

$$\{RR'\} = \mu RS + \{SR'\} = \mu RQ + \{QR'\}$$

$$\{SS'\} = \{SP'\} + \mu' P'S' = \{SR'\} + \mu' R'S'$$

$$\text{or } \mu(PQ + RS - PS - RQ) = \mu' (P'Q' + R'S' - P'S' - R'Q').$$

Now without altering the configuration of the figure $PQRS$ we may, if the focal lengths of the system are finite, make the scale of the figure $P'Q'R'S'$ as large or as small as we like by moving $PQRS$ as near or as far from the lens as we like. In particular we may make each dimension of the figure $P'Q'R'S'$ smaller than any assigned finite small length. This relation cannot therefore hold, and collinear imagery is not possible for a system of finite focal length. In other words it is impossible to construct an optical system having a finite focal length which will refract all rays from any given object point so as to pass through a single image point. Using terms significant in the wave theory, the time taken to travel through the instrument between a point in the object space and a point in the image space cannot be independent of the path followed for an arbitrary choice of the object point. When the focal length is not finite the image is a copy of the object on uniform transverse and longitudinal scales, and collinear imagery is achieved when the two refractive indices are numerically equal and the object and image are congruent figures. The most familiar example is afforded by reflection at a plane mirror, where we suppose the two external refractive indices differ only in sign. (See MIRROR.)

The Size of a Point Image: Resolving Power.—The extent of the divergence between the two theories may be illustrated by considering properties of importance to the user of the instrument. First we will consider the size of the image of a point source. Of the spherical wave which spreads out from the source only a portion can enter the instrument, and corresponding to the perfect reunion of the rays in an image point have an emergent

FIG. 5.—RATIO OF FOCAL LENGTHS

wave of spherical form. In fig. 6, BAC represents a wave-front filling the aperture BC : the wave is in the form of a portion of a concave sphere of which F is the centre. According to geometrical optics the image is the point F , and is formed by rays filling the cone BFC of which AF is the axis and α is the semi-angle. By the principles of physical optics the disturbances produced by the train of waves are the same as would be produced by a suitable series of disturbances situated in the wave-front BAC . Now any disturbance at A gives rise to a spherical wave with A as centre. If we confine ourselves to a region around F of dimensions small compared with AF we may consider the wave from A to be a plane wave PP' at F . Similarly from B and C we get plane waves QQ' and RR' making angles $\pm \alpha$ with PP' . Now all parts of the wave

FIG. 6.—DEPENDENCE OF RESOLVING POWER ON APERTURE

front BAC are equidistant from F , and the component disturbances at F are therefore all in the same phase—that is to say, all the displacements are in the same direction and reach their maximum values at the same instant.

The energy of the wave motion is therefore a maximum at F , for there the co-operation is as great as possible. The wave from B will, however, have already passed beyond P , and that from C will not yet have reached P by the time the wave from A has arrived at the position PP' . To find the disturbance at P we therefore have to take the displacement at B when the wave-front BAC is short of the position shown by the distance PQ , and similarly the displacement at C when this wave-front has advanced beyond the position shown by the distance PR . That is to say the component displacements at P vary in phase, the total range being found by measuring the difference of path, *i.e.*, the length $2PF \sin \alpha$, along the train of waves in the direction of their motion. Now if P is near enough to F the differences of phase are small, and the displacements differ very little from those at F ; in other words at points very close to F the light energy is practically the same as at F , so that the image is of finite dimensions, and not a point. As P moves farther away from F the range of phase increases, and at a certain stage we begin to receive contributions from points near B which tend to neutralize those contributed from points near C , so that the light energy as we pass through these positions of P diminishes rapidly. Finally we reach a position of P at which the range of phase is great enough for the various contributions to neutralize one another, or at least to so nearly neutralize one another that our impression on looking at this point is that we have reached or passed the edge of the image.

Since the changes of intensity are due wholly to differences of phase, the image edge will be reached when the difference of path is some constant θ times the wave length λ of the light, *i.e.*,

$$2PF \sin \alpha = \theta \lambda$$

$$\text{or} \quad \text{image diameter} = 2PF = \frac{\theta \lambda}{\sin \alpha} = d.$$

If λ_0 is the wave length of the light in the standard medium $\lambda_0 = \lambda \mu$, and the last fraction becomes $\theta \lambda_0 / \mu \sin \alpha$. As the aperture which limits the light passing through the instrument is reduced, $\sin \alpha$ decreases, and the size of the image increases. If two near object points are to be distinguished on examining them through the instrument their images must be separate, and the resolving power of the instrument, as its capacity for rendering distinct images of near objects is called, is measured by the reciprocal of the image diameter, that is by $\mu \sin \alpha / \theta \lambda_0$. With light of a given wave length the denominator is invariable, and as $d \mu \sin \alpha$, as we shall see later, is unaltered by refraction, the resolving power of an instrument is measured by $\mu' \sin \alpha'$, where the accented quantities relate to the object space. On account of its importance in microscopy this quantity is known as the numerical aperture of the instrument. The utility of an optical instrument evidently depends upon the variation in path having a small value compared with the wave length of the light used. Since the wave length is

very small, a very close approach to the theoretical form, as has already been mentioned, is necessary in the refracting surfaces.

Depth of Focus.—We will now consider according to the two theories how far we may expect to be able to depart along the axis of the instrument from the ideal focus F and still retain a satisfactory image. According to geometrical optics light rays fill the cone BFC , fig. 7, and the image in the plane XY will be a circle of diameter IJ . The image is considered satisfactory if IJ does not exceed a certain diameter, say d , so that the permissible range for G is given by the condition

$$FG = \frac{1}{2} d \cot \alpha$$

or very approximately

$$FG = d \cdot \frac{I}{a},$$

FIG. 7.—DEPTH OF FOCUS

where I is the distance of the image from the principal point and a is the effective diameter of the lens aperture, supposed situated in the unit plane. The important feature of this formula is that the depth of focus is inversely proportional to the first power of the diameter of the aperture.

Let us now consider the same problem from the point of view of the wave-theory. Instead of relying on the geometrical hypothesis we are able to rest on the well attested fact that an image begins to appear less sharp when the extreme difference between the phases of the component waves at the centre of the image reaches a definite value, that is to say when the path difference at G amounts to $\phi \lambda$ where ϕ is a definite number. This criterion differs from that considered on the geometrical theory less radically than might at first sight appear, for the existence of an appreciable phase difference at the image centre means that in this neighbourhood the light energy is less: but the total light energy of the waves is absorbed wherever the plane may be placed, and energy removed from the central regions must therefore appear in some other place. But to say that an appreciable amount of energy is found farther from the centre is only another way of stating that the image is sensibly enlarged.

Resuming, however, the determination of the range for G , the distance of this point from B differs by an unimportant amount from BH , where GH is perpendicular to BF . Since the extreme paths obviously arise from A at one limit and marginal points such as B at the other, and since all path lengths to F are equal, the extreme path difference is the difference between FG and FH , or $FG(1 - \cos \alpha)$ or

$$FG = \frac{\phi \lambda}{1 - \cos \alpha}$$

Now $a = 2I \sin \alpha$, and therefore approximately

$$FG = 8\phi \lambda \left(\frac{I}{a} \right)^2.$$

This formula indicates a law of a quite different type from that derived geometrically, the range varying inversely as the square of the aperture diameter, instead of as the first power.

The Depth of Field.—By reasoning of a character essentially similar to that of the foregoing section we can find expressions for the nearest and greatest distances x and x' at which objects may be situated from the lens for their images to appear sharp on a screen focussed for a distance X . According to the geometrical theory the conditions are

$$\frac{I}{x} - \frac{I}{X} = \frac{I}{X} - \frac{I}{x'} = \frac{d}{Ia},$$

and the conditions derived from a limiting difference of path are

$$\frac{I}{x} - \frac{I}{X} = \frac{I}{X} - \frac{I}{x'} = \frac{8\phi \lambda}{a^2},$$

where the symbols bear the same meanings as in the previous section. Thus assuming the objects are at a considerable distance from the lens, so that I is approximately equal to the focal length of the lens, according to geometrical optics the focal

length of the lens and the aperture are equally important, the range being inversely proportional to both. On the other hand according to the wave theory the focal length has nothing whatever to do with the question, and the range is inversely proportional to the square of the aperture. Both theories, it will be observed, indicate the selection of the same plane for the theoretical focus to secure the utmost sharpness for all objects between two given extreme planes.

It should be unnecessary to point out that the problems on which it has been shown that the two theories differ so widely, are of much practical importance in the use of optical instruments. As an example in photography, when considerable depth of focus is required, the geometrical formula is likely to lead to the use of an unnecessarily small stop, thereby involving not only a longer exposure, but also, through the tendency of a small stop to cause loss of sharpness, a poorer negative.

The Eikonal.—The examples we have just considered show that a complete investigation of the properties of lenses involves the determination of the time taken by light to reach any given point in the neighbourhood of the geometrically determined image, by both stationary and non-stationary routes (that is along "rays" and along other paths), as a preliminary to the calculation of the energy of the wave motion there. The computation of the time by non-stationary routes may be omitted if the surface where the secondary sources are placed is selected in the image space and the times from the source to this surface are determined for stationary routes only. In practice the energy distribution will not be determined in routine calculations, as typical calculations or observations will show the effects caused by departing from strict equality of path by different amounts, for each of the types of variation encountered in well-corrected systems.

All calculations will therefore relate to the geometrical paths, but variation in the lengths of these paths rather than their distances from a mean point in the neighbourhood of an image is to be regarded as the significant factor on which the quality of the image depends. The two sets of magnitudes are not independent, and we proceed to find the connection between them.

Take origins of rectangular co-ordinates in both object and image spaces. Suppose in the first space that a point source of light is situated at (x, y, z) in the object space. Light is radiated from this point in all directions, and some traverses the optical system and finds its way into the image space. Generally the wave-front in the image space will be a curved surface, and the normals or rays at different points of this surface differ in direction. A particular emergent ray may therefore be specified by its direction cosines. Let these be (L', M', N') , and suppose also that (ξ', η', ζ') is a point on this ray. The disturbance has taken a definite time to reach (ξ', η', ζ') from (x, y, z) : let the corresponding optical path length, that is, the distance light travels in a standard medium in this time, be denoted by \mathcal{U} . Let $\mathcal{U} + \delta\mathcal{U}$ be the path length for a neighbouring ray starting from (x, y, z) and finishing at $(\xi' + \delta\xi', \eta' + \delta\eta', \zeta' + \delta\zeta')$, the final direction being $(L' + \delta L', M' + \delta M', N' + \delta N')$. If μ' is the refractive index of the final medium, the second path exceeds the first by

$$\mu' \{ (L' + \delta L') \delta\xi' + (M' + \delta M') \delta\eta' + (N' + \delta N') \delta\zeta' \}$$

since the wave-front, which marks the locus of points optically equidistant from (x, y, z) , is normal to the ray. Now suppose that the tangent planes to the wave-fronts at (ξ', η', ζ') and $(\xi' + \delta\xi', \eta' + \delta\eta', \zeta' + \delta\zeta')$ pass through the image space origin. Then

$$L'\xi' + M'\eta' + N'\zeta' = 0,$$

$(L' + \delta L')(\xi' + \delta\xi') + (M' + \delta M')(\eta' + \delta\eta') + (N' + \delta N')(\zeta' + \delta\zeta') = 0$, and these conditions enable the expression we have found for the path difference to be written

$$-\mu' \{ \xi' \delta L' + \eta' \delta M' + \zeta' \delta N' \} = \delta\mathcal{U} \quad (1).$$

Now L', M', N' are connected by the relation

$$L'^2 + M'^2 + N'^2 = 1,$$

and therefore only two of them, say M' and N' , may be regarded

as independent variables. On eliminating L' (1) becomes

$$-\mu' \left(\eta' - \frac{M'}{L'} \xi' \right) \delta M' - \mu' \left(\zeta' - \frac{N'}{L'} \xi' \right) \delta N' = \delta\mathcal{U}.$$

Since \mathcal{U} is now regarded as a function of M' and N' , for any small variations of M' and N' we shall have

$$\delta\mathcal{U} = \frac{\partial\mathcal{U}}{\partial M'} \delta M' + \frac{\partial\mathcal{U}}{\partial N'} \delta N',$$

and, since M' and N' may be varied independently, we find, by comparing these equations,

$$\mu' \left(\eta' - \frac{M'}{L'} \xi' \right) = - \frac{\partial\mathcal{U}}{\partial M'}, \quad \mu' \left(\zeta' - \frac{N'}{L'} \xi' \right) = - \frac{\partial\mathcal{U}}{\partial N'}.$$

Now $\eta' - \frac{M'}{L'} \xi'$ and $\zeta' - \frac{N'}{L'} \xi'$ are invariants for any given ray,

and represent the y' and z' co-ordinates of the intersection of the ray with the plane $x' = 0$. If we understand that y' and z' are the co-ordinates of a point in this plane we may write these equations

$$\mu' y' = - \frac{\partial\mathcal{U}}{\partial M'}, \quad \mu' z' = - \frac{\partial\mathcal{U}}{\partial N'} \quad (2)$$

If then we know \mathcal{U} as a function of M' and N' , that is to say if we know how the length of the optical path from the source to a plane through the image space origin varies as the direction of this plane alters, we can find where the common normal to this plane and the wave meets an arbitrary fixed plane through the origin.

If, instead of starting with a source of light at a known point of the object space, we had assumed it to be situated in the image space, some of the light diverging from this point would reach the lens and after refraction would emerge into the object space. We could take \mathcal{U}' as a measure of the time taken by the light to reach a plane in the direction (L, M, N) passing through the object space origin, and obtain the equations

$$\mu y = \frac{\partial\mathcal{U}'}{\partial M}, \quad \mu z = \frac{\partial\mathcal{U}'}{\partial N} \quad (3)$$

for the point (y, z) in which the common normal to the wave-front and the plane $L\xi + M\eta + N\zeta = 0$ meets the plane $x = 0$. The change of sign which will be observed on comparing equations (2) and (3) is due to the assumption that the positive directions of the axes are unaltered, so that a positive displacement of (ξ, η, ζ) corresponds to a decrease in the time \mathcal{U}' .

The function \mathcal{U} suffers from the grave disadvantage that it is unsymmetrical, the variables in the object space being point co-ordinates, and in the image space direction cosines. A function which is symmetrical is at once obtained by considering the particular case in which the source of light is at infinity. It is inconvenient to include in the function the infinite term representing the length of the path between the source and a reference position near the lens, so the path is measured from the wave-front which passes through the object space origin. Since all points on the same wave-front are at the same optical distance from the source, \mathcal{E} , the new finite path length, which is a function of (M, N, M', N') , differs from \mathcal{U} only by a constant, and, as in the case of \mathcal{U} , the equations

$$\mu' y' = - \frac{\partial\mathcal{E}}{\partial M'}, \quad \mu' z' = - \frac{\partial\mathcal{E}}{\partial N'} \quad (4)$$

are satisfied. In a similar way from \mathcal{U}' , by placing the source at infinity in the image space in the direction L', M', N' , and rejecting the constant infinite part of the path, we obtain a finite function \mathcal{E}' having (M, N, M', N') as its variables and satisfying the equations

$$\mu y = \frac{\partial\mathcal{E}'}{\partial M}, \quad \mu z = \frac{\partial\mathcal{E}'}{\partial N} \quad (5).$$

Now \mathcal{E} and \mathcal{E}' measure the time taken by the light to travel between the same two planes in opposite directions along the stationary path. This stationary path between two planes is unique and independent of the curvature of the wave-front at either

plane. Moreover the speed of light is independent of direction. It follows that \mathcal{E} and \mathcal{E}' are equal, and, since they are expressed in terms of the same variables, they must be identical. This symmetrical function of the direction cosines, which is one of the Characteristic Functions introduced into Optics by Hamilton, will be referred to as the Eikonal, a name proposed by Bruns.

In the application of this function the planes $x=0$ and $x'=0$ will be chosen to coincide with the object and image planes, or at least to be parallel to them. Equations (4) and (5) then show how this function, which itself expresses the length of a path carried through the refracting surfaces, and is thus particularly suitable for investigations according to the wave theory, enables the points in which rays travelling in specified directions meet the object and image surfaces to be found.

Focal Lengths and Principal Foci.—The rays, being the normals to the wave front, are the loci of points for which the path is stationary for slightly displaced routes, and conjugate foci are points of a particular path between which the path length is stationary for larger deviations. In an axially symmetrical system we can see immediately that a pair of such points for a skew ray (that is to say, a ray which does not lie entirely in an axial plane) are the intersections of any axial plane with the incident and emergent rays. By considering a ray in an axial plane as the limiting position of a skew ray, we can extend the definition to all rays. We shall call such conjugate points secondary foci. We proceed to find the positions of the principal secondary foci and the magnitudes of the corresponding focal lengths.

Take the axes of x and x' in coincidence with the axis of symmetry, so that \mathcal{E} may be regarded as a function of three variables only, viz., $\frac{1}{2}\mu^2(M^2+N^2)$, $\mu\mu'(MM'+NN')$ and $\frac{1}{2}\mu'^2(M'^2+N'^2)$. Denoting these by a , b , c respectively, and differentiation by the addition of a suffix, equations (4) give

$$y' + \mu M \mathcal{E}_b + \mu' M' \mathcal{E}_c = z' + \mu N \mathcal{E}_b + \mu' N' \mathcal{E}_c = 0 \quad (5)$$

that is to say, the ray goes through the point $(\rho'L', Y', Z')$ distant ρ' along the ray from the reference plane $x'=0$, where $\rho' = \mu' \mathcal{E}_c$ provided

$$Y' = -\mu M \mathcal{E}_b, \quad Z' = -\mu N \mathcal{E}_b \quad (6)$$

These equations show that at this point the ray goes through a point in the axial plane containing the infinitely distant origin of light (L, M, N) . In other words the secondary principal focus lies on the ray at the distance $\mu' \mathcal{E}_c$ beyond its intersection with the reference plane $x'=0$. Similarly the secondary principal focus in the object space lies on the ray at a distance $-\mu \mathcal{E}_a$ from its intersection with the reference plane $x=0$, the measurement being made in the positive direction. By partial analogy with the properties associated with the nodal points of collinear imagery, if f is the object space secondary focal length, the y' and z' co-ordinates of the secondary image of the infinitely distant object (L, M, N) are Mf and Nf respectively. Equations (6) thus give $f = -\mu \mathcal{E}_b$, and similarly the image space secondary focal length is given by $f' = -\mu' \mathcal{E}_c$.

The secondary conjugate points corresponding to the magnification S must satisfy

$$\frac{Y'}{Y} = \frac{Z'}{Z} = s,$$

and if these points are distant ρ' and ρ from the corresponding principal foci, by equations (5) we have

$$\frac{\rho' M' - \mu M \mathcal{E}_b}{\rho M + \mu' M' \mathcal{E}_b} = \frac{\rho' N' - \mu N \mathcal{E}_b}{\rho N + \mu' N' \mathcal{E}_b} = s$$

$$\text{or} \quad \rho = -\frac{\mu \mathcal{E}_b}{s}, \quad \rho' = \mu' \mathcal{E}_b \cdot s$$

since for a skew ray M/M' and N/N' are not equal. The connection between the principal foci, the focal lengths, a pair of conjugate foci and the magnification for any ray thus correspond exactly to those found for the instrument as a whole in collinear imagery. The fact that this law is followed for lengths measured along the ray itself, and not their projections on the axis, clearly involves the failure of collinear imagery. The constant magnifica-

tion surfaces in fact tend to be spherical rather than plane.

We will next determine the primary principal foci, which are the points of intersection of successive parallel incident rays lying in the same plane through the axis of the system. Without loss of generality we may suppose $z=z'=N=N'=0$, and the y' co-ordinate of the point in which the ray meets the plane $x'=X'$ is $\frac{M'}{L'} X' - \mu' M' \mathcal{E}_c - \mu M \mathcal{E}_b$. If this point is conjugate to the infinitely distant point (L, M) , this value of y' will be unaltered by substituting $(L' - \frac{M'}{L'} \delta M', M' + \delta M')$ for (L', M') . Since $\delta M'$ is finite, we see that we must travel along the ray from its intersection with the reference plane the distance

$$\frac{X'}{L'} = \mu' L'^2 \{ \mathcal{E}_c + 2a \mathcal{E}_{bb} + 2b \mathcal{E}_{bc} + 2c \mathcal{E}_{cc} \}$$

to reach the primary principal focus. The corresponding distance for the object space is

$$-\mu L^2 \{ \mathcal{E}_a + 2a \mathcal{E}_{aa} + 2b \mathcal{E}_{ab} + 2c \mathcal{E}_{bc} \}.$$

To determine the focal lengths we note from (5) that the ray $(M + \delta M, M')$ meets the reference plane in the point $y' + \delta y'$ where

$$\delta y' = -\mu \delta M \{ \mathcal{E}_b + 2a \mathcal{E}_{ab} + b(\mathcal{E}_{bb} + \mathcal{E}_{ac}) + 2c \mathcal{E}_{bc} \}.$$

Now the separation between these parallel emergent rays is $L' \delta y'$, and the angle between the two incident rays is $\delta M/L$. We define the focal length as the distance at which this separation is subtended by this angle, or

$$F = -\mu L L' \{ \mathcal{E}_b + 2a \mathcal{E}_{ab} + b(\mathcal{E}_{bb} + \mathcal{E}_{ac}) + 2c \mathcal{E}_{bc} \},$$

and similarly

$$F' = -\mu' L' L' \{ \mathcal{E}_c + 2a \mathcal{E}_{ac} + b(\mathcal{E}_{bb} + \mathcal{E}_{ac}) + 2c \mathcal{E}_{bc} \},$$

where F and F' are the first and second primary focal lengths respectively. Substituting these values in generalised variations of (5) we find for points distant ρ and ρ' from the principal primary foci

$$L \delta Y - M \delta X = \rho \frac{\delta M}{L} - F' \frac{\delta M'}{L'},$$

$$L' \delta Y' - M' \delta X' = \rho' \frac{\delta M'}{L'} + F \frac{\delta M}{L},$$

showing that conjugate points for the transverse magnification p are given by $\rho = F/p$, $\rho' = -F'p$, in harmony with the laws found in other cases. Just as we extended the conception of secondary foci from skew rays to rays in an axial plane, we may extend the primary concept to rays in general by basing generalised definitions upon the expressions we have derived.

The Sine Law and the Cosine Law.—The conditions that must be satisfied for an instrument to yield a plane image of a plane object at the constant magnification G may now be investigated. Put

$$a = S^2 A - SGB + G^2 C,$$

$$b = 2SA - (S+G)B + 2SGC,$$

$$c = A - B + C,$$

so that

$$(S-G)^2 A = a - Gb + G^2 c,$$

$$(S-G)^2 B = 2a - (S+G)b + 2SGc,$$

$$(S-G)^2 C = a - Sb + S^2 c.$$

Adopting for the moment the ray conception of imagery,

$$y = \frac{\partial \mathcal{E}}{\mu \partial M} = \mu M \mathcal{E}_a + \mu' M' \mathcal{E}_b =$$

$$\frac{1}{(S-G)^2} \{ (\mu M - G\mu' M')(\mathcal{E}_a + \mathcal{E}_b) + (\mu M - S\mu' M')(\mathcal{E}_b + \mathcal{E}_c) \}$$

$$y' = \frac{\partial \mathcal{E}}{\mu' \partial M'} = \frac{1}{(S-G)^2} \{ (\mu M - G\mu' M')(G\mathcal{E}_a + S\mathcal{E}_b) + (\mu M - S\mu' M')(G\mathcal{E}_b + S\mathcal{E}_c) \}$$

so that

$$y' - Gy = \frac{1}{S-G} \{ (\mu M - G\mu' M') \mathcal{E}_B + (\mu M - S\mu' M') \mathcal{E}_C \}$$

and similarly

$$z' - Gz = \frac{1}{S-G} \{ (\mu N - G\mu' N') \mathcal{E}_B + (\mu N - S\mu' N') \mathcal{E}_C \}$$

Thus, if the reference points lie in the planes conjugate to one another for magnification G , the presence of terms in B and C with finite coefficients involves displacements of the image points from their desired positions. The condition required is therefore that \mathcal{E} should be a function of A only, that is the direction cosines only occur in the combination

$$(\mu M - G\mu' M')^2 + (\mu N - G\mu' N')^2.$$

$\mu M - G\mu' M'$ and $\mu N - G\mu' N'$ must then be constant for all rays through a given object point. These are the generalised sine conditions. When the object point lies on the axis each of these quantities must vanish. In consequence of the axial symmetry only one condition, known as Abbe's sine condition, is in fact involved. If we write $G = \frac{l'}{l}$ where l and l' are conjugate lengths

normal to the axis, and ψ and ψ' are the angles made by the ray with the axis, Abbe's condition takes the form $\mu' \sin \psi = \mu' l' \sin \psi'$, a result of which use has already been made in discussing the resolving power of optical instruments.

If (o, y, z) is the point of intersection with the first reference plane of a ray A in the direction (L, M, N) , and $(o, y + \delta y, z + \delta z)$ is the point in which a parallel ray B meets the same plane, the change of co-ordinates may be regarded as the result of a displacement through the distance σ in the direction l, m, n if $L\delta y = \sigma(Lm - Ml)$, $L\delta z = \sigma(Ln - Nl)$, which involve

$$L(\delta y \delta M + \delta z \delta N) = \sigma L(l\delta L + m\delta M + n\delta N) - \sigma l(L\delta L + M\delta M + N\delta N)$$

whatever $\delta L, \delta M, \delta N$ may be. If $(L + \delta L, M + \delta M, N + \delta N)$ is a neighbouring direction to (L, M, N) the equation becomes

$$\delta y \delta M + \delta z \delta N = \sigma(l\delta L + m\delta M + n\delta N).$$

Similarly if (o, y', z') lies on ray A , and a parallel emergent ray C passes through $(o, y' + \delta y', z' + \delta z')$, and the displacement corresponds to a movement through the distance σ' in the direction (l', m', n') , we shall have

$$\delta y' \delta M' + \delta z' \delta N' = \sigma'(l'\delta L' + m'\delta M' + n'\delta N')$$

where $(L' + \delta L', M' + \delta M', N' + \delta N')$ is any direction near that of these two parallel rays. Now if the ray B emerges in the direction $(L' + \delta L', M' + \delta M', N' + \delta N')$ we have

$$\mu \delta y = \mu(y + \delta y - y) = \frac{\partial}{\partial M} (\mathcal{E}_{(B)} - \mathcal{E}_{(A)}) = \mathcal{E}_{NM} \delta M' + \mathcal{E}_{NN} \delta N' + \dots$$

$$\text{Similarly } \mu \delta z = \mathcal{E}_{NM'} \delta M' + \mathcal{E}_{NN'} \delta N' + \dots$$

Also if $(L + \delta L, M + \delta M, N + \delta N)$ is the direction of incidence of the ray C ,

$$\mu' \delta y' = -\mathcal{E}_{NM'} \delta M - \mathcal{E}_{NN} \delta N \dots$$

$$\mu' \delta z' = -\mathcal{E}_{NM'} \delta M - \mathcal{E}_{NN} \delta N \dots$$

so that neglecting small quantities of the third order

$$\mu(\delta y \delta M + \delta z \delta N) + \mu'(\delta y' \delta M' + \delta z' \delta N') = 0$$

$$\text{or } \mu\sigma(l\delta L + m\delta M + n\delta N) + \mu'\sigma'(l'\delta L' + m'\delta M' + n'\delta N') = 0,$$

$$\text{that is } \mu\sigma(\cos\theta_C - \cos\theta_B) + \mu'\sigma'(\cos\theta_{B'} - \cos\theta_{C'}) = 0$$

$$\mu\sigma\cos\theta_B - \mu'\sigma'\cos\theta_{B'} = \mu\sigma\cos\theta_C - \mu'\sigma'\cos\theta_{C'},$$

where θ and θ' are the angles made by the ray indicated with the directions (l, m, n) and (l', m', n') respectively. If then a small parallel displacement of a collection of incident rays, determined for example by their caustic surface, is to correspond to a parallel displacement of the emergent group, so that the caustic surface of the latter is to be translated without change of shape, the set of rays must all satisfy an equation of the form

$$\mu\cos\theta = p\mu'\cos\theta' + q$$

where p and q are constants, and the displacement in the image space will be p times as great as that in the object space. This cosine law is of wider application than the laws previously given, since no special assumptions, such as that the rays concerned all pass through a given point, have been made. The converse of this law, which has recently been extended in various directions, may also be proved. We can only consider here some specially simple applications.

The law of refraction is obtained by considering rays which pass through a point on the surface, the object and image displacements being necessarily equal. By considering a movement in the plane containing both rays we find, on writing ϕ and ϕ' for the complements of θ and θ' , $\mu\sin\phi = \mu'\sin\phi' + q$, and q vanishes as ϕ and ϕ' vanish together. The analytical form may also be derived at once, for we must have

$$\mu(L\delta x + M\delta y + N\delta z) = \mu'(L'\delta x + M'\delta y + N'\delta z) + q,$$

where $\delta x, \delta y, \delta z$ are the components of the common displacement, so long as $l\delta x + m\delta y + n\delta z = 0$ where l, m, n are the direction cosines of the normal to the surface. That is to say $q = 0$ and

$$\frac{\mu' L' - \mu L}{l} = \frac{\mu' M' - \mu M}{m} = \frac{\mu' N' - \mu N}{n}$$

is the formula required.

The Abbe Sine Law.—In a system symmetrical about an axis let there be no aberration in the image of a given point on the axis. The condition for the absence of aberrations in the image of a small object normal to the axis through this point is obtained by considering displacements normal to the axis. If ψ and ψ' are the angles made by an incident and the corresponding emergent ray with the axis, the condition is

$$\mu\sin\psi = p\mu'\sin\psi' + \text{constant}$$

where p is the transverse linear magnification. Since the axis itself is both an incident and emergent ray of the group forming the axial image, the constant is zero.

The Sine Law for Axial Displacements (Herschel's Condition).—In the previous system let displacements along the axis be considered. Then the condition that there should be no aberration in the image of a short element of length along the axis is

$$\mu\cos\psi = P\mu'\cos\psi' + \text{constant}.$$

Since $\psi = \psi' = 0$ is a member of the group of rays, the constant is equal to $\mu - P\mu'$, and the condition may be written in the form

$$\mu^{\frac{1}{2}} \sin \frac{1}{2} \psi = P^{\frac{1}{2}} \mu'^{\frac{1}{2}} \sin \frac{1}{2} \psi'$$

which is inconsistent with the Abbe sine law unless $\psi = \pm \psi'$. Both conditions are satisfied by paraxial rays, and therefore $P = p^2 \mu' / \mu$. This condition illustrates the proportionality of the longitudinal magnification to the square of the transverse magnification.

The Extended Sine Law.—If there is perfect imagery for the transverse plane for which the magnification is m , the displacement of the object and image point caustics must satisfy the cosine law for displacements in the directions of the y and z axes. Thus in the symmetrical system in which the axes of x and x' coincide with the axis of symmetry, and the axes of y and y' and of z and z' are respectively parallel to one another, the conditions for perfect imagery over the whole plane when there is no aberration on the axis are

$$\mu M - \mu' M' m = q$$

$$\mu N - \mu' N' m = q'$$

where q and q' are functions of y, z , the co-ordinates of the object point from which the rays arise. Symmetry shows that $q = yQ$, $q' = zQ$ where Q is a function of $y^2 + z^2$.

The Construction of the Eikonal.—Before the expressions which have been derived can be applied the eikonal must be constructed. We proceed to show how this may be done.

Suppose that the surface whose homogeneous equation is

$f(a, x, y, z) = 0$ separates media whose refractive indices are μ and μ' respectively. Let the reference planes for the two media both pass through the origin of co-ordinates and have direction cosines (L, M, N) and (L', M', N') respectively. Since for the stationary path the light travels perpendicularly to these planes, the distances of (x, y, z) from these planes for the light are $Lx + My + Nz$ and $L'x + M'y + N'z$ respectively. It readily follows that in the time taken by the light to travel from the plane (L, M, N) to the plane (L', M', N') via the point (x, y, z) the distance travelled in the standard medium is

$$\mathcal{E} = \mu(Lx + My + Nz) - \mu'(L'x + M'y + N'z).$$

If (x, y, z) determines the neighbourhood of the surface for which the time is stationary between the planes, we must have

$$(\mu L - \mu' L')\delta x + (\mu M - \mu' M')\delta y + (\mu N - \mu' N')\delta z = 0$$

for all infinitesimal values of $\delta x, \delta y, \delta z$ which satisfy

$$f_x \delta x + f_y \delta y + f_z \delta z = 0.$$

That is to say we shall have

$$\frac{\mu L - \mu' L'}{f_x} = \frac{\mu M - \mu' M'}{f_y} = \frac{\mu N - \mu' N'}{f_z}$$

and each of these will be equal to

$$\frac{\mu(Lx + My + Nz) - \mu'(L'x + M'y + N'z)}{xf_x + yf_y + zf_z}.$$

Now, since f is homogeneous in a, x, y, z ,

$$af_a + xf_x + yf_y + zf_z = 0,$$

and therefore

$$\frac{\mathcal{E}}{af_a} = \frac{\mu' L' - \mu L}{f_x} = \frac{\mu' M' - \mu M}{f_y} = \frac{\mu' N' - \mu N}{f_z}$$

Now f_a, f_x, f_y, f_z are four homogeneous functions of a, x, y, z , between which the three ratios of these variables may be eliminated, giving

$$\phi(f_a, f_x, f_y, f_z) = 0$$

where ϕ is a homogeneous function. It at once follows that \mathcal{E} satisfies the equation

$$\phi(\mathcal{E}/a, \mathcal{E}/x, \mathcal{E}/y, \mathcal{E}/z) = 0$$

where $\mathcal{E}, \mathcal{E}/x, \mathcal{E}/y, \mathcal{E}/z$ denote $\mu' L' - \mu L, \mu' M' - \mu M, \mu' N' - \mu N$ respectively. This equation expresses \mathcal{E} , the stationary path length between the planes (L, M, N) and (L', M', N') , in terms of their direction cosines, so that \mathcal{E} is the eikonal.

Consider refraction at the paraboloid of revolution

$$y^2 + z^2 - 4ax = 0.$$

Here

$$\frac{f_a}{-4x} = \frac{f_x}{-4a} = \frac{f_y}{2y} = \frac{f_z}{2z},$$

so that

$$f_y^2 + f_z^2 - f_x f_a = 0$$

and

$$\mathcal{E} = a \frac{\mathcal{M}^2 + \mathcal{N}^2}{\mathcal{L}}.$$

Again at the spherical surface

$$x^2 + y^2 + z^2 - r^2 = 0$$

we have

$$\frac{f_x}{x} = \frac{f_y}{y} = \frac{f_z}{z} = \frac{f_r}{-r},$$

and therefore

$$f_x^2 + f_y^2 + f_z^2 = f_r^2$$

or

$$\mathcal{E} = \pm r(\mathcal{L}^2 + \mathcal{M}^2 + \mathcal{N}^2)^{\frac{1}{2}}.$$

One root corresponds to the part of the surface which is convex, the other to the part which is concave, to the incident light.

By a similar process the equation of the refracting surface may be found when \mathcal{E} is given as a homogeneous function of the first order in $\mathcal{L}, \mathcal{M}, \mathcal{N}$. The equation of the eikonal for the sphere may be written

$$\mathcal{E} = r[\mu'^2 + \mu^2 - 2b - 2(\mu^2 - 2a)^{\frac{1}{2}}(\mu'^2 - 2C)^{\frac{1}{2}}] = r(\mu' \cos \phi' - \mu \cos \phi)$$

where ϕ and ϕ' are the angles of incidence and refraction. If then we write $\kappa = \frac{\mu' \cos \phi' - \mu \cos \phi}{r}$, we have $\mathcal{E} = r^2 \kappa$, $\mathcal{E} \mathcal{E}_b = -r^2$ or the secondary focal lengths are μ/κ and μ'/κ respectively, where κ is called the secondary power. The equations

$$\kappa \mathcal{E}_a = \frac{\mu' L'}{\mu L}, \quad \kappa \mathcal{E}_c = \frac{\mu L}{\mu' L'}$$

merely mean that the refracting surface is the unit surface. Again

$$\mathcal{E}_b + 2a \mathcal{E}_{ab} + b \mathcal{E}_{bb} + b \mathcal{E}_{ac} + 2c \mathcal{E}_{bc} = -\frac{\cos \phi \cos \phi'}{LL'\kappa}$$

so that the primary power is $\kappa \sec \phi \sec \phi'$; also

$$\mathcal{E}_c - L'^2 \{ \mathcal{E}_a + 2a \mathcal{E}_{ab} + 2b \mathcal{E}_{bc} + 2c \mathcal{E}_{cc} \} = \frac{\sin^2 \phi}{\kappa},$$

the quantity on the left when multiplied by μ' being the distance between the primary and secondary principal foci in the image space, that is to say the astigmatism. It is worth noting that at the two principal foci the astigmatism is inversely as the refractive index.

When the incidence is normal both powers become equal to $\frac{\mu' - \mu}{r}$, an expression of importance because in a symmetrical

instrument incidence is normal for paraxial rays, that is rays which lie close to the axis of symmetry. As the unit in which powers are expressed, the dioptre or dioptre, the inverse of a metre, is universally employed. Thus a lens of power 5 dioptres (written 5D.) has a focal length of 20 cm. in air.

The Combination of Systems.—Having found the eikonal for the separate surfaces of the instrument it is now necessary to find those for the combination. The process involved may be illustrated by combining two systems. Let O_0, O_1 and O_2 in media of refractive indices μ_0, μ_1 and μ_2 be the reference points on the axis, \mathcal{E}_1 the eikonal for the first portion between planes through O_0 and O_1 , \mathcal{E}_2 that for the second part between planes through O_1 and O_2 , and \mathcal{E}_{12} that for the whole. From the definitions of the eikonal it follows that $\mathcal{E}_{12} = \mathcal{E}_1 + \mathcal{E}_2$. Moreover

$$-\frac{\partial \mathcal{E}_1}{\partial M_1} = \mu_1 y_1 = \frac{\partial \mathcal{E}_2}{\partial M_1}, \text{ or } \frac{\partial}{\partial M_1} (\mathcal{E}_1 + \mathcal{E}_2) = 0$$

with a similar equation involving N_1 . These two conditions enable M_1 and N_1 to be eliminated from $\mathcal{E}_1 + \mathcal{E}_2$, leaving \mathcal{E}_{12} expressed in terms of the external variables only.

Paraxial Laws.—From the formulae reached in a previous section we see that the refraction of paraxial rays is determined by the part of \mathcal{E} which is linear in a, b and c . Let us put

$$\mathcal{E} = \text{const.} + \alpha a + \beta b + \gamma c + \dots;$$

then the conditions from which M_1 and N_1 are to be found are

$$\mu_0 M_0 \beta_1 + \mu_1 M_1 \gamma_1 + \mu_1 M_1 \alpha_2 + \mu_2 M_2 \beta_2 = 0,$$

$$\mu_0 N_0 \beta_1 + \mu_1 N_1 \gamma_1 + \mu_1 N_1 \alpha_2 + \mu_2 N_2 \beta_2 = 0.$$

Squaring and adding we find for the combination

$$\mathcal{E} = \text{constant} + \alpha_1 a - \frac{\beta_1^2 a + \beta_1 \beta_2 b + \beta_2^2 c}{\gamma_1 + \alpha_2} + \gamma_2 c + \dots$$

This expression shows that if we put

$$\alpha = \frac{A}{B}, \quad \beta = -\frac{1}{B}, \quad \gamma = \frac{C}{B}, \quad AC - BD = 1$$

the paraxial constants of the compound instrument are given by the matrix law

$$\begin{pmatrix} A_{12} & D_{12} \\ B_{12} & C_{12} \end{pmatrix} = \begin{pmatrix} A_1 & D_1 \\ B_1 & C_1 \end{pmatrix} \begin{pmatrix} A_2 & D_2 \\ B_2 & C_2 \end{pmatrix},$$

the extension of which to any number of systems is simple. It is an easy matter to show that the equations for the points in which a ray meets the reference planes are given by

$$\begin{pmatrix} A & 1 \\ 1 & C \end{pmatrix} \begin{pmatrix} \mu M \\ -\mu' M' - \mu' N' \end{pmatrix} = B \begin{pmatrix} y & z \\ y' & z' \end{pmatrix},$$

the converse relation by

$$\begin{pmatrix} A & 1 \\ 1 & C \end{pmatrix} \begin{pmatrix} -y' & -z' \\ y & z \end{pmatrix} = D \begin{pmatrix} \mu' M' & \mu' N' \\ \mu M & \mu N \end{pmatrix},$$

and the relation between axial conjugate points by

$$\begin{pmatrix} \mu & x \\ \mu & x \end{pmatrix} \begin{pmatrix} A & D \\ B & C \end{pmatrix} \begin{pmatrix} x' \\ -\mu' \end{pmatrix} = 0.$$

If the system consists of a series of spherical refracting surfaces of powers $\kappa_1, \kappa_2, \kappa_3, \dots$ and separations $\mu_1\tau_1, \mu_2\tau_2, \dots$ between their vertices, the constants are calculated from the product

$$\begin{pmatrix} A & D \\ B & C \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ \kappa_1 & 1 \end{pmatrix} \begin{pmatrix} 1 & -\tau_1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ \kappa_2 & 1 \end{pmatrix} \begin{pmatrix} 1 & -\tau_2 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ \kappa_3 & 1 \end{pmatrix} \dots$$

where the reference points are at the points of intersection of the axis with the **extreme** surfaces and, for any surface separating media of refractive indices μ and μ' , $\kappa = R(\mu' - \mu)$, R being the curvature of the surface at the vertex, considered positive if its **convex side** is presented to the incident light. In the special case in which all the refracting surfaces cross the axis at the same point this product reduces to the simple form

$$\begin{pmatrix} A & D \\ B & C \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ \kappa_1 + \kappa_2 + \kappa_3 + \dots & 1 \end{pmatrix}.$$

Systems in which the overall axial depth is negligible are termed "**thin**." They are of much importance in the preliminary development of instruments owing to the simplicity of all formulae relating to thin systems and to the accident that it is nearly always the aim of the designer of optical systems to use no greater amount of glass, quartz or other transparent solid than is necessary.

Chromatic Aberrations.—We have hitherto regarded the refractive index as a property of the medium only. Optical instruments in general are used for the control of light of various wave-lengths, and as the nature of the light is changed the refractive index of the medium alters. It follows that A, B, C, D are liable to vary as the colour of the light changes and the position and size of the image of a given object likewise vary. Most instruments would not be of much value unless these variations could be reduced to very small amounts. We will determine the conditions that must be satisfied for them to be eliminated. We shall assume that the two media external to the system are alike and are the standard medium to which the value unity for the refractive index is conventionally ascribed for all wave-lengths.

The matrix for refraction at a single surface is

$$\begin{pmatrix} 1 & 0 \\ R(\mu' - \mu) & 1 \end{pmatrix},$$

and this may be replaced by the product

$$\begin{pmatrix} 1 & 0 \\ R(1 - \mu) & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ R(\mu' - 1) & 1 \end{pmatrix}$$

corresponding to refraction from the medium of index μ into the standard medium followed immediately by refraction from the standard medium into that of index μ' . We may therefore consider the system as a combination of a series of bodies, each bounded by two refracting surfaces, immersed in the standard medium. We call each of these elementary bodies a simple lens, and it is convenient to regard such lenses rather than the separate surfaces as the elements from which the instrument is built. The matrix for the instrument now takes the form

$$\begin{pmatrix} A & D \\ B & C \end{pmatrix} = \begin{pmatrix} A_1 & D_1 \\ B_1 & C_1 \end{pmatrix} \begin{pmatrix} 1 & -s_1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} A_2 & D_2 \\ B_2 & C_2 \end{pmatrix} \begin{pmatrix} 1 & -s_2 \\ 0 & 1 \end{pmatrix} \dots$$

where s_1, s_2 are separations in the standard medium between the vertices of successive lenses, and thus do not vary as the constitution of the light changes. If in consequence of a change in the wave-length of the light the matrix for a typical lens becomes

$$\begin{pmatrix} A + \delta A & D + \delta D \\ B + \delta B & C + \delta C \end{pmatrix},$$

the changes in the coefficients for the entire instrument to a first approximation will be given by

$$\begin{pmatrix} \delta A & \delta D \\ \delta B & \delta C \end{pmatrix} = \sum (P) \begin{pmatrix} \delta A_k & \delta D_k \\ \delta B_k & \delta C_k \end{pmatrix} (P')$$

where (P) and (P') denote the products of the matrices respectively preceding and following those of the lens κ in the matrix product for the entire system, and the summation extends to all the lenses.

$$\text{Now} \quad \begin{pmatrix} A & D \\ B & C \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ C-1 & 1 \end{pmatrix} \begin{pmatrix} 1 & D \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ A-1 & 1 \end{pmatrix},$$

and thus $\frac{C-1}{D} = R(\mu-1)$, $\frac{A-1}{D} = R'(1-\mu)$, $D = -t/\mu$ where R, R', t are the curvatures of the two surfaces and the axial thickness of the single lens. It follows that for light of a different colour for which the refractive index is $\mu + (\mu-1)/\nu$, where ν is a quantity regularly given by glass makers, the increments in A, C, D are given to the first order by

$$\delta \frac{A-1}{D} = \frac{A-1}{D\nu}, \quad \delta \frac{C-1}{D} = \frac{C-1}{D\nu}, \quad \delta D = -D \frac{\mu-1}{\mu\nu},$$

$$\text{so that } \delta A = \frac{A-1}{\mu\nu}, \quad \delta C = \frac{C-1}{\mu\nu}, \quad \delta B = \frac{B}{\nu} + \frac{(A-1)(C-1)}{\mu\nu D},$$

that is to say the increment in the matrix is

$$\frac{1}{\nu} \begin{pmatrix} 0 & -D \\ B & 0 \end{pmatrix} + \frac{1}{\mu\nu} \begin{pmatrix} A-1 & D \\ (A-1)(C-1) & C-1 \end{pmatrix}.$$

When the thickness of the component is negligible only the first of these matrices is of consequence, and the only alteration is due to a proportional change in B . If all the components are thin lenses in contact, the properties of the system, so far as the paraxial terms are concerned, will be the same for light of the two wave-lengths if $\sum \frac{B}{\nu} = 0$. In particular for a system of two thin lenses in contact we have

$$\frac{B_1}{\nu_1} = -\frac{B_2}{\nu_2} = \frac{B_{12}}{\nu_1 - \nu_2}$$

as the sole condition for achromatism. In the more general case the expressions most frequently employed are that given for δB and

$$\delta \left(\frac{A}{B} \right) = -\frac{1}{\nu} \left\{ \frac{A}{B} - \frac{(A-1)^2}{\mu D B^2} \right\}, \quad \delta \left(\frac{C}{B} \right) = -\frac{1}{\nu} \left\{ \frac{C}{B} - \frac{(C-1)^2}{\mu D B^2} \right\}.$$

Alternatively we may divide the complete expression into the three parts

$$\frac{1}{\nu} \begin{pmatrix} 0 & -D \\ B & 0 \end{pmatrix} + \frac{1}{\mu\nu} \begin{pmatrix} A & D \\ B & C \end{pmatrix} - \frac{1}{\mu\nu} \begin{pmatrix} 1 & C-2 \\ A+1 & 1 \end{pmatrix}$$

where the first indicates a proportional increment in the power of the element and a decrement in its effective thickness, the second a proportional change in all constants of the complete system, and the last the subtraction of the change in these constants which would arise if the separation between the surfaces of the component were annihilated without any change in the curvatures of its surfaces. In actual calculations it is probably more convenient to replace the $-D$ in the first part by 0 and the 0 in the last part by -1 .

In a large number of instruments having a small field of view the only condition to which close attention is paid is the coincidence of the principal focal planes for different colours corresponding to $\delta \left(\frac{C}{B} \right) = 0$. When the field is large the condition

$\delta B = 0$ has to be closely satisfied also. In the older eyepieces consisting of two separated simple thin lenses (those nearest the objective and the eye being respectively named the field lens and the eye lens), no other chromatic condition was imposed on this part of the instrument. This leads to the definite value

$$\left(\frac{\nu_1}{\kappa_1} + \frac{\nu_2}{\kappa_2} \right) / (\nu_1 + \nu_2)$$

for the axial separation of the two lenses, and when both lenses are made from the same kind of glass the old rule that the separation should equal the mean of the focal lengths of the two lenses follows. Modern eyepieces have to cover larger fields than are suited to the older forms, and either the field lens, or the eye lens, or both are compound. Attention to all three conditions is comparatively rare, and is only of importance when good correction is desired in widely separated image planes. If the system is symmetrical end for end, $A=C$, and the three conditions fall to two. Since

$$\begin{pmatrix} A & D \\ B & C \end{pmatrix} \begin{pmatrix} C & \frac{D}{p} \\ pB & A \end{pmatrix} = \begin{pmatrix} AC + pBD & (1 + \frac{1}{p})AD \\ (1 + p)BC & AC + \frac{1}{p}BD \end{pmatrix},$$

a complete system made from two similar components, not necessarily of equal focal length, with corresponding parts next to one another, will be achromatised if A/B and D/C remain unaltered as the colour changes, that is to say the separate components, must be corrected for the position in which light parallel to the axis between the components comes to a focus, and for the image of the centre of symmetry.

The discussion of the conditions which should be satisfied when the rays considered do not lie close to the axis does not differ in any essential feature from that just given.

Aberrations for Homogeneous Radiation.—We have seen earlier that a plane image of a plane object will only be secured when \mathcal{E} is expressible as a function of $(\mu M - G\mu' M')$ and $(\mu N - G\mu' N')$ only, where G is the transverse magnification. In general other terms occur, and the characteristic effects due to them are called aberrations. The quadratic terms in \mathcal{E} may be written in the form

$$-\frac{1}{2}[\sigma_0 A^2 - 2\sigma_1 AB + \sigma_2 B^2 + 2(\sigma_2 + \frac{\omega}{\kappa})AC - 2\sigma_3 BC + \sigma_4 C^2]$$

where A, B, C denote the quantities previously defined and the σ 's are known as the aberrational coefficients; σ_1 is the coefficient for distortion, σ_2 for astigmatism, ω for curvature of the field, σ_3 for coma, and σ_4 for central aberration. Central aberration is so named because the other aberrations disappear on the axis of the system. It must not be supposed that central aberration is not present over the whole field. The significance of these terms will be more fully appreciated if we note that the co-ordinates (Y, Z) of an image point when aberrations are absent are given by

$$Y\kappa = \mu M - G\mu' M', \quad Z\kappa = \mu N - G\mu' N'.$$

If then (η, ζ) is the point in which the plane of the stop is met we may substitute

$$A = \frac{(Y^2 + Z^2)\kappa^2}{2(S - G)^2}, \quad B = \frac{(Y\eta + Z\zeta)\kappa^2}{(S - G)^2}, \quad C = \frac{(\eta^2 + \zeta^2)\kappa^2}{2(S - G)^2}$$

in either the expression for \mathcal{E} or in

$$y' - Y = \frac{1}{(S - G)} (Y\mathcal{E}_B + \eta\mathcal{E}_C), \quad z' - Z = \frac{1}{S - G} (Z\mathcal{E}_B + \zeta\mathcal{E}_C).$$

From the latter we see that a finite value of σ_1 implies only a fixed displacement of the image point from its ideal position, so that object and image are not geometrically similar; hence the description of this aberration as distortion. At the displaced image point there is no difference of phase. By writing

$$(Y^2 + Z^2)(\eta^2 + \zeta^2) = (Y\eta + Z\zeta)^2 + (Y\zeta - Z\eta)^2$$

we see that the terms in B^2 and AC may be analysed into two components, for one of which the point of intersection with the stop lies in the same axial plane as the object point, and for the other in a perpendicular axial plane. It is easy to show that either of these divergences may be removed for a given object point by moving the image plane along the axis. The terms in fact denote that the primary and secondary image surfaces are curved, the curvatures at the axis being $3\kappa^2\sigma_2 + \kappa\omega$ and $\kappa^2\sigma_2 + \kappa\omega$ respectively. The common part $\kappa\omega$, which depends only on the Airy-Petzval sum, is known technically as the curvature. A finite value of σ_2

implies that the primary and secondary image surfaces differ in curvature, so that σ_2 measures their separation, *i.e.*, the astigmatism. The coma, which has σ_3 for its coefficient, differs from the others in that $y' - Y$ and $z' - Z$ change in sign with η and ζ . The geometrical trace of the rays is therefore unsymmetrical and the phase variation is also unsymmetrical. No change of focus will remove this defect, but the want of symmetry may be removed, for small apertures, by choosing a proper position for the stop. Such a change however also affects the aberrations we have already mentioned. It may easily be shown that the rays from any object point which pass through one half of a circular zone of the stop concentric with the axis, meet the image plane in a complete circle, touching two straight lines, making an angle of 60° with one another, which meet in the image point for light which has passed through the centre of the stop. The primary focus for rays in the axial plane is three times as far as the secondary focus from the ideal image point. The central aberration measured by σ_4 is symmetrical, the rays through concentric circular zones of the stop meeting the image surface in concentric circular zones of radii proportional to the cube of the radii of the former. The aberration implies that each zone has a separate surface on which the image is formed, owing to want of agreement of phase. The primary foci for light from a point on the axis lie on a semi-cubical paraboloid with the axis of the system for its axis of revolution; the axis itself is the locus of the secondary foci. The former are three times as far as the latter from the paraxial image plane. The coefficient σ_0 , with a correction added, is the quantity which corresponds to σ_4 when the reference plane is moved to another position. It is interpreted as the central aberration at the middle of the stop.

We can obtain the addition laws very simply for these aberrations by noting that, since all the paraxial terms when eikonals are added are completely accounted for by substituting for the intermediate direction cosines expressions linear in the external direction cosines, we have only to make the same substitutions for A, B, C in these aberrational terms. The expressions obtained in this way are

$$(\sigma_p)_{1,n} = \sum (\sigma_p)_\kappa S_\kappa^{4-p} G_\kappa^p, \quad (p = 0, 1, 2, 3, 4),$$

where the component parts are n in number, of which κ is a typical member, and S_κ, G_κ are the magnifications which the images of the stop and of the object formed by lens κ undergo in

the subsequent parts of the system. The quantity $\frac{\omega}{\kappa}$, where κ is

the power of the system, is transformed according to the same law as σ_2 , and in this case we are led to an expression which is well known on account of its simplicity. This is the so-called Petzval sum

$$(\omega\kappa)_{1,n} = \sum (\omega\kappa)_\kappa$$

where $\omega_\kappa = \frac{1}{\mu_\kappa \mu'_\kappa}$. A more correct name would be the Airy sum, using the name of its first discoverer.

If \mathcal{E} and \mathcal{E}' are the eikonals for the same system when the reference points correspond to two different magnifications G and G' , we have

$$\mathcal{E} - \frac{\mu^2 L}{\kappa G} - \frac{\mu'^2 L' G}{\kappa} = \mathcal{E}' - \frac{\mu^2 L}{\kappa G'} - \frac{\mu'^2 L' G'}{\kappa},$$

and if A', B', C' are the effective variables in the latter expression corresponding to the A, B, C of the former, we obtain a linear transformation from the one system to the other, and the aberrational coefficients for any positions of the object and stop can be expressed in terms of those for standard positions. By paying special attention to the factor $4AC - B^2$ which can be separated in a large number of terms, we are enabled to classify the aberrations generally by order and by series, the latter classification deriving its importance from the fact that though the conditions for the disappearance of any given aberration depend on the magnification, the disappearance of all the aberrations of a given order and series for a given pair of object and stop positions involves their disappearance for all positions. To this rule there is only one exception—that of the zero series, comprised of terms

which do not contain $4AC - B^2$ as a factor. In the quadratic terms just considered we may write the terms in B^2 and AC in the form

$$-\frac{1}{6}\left(3\sigma_2 + \frac{\omega}{\kappa}\right)(B^2 + 2AC) - \frac{\omega}{6\kappa}(4AC - B^2)$$

showing that the term involving ω belongs to series 1.

It is no less advantageous when considering aberrations than when dealing with the paraxial constants to take the simple lens rather than the single surface as the effective unit. We proceed to find expressions for the aberrational coefficients of a simple thin lens, taking as the standard conditions the stop in the unit surface and the object in the surface for magnification -1 . This choice offers many advantages due to symmetry. If object and image space are interchanged the coefficients with an even suffix are unaltered and those with an odd suffix merely changed in sign.

If the origins are taken at the vertex of a single surface system of power κ_1 ,

$$\mathcal{E}_1 = \frac{\mu_1 - \mu_0}{2\kappa_1} \left[\frac{\mathcal{M}_1^2 + N_1^2}{\mathcal{E}_1} - \frac{\epsilon_1(\mathcal{M}_1^2 + N_1^2)^2}{2\mathcal{E}_1^3} + \dots \right].$$

Adding a similar expression, the condition, $\frac{\partial}{\partial M_1}(\mathcal{E}_1 + \mathcal{E}_2) = 0$

gives $\mu_1 M_1 \kappa = \mu_0 M_0 \kappa_2 + \mu_2 M_2 \kappa_1$, where $\kappa = \kappa_1 + \kappa_2$.

Hence $\mu_1 M_1 = \frac{\mu_0 M_0 + \mu_2 M_2}{2} - \frac{\kappa_1 - \kappa_2}{\kappa} \left(\frac{\mu_0 M_0 - \mu_2 M_2}{2} \right)$,

$$\frac{\mathcal{M}_1}{\kappa_1} = \frac{\mathcal{M}_2}{\kappa_2} = - \frac{\mu_0 M_0 - \mu_2 M_2}{\kappa}.$$

To secure reference points at the negative unit surfaces we have to add $2(\mu_2^2 L_2 + \mu_0^2 L_0)/\kappa$ to \mathcal{E} . Write τ, μ, τ for μ_0, μ_1, μ_2 and put $\kappa_1 - \kappa_2 = 2(\mu - \tau)\rho\kappa$ so that $\rho\kappa$ is the common addition made to the curvature of both surfaces to derive its shape from the symmetrical form. Then on expansion we find

$$\begin{aligned} \mathcal{E}\kappa &= 4 - 4A - 2A^2 - 2B^2 - 4(1 + \omega)AC - 8\rho(1 + \omega)BC \\ &- 2\left\{ \frac{1}{(1 - \omega)^2} + 4\rho^2(1 + 2\omega) + (\epsilon_1 + \epsilon_2 - 1) \left\{ \frac{1}{(\mu - 1)^2} + 12\rho^2 \right\} \right. \\ &\quad \left. + (\epsilon_1 - \epsilon_2)2\rho \left\{ \frac{3}{\mu - 1} + 4\rho^2(\mu - 1) \right\} \right\} C^2 + \dots \end{aligned}$$

where $\omega = \tau/\mu$. If the surfaces are spherical $\epsilon_1 = \epsilon_2 = \frac{1}{2}$ and the last two terms disappear from the coefficient of C^2 . If they are paraboloidal $\epsilon_1 = \epsilon_2 = 0$ and the coefficient of C^2 becomes

$$-2\left[\frac{1 + \omega}{1 - \omega} - 8\rho^2(1 - \omega) \right].$$

Since the refracting surfaces are in contact the coefficient of A^2 must correspond to the absence of stop aberration. The absence of a term in AB indicates that there is no distortion. The coefficients which determine the curvature and astigmatism are not under control. The coma may be removed by giving the lens a symmetrical form—that is by making $\rho = 0$. The central aberration can then only be controlled by giving the surfaces a suitable shape—viz., by making $\epsilon_1 = \epsilon_2 = -\frac{1}{2}(\mu^2 - 1)$. This fixes the eccentricity of the osculating ellipsoids.

Let us write 4β for the coefficient BC and -2γ for that of C^2 . Then with the stop magnification S and the object magnification G , after moving the origins and introducing the appropriate changes in A, B, C , we find the following expression, most of the coefficients in which were first obtained by Airy.

$$\begin{aligned} \mathcal{E}\kappa &= -\frac{(1 - G)^2}{G} + \frac{(S - G)^2}{G}A - \frac{(S - G)(S^2 - G)}{2G}A^2 \dots \\ &- \frac{1}{2}[\gamma - 4S\beta + S^2(3 + 2\omega)](1 - S)^4A^2 \\ &+ \frac{1}{2}[\gamma - (3S + G)\beta + 3S^2 + S(S + G)\omega](1 - S)^2(1 - G)AB \\ &- \frac{1}{2}[\gamma - 2(S + G)\beta + S(S + 2G) \\ &+ \frac{1}{2}(S^2 + 4SG + G^2)\omega](1 - S)^2(1 - G)^2(2AC + B^2) \end{aligned}$$

$$-\frac{\omega}{12}(S - G)^2(4AC - B^2)$$

$$+ \frac{1}{2}[\gamma - (S + 3G)\beta + G(2S + G) + G(S + G)\omega](1 - S)(1 - G)^2BC \\ - \frac{1}{2}[\gamma - 4G\beta + G^2(3 + 2\omega)](1 - G)^4C^2$$

where $S = \frac{1 + S}{1 - S}$, $G = \frac{1 + G}{1 - G}$ and the terms in the first line correspond to the elimination of aberrations. We may now employ the addition formulae for these aberrational coefficients to obtain corresponding expressions for any number of thin lenses in contact. We then find that ω is the Airy-Petzval sum, and if $\rho\kappa$ is a common curvature addition made to all the surfaces from a standard form the preceding formulae apply without alteration except that β and γ take the forms

$$\beta = \beta_0 + 2\rho(1 + \omega), \quad \gamma = \gamma_0 + 4\rho^2(1 + 2\omega).$$

These formulae are particularly advantageous in their application to lenses which are to be cemented together, so that the second surface of one lens has the same curvature as the first surface of the next succeeding lens. For example telescope objectives may be advantageously designed in this way, the conditions to be applied being $\sigma_3 = \sigma_4 = 0$, that is $\beta = (2 + \omega)G$, $\gamma = (5 + 2\omega)G^2$, where $G = 1$ for an infinitely distant object. The coma is eliminated by giving a suitable degree of "bending" to the lens as a whole, and the central aberration by the choice of suitable glasses, or by departing from the spherical form for the surfaces, or by distributing the lens powers suitably between three or more components. When there are only two component lenses the ratio of their powers is determined by the condition for the removal of the chromatic aberrations. For more complete information on these developments the reader is referred to numerous papers in the *Transactions of the Optical Society*.

When the lens is no longer thin expressions for the aberrations differing very slightly from those just given may be obtained by the same general procedure. As a rule it is unnecessary to repeat the calculations after such thicknesses as are necessary for the construction of an actual lens have been introduced, as it has been shown that over a wide range of constructions the aberrations of this order introduced by separating the surfaces are automatically compensated in the most advantageous way by the aberrations of the next higher order which become significant at the aperture the thickness is introduced to yield.

Formulae may be obtained for these higher order aberrations in a similar manner; the chief complication is due to the necessity for taking into account in the values of M_1 and N_1 terms depending on the lower order aberrations.

Main Types of Optical Instruments.—Optical instruments tend to assume one of a few forms. Telescopes are systems of very great or even infinite focal length; they may invariably be regarded as a combination of two systems of finite focal length placed with their inner principal focal surfaces nearly or exactly in coincidence. The one part, often of large absolute aperture and long focal length, usually conforms to the thin lens type and is corrected for coma and central aberration. In the other part, the eyepiece, attention is chiefly given to the curvature and astigmatism. Telescopes are essentially instruments for increasing the angle an object appears to subtend at an observer's eye, and in most of them the field of view is small. At the opposite extreme are microscopes, also divisible into objective and eyepiece, but the former is of short focal length and small absolute, but large numerical, aperture. In the higher powers (that is shorter focal lengths) the objectives tend to be very complex. As with telescopes the most important objective corrections are those for colour, central aberration and coma. The eyepiece is of simple construction. Only a small part of an object can be viewed at once. Camera lenses form a class in some respects intermediate between telescopes and microscopes. The field is large and the numerical aperture moderate. In general they are not separable into parts having distinct functions, and all aberrations must be considered. The use of lenses at appreciable axial separations is necessary for the attainment of satisfactory

corrections.

Ray Tracing.—The professional optical designer in evolving complex instruments finds it expedient to use formulae for the aberrational coefficients merely as a general qualitative or roughly quantitative guide to indicate the modifications he should make in a partially developed system to reduce as far as possible the remaining aberrations. The outstanding difficulty in the way of using algebraic expansions for the whole of his work is the uncertain value of the terms of the expansion he must neglect. As he aims at taking into consideration lengths as small as a quarter of a wave length or less, that is to say about one ten-thousandth of a millimetre, it will be appreciated that our knowledge of the higher order aberrations must be thorough before reliance can in general be placed on expansions. The method adopted by the designer is to trace step by step through the system a selected set of rays, and to infer from their positions in the image space the aberrations remaining in the system. For tracing these rays many methods have been devised, of which particulars may be obtained from practical treatises. They are usually entirely trigonometrical, and logarithmic tables are generally employed. The calculations for skew rays are necessarily much more troublesome than those for rays in an axial plane, and in practice skew rays are rarely computed. A method of computing rays in an axial plane, suitable for use with a calculating machine, is as follows.

The incident ray is defined by b , the length of the perpendicular to the ray from the vertex of the surface, and $\sin\psi$, where ψ is the angle between the ray and the axis. The refractive index is denoted by μ , the angle of incidence by ϕ , the curvature of the surface by R , and the separation between the vertices of this and the next surface by l . The same letters, with accents where necessary, are used for the refracted ray, and with the suffix 1 for the following surface.

In the customary methods of calculation ψ_1 is found by the angular relation

$$\psi_1 = \psi' = \psi - \phi + \phi'$$

which necessitates references to tables. In the present method the use of these tables is avoided by first finding an approximate value $\sin\theta$ for $\sin\psi'$ given by

$$\sin\theta = \sin\psi - \sin\phi + \sin\phi'.$$

In the absence of aberration this value is correct, and also $b' = b$. In general aberration is present and corrections of aberrational magnitude are required. The working equations are

$$\begin{aligned}\sin\phi &= \sin\psi + Rb, \\ \sin\phi' &= \sin\phi \times \mu/\mu', \\ \sin\theta &= \sin\psi - \sin\phi + \sin\phi', \\ N &= b(\sin\phi - \sin\phi')(\sin\psi + \sin\phi'), \\ D &= \frac{1}{2}\{\sin^2\theta + (\cos\psi + \cos\phi + \cos\psi')^2 - 1\}, \\ b' - b &= N/D, \\ \sin\psi' &= \sin\theta - R(b' - b), \\ b_1 &= b' + l\sin\psi_1.\end{aligned}$$

It is to be noted that $\frac{1}{2}N$ and $\frac{1}{2}N\mu\sin\phi$ are the linear first order coma and spherical aberration respectively for the single refraction, D is the ratio of twice the first order aberration to the total aberration, and

$$(b' - b)\mu\sin\phi$$

$$\{(1 + \cos\psi)(1 + \cos\phi)(1 + \cos\phi')(1 + \cos\psi')\}^{\frac{1}{2}},$$

which is represented at most refractions with ample accuracy by

$$\frac{1}{2}(b' - b)\mu\sin\phi,$$

is the difference in path between the route along the ray and that along the axis from their first to their second crossing point. Brief tables are used for finding D .

Graphical methods of representing the state of correction of the system are widely used. For example the central aberrations may be shown by taking as ordinate the distance from the axis

at which a ray crosses the unit surface and as abscissa the distance of its intersection with the axis from a suitable fixed point. The type of curve thus secured is widely used. The paraxial portion of the curve touches the ordinate axis. A more useful curve is obtained by taking the square of the height at which the unit surface is crossed as ordinate. The inclination of this curve to the ordinate axis for rays near the axis depends on the lowest order central aberration, and the curvature gives higher order aberrations. Moreover if we draw through any point X on the abscissa axis a straight line parallel to the ordinate axis, the areas intercepted between this line and the curve measure the differences of path for light passing through the corresponding zones of the unit surface when the image point is at X . By choosing this ordinate so as to cut off alternately equal areas on opposite sides of the curve we can determine the point for which the differences of phase will be least. Corresponding to each geometrical figure a second curve may be drawn with the same ordinates, and the phase at a given image point as abscissa. When only first order aberration is present the geometrical figure is an inclined straight line, the phase curve is a parabola, and the best focus will be at the mid-point of the projection of the straight line on the abscissa axis. This result is at variance with the geometrical prediction that the best position of focus is three times as far from the position where the paraxial rays come to a focus as from the intersection of a marginal ray with the axis.

Aplanatic Surfaces.—Although some lenses designed in the last few years show marked improvements on any that were produced before the World War, no system has yet been evolved which yields over a wide surface an image entirely free from aberration. Points imaged without differences of phase for monochromatic (often called monochromatic) light have long been named aplanatic points. A more restricted interpretation of the term, now universally adopted, was introduced by Abbe, the change involving the absence of aberrations when the object point makes small excursions in a definite surface. Connected aggregates of object and image points each having this property form a pair of aplanatic surfaces. Until recently our knowledge of the conditions under which such perfect imagery is possible were very limited—they amounted to hardly more than the plane mirror reflection, in which the whole object space is imaged without aberration, the aplanatic spheres discovered by Thomas Young for refraction at a sphere, and the trivial case of any single surface at which refraction occurs. A more general result is obtained by noting that if \mathcal{E} is given explicitly as a function of the direction cosines (L, M, N) and (L', M', N') , the points

$$\left(\frac{\partial \mathcal{E}}{\partial L}, \frac{\partial \mathcal{E}}{\partial M}, \frac{\partial \mathcal{E}}{\partial N}\right) \text{ and } \left(-\frac{\partial \mathcal{E}}{\partial L'}, -\frac{\partial \mathcal{E}}{\partial M'}, -\frac{\partial \mathcal{E}}{\partial N'}\right)$$

are on the incident and emergent rays respectively. Let us now suppose that \mathcal{E} is a homogeneous function of the first order of three variables α, β, γ , each of which is a linear function of the six direction cosines, so that

$$\alpha = \alpha_0 + \alpha_1\mu L + \alpha_2\mu M + \alpha_3\mu N - \alpha_4\mu' L' - \alpha_5\mu' M' - \alpha_6\mu' N'$$

where $\alpha_0, \alpha_1, \dots$ are constants, with corresponding expressions for β and γ . Then

$$x = \alpha_1 E_\alpha + \beta_1 E_\beta + \gamma_1 E_\gamma, \quad x' = \alpha_4 E_\alpha + \beta_4 E_\beta + \gamma_4 E_\gamma$$

with similar equations for y, y' and z, z' . It follows that $E_\alpha, E_\beta, E_\gamma$ can be found in terms of x, y, z , and thus definite values of x', y', z' obtained. That is to say we obtain a one-one correspondence between these points of the object and image spaces. They will be object and image points if the length of the optical path between them is constant. Now this path is

$$\mathcal{E} + \mu'(L'x' + M'y' + N'z') - \mu(Lx + My + Nz)$$

or substituting from the equations for x, y, z, x', y', z' the path length is

$$\mathcal{E} - (\alpha - \alpha_0)E_\alpha - (\beta - \beta_0)E_\beta - (\gamma - \gamma_0)E_\gamma;$$

that is, since \mathcal{E} is homogeneous of the first order in α, β, γ , the path is

$$\alpha_0 \mathcal{E}_\alpha + \beta_0 \mathcal{E}_\beta + \gamma_0 \mathcal{E}_\gamma$$

which depends only on the object point (x, y, z) . There is thus no aberration in the image of this point. Moreover the aggregate of these object points forms a surface. For \mathcal{E} satisfies a homogeneous relation of the form $\theta(\mathcal{E}, \alpha, \beta, \gamma) = 0$, to which we can add three homogeneous equations

$$\frac{\theta_\alpha}{\mathcal{E}_\alpha} = \frac{\theta_\beta}{\mathcal{E}_\beta} = \frac{\theta_\gamma}{\mathcal{E}_\gamma} = -\epsilon_r.$$

On eliminating the ratios α, β and γ bear to \mathcal{E} between these four equations we obtain a relation of the form $\phi(\mathcal{E}_\alpha, \mathcal{E}_\beta, \mathcal{E}_\gamma) = 0$, and if $\mathcal{E}_\alpha, \mathcal{E}_\beta, \mathcal{E}_\gamma$ are replaced by their values in terms of x, y, z and of x', y', z' we obtain the equations of the object and image surfaces. From the linear character of α, β, γ it follows that the image surface can at most be a regular deformation of the object surface.

The converse process of constructing the eikonal which will yield given aplanatic surfaces can be carried out. It is merely a slight generalization of the process by which the eikonal was constructed for a given refracting surface.

In general a given optical system can have only one pair of aplanatic surfaces, for \mathcal{E} can only be expressed in one way as a homogeneous function of the direction cosines. Spherically symmetrical systems are exceptional. For example if

$$\mathcal{E} = (\alpha^2 + \beta^2 + \gamma^2)^{\frac{1}{2}}$$

where $\alpha = pL + qL', \beta = pM + qM', \gamma = pN + qN'$,

we may, in consequence of the identities

$$L^2 + M^2 + N^2 = 1 = L'^2 + M'^2 + N'^2,$$

rewrite the equation in the form $\mathcal{E} = (\alpha'^2 + \beta'^2 + \gamma'^2)^{\frac{1}{2}}$ where

$$\alpha' = qL + pL', \beta' = qM + pM', \gamma' = qN + pN'.$$

Corresponding to the first form we have the conjugate surfaces

$$\mu^2(x^2 + y^2 + z^2) = p^2, \mu'^2(x'^2 + y'^2 + z'^2) = q^2,$$

and corresponding to the second the pair

$$\mu^2(x^2 + y^2 + z^2) = q^2, \mu'^2(x'^2 + y'^2 + z'^2) = p^2.$$

Thus with a sphere, since its surface is self-conjugate, we may put $p = \mu r, q = \mu' r$, and the alternative solution shows that the concentric spheres of radii $r\mu'/\mu$ and $r\mu/\mu'$ are respectively aplanatic conjugate object and image surfaces.

Asymmetrical Systems.—We have discussed at some length the properties of symmetrical lens systems because they form by far the most important section of geometrical optics. The expressions that have been given enable all the ordinary problems to be dealt with—for example the paraxial expressions are sufficiently accurate to determine how large any simple lens must be to pass the rays the instrument should transmit. It is also a simple matter to derive a number of well-known conclusions from the general laws that have been given—for example that the use of an optical instrument will not enable a brighter image of an object subtending an appreciable angle to be formed on the retina of an observer's eye. The reader is not likely to encounter any difficulty arising from the use of prisms inserted for the reflection of light at plane surfaces into the system, for they are equivalent to the insertion of a thick plate of glass with plane parallel faces. Methods of designing prisms to produce desired results cannot be considered in detail here. As a rule a trigonometrical procedure is adopted, but algebraic methods employing matrices appear to offer decided advantages.

There remain systems of much importance without axial symmetry. The theory of such systems, though not difficult, is much more involved than that of axially symmetrical systems. Taking systems in which all the surfaces are met normally by some straight line, and yield symmetrical sections when cut by any plane through this line, which may be called the axis, we find that in place of the second degree matrix for the axially symmetrical system we have to adopt a square matrix of the fourth degree, with sixteen constituent elements. Between these sixteen

quantities six independent identities subsist, so that at most there are ten degrees of freedom for paraxial rays. For an account of these quantities, their connections with the positions of the rays and with various expressions giving the lengths of paths through the system, reference should be made to the *Transactions of the Optical Society*. When we proceed to higher order terms representing aberrations the complexity of the theory is enhanced. For example corresponding to the six coefficients for the lowest order monorhythmic aberrations in axially symmetric systems we have in these unsymmetrical systems no less than thirty-five coefficients.

Experimental Methods.—The marked changes in the way optical instruments have come to be regarded in recent years is reflected in experimental applications of the theory. A good example is afforded by the use of modified types of Michelson interferometers for the testing of optical instruments. This application of interference is due to F. Twyman. An instrument of this type, equipped for varied work, has been constructed by Messrs. Adam Hilger, Ltd., for the National Physical Laboratory, at Teddington, England. Many other interference methods have recently been described. Space will not permit us to discuss many interesting points which arise in the use of these and other methods of investigating the properties of optical instruments experimentally. (See LENS.)

BIBLIOGRAPHY.—Nearly all authorities deal with the geometrical theory only, and some are chiefly of value on account of miscellaneous articles.

See for historical interest mainly: H. Coddington, *Treatise on the Reflexion and Refraction of Light*; W. R. Hamilton, "Theory of Systems of Rays" (4 papers from the *Proceedings of the Royal Irish Academy* which serve as a starting point for modern work); R. Smith, *Complete System of Opticks*.

More modern works are: S. Czapski and O. Eppenstein, *Grundzüge der Theorie der optischen Instrumente*; H. Geiger and K. Scheel, *Handbuch der Physik*; XVIII. H. Koenig, *Geometrische Optik*; R. T. Glazebrook, *Dictionary of Applied Physics*; IV. *Optics*; R. S. Heath, *Geometrical Optics*; R. A. Herman, *Geometrical Optics*; M. von Rohr (trans. R. Kanthack), *Formation of Images in Optical Instruments*; J. P. C. Southall, *Principles and Methods of Geometrical Optics*; Steinheil and Voit (trans. J. W. French), *Applied Optics*; G. C. Steward, *The Symmetrical Optical System* (Tract); H. D. Taylor, *A System of Applied Optics*.

For the physical principles involved reference may be made to the optical papers of the late Lord Rayleigh. The writings of A. Gullstrand are important for the optics of spectacle lenses.

Most recent work has been described in journals devoted to optics, of which the chief are the *Transactions of the Optical Society*, *Revue d'Optique*, *Journal of the Optical Society of America*, and *Rivista d'Optica*.

Valuable contributions will also be found in *Zeitschrift für Instrumentenkunde*, *Die Naturwissenschaften*, *Phil. Trans.*, *Proceedings of the Physical Society*, and many others. An extensive bibliography is given by Czapski and Eppenstein. (T. SM.)

OPTIMISM, in philosophy, is the theory that the world is the best possible, or that life is worth living (to allude to the popular form of the problem). For a discussion of this question see MELIORISM; PESSIMISM; PLATO; LEIBNITZ; HEGEL; also J. Sully, *Pessimism* (1877).

OPTIMUM POPULATION. The origin of this term is not clear. Since the World War it has come into common use to indicate a conception of the relation between population and the produce of industry to which Prof. Edwin Cannan first gave clear expression. The optimum theory of population which is outlined in what follows was not held by Malthus or by the older authors who discussed the population problem. It was their failure to formulate this theory which robs their treatment of the matter of much of its value. This conception which lies at the basis of the position now taken by all authorities may be briefly expressed as follows. At any given time the population which can exist on a given extent of land, consistently with the attainment of the maximum return to industry possible at the time, is definite. In other words, for any given area of land under any given set of circumstances there is an optimum population. If population is at the optimum number the greatest return per head possible under the circumstances will be attained. Departure from the optimum, whether in the direction of deficiency or of excess, will be accom-

panied by a return per head less than the possible return. Departure in the direction of deficiency is called under-population and departure in the direction of excess is called over-population. It is important to realize that no distinction is to be drawn between agriculture and manufacture in relation to this matter. In Prof. Cannan's words "if we start from what I have called the point of maximum return, we can say of manufacture as well as of agriculture that returns diminish as we move in either direction from that point." It is therefore essential from the point of view of economic prosperity that the population of any country should approach as closely as possible to the optimum. Over and under-population alike imply a smaller income per head than could be attained with smaller and larger numbers respectively. Unfortunately attempts to ascertain whether under- or over-population exist meet with the utmost difficulties. Unemployment is not necessarily an indication of over-population and the comparison of figures for the national income over a period of years is an uncertain guide. It is not possible to say whether or not England or the United States are over- or under-populated. It is, however, generally held that parts of India and China are probably over-populated. It is in other words probably true that the inhabitants of these countries would be better off if the population was less dense. (See also POPULATION.)

OPTION, the action of choosing, choice, or the opportunity of choosing. In ecclesiastical law "option" was the right claimed by an archbishop to select one benefice from the diocese of a newly-appointed bishop, the next presentation to which would fall to his, the archbishop's, patronage. This right was abolished in the early 19th century. For the stock exchange "option" see *infra* OPTIONS. "Local option" or "local veto" in politics is the power given to the electorate of a particular district to choose whether licences for the sale of intoxicating liquor shall be granted or not. (See LIQUOR LAWS.)

OPTIONS. Option dealing is practised much more extensively on the Continent of Europe than in Great Britain or America, but a fair amount of business of this description is carried out daily on the London and American Stock Exchanges. Option dealing is a complicated matter, and on this account is indulged in more by professional than amateur speculators. As the name implies, an option is a right over certain stocks, commodities or things. It may be the right to buy or the right to sell. In the former case it is termed a "call" option, *i.e.*, the holder of the option has the right to take up the shares or whatever it is; in the case of an option to sell, it is termed a "put" option, the holder having the right to sell the shares to the person with whom he has entered into the bargain constituting the option. It is possible to buy a "put and call" option, which gives the holder the right either to deliver and obtain for payment the stipulated quantity of stock at a date and price arranged when the bargain is entered into, or to call for delivery to him of the same amount of stock at the same price and at the same date.

The first column represents the price to be paid for an option running for one month—or to be more precise, to the last settling day of the month following the conclusion of the bargain; the second column is for an option running yet another month, whilst the third column represents the price asked for a three-months' option. The rules of the Stock Exchange do not permit of dealings in options which run for more than three months. The price stated is for either a call option or a put option, and the double option (put and call) can be purchased for double the price named. The first price in the above list of 1½ means that for every £1.15.0. paid at the time the bargain was entered into, the Stock Exchange jobber would give the purchaser of a call option the right to buy of him for settlement on July 26 £100 of Great Western Ordinary stock at a given price, regardless of what the actual market quotation might be on that date. This given price would be approximately the price of the day on which the option bargain was entered into, plus perhaps a fractional increase to allow for the fact that by the time the option was exercised the

dividend date would be much nearer. The holder of an option, when he comes to exercise it, is entitled to all dividends, bonuses, or subscription rights that may have accrued during the period of his option. In the case of a put option being required, the price would be the same.

The following is part of a typical list as published in the daily press of option prices quoted on the London Stock Exchange.

Intricacies of Options.—Thus far it might appear as though the complications of option dealing had been exaggerated; but now we approach some of the intricacies of the business. To the uninitiated the purchase of a call option would appear to be a perfectly simple matter. The speculator buys on Jan. 1 an option entitling him to take up at the end of March settlement £10,000 of Great Western Railway Ordinary stock at, say, 100. He waits until the closing days of March and then if the price is 103 he sells in the market £10,000 of stock at that price, calls stock in respect of his option at 100 and delivers it in satisfaction of his sale, netting the difference as profit, less his brokerage charges. If during the period of his option the stock has fallen below par, he simply allows it to lapse, his loss being confined to the cost of the option.

That is how an option transaction appears to the layman. That is not, however, in the least the idea of the average purchaser of an option. What he desires is not to enter into a bet as to what the price will be on a certain date, but to be able to avail himself of market fluctuations during the life of his option. Suppose, in the case named, that a week after the option has been purchased the price rises to 103, the holder of the option cannot demand delivery of the stock before the expiry of the option, and if he sells a week after he has bought a three-months' option, he will be called upon at the next settlement to deliver the stock he has sold. That is, however, just the sort of position that the experienced option speculator desires. He sells at 103 for the next account, feeling that he is in the position of a "protected bear." When the settlement arrives he does not deliver, but has the

bargain carried over, and as the stock has risen there will probably be a number of investors for the rise who are desirous of not taking up the stock they have purchased, but wish to carry over their bargains, and have to pay interest for so doing. Our "protected bear," therefore, so far from having to pay for the privilege of not delivering the stock he has sold, receives payment for not doing so. If within the next few days or weeks Great Western Ordinary falls a point or more, he can repurchase the stock he has sold (close his "bear") and is in the position where he started, with part of his option still to run. In a fluctuating market this process might be repeated several times during the course of the option, making it possible for the holder to realize several profits from the variations in price.

All sorts of combinations of this nature are possible with options, and there are a few men in London, almost invariably foreigners, who have the reputation of being exceptionally clever in this class of dealing, and of making large profits out of it. The brokerage on options is exactly the same as if the actual stock were purchased.

Options as described above should not be confused with *Option Certificates* which are quoted in the ordinary sections of the Stock Exchange lists. A company will sometimes issue certificates conferring upon the holder the right to take up shares at a certain price within a certain period, and these option certificates are dealt in just as though they were shares. A case in point is that of Consolidated Diamond Mines of South West Africa which in the year 1925 induced holders of its 8% debenture stock to consent to a reduction in the rate of interest to 6½%, and as compensation gave them option certificates carrying the right up to Oct. 1, 1929 of obtaining at 20 shillings 100 fully-paid £1 shares for each £100 bond. Another instance is that of the Redeemable Securities Investment Trust which, in making an issue in 1928 of 6% preference shares, gave in respect of every two preference shares subscribed, one option entitling the holder to take up an ordinary £1 share at 22s. 6d., such right expiring Dec. 31, 1929. Both these option certificates are quoted on the London Stock Exchange and are dealt in just as though they were shares.

(A. E. DA.)

OPTOPHONE, an instrument invented by E. E. Fournier d'Albe in 1914 which enables the blind to read ordinary letter-press such as printed books or newspapers. The invention thus places within reach of the blind the entire range of world literature, while previously their only means of reading—by raised letter systems—necessitated special books, both bulky and expensive.

The instrument depends for its action upon the chemical element, selenium, the electrical conductivity of which varies greatly in accordance with the amount of light to which it is exposed. Such a light-sensitive selenium bridge is placed between two separate conducting lines of graphite resting on a porcelain tablet and the whole connected in series with an electric battery to a telephone receiver. A beam of light is rendered intermittent by the interposition of a revolving siren disc and is then concentrated into a small bright point on the letter to be read. This is reflected back onto the selenium bridge. As the selenium bridge is exposed to the forms of letters in the line traversed, its changes in conductivity produce a succession of varying notes and chords in the telephone receiver, each letter having its characteristic sound. That is its simple form. Actually in the regular instrument a row of five or six luminous points just filling up the size of the tallest letters to be read is substituted for a single point, and each point is given a different frequency by suitably perforating the disc. A blind reader does not analyze the resulting sounds, but soon comes to recognize the general sound of each letter and in time knows his alphabet of sounds. Later in his practice the succession of sounds which make up certain words becomes familiar. Controlling apparatus to regulate the speed and position of the tracer is designed with a view to ease of manipulation by blind persons. After 1920 developments in amplification enabled the sounds to be made audible to any number in a room if desired, though individual receivers were retained for silent reading. (See SELENIUM CELL.)

OPZOOMER, CORNELIUS WILLIAM (1821-1892), Dutch philosopher, was born in Rotterdam on Sept. 20, 1821. He studied at the University of Leyden, receiving the degree of doctor of law in 1845. In 1846 he was appointed professor of philosophy at the University of Utrecht, which position he held the remainder of his life. His specialty was jurisprudence and many of his numerous writings were in that field, notably *Scheiding van Kerk en Staat* (1875), in which he sustained the primacy of the civil power, and a commentary on the civil code of Holland (11 vols., 1864-87). His greatest influence, however, was in the field of philosophy. He was an empiricist of the positivistic type. His thought can best be traced in such of his writings as *Der Weg de Wetenschap* (1851), *Wetenschap en Wijsbegeerte* (1857), *Het Wesen der Kennis* (1863), *De Waarheid en hare Kenbronnen* (1863), *De Godsdienst* (1864), *Goethe's Godsdienst* (1868), and *Ein Nieuwe Kritik der Wijsbegeerte* (1871). He advocated expulsion of the unscientific from religion, believing that the latter would be left unimpaired, and that it would lead to the reconciliation of religion and science and bring about a new Reformation. Though vigorously opposed at first his views rapidly gained adherents and he became the leader of the liberals and the founder of modern theology in his country. He was also a widely read man of letters, translated the *Antigone* of Sophocles and the *Julius Caesar* of Shakespeare into Dutch, and published (1872) a volume of critical studies on the great English dramatist. He died in Osterbeck on Aug. 23, 1892.

ORACHE or **MOUNTAIN SPINACH**, known botanically as *Atriplex hortensis* (family, Chenopodiaceae), a tall-growing hardy annual, whose leaves, though coarsely flavoured, are very often used as a substitute for spinach, and to correct the acidity of sorrel. The white and the green are the most desirable varieties. The plant should be grown quickly in rich soil. It may be sown in rows 2 ft. apart, and about the same distance in the row, about March, and for succession again in June. If needful, water must be given freely, so as to maintain a rapid growth. A variety, *A. hortensis* var. *rubra*, commonly called red mountain spinach, is a hardy annual 3 to 4 ft. high with fine ornamental foliage.

ORACLE, a special place where a deity is supposed to give a response, by the mouth of an inspired priest, to the enquiries of his votaries, or the actual response. (Lat. *oraculum*, from *orare*, to speak; the corresponding Greek word is *μαντεῖον* or *χρηστήριον*.) (See DIVINATION, MAGIC, OMENS.) The whole question of oracles is bound up with that of magic. They are commonly found in the earlier stages of religious culture among different nations. But it is as an ancient Greek institution that they are most interesting historically.

A characteristic feature of Greek religion which distinguishes it from many other systems of advanced cult was the wide prevalence of a ritual of divination and the prominence of certain oracular centres which were supposed to give voice to the will of Providence. In the Greek world the methods of divination were of great variety, but nearly all can be traced among other communities, primitive and advanced, ancient and modern. The most obvious and useful classification of them is that of which Plato was the author, who distinguishes between (a) the "sane" form of divination and (b) the ecstatic, enthusiastic or "insane" form (Phaedrus p. 244). The first method appears to be cool and scientific, the diviner (*μάντις*) interpreting certain signs according to fixed principles of interpretation. The second is worked by the prophet, shaman or Pythoness, who is possessed and overpowered by the deity, and in temporary frenzy utters mystic speech under divine suggestion. To these we may add a third form (c) divination by communion with the spiritual world in dreams or through intercourse with the departed spirit: this resembles class (a) in that it does not necessarily involve ecstasy, and class (b) in that it assumes immediate *rapproch* with some spiritual power.

We may subdivide the methods that fall under class (a) according as they deal with the phenomena of the animate or the inanimate world; although this distinction would not be relevant in the period of primitive animistic thought. The Homeric poems attest that auguries from the flight and actions of birds were

commonly observed in the earliest Hellenic period as they occasionally were in the later, but we have little evidence that this method was ever organized as it was at Rome into a regular system of state-divination, still less of state-craft. We can only quote the passage in the *Antigone* where Sophocles describes the method of Teiresias, who keeps an aviary where he studies and interprets the flight and the cries of the birds; it is probable that the poet was aware of some such practice actually in vogue. But normally the Greek augur drew omens from the cries or actions of some bird or beast casually met with (as Hom. *Il.* xiii. 521; Aesch. *Agam.* 109; Serv. Virg. *Aen.* iv. 377; Paus. ii. 19. 3); it is very rare to find such omens habitually consulted in any public system of divination sanctioned by the State. We hear of a shrine of Apollo at Sura in Lycia (Steph. Byz. s.v. Σούρα; Plutarch, *De sollert. anim.* p. 976 c; Ael. *Nat. anim.* xii. 1) where omens were taken from the movements of the sacred fish that were kept there in a tank; and again of a grove consecrated to this god in Epirus, where tame serpents were kept, and fed by a priestess, who could predict a good or bad harvest according as they ate heartily or came willingly to her or not (Ael. *Nat. anim.* xi. 2).

But the method of animal divination that was most in vogue was the inspection of the inward parts of the victim offered upon the altar, and the interpretation of certain marks found there according to a conventional code. A conspicuous example of an oracle organized on this principle was that of Zeus at Olympia, where soothsayers of the family of the Iamidae prophesied partly by the inspection of entrails, partly by the observation of certain signs in the skin when it was cut or burned (Schol. Pind. *Ol.* 6. 111). Another less familiar procedure that belongs to this subdivision is that which was known as divination *διὰ κληιδόων*, which might sometimes have been the cries of birds, but in an oracle of Hermes at the Achaean city of Pharae were the casual utterances of men. Pausanias (VII. 22. 2) tells us how this was worked. The consultant came in the evening to the statue of Hermes in the market-place that stood by the side of a hearth-altar to which bronze lamps were attached; having kindled the lamps and put a piece of money on the altar, he whispered into the ear of the statue what he wished to know; he then departed, closing his ears with his hands, and whatever human speech he first heard after withdrawing his hands he took for a sign. The same custom seems to have prevailed at Thebes in a shrine of Apollo, and in the Olympian oracle of Zeus (Farnell, *Cults* iv. 221).

Of omens taken from what we call the inanimate world salient examples are those derived from trees and water. Both were in vogue at Dodona, where the ecstatic method of prophecy was never used; we hear of divination there from the bubbling stream, and still more often of the "talking oak"; under its branches may once have slept the Selloi, who interpreted the sounds of the boughs. (Hom. *Il.* xvi. 233, *Od.* xiv. 327; Hesiod, *ap.* Schol. Soph. *Trach.* 1169; Aesch. *Prom. Vinct.* 820). At Corope in Thessaly we hear vaguely of an Apolline divination by means of a branch of the tamarisk tree (Nicander, *Theriaka*, 612, Schol.), and there is a late record that at Daphne near Antioch oracles were obtained by dipping a laurel leaf or branch in a sacred stream (Robertson-Smith *Relig. Sem.* p. 128). We find water divination at Daphne, Taenarum and Patrae. Thunder magic, which was practised in Arcadia, is usually associated with thunder divination; but of this, which was so much in vogue in Etruria (see HARUSPICES) and at Rome, the evidence in Greece is singularly slight. Once a year watchers took their stand on the wall at Athens and waited till they saw the lightning flash from Harma, which was accepted as an auspicious omen for the setting out of the sacred procession to Apollo Pythius at Delphi; and the altar of Zeus Σημάλιος, the sender of omens, on Mount Parnes, may have been a religious observatory of meteorological phenomena (Paus. i. 32. 2). No doubt such a rare and portentous event as the fall of a meteor-stone would be regarded as ominous, and the State would be inclined to consult Delphi or Dodona as to its divine import.

We may conclude the examples of this main department of *μαρτυρή* by mentioning a method that seems to have been much in vogue in the earlier times, that which was called *ἡ διὰ ψήφων μαρτυρή*, or divination by the drawing or throwing of lots; these

must have been objects, such as small pieces of wood or dice, with certain marks inscribed upon them, drawn casually or thrown down and interpreted according to a certain code. This was practised at Delphi and Dodona by the side of the more solemn procedure; we hear of it also in the oracle of Heracles at Bura in Achaia (Cic. *De div.* i. 76; Suid. s.v. πύδω; Paus. vii. 25. 10). It is this method of "scraping" or "notching" (*χράειν*) signs on wood that explains probably the origin of the words *χρησμός*, *χοήσθαι*, *ἀνακρίειν* for oracular consultation and deliverance. In Italy, oracles by lot (*sortes*) are the only native kind of whose existence we are certain; that of *Fortuna* at Praeneste was the best known.

All these methods are world-wide, and may depend on belief in the *mana* of the bird, spring, lot, etc., or in the controlling influence of a spirit or god. And, again, if we are to understand the most primitive thought, we probably ought to conceive of it as regarding the omen not as a mere sign, but in some confused sense as a cause of that which is to happen. By sympathetic magic the flight of the bird, or the appearance of the entrails, is mysteriously connected, as cause with effect, with the event which is desired or dreaded. When of the three beasts over which three kings swore an oath of alliance, one died prematurely and was supposed thereby to portend the death of one of the kings (Plut. *Vit. Pyrrh.* c. 6), or when in the Lacedaemonian sacrifice the head of the victim mysteriously vanished, and this portended the death of their naval commander (Diod. Sic. xiii. 97), these omens would be merely signs of the future for the comparatively advanced Hellene; but we may discern at the back of this belief one more primitive still, that these things were somehow casually or sympathetically connected with the kindred events that followed.

The other branch of the mantic art, the ecstatic or inspired, has had the greater career among the peoples of the higher religions; it is no doubt of great antiquity, and it is found still existing at a rather low grade of savagery. Therefore it is unsafe to infer from Homer's silence about it that it only became prevalent in Greece in the post-Homeric period. It did not altogether supersede the simpler method of divination by omens; but being far more impressive and awe-inspiring, it was adopted by some of the chief Apolline oracles, though never by Dodona.

The most salient example of it is afforded by Delphi. In the historic period, and perhaps from the earliest times, a woman known as the Pythia was the organ of inspiration, and it was generally believed that she delivered her oracles under the direct afflatus of the god. The divine possession worked like an epileptic seizure, and was exhausting and might be dangerous; nor is there any reason to suppose that it was simulated. This communion with the divinity needed careful preparation. Originally, as it seems, virginity was a condition of the tenure of the office; for the virgin has been often supposed to be the purer vehicle for divine communication; but later the rule was established that a married woman over 50 years of age should be chosen, with the proviso that she should be attired as a maiden. As a preliminary to the divine possession, she appears to have chewed leaves of the sacred laurel, and then to have drunk water from the prophetic stream called Kassotis which flowed underground. But the culminating point of the afflatus was reached when she seated herself upon the tripod; and here, according to the belief of at least the later ages of paganism, she was supposed to be inspired by a mystic vapour that arose from a fissure in the ground. Against the ordinary explanation of this as a real mephitic gas producing convulsions, there seem to be geological and chemical objections (see Oppe, "The chasm at Delphi," *Journ. Hell. Stud.*, 1904); nor have the recent French excavations revealed any chasm or gap in the floor of the temple. But the strong testimony of the later writers, especially Plutarch (*De defectu Orac.* c. 43), cannot wholly be set aside; and we can sufficiently reconcile it with the facts if we suppose a small crack in the floor through which a draught of air was felt to ascend. This, combining with the other mantic stimulants used, would be enough to throw a believing medium into the condition, familiar enough nowadays, of a "trance." It is probable that what she uttered were only unintelligible murmurs,

and that these were interpreted into relevance and set in metric or prose sentences by the "prophet" and the "holy ones" or *ὁσίοι* as they were called, members of leading Delphic families, who sat round the tripod, who received the questions of the consultant beforehand, probably in writing, and usually had considered the answers that should be given.

Examples of the same enthusiastic method can be found in other oracles of Apollo. At Argos, the prophetess of the Apollo Pythius attained to the divine afflatus by drinking the blood of the lamb that was sacrificed in the night to him (Paus. ii. 24. 1); this is obviously a mantic communion, for the sacrificial victim is full of the spirit of the divinity. And we find the same process at the prophetic shrine of Ge at Aegae in Achaea, where the prophetess drank a draught of bull's blood for the same purpose (Farnell, *op. cit.* iii. 11). In the famous oracle shrines of Apollo across the sea, at Clarus and Branchidae near Miletus (the prophetic fountain at Branchidae is attested by Strabo, p. 814, and in a confused mystic passage of Iamblichus, *De Myst.*, 3, 11), the divination was of the same ecstatic type, but produced by a simple draught of holy water. The Clarian prophet fasted several days and nights in retirement and stimulated his ecstasy by drinking from a subterranean spring which is said by Pliny to have shortened the lives of those who used it (*Nat. Hist.* ii. 232). Then, "on certain fixed nights after many sacrifices had been offered, he delivered his oracles, shrouded from the eyes of the consultants" (Iamb. *loc. cit.*).

The divination by "incubation" was allied to this type, because though lacking the ecstatic character, the consultant received direct communion with the god or departed spirit. He attained it by laying himself down to sleep or to await a vision, usually by night, in some holy place, having prepared himself by a course of ritualistic purification. Such consultation was naturally confined to the underworld divinities or to the departed heroes. It appears to have prevailed at Delphi when Ge gave oracles there before the coming of Apollo, and among the heroes Amphiaras, Calchas and Trophonius are recorded to have communicated with their worshippers in this fashion. And it was by incubation that the sick and diseased who repaired to the temple of Epidauros received prescriptions from Asclepius.

Turning now to the history of oracles in Greece, we know that the leading one, Delphi, was a seat of prophecy from the earliest days of Greek tradition. Ge, Themis and perhaps Poseidon had given oracles here before Apollo. But it is clear that he had won it in the days before Homer, who attests the prestige and wealth of his Pythian shrine; and it seems clear that before the Dorian conquest of the Peloponnese a Dryopian migration had already carried the cult of Apollo Pythius to Asine in Argolis. Also the constitution of the Amphictyones, "the dwellers around the temple," reflects the early age when the tribe rather than the city was the political unit, and the Dorians were a small tribe of north Greece. The original function of these Amphictyones was to preserve the sanctity and property of the temple; but this common interest early developed a certain rule of intertribal morality. By the formula of the Amphictyonic oath preserved by Aeschines, which may be of great antiquity, the members bound themselves "not to destroy any city of the league, not to cut any one of them off from spring-water, either in war or peace, and to war against any who violated these rules." We discern here that Greek religion offered the ideal of a federal national union that Greek politics refused to realize.

The next stage in the history of the oracle is presented by the legend of the Dorian migration. For we have no right to reject the strong tradition of the Delphic encouragement of this movement, which well accounts for the devotion shown by Sparta to the Pythian god from the earliest days; and accounts also for the higher position that Delphi occupied at the time when Greek history is supposed to begin.

We have next to consider a valuable record that belongs to the end of the 8th century or beginning of the 7th, the Homeric hymn to Apollo, which describes the coming of the Dolphin-god *Δελφίνιος* to Pytho, and the organization of the oracle by Cretan ministers. Of this Cretan settlement at Delphi there is no other

literary evidence, and the *Ὀσίοι* who administered the oracle in the historic period claimed to be of aboriginal descent. Yet recent excavation has proved a connection between Crete and Delphi in the Minoan period; and there is reason to believe that in the 8th century some ritual of purification, momentous for the religious career of the oracle, was brought from Crete to Delphi, and that the adoption of this latter name for the place which had formerly been called *Ἰνδῶ* synchronized with the coming of Apollo Delphinus.

The influence of Delphi was great in various ways. We may first consider its political influence upon the other states. The practice of a community consulting an oracle on important occasions undoubtedly puts a powerful weapon into the hands of the priesthood, and might lead to something like a theocracy. And there are one or two ominous hints in the *Odyssey* that the ruler of the oracle might overthrow the ruler of the land. Yet owing to the healthy temperament of the early Greek, the civic character of the priesthood, the strength of the autonomous feeling, Greece might flock to Delphi without exposing itself to the perils of sacerdotal control. The Delphic priesthood, content with their rich revenues, were probably never tempted to enter upon schemes of far-reaching political ambition, nor were they in any way fitted to be the leaders of a national policy. Once only, when the Spartan State applied to Delphi to sanction their attack on Arcadia, did the oracle speak as if, like the older papacy, it claimed to dispose of territory (Herod. i. 66)—"Thou askest of me Arcadia; I will not give it thee." But here the oracle is on the side of righteousness, and it is the Spartan that is the aggressor. In the various oracles that have come down to us, many of which must have been genuine and preserved in the archives of the State that received them, we cannot discover any marked political policy consistently pursued by the "holy ones" of Delphi. As conservative aristocrats they would probably dislike tyranny; their action against the Peisistratidae was interested, but one oracle contains a spirited rebuke to Cleisthenes, while one or two others, perhaps not genuine, express the spirit of temperate constitutionalism. As exponents of an Amphictyonic system they would be sufficiently sensitive of the moral conscience of Greece to utter nothing in flagrant violation of the "ius gentium." In one department of politics, the legislative sphere, it has been supposed that the influence of Delphi was direct and inspiring. Plato and later writers imagined that the Pythia had dictated the Lycurgan system, and even modern scholars like Bergk have regarded the *εἴρεσις* of Sparta as of Delphic origin. But a severer criticism dispels these suppositions. The Delphic priesthood had neither the capacity nor probably the desire to undertake so delicate a task as the drafting of a code. They might make now and again a general suggestion when consulted, and, availing themselves of their unique opportunities of collecting foreign intelligence, they might often recommend a skilful legislator or arbitrator to a state that consulted them at a time of intestine trouble. Finally, a legislator with a code would be well advised, especially at Sparta, in endeavouring to obtain the sanction and the blessing of the Delphic god, that he might appear before his own people as one possessed of a religious mandate. In this sense we can understand the stories about Lycurgus.

There is only one department of the secular history of Greece where Delphi played a predominant and most effective part, the colonial department. The great colonial expansion of Greece, which has left so deep an imprint on the culture of Europe, was in part inspired and directed by the oracle. For the proof of this we have not only the evidence of the *χορησμοί* preserved by Herodotus and others, such as those concerning the foundation of Cyrene, but also the worship of Apollo *Ἀρχηγέτης*, "the Founder," prevalent in Sicily and Magna Graecia, and the early custom of the sending of tithes or thanksgiving offerings by the flourishing western states to the oracle that had encouraged their settlements.

Apollo was already a god of ways, *Ἀγνέις*, who led the migration of tribes before he came to Delphi. And those legends are of some value that explain the prehistoric origin of cities such as Magnesia on the Maeander, the Dryopian Asine in the Pelopon-

nese, as due to the colonization of temple-slaves, acquired by the Pythian god as the tithe of conquests, and planted out by him in distant settlements. The success of the oracle in this activity led at last to the establishment of the rule that Herodotus declares to be almost universal in Greece, namely, that no leader of a colony would start without consulting Delphi. Doubtless in many cases the priesthood only gave encouragement to a preconceived project. But they were in a unique position for giving direct advice also, and they appear to have used their opportunities with great intelligence.

Their influence on the state cults can be briefly indicated, for it was not by any means far-reaching. They could have felt conscious of no mission to preach Apollo, for his cult was an ancient heritage of the Hellenic stocks. Only the narrower duty devolved upon them of impressing upon the consultants the religious obligation of sending tithes or other offerings. Nevertheless their opportunity of directing the religious ritual and organization of the public worship was great; for Plato's view (Rep. 427A) that all questions of detail in religion should be left to the decision of the god "who sits on the *omphalos*" was on the whole in accord with the usual practice of Greece. Such consultations would occur when the State was in some trouble, which would be likely to be imputed to some neglect of religion, and the question to the oracle would commonly be put in this way—"to what god or goddess or hero shall we sacrifice?" The oracle would then be inclined to suggest the name of some divine personage hitherto neglected, or of one whose rites had fallen in decay. Again, Apollo would know the wishes of the other divinities, who were not in the habit of directly communicating with their worshippers; therefore questions about the sacred land of the goddesses at Eleusis would be naturally referred to him. From both these points of view we can understand why Delphi appears to have encouraged the tendency towards hero-worship which was becoming rife in Greece from the 7th century onwards. But the only high cult for which we can discover a definite enthusiasm in the Delphic priesthood was that of Dionysus. And his position at Delphi, where he became the brother-deity of Apollo, sufficiently explains this.

As regards the development of religious morality in Greece, we must reckon seriously with the part played by the oracle. The larger number of deliverances that have come down to us bearing on this point are probably spurious, in the sense that the Pythia did not actually utter them, but they have a certain value as showing the ideas entertained by the cultivated Hellene concerning the oracular god. On the whole, we discern that the moral influence of Delphi was beneficent and on the side of righteousness. It did nothing, indeed, to abolish, it may even have encouraged at times, the barbarous practice of human sacrifice, which was becoming abhorrent to the Greek of the 6th and 5th centuries; but a conservative priesthood is always liable to lag behind the moral progress of an age in respect of certain rites, and in other respects it appears that the "Holy Ones" of Delphi kept well abreast of the Hellenic advance in ethical thought. An oracle attributed to the Pythoness by Theopompus (Porph. *De abstinentia*, 2, 16 and 17) expresses the idea contained in the story of "the widow's mite," that the deity prefers the humble offering of the righteous poor to the costly and pompous sacrifice of the rich. Another, of which the authenticity is vouched for by Herodotus (vi. 86), denounces the contemplated perjury and fraud of a certain Glaucus, and declares to the terrified sinner that to tempt God was no less a sin than to commit the actual crime. A later *χρησμός*, for which Plutarch (*De Pyth. Or.*, p. 404 B) is the authority, embodies the charitable conception of forgiveness for venial faults committed under excessive stress of temptation: "God pardons what man's nature is too weak to resist." And in one most important branch of morality, with which progressive ancient law was intimately concerned, namely, the concept of the sin of homicide, we have reason for believing that the Apolline oracle played a leading part. Perhaps so early as the 8th century, it came to lay stress on the impurity of bloodshed and to organize and impose a ritual of purification; and thus to assist the development and the clearer definition of the concept of murder as a

sin and the growth of a theory of equity which recognizes extenuating or justifying circumstances (Farnell, *Cults*, iv. 300). Gradually, as Greek ethics escaped the bondage of ritual and evolved the idea of spiritual purity of conscience, this found eloquent expression in the utterances imputed to the Pythia (Ael. *Var. Hist.* iii. 44; Anth. Pal. xiv. 71 and 74). Many of these are no doubt literary fictions; but even these are of value as showing the popular view about the oracular god, whose temple and tripod were regarded as the shrine and organ of the best wisdom and morality of Greece. The downfall of Greek liberty before Macedon destroyed the political influence of the Delphic oracle; but for some centuries after it still retained a certain value for the individual as a counsellor and director of private conscience. But in the latter days of paganism it was eclipsed by the oracles of Claros and Branchidae.

ORADEA MARE, a town of western Rumania, capital of the department of Bihor. Pop. (1928) 49,200, mainly Magyar. It is situated in a plain on both banks of the river Crisul Repede, and is the seat of a Roman Catholic and of a Greek Uniate Bishopric (founded 1776). Among its principal buildings are the St. Ladislaus parish church, built in 1723, which contains the remains of the king St. Ladislaus (d. 1095), the Roman Catholic cathedral, built in 1752-1779, the Greek cathedral, the large rococo palace of the Roman Catholic bishop, built in 1778, and the archaeological and historical museum. There is a law academy, a seminary for priests, a modern school, a Roman Catholic and a Calvinistic gymnasium, a commercial academy, a training school for teachers and a secondary school for girls. Oradea Mare is an important railway junction; it possesses extensive manufactures of pottery and large distilleries, and carries on a brisk trade in agricultural produce, cattle, horses, fruit and wine.

Oradea Mare is a very old town; its bishopric was founded by St. Ladislaus in 1080. The town was destroyed by the Tatars in 1241. Peace was concluded here on Feb. 24, 1538 between Ferdinand I. of Austria and his rival John Zápolya, voivode of Transylvania. In 1556 it passed to Transylvania, but afterwards reverted to Austria. In 1598 the Turks besieged the fortress unsuccessfully, but took it in 1660 and held it till 1692. After the World War it was ceded by Hungary to Rumania.

ORAN, a city of Algeria, capital of the department and military division of the same name. It stands at the head of the Gulf of Oran, on the Mediterranean, in 35° 44' N., 0° 41' W. The city is 261 m. by rail W.S.W. of Algiers, 220 m. E. of Gibraltar and 130 m. S. of Cartagena, Spain. It is built on the steep slopes of the Jebel Murjajo, which rises to a height of 1,900 feet. The city was originally cut in two by the ravine of Wad Rehhi, now for the most part covered by boulevards and buildings. West of the ravine lies the old port, and above this rises what was the Spanish town, with the ancient citadel looking down on it; but few traces of Spanish occupation remain. The modern quarter rises, like an amphitheatre, to the east of the ravine, and is extending more and more to the north-east and to the south-east upon the plateau of Karquenta, where the centre of the town now lies; a ring of populous suburbs, Montplaisant, Gambetta, Saint-Eugène, Eckmühl, encircle it from north-east to south-west. The Place d'Armes, built on the plateau above the ravine, is the centre of the modern quarter. It contains a fine column commemorative of the battle of Sidi Braham (1845), between the French and Abdel-Kader. The Château Neuf, built in 1563 by the Spaniards, is surrounded by the beautiful Promenade de L'étang, which overlooks the port. Formerly the seat of the beys of Oran, it is occupied by the general in command of the military division, and also serves as barracks. The *kasbah* (citadel), or Château Vieux

used for military purposes, lies south-west of the Château Neuf. It was partly destroyed by the earthquake of Oct. 8 and 9, 1790. On the hills behind the kasbah are Fort St. Grégoire and Fort Santa Cruz, crowning, at a height of 1,312 ft., the summit of the Aidur. The Grand Mosque (in rue Philippe) was erected at the end of the 18th century to commemorate the expulsion of the Spaniards, and with money paid as ransom for Christian slaves.

Oran is the seat of a large trade. There is regular communication with Marseille, Cette, Barcelona, Valencia, Cartagena, Malaga, Gibraltar and the various ports on the Barbary coast. The harbour is sheltered by a large jetty stretching from west to east, parallel to the shore and more than 1,200 metres long. The different basins which it protects include the old harbour (1868), the Aucour basin (1876), the Morocco basin (1914), and the Poincaré basin (1928). The surface of water is 40 hectares, the length of the quays 2,097 metres, the extent of the platforms 160,000 sq. metres; a dock railway station has been built on the south quay. Oran is the terminus of the wide gauge railway lines from Algiers and from Ujda via Tlemçen and Sidi-bel-Abbes, and of the narrow gauge line from Colomb-Bechar-Kenadsa, which penetrates 771 km. towards the south. The construction of the broad gauge railway from Ujda to Fez, that of the lines penetrating eastern Morocco, eventually that of the Trans-Saharan railway, is destined to increase still more the importance of the port, the growth of which has been extremely rapid. Gross tonnage reaches 16 million tons, the tonnage of goods 2,462,000 tons (imports 1,382,000, exports 1,080,000).

The total population of Oran is 150,301, the municipal population 145,183, of whom 24,615 are natives and 120,568 Europeans (81,405 French).

See Augustin Bernard, "Oran, port du Maroc et du Sahara" (*Bull. Soc. Géogr. Oran*, 1928).

History.—Andalusian Arabs settled here in the beginning of the 10th century and gave Oran its name. Rapidly rising into importance as a seaport, Oran was taken and retaken, pillaged and rebuilt, by the various conquerors of northern Africa. In the latter half of the 15th century it became subject to the sultans of Tlemçen, and reached the height of its prosperity. Active commerce was maintained with the Venetians, the Pisans, the Genoese, the Marseillais and the Catalans, who imported the produce of their looms, glass-ware, tin-ware, and iron, and received in return ivory, ostrich feathers, gold-dust, tanned hides, grain, and negro slaves. Admirable woollen cloth and splendid arms were manufactured. The magnificence of its mosques and other public buildings, the number of its schools, and the extent of its warehouses shed lustre on the city; but luxury began to undermine its prosperity and its ruin was hastened by the conduct of the Muslim refugees from Spain, under whose influence the legitimate trade of the town gave place to piracy, Mers-el-Kebir becoming the stronghold of the pirates.

Animated by the enthusiasm of Cardinal Ximenes, the Spaniards determined to put a stop to these expeditions. Mers-el-Kebir fell into their hands on Oct. 23, 1505, and Oran in May 1509. The latter victory, obtained with but trifling loss, was stained by the massacre of a third of the Mohammedan population. From 6,000 to 8,000 prisoners, 60 cannon, engines of war and a considerable booty fell into the hands of the conquerors. Cardinal Ximenes introduced the Inquisition, etc., and also restored and extended the fortifications. Oran became the penal settlement of Spain, but neither the convicts nor the noblemen in disgrace who were also banished thither seem to have been under rigorous surveillance. The bey of Mascara seized Oran in 1708. The Spaniards recovered it in 1732, but found the maintenance of the place a burden rather than a benefit, the neighbouring tribes having ceased to deal with the Christians. The earthquake of 1790 furnished an excuse for withdrawing their forces. Commencing by 22 separate shocks at brief intervals, the oscillations continued from Oct. 8 to Nov. 22. Houses and fortifications were overthrown and a third of the garrison and a great number of the inhabitants perished. Famine and sickness had begun to aggravate the situation when the bey of Mascara appeared before the town with 30,000 men. By prodigies of

energy the Spanish commander held out till Aug. 1791, when, the Spanish Government having made terms with the bey of Algiers, he was allowed to set sail for Spain with his guns and ammunition. The bey Mohammed took possession of Oran in March 1792 and made it his residence instead of Mascara. On the fall of Algiers the bey (Hassan) placed himself under the protection of the conquerors and shortly afterwards removed to the Levant. The French army entered the city on Jan. 4, 1831, and took formal possession on Aug. 17.

See M. D. Stott, *The Real Algeria* (1914).

ORANGE, HOUSE OF. The small principality of Orange, a district now included in the French department of Vaucluse, traces back its history as an independent sovereignty to the time of Charlemagne. William, surnamed *le Cornet*, who lived towards the end of the 8th century, is said to have been the first prince of Orange, but the succession is only certainly known after the time of Gerald Adhemar (*f.* 1086). In 1174 the principality passed by marriage to Bertrand de Baux, and there were nine princes of this line. By the marriage of John of Châlons with Marie de Baux, the house of Châlons succeeded to the sovereignty in 1393. The princes of Orange-Châlons were (1) John I., 1393-1418, (2) Louis I., 1418-1463, (3) William VIII., 1463-1475, (4) John II., 1475-1502, (5) Philibert, 1502-1530. Philibert was a great warrior and statesman, who was held in great esteem by the emperor Charles V. For his services in his campaigns the emperor gave him considerable possessions in the Netherlands in 1522, and Francis I. of France, who had occupied Orange, was compelled, when a prisoner in Madrid, to restore it to him. Philibert had no children, and he was succeeded by his nephew René of Nassau-Châlons, son of Philibert's sister Claudia and Henry, count of Nassau, the confidential friend and counsellor of Charles V. He too died without an heir in 1544 at the siege of St. Dizier, having devised all his titles and possessions to his first cousin William, the eldest son of William, count of Nassau-Dillenburg, who was the younger brother of René's father, and had inherited the German possessions of the family.

William of Orange-Nassau was but 11 years old when he succeeded to the principality. He was brought up at the court of Charles V. and became famous in history as William the Silent (*q.v.*), the founder of the Dutch Republic. On his assassination in 1584 he was succeeded by his eldest son Philip William, who had been kidnapped by Philip II. of Spain in his boyhood and brought up at Madrid. This prince never married, and on his death in 1618 his next brother, Maurice (*q.v.*), stadtholder in the United Netherlands and one of the greatest generals of his time, became prince of Orange. Maurice died in 1625, also unmarried. Frederick Henry, the son of Louise de Coligny, William's fourth wife, born just before his father's murder, now succeeded to the principedom of Orange and to all his brothers' dignities, posts and property in the Netherlands. Frederick Henry was both a great general and statesman. His only son, William II. (*q.v.*), was married in 1641 to Mary, princess royal of England, he being fifteen and the princess nine years old at that date, and he succeeded to the title of prince of Orange on his father's death in 1647. At the very outset of a promising career he suddenly succumbed to an attack of smallpox on Nov. 6, 1650, his son William III. (*q.v.*) being born a week after his father's death.

A revolution now took place in the system of government in the United Provinces, and the offices of stadtholder and captain-and-admiral-general, held by four successive princes of Orange, were abolished. However, the counter revolution of 1672 called William III. to the head of affairs. At this time Louis XIV. conquered the principality of Orange and the territory was incorporated in France, the title alone being recognized by the treaty of Ryswick. For William III.'s accession to the throne of England, see *ENGLAND: History*. He left no children, and a dispute arose among various claimants to the title of prince of Orange. The king of Prussia claimed it as the descendant of the eldest daughter of Frederick Henry; John William Friso of Nassau-Dietz claimed it as the descendant of John, the brother of William the Silent, and also of the second daughter of Frederick Henry. The result was that at the Peace of Utrecht in 1713, the king of Prussia aban-

doned the principality to the king of France in exchange for compensation elsewhere, and John William Friso gained the barren title and became William IV., prince of Orange. His sons William V. and William VI. succeeded him. William VI. in 1815 became William I., king of the Netherlands (q.v.).

See Bastet, *Histoire de la ville et de la principauté d'Orange* (Orange, 1856).

ORANGE, a town of France, 18 m. N. of Avignon on the P.L.M. railway. Pop. (1926), 6,828. Orange (*Arausio*), capital of the Cavari, was in 105 B.C. the scene of the defeat of a Roman army by the Cimbri and Teutones. It became after Caesar an important Roman colony. Its ramparts and fine buildings were partly destroyed by the Alamanni and Visigoths, and partly ruined by the erections of the middle ages. Orange was included in the kingdom of Austrasia, fell into the hands of the Saracens and was recovered by Charlemagne. It became the seat of an independent countship in the 11th century. The town had a university from the 14th century till the Revolution. Orange stands at some distance from the left bank of the Rhone, in the midst of meadows, orchards and mulberry plantations, watered by the Meyne, and overlooked by Mont Ventoux, 22 m. to the east.

Orange has famous Roman remains. The triumphal arch ranks third in size and importance among those still extant in Europe; 72 ft. in height, 69 ft. in width, and 26 ft. in depth, it is composed of three arches supported by Corinthian columns. On three sides its sculptured decorations are well preserved. The arch seems to have been set up in honour of Tiberius, perhaps to commemorate his victory over the Gallic chieftain Sacrovir in A.D. 21. It was used as a donjon in the middle ages. The theatre, dating from the time of the emperor Hadrian and built against a hill on the summit of which a colossal figure of the Virgin stands, has a façade 121 ft. high, 340 ft. long and 13 ft. thick, which is pierced by three square gates surmounted by a range of blind arches and a double row of projecting corbels, with holes in which the poles of the awning were placed. Of the seats for the spectators, only the lower tiers remain. It was used as an out-work to the fortress built on the hill by Maurice of Nassau in 1622, and destroyed fifty years later by order of Louis XIV., who in 1660 captured the town. At the beginning of the 19th century it was filled with hovels and stables; the building has been cleared and restored, and now serves as a national theatre. Near the theatre traces have been found of a hippodrome; and there are statues, bas-reliefs and ruins of an amphitheatre. Notre Dame, the old cathedral, originally built by the prefect of Gaul, was ruined by the barbarians, rebuilt in the 11th and 12th centuries, and damaged by the Protestants.

There are manufactories of footwear, brooms, jewellery and beet-sugar. The town deals largely in fruit, and millet-stalks for brooms, as well as in wool, silk, honey and truffles.

ORANGE, a city of Orange county, California, U.S.A., 30 m. S.E. of Los Angeles and 14 m. from the Pacific ocean; served by the Pacific Electric, the Santa Fe and the Southern Pacific railways. Pop. 4,884 in 1920 (88% native white); estimated locally at 9,000 in 1928. It is surrounded by orange, lemon and walnut groves. Beans, peppers and dairy products are other important agricultural products of the county, and its oil-fields had an output valued at \$50,000,000 in 1927. The county's citrus crops in 1927 were valued at \$27,000,000. Fruit-packing is one of the principal industries of the city. The manufactures include copper wire, twine and cordage, hosiery, machinery and gold-leaf.

ORANGE, a town of Franklin county, Mass., U.S.A., on Miller's river and the Boston and Maine railroad, 35 m. N.W. of Worcester. Pop. (1920) 5,393 (86% native white). It has numerous and varied manufacturing industries. The district of Orange was formed in 1783 from parts of Athol, Royalston and Warwick, and certain common lands, and in 1810 it was made a town.

ORANGE, a city of Essex county, New Jersey, U.S.A., 12 m. W. of New York city, 4 m. W. of Newark; served by the Erie and the Lackawanna railways, interurban trolleys and motor-bus lines. Pop. (1920), 33,268 (21% foreign-born white and 11% negro); 1928 local estimate, 37,000. The city covers 2.2 sq.m. at the base of the first Watchung mountain, in the heart of the

great suburban residential community known as "the Oranges," completely surrounded by East, South and West Orange. There are some 60 manufacturing establishments in the city, with an output in 1925 valued at \$9,319,962. The assessed valuation of property for 1927 was \$41,717,116. Since 1914 the city has had a commission form of government. Settlement began here soon after the founding of Newark in 1666, and the region was generally called Newark Mountain. In 1718 the people of "the mountain" severed connections with the church at Newark and formed an independent congregation. The neighbourhood was referred to as Orange Dale in 1782 and two years later "Orange" was in use. The township of Orange was set off from Newark and incorporated in 1806. It was incorporated as a town in 1860; the other "Oranges" were set off from it in 1861, 1862 and 1863; and in 1872 it was chartered as a city.

ORANGE, a city on the eastern boundary of Texas, U.S.A., at the head of navigation on the Sabine river; the county seat of Orange county. It is on Federal highway 90; has an airport of 200 ac. and a 30-ft. harbour, with a deep-water channel to the Gulf of Mexico; and is served by the Missouri Pacific and the Southern Pacific railways. The population was 9,212 in 1920 (27% negroes) and was estimated locally at 15,500 in 1928. The city is built around a deep hairpin bend in the river. It is surrounded by six gas and oil fields, huge forests of pine and cypress, and a cultivated district devoted chiefly to truck farming, poultry, and figs. The commerce of the port amounted to 729,543 tons in 1925, valued at \$16,702,845, of which 36% represented foreign trade, largely exports of timber and lumber. The rapidly developing manufacturing industries include saw and shingle mills, a rice mill, cotton gins, an oil refinery, shipyards, wrapping-paper and paper-bag factories, creosoting and fabricating steel plants and canneries. The city was founded as a trading post about 1800; and began on its present expansion with the completion of harbour improvements in 1914 and the discovery of oil in 1920.

ORANGE, the longest river of South Africa, almost traversing the continent from ocean to ocean. It rises in Basutoland, less than 200 m. from the Indian ocean, and flows west, with wide sweeps south and north, to the Atlantic. It drains, with its tributaries, an area estimated at over 400,000 sq.m., passing through more than twelve degrees of longitude or 750 m. in a straight line from source to mouth. The valley of the river exceeds 1,000 m., and the stream has a length of not less than 1,300 m. Its head-streams are in the highest part of the Drakensberg range, the principal source, the Sinqu, rising, at an elevation of more than 10,000 ft., on the Mont aux Sources in 28° 48' E., 28° 50' S.

Rising on the inner slopes of the hills these rivulets all join the Sinqu, which receives from the north several streams which rise in the Maluti Mountains. Of these the largest are the Semene and Sinqunyane (little Sinqu) and the best known the Maletsunyane, by reason of its magnificent waterfall—an unbroken leap of 630 ft. Increased by the perennial waters of these numerous torrents the Sinqu makes its way S.W. across the upland valleys between the Maluti and Drakensberg ranges. After a course of some 200 m., the Sinqu, already known as the Orange, receives the Makhaleng, or Kornet Spruit (90 m.), which rises in Machacha Mountain. The Orange here enters the great inner plateau of South Africa, which at Aliwal North, the first town of any size on the banks of the river, 80 m. below the Kornet Spruit confluence, has an elevation of 4,300 feet. Forty miles lower down the Orange is joined by the first of its large tributaries the Caledon (230 m.), which, rising on the western side of the Mont aux Sources, flows, first west and then south, through a broad and fertile valley. At the confluence the united stream has a width of 350 yards. Thirty miles lower down the Orange reaches, in 25° 40' E., its southernmost point—30° 40' S., approaching within 20 m. of the Zuurberg range. In this part of its course the river receives from the south the streams, often intermittent, which rise on the northern slopes of the Stormberg, Zuurberg and Sneeuwberg ranges. Of these the chief are the Kraai, which joins the Orange near Aliwal North, the Stormberg and the Zeekoe (Sea Cow), the last named having a length of 120 miles.

From its most southern point the Orange turns sharply N.W. for

200 m., when having reached 29° 3' S., 23° 36' E. it is joined by its second great affluent, the Vaal (*q.v.*). Here it bends south again, and with many a zigzag continues its general westerly direction, crossing the arid plains of Bechuana, Bushman and Namaqualands. Flowing between steep banks, considerably below the general level of the country, here about 3,000 ft., it receives, between the Vaal confluence and the Atlantic, a distance of more than 400 m. in a direct line, no perennial tributary but on the contrary loses a great deal of its water by evaporation. In this region, nevertheless, skeleton river systems cover the country north and south. These usually dry sandy beds, which on many maps appear rivers of imposing length, for a few hours or days following rare but violent thunder-storms, are deep and turbulent streams.

In 28° 35' S., 20° 20' E., are the great waterfalls of the Orange, where in cataracts, and cascades the river drops 400 ft. in 16 miles. The Aughrabies or Hundred falls, as they are called, are divided by ledges, reefs and islets, the last named often assuming fantastic shapes. Below the falls the river rushes through a rocky gorge, and openings in the cliffs to the water are rare. These openings are usually the sandy beds of dried-up or intermittent affluents, such as the Bak, Ham, Houm, Aub (or Great Fish) rivers of Great Namaqualand. Crossing the narrow coastal plain the river, with a south-westerly sweep, enters the ocean by a single mouth, studded with small islands, in 28° 37' S., 16° 30' E. A large sand bar obstructs the entrance to the river, which is not quite 1 m. wide. The river when in flood, at which time it has a depth of 40 ft., scours a channel through the bar, but the Orange is at all times inaccessible to sea-going vessels. Above the bar it is navigable by small vessels for 30 or 40 miles.

Captain Henry Hop first crossed the Orange in September 1761, but shortly afterwards returned. In 1777 Captain (afterwards Colonel) R. J. Gordon, a Dutch officer of Scottish extraction, who commanded the garrison at Cape Town, reached the river in its middle course and named it the Orange in honor of the Prince of Orange. Next year Lieut. W. Paterson, an English traveller, reached the river in its lower course, and in 1779 Paterson and Gordon journeyed along the west coast of the colony and explored the mouth of the river. F. Le Vaillant also visited the Orange near its mouth in 1784. Mission stations north of the Orange were established a few days later, and in 1813 the Rev. John Campbell, after visiting Griqualand West for the London Missionary Society, traced the Harts River, and from its junction with the Vaal followed the latter stream to its confluence with the Orange, journeying thence by the banks of the Orange as far as Pella, in Little Namaqualand, discovering the great falls. These falls were in 1885 visited and described by G. A. Farini, from whom they received the name of the Hundred Falls. The source of the Orange was first reached by the French Protestant missionaries T. Arbousset and F. Dumas in 1836.

The story of Hop's expedition is told in the *Nouvelle description du Cap de Bonne Espérance* (Amsterdam, 1778). Lieut. Paterson gave his experiences in *A Narrative of Four Journeys into the Country of the Hottentots and Caffraria in the Years 1777-1778-1779* (London, 1789). See also Campbell's *Travels in South Africa* (London, 1815), Arbousset and Dumas' *Relation d'un voyage d'exploration au nord-est de la colonie du Cap de Bonne Espérance en 1836* (Paris, 1842), and Farini's *Through the Kalahari Desert* (London, 1886).

ORANGE. The plant that produces the familiar fruit of commerce is closely allied to the citron, lemon and lime; all the cultivated forms of the genus *Citrus* (family Rutaceae) are nearly related. The numerous kinds of orange chiefly differing in the external shape, size and flavour of the fruit may all probably be traced to two well-marked species—the sweet or China orange, *Citrus sinensis*, and the sour Seville orange or bigarade, *Citrus Aurantium*.

The Sour, SEVILLE or BIGARADE ORANGE, *C. Aurantium*, *C. Aurantium*, is a rather small tree, rarely exceeding 30 ft. in height. The green shoots bear sharp axillary spines, and alternate evergreen oblong leaves, pointed at the extremity, and with the margins entire or very slightly serrated; they are of a bright glossy green tint, the stalks distinctly winged and, as in the other species, articulated with the leaf. The fragrant white flowers appear in the spring months, and the fruit, usually round or spheroidal, does

not perfectly ripen until the following spring, so that flowers and both green and mature fruit are often found on the plant at the same time. The bitter aromatic rind of the bigarade is rough, and dotted closely over with concave oil-cells; the pulp is acid and more or less bitter in flavour.

The Sweet or common China Orange (*C. sinensis*) including the Malta or Portugal orange, has the petioles less distinctly winged, and the leaves more ovate in shape, but chiefly differs in the fruit, the pulp of which is agreeably acidulous and sweet, the rind comparatively smooth, and the oil-cells convex. The ordinary round shape of the sweet orange fruit is varied greatly in certain varieties, in some being greatly elongated, in others much flattened; while several kinds have a conical protuberance at the apex, others are deeply ribbed or furrowed, and a few are distinctly "horned" or lobed, by the partial separation of the carpels. The two species of orange reproduce themselves true to species by seed; and, where hybridizing is prevented, the seedlings of the sweet and bitter orange retain respectively the more distinctive features of the parent plant.

History.—Though now the most widely cultivated of *Citrus* fruits and grown in most of the warmer parts of the world, and apparently in many completely naturalized, the diffusion of the orange has taken place in comparatively recent historical periods. To ancient Mediterranean agriculture it was unknown; and, though the later Greeks and Romans were familiar with the citron as an exotic fruit, their "Median apple" appears to have been the only form of the citrine genus with which they were acquainted. The careful researches of Gallezio have proved that India was the country from which the orange spread to western Asia and eventually to Europe. Oranges are at present found apparently wild in the jungles along the lower mountain slopes of Sylhet, Kumaon, Sikkim and other parts of northern India, and, according to Royle, even in the Nilgiri hills; the plants are generally thorny, and present the other characters of the bitter variety, but occasionally wild oranges occur with sweet fruit; it is, however, doubtful whether either sub-species is really indigenous to Hindustan, and De Candolle is probably correct in regarding south China and the Indo-Chinese peninsula as the original home of the orange. Cultivated from a remote period in south-eastern Asia, it was carried to south-western Asia by the Arabs, probably before the 9th century, towards the close of which the bitter orange seems to have been well known to that people; though, according to Mas'udi, it was not cultivated in Arabia itself until the beginning of the 10th century, when it was first planted in 'Omān, and afterwards carried to Mesopotamia and Syria. It spread ultimately, through the agency of the same race, to Africa and Spain, and perhaps to Sicily, following everywhere the tide of Mohammedan conquest and civilization. In the 12th century the sour orange or bigarade was abundantly cultivated in all the Levant countries, and the returning soldiers of the Cross brought it from Palestine to Italy and Provence.

No allusion to the sweet orange occurs in contemporary literature at this early date, and its introduction to Europe took place at a considerably later period, though the exact time is unknown. It was commonly cultivated in Italy early in the 16th century, and seems to have been known there previously to the expedition of Da Gama (1497), as a Florentine narrator of that voyage appears to have been familiar with the fruit. The importation of this tree into Europe is usually attributed to the Portuguese who first circumnavigated Africa and found the way to India and China although Gallezio suspects that Genoese merchants of the 15th century, who must have found it growing abundantly then in the Levant, may have introduced it.

The prevailing European names applied to the orange are sufficient evidence of its origin and of the line taken in its migration westward. The Sanskrit designation *nagrungo*, becoming *narungee* in Hindustani, and corrupted by the Arabs into *nāranj* (Spanish *naranja*), passed by easy transitions into the Italian *arancia* (Latinized *aurantium*), the Romance *arangi*, and the later Provençal *orange*. The true Chinese sweet orange, however, was undoubtedly brought by the Portuguese navigators direct from the East both to their own country and to the Azores, where now

it grows luxuriantly. Throughout China and in Japan the orange has been grown from very ancient times, and it was found diffused widely when the East Indian archipelago was first visited by Europeans. In more recent days its cultivation has extended over most of the warmer regions of the globe, the tree growing freely and producing fruit abundantly wherever the temperature is sufficiently high, and enough moisture can be supplied to the roots; where night-frosts occur in winter or spring the culture becomes more difficult and the crop precarious.

Cultivation.—The orange flourishes in any moderately fertile soil, if it is well drained and sufficiently moist; but a rather stiff loam or calcareous marl, intermingled with some vegetable humus, is usually considered most favourable to its growth. Grafting or budding on stocks raised from the seed of some vigorous variety of sour or sweet orange, trifoliate orange or the so-called rough lemon is the plan usually adopted by the cultivator. The seeds, carefully selected, are sown in well-prepared ground, and the seedlings removed to a nursery-bed in the fourth or fifth year, and, sometimes after a second transplantation, grafted in the seventh or eighth year with the desired variety. When the grafts have acquired sufficient vigour, the trees are placed in rows in the permanent orangery. Propagation by marcottage or air-layers is occasionally adopted; cuttings do not readily root, and multiplication directly by seed is always doubtful in result, on account of the lack of uniformity among the seedlings. The distance left between the trees in the permanent plantation or grove varies according to the size of the plants and subsequent culture adopted. The ground is kept well stirred between the trunks, and the roots manured with well-rotted dung, guano or other highly nitrogenous matter; shallow pits are sometimes formed above the roots for the reception of liquid or other manures; in dry climates water must be abundantly and frequently supplied. Between the rows melons, pumpkins and other annual vegetables are frequently raised. In garden culture in southern Europe the orange is sometimes trained as an espalier, and with careful attention yields fruit in great profusion when thus grown. In favourable seasons the oranges are produced in great abundance, from 400 to 1,000 being commonly borne on a single plant in full bearing, while on large trees the latter number is often vastly exceeded. The trees will continue to bear abundantly from 50 to 80 years, or even more; and some old orange trees, whose age must be reckoned by centuries, still produce a crop; these very ancient trees, are, however, generally of the sour or Seville orange. Oranges intended for export to colder climates are gathered long before the deep tint that indicates maturity is attained, the fruit ripening rapidly after picking; but the delicious taste of the China orange maturing on the tree is seldom thus acquired. Carefully gathered, the oranges are packed in boxes, each orange being wrapped in paper, or with dry maize husks or leaves placed between them. The immense quantities of this valuable fruit imported into Britain are derived from various sources, the Azores ("St. Michael's" oranges), Sicily, Portugal, Spain and other Mediterranean countries, Jamaica, the Bahamas, Florida and California, South Africa and Australia. In Florida the sour orange has grown, from an unknown period, in a wild condition, and some of the earlier botanical explorers regarded it as an indigenous tree; but it was undoubtedly brought by the Spanish colonists to the West Indies, and was probably soon afterwards transplanted to Florida; its chief use in America is for stocks on which to graft sweet orange and other species of *Citrus*.

There are numerous varieties of the sweet orange. Maltese or blood oranges are characterized by the deep-red tint of the pulp, and comprise some of the best varieties. Galesio refers to the blood orange as cultivated extensively in Malta and Provence; they are largely grown in the Mediterranean region in the present day, and have been introduced into America. The Washington or Bahia Navel and other so-called navel oranges have a navel-like mark on the apex of the fruit due to the production of an incipient second whorl of carpels forming a more or less abortive small orange under the skin of the main one. Baptiste Ferrari, a Jesuit monk, in his work *Hesperides, sive de malorum aureorum cultura et usus libri quatuor*, published at Rome in 1646, figures and de-

scribes such an orange.

Citrus nobilis is the king orange, of which *c. nobilis* var *deliciosa* is the mandarin or tangerine orange. It is remarkable for its flattened spheroidal fruit, the rind of which readily separates with the slightest pressure; the pulp has a peculiarly luscious flavour when ripe. The small tangerine orange, valued for its fine colour and fragrance, is a variety of loose-skinned orange now grown rather extensively in Florida and California. The Bergamot orange (*Citrus Bergamia*) largely grown in Southern Italy and Sicily, yields the perfume. It is probably of hybrid origin.

Another loose-skinned orange, the Satsuma, introduced into the United States many years ago, is cultivated on a fairly large scale in the region bordering on the Gulf of Mexico in western Florida, southern Alabama, southern Mississippi and southern Louisiana. The Satsuma is the chief variety grown in Japan and is the earliest citrus fruit grown in the United States, ripening from the first of October to the first of December.

The fruit is a very wholesome article of diet, abounding in citric acid, and, like the lemon and lime, possessing a high vitamin content.

Diseases.—Several are caused by fungi, others by insects. Of the fungus diseases that known as root-rot in Florida and *mal-digamma* in Italy is very widely distributed. It occurs on the lower part of the trunk and the main roots of the tree, and is indicated by exudation of gum on the bark covering the diseased spot. The diseased patches spread into the wood, killing the tissues, which emit a foetid odour; the general appearance of the tree is unhealthy, the leaves become yellow and the twigs and young branches die. A fungus (*Phytophthora terrestris*) is found associated with the disease, which is also fostered by faulty drainage, a shaded condition of the soil, the use of rank manures and other conditions. For treatment, the diseased patches should be cut away and the wound treated with an antiseptic. A very similar disease, brown-rot gummosis, occurs in California; it is caused by *Pythiactis citrophthora*, and is treated in much the same way. The sour orange resists both root-rot and gummosis and is in consequence largely used as root stock both in Florida and California.

Decay of oranges in transit often causes serious losses; this has been shown to be due to *Penicillium*, the germinating of which spores penetrate the skin of damaged fruits. Careful picking, handling and packing have much reduced the amount of loss from this cause. Another fungus disease, scab, has been very injurious to the lemon and sour orange and grapefruit in Florida. It is caused by *Cladosporium citri* which forms small warts on the leaves and fruits; spraying with a weak solution of Bordeaux mixture or with ammoniacal solution of copper carbonate is recommended. Citrus canker, a bacterial disease caused by *Phytophthora citri*, formerly caused much loss in Florida and nearby states. It has been eradicated at a cost of many millions of dollars. The sooty mould of the orange, which forms a black incrustation on the leaves and also the fruit, probably occurs wherever the orange is cultivated. It is caused by species of *Meliola*; in Europe and the United States by *M. Penzigi*. The fruit is often rendered unsaleable and the plant is also injured as the leaves are unable properly to perform their functions. The fungus is not a parasite, but lives apparently upon the honey dew secreted by aphides, etc., and is therefore dependent on the presence of these insects. Spraying with resin-wash is an effective preventive, as it destroys the insects. The diseases of citrus fruits have been very thoroughly studied during recent years. (See Fawcett's *Citrus Diseases*.)

Several insect enemies attack the plant, of which the scale insect *Aspidiotus* is the most injurious in Europe and the Azores. In Florida another species, *Mytilaspis citricola* (purple scale), sometimes disfigures the fruit to such an extent as to make it unfit for market. Several species of *Aleyrodes* are insect pests on leaves of the orange; *A. citri*, the white orange fly of Florida, is described as the most injurious of the insect pests of the crop in Florida at the present time; *A. Howardi* is a very serious pest in Cuba. Cold weather in winter has sometimes proved destructive in Provence, and many plantations were destroyed by the hard frosts of 1780 and 1820.

The Sour Orange.—The sour orange is chiefly cultivated for the

aromatic qualities of the rind. Planted years ago in Andalusia by the Moorish conquerors, it is still extensively grown in southern Spain—deriving its common English name "Seville" orange from the abundant groves that still exist around that city, though the plant is now largely cultivated elsewhere. The fruit is imported into Great Britain in large quantities for the manufacture of orange marmalade, which is prepared from the pulp and rind, usually more or less mingled with the pulp of the sweet orange. In medicine the fresh peel is largely employed as an aromatic tonic, and often, in tincture and syrup and "orange wine," as a mere vehicle to disguise the flavour of more nauseous remedies. The chief constituents are three glucosides, hesperidin, isohesperidin and aurantiamarin, the latter being the bitter principle; and an oil which mainly consists of a terpene known as limonene. The essential oil of the rind is collected for the use of the perfumer, being obtained either by the pressure of the fresh peel against a piece of sponge, or by the process known as *écuelle*, in which the skin of the ripe fruit is scraped against a series of points or ridges arranged upon the surface of a peculiarly-shaped dish or broad funnel, when the oil flows freely from the broken cells. Another fragrant oil, called in France *essence de petit grain*, is procured by the distillation of the leaves, from which also an aromatic water is prepared. The flowers of the bitter orange yield, when distilled with water, the "oil of Neroli" of the druggist and perfumer, and likewise the fragrant liquid known as "orange-flower water," which is a saturated solution of the volatile oil of the fresh flowers. The candied peel is much in request by cook and confectioner; the fragrant liqueur sold as "curaçoa" derives its aromatic flavour from the rind of the bitter orange.

Orange trees occasionally acquire a considerable diameter; the trunk of one near Nice, still standing in 1789, was so large that two men could scarcely surround it with their arms; the tree was killed by the intense cold of the winter of that year. The wood of the orange is of a fine yellow tint, and, being hard and close-grained, is valued by the turner and the cabinetmaker for the manufacture of small articles; it takes a good polish.

Although the bitter "Poma de Orenge" were brought in small quantities from Spain to England as early as the year 1290, no attempt appears to have been made to cultivate the tree in Britain until about 1595, when some plants were introduced by the Carews of Beddington in Surrey, and placed in their garden, where, trained against a wall, and sheltered in winter, they remained until destroyed by the great frost of 1739–1740. In the 18th century the tree became a favourite object of conservatory growth; in the open air, planted against a wall and covered with mats in winter, it has often stood the cold of many seasons in the southern counties, in such situations the trees occasionally bearing abundant fruit.

The orange has been usually cultivated in England for the beauty of the plant and the fragrance of its blossoms, rather than for the purpose of affording a supply of edible fruit. The latter can, however, be easily grown in a hot-house, some of the fruits thus grown, especially those of the pretty little Tangerine variety, being superior in quality to the imported fruit.

Production and Consumption of Oranges.—Oranges are produced and consumed in enormous quantities in the United States. According to Wellman and Braun, the average production during the five-year period 1923–27 inclusive was 31,756,000 boxes (of 72 to 80 lb. net weight), of which amount California produced 67%, Florida 32%, other States about 1 per cent. Exports of oranges from the U.S. amounted to an average of 2,597,000 boxes, or 8.2% of the total production, while imports (mostly from Porto Rico) averaged only 397,000 boxes, or only 1.2% of the total domestic production.

The average carload shipments of oranges in the U.S. for the five-year period 1923–27 was 70,534 cars, an amount exceeded only by apples, about 110,000 cars, and bananas, 111,414 cars. The next largest fruit shipments were of peaches 32,252 cars.

The value of the orange crop of the United States in 1928, as estimated by the Crop-Reporting Board of the U.S. Department of Agriculture was \$130,500,000. This value was exceeded by

only one other fruit crop, apples, the crop of which for 1928 was worth \$185,125,000. Among all farm crops produced in the United States in 1928 oranges ranked eleventh in value.

The estimated annual production (in 70 lb. boxes) of the other chief orange producing countries is as follows: Spain 33,898,000 boxes (1927), Italy 9,168,000 (1925), Japan 9,802,000 (1926), Palestine 2,429,000 (1926), Australia 2,098,000 (1925), Algeria 2,236,000 (1923). The production in China is large but figures are not available.

Great Britain probably ranks next to the United States in the consumption of oranges, her annual imports for the five-year period 1922–26, inclusive, averaged 12,105,000 boxes of 70 lb. each.

For further details, see G. Gallesio, *Traité du Citrus* (Paris, 1811), for early history; A. Risso and A. Poiteau, *Histoire et culture des Oranges*, 2nd edition (Paris, 1872); A. de Candolle, *Origin of Cultivated Plants* (1881); F. Engler and A. Swingle the article "Citrus," in L. H. Bailey, *The Standard Cyclopaedia of Horticulture* (1914); Howard S. Fawcett, *Citrus Diseases and their Control* (1926); James B. McNair "Citrus Products," *Field Mus. of Nat. Hist. Pub.* 238, Botanical Ser. vol. vi., no. 1. (Chicago, 1926); H. R. Wellman and E. W. Braun "Oranges," *Calif. Agric. Exp. Sta.* (Berkeley, 1928).

ORANGE, COUNCILS OF: see COUNCILS OF ORANGE.

ORANGEBURG, a city of South Carolina, U.S.A., the county seat of Orangeburg county; on the North Edisto river and Federal highway 21, at an altitude of 259 ft., 48 m. S.E. of Columbia. It is served by the Atlantic Coast Line and the Southern railways. Pop. 7,290 in 1920 (45% negroes); estimated locally at 10,000 in 1928. It is the financial, commercial and industrial centre of a rich section of the Atlantic Coastal plain, and is the seat of the State Agricultural and Mechanical college for negroes (1896). Cotton, grain, live stock, poultry, tobacco and pecans are leading products of the county; and the city has lumber mills, veneer plants, cotton mills and various other manufacturing industries. It operates under a commission form of government. In 1704 a trader and trapper built his cabin here, and in 1735 a colony of Germans and Swiss established a settlement, naming it in honour of William, Prince of Orange. The town was incorporated in 1851, and was chartered as a city in 1883.

ORANGE FREE STATE, an inland province of the Union of South Africa. It is divided from Natal by the Drakenberg, from Basutoland by the Caledon river, from the Transvaal by the Vaal river and from the Cape of Good Hope by the Orange river, and in the west by a line drawn across the veld from the Orange to the Vaal. It lies between 26° 30' and 30° 40' S. and between 24° 10' and 29° 40' E. Its area is 49,647 sq. miles.

The country forms part of the inner plateau of South Africa, and most of it lies between 4,000 and 5,000 ft. above sea level. From the mountainous, eastern districts it slopes gradually westward, no natural boundary marking its western frontier. The aspect of the country is that of vast, undulating, treeless plains, with a certain number of willows and thorn trees along the streams. The latter were formerly more widely spread, but have nearly all been cut down for fuel. The Australian black wattle, gums and the pepper tree have been successfully introduced and are grown along the streets of the towns, and in plantations on farms, especially in the eastern districts, to provide shelter, poles and firewood. The general level of the surface is broken by low ridges, and isolated table mountains, the latter attaining considerable elevation above the plain. They are particularly numerous and well developed in the east, and are due to the outcrop of beds of sandstones and dolerites. The rivers, except the Orange, Vaal and Caledon, are dry or nearly dry, for three or four months during the dry winter season, but after rain even the small spruits may become raging torrents. (For geology, climate, flora and fauna, see SOUTH AFRICA, UNION OF.)

Population.—In 1926 the white population numbered 202,985. The corresponding figures are not available (1929) for the non-European elements, but in 1921 their numbers amounted to 421,306 natives, 395 Asiatics and 17,898 mixed and others. The largest element among the natives is probably the Basuto, who are largely represented in the districts of Harrismith, Bethlehem, Ficksburg

and Ladybrand. A considerable number of Barolong live in the districts of Thaba'nchu and Bloemfontein, and the Amazulu are well represented chiefly in the north-eastern area, adjoining Zululand. Other tribes include Fingoes, Ama-xosa, etc. The population of the country as a whole, which amounts to 9.08% of the Union, and which has an average density of 12.67 per sq. m., is concentrated in the eastern and better-watered districts.

Towns.—These call for little comment. They are mostly small administrative and provisioning centres for their surrounding districts. Only eight have a white population exceeding 2,000 and of these Bloemfontein, the capital, Kroonstad, Ladybrand and Ficksburg have been described in separate articles. Harrismith and Bethlehem are prosperous centres for the north-eastern districts. The former, situated at the foot of the Plattberg, was formerly a military station and is a recognized resort for sufferers from chest diseases. Parys (whites [1926], 2,656; total [1921], 3,653) is situated on the Vaal river, and is developing as a pleasure resort. Jam making and fruit preserving are carried on and the town has spinning and weaving schools.

Agriculture and Pastoralism.—The Orange Free State is a healthy stock country. It is little affected by horse sickness and the number of horses in 1926 was 265,748. These probably include many ponies kept by natives. Cattle number 1,955,772 and are most numerous in the eastern districts, especially about Ficksburg. Sheep, totalling over 10,000,000, are most abundant in the Rouxville, Wepener and Smithfield districts, while goats, which exceed 160,000, are either kept largely by natives, or concentrated in the dry south-western area about Philippolis. Among the chief crops, maize takes first place, the districts of Heilbron and Frankfurt forming part of the South African maize belt (*q.v.*). Toward the west the area sown with maize varies greatly from year to year, according to the incidence of the rains. The most fertile part of the country lies in the valley of the Caledon river. Here a considerable quantity of wheat is grown, especially in the districts of Ladybrand, Ficksburg, Bethlehem and Rouxville. The same districts and Harrismith also produce oat-hay. Here, too, there has been a considerable recent development of apple and plum orchards, the apples being among the best grown in South Africa. Potatoes, tobacco, pumpkins, etc., are also grown.

Diamonds and Other Mining Industries.—In the Orange Free State the occurrences of diamonds appear to cluster about Boshof, Koffiefontein, Jagersfontein, Kroonstad and Theunissen. The production in 1926 was valued at £976,204. The chief mines are at Jagersfontein, which, however, are closed down (1928). The alluvial diamonds, found in the gravels of the Vaal and some of its tributary streams, are of great purity. Coal approaching a million tons was produced in 1926. The chief producers are the Cornelia colliery on the Vaal river, opposite to Vereeniging, and the Clydesdale, about 15 m. to the south. The coal is not of the best quality. Flour-milling is carried on at a number of local centres. Salt making is also carried on. The source of supply is the heavily saline waters of certain "pans" in the western districts, evaporated from shallow basins, in most cases by solar heat.

Education, other than higher education, is controlled by the provincial education department, subject to the sanction of the provincial administration. At the head of the department is the director. It has powers to establish and maintain primary, secondary and certain special schools, and to make grants in aid of private schools which comply with certain conditions and attain a satisfactory standard. There is a normal training college in Bloemfontein. The province is divided into 57 school districts, in each of which is an advisory board, consisting of elected members, and having certain powers of supervision. In 1926 there were in the province 858 State and State-aided schools, attended by 44,866 scholars. There were also 201 schools for natives, two for other non-Europeans, and one training school. (R. U. S.)

HISTORY

The country north of the Orange river was first visited by Europeans towards the close of the 18th century. At that time it was somewhat thinly peopled, mainly by tribes of the Bechuana division of the Bantus. Early in the 19th century Griquas established

themselves north of the Orange. Between 1817 and 1831 the country was devastated by the chief Mosilikatze and his Zulus. Up to this time the few white men who had crossed the Orange had been chiefly hunters or missionaries. In 1834 Dutch farmers from Cape Colony seeking pasture for their flocks settled in the country. They were followed in 1836 by the first parties of the Great Trek. These emigrants left Cape Colony from various motives, but all were animated by the desire to escape from British sovereignty. (See SOUTH AFRICA, UNION OF; and CAPE COLONY.) The leader of the first large party of emigrants was A. H. Potgieter, who concluded an agreement with Makwana, the chief of the Bataung tribe of Bechuanas, ceding to the farmers the country between the Vet and Vaal rivers. The emigrants soon came into collision with Mosilikatze, who in Nov. 1837 was decisively defeated by the Boers and thereupon fled northward. In the meantime another party of emigrants had settled at Thaba'nchu, where the Wesleyans had a mission station for the Barolong. The emigrants were treated with great kindness by Moroko, the chief of that tribe, and with the Barolong the Boers maintained uniformly friendly relations. In Dec. 1836 the emigrants beyond the Orange drew up in general assembly an elementary republican form of government. After the defeat of Mosilikatze the town of Winburg (so named by the Boers in commemoration of their victory) was founded, a *volksraad* elected, and Piet Retief, one of the ablest of the *voortrekkers*, chosen "governor and commandant-general." The emigrants already numbered some 500 men, besides women and children and many coloured servants. Dissensions speedily arose among the emigrants, whose numbers were constantly added to, and Retief, Potgieter and other leaders crossed the Drakensberg and entered Natal. Those that remained were divided into several parties intensely jealous of one another.

Meanwhile a new power had arisen in the mountainous region of the Upper Orange and in the valley of the Caledon. There a Bechuana chief named Moshesh had welded together a number of scattered and broken clans and had formed of them the Basuto nation. The Basuto were a menace to the white farmers, and the farmers were equally a menace to the Basuto. At that time the British Government was not prepared to exercise effective control over the emigrant farmers, but on the advice of Dr. John Philip, the superintendent of the London Missionary society's stations in South Africa, a treaty was concluded in 1843 with Moshesh, placing him under British protection. A similar treaty was made with the Griqua chief, Adam Kok III. (See BASUTOLAND and GRIQUALAND.) By these treaties, which recognized native sovereignty over large areas on which Boer farmers were settled, it was sought to keep a check on the emigrants and to protect both the natives and Cape Colony. Their effect was to precipitate collisions between all three parties. Trouble first arose between the Boers and the Griquas in the Philippolis district. British troops were moved up to support the Griquas, and after a skirmish at Zwartkopjes (May 2, 1845), a new arrangement was made between Kok and Sir Peregrine Maitland, then governor of Cape Colony, virtually placing the administration of his territory in the hands of a British resident, a post filled in 1846 by Capt. (afterwards Major) H. D. Warden. The place chosen by Warden as the seat of his court was known as Bloemfontein, and it subsequently became the capital of the whole country.

First Annexation by Great Britain.—The *volksraad* at Winburg during this period continued to claim jurisdiction over the Boers living between the Orange and the Vaal and the relations between the Boers and the British were in a continual state of tension. Sir Harry Smith became governor of the Cape at the end of 1847. He recognized the failure of the attempt to govern on the lines of the treaties with the Griquas and Basutos, and on Feb. 3, 1848, he issued a proclamation declaring British sovereignty over the country between the Orange and the Vaal eastward to the Drakensberg. The justness of Sir Harry Smith's measures and his popularity among the Boers gained for his policy considerable support, but the Republican Party, at whose head was Andries Pretorius (*q.v.*), did not submit without a struggle. They were, however, defeated by Sir Harry Smith in an engagement at Boomplaats (Aug. 29, 1848). Thereupon Pretorius, with those

most bitterly opposed to British rule, retreated across the Vaal.

Warden remained British resident until July 1852. A nominated legislative council was created, a high court established and other steps taken for the orderly government of the country, which was officially styled the Orange River Sovereignty. In Oct. 1849 Moshesh was induced to sign a new arrangement considerably curtailing the boundaries of Basutoland. The frontier towards the Sovereignty was thereafter known as the Warden line. The British resident had, however, no force sufficient to maintain his authority, and Moshesh and all the neighbouring clans became involved in hostilities with one another and with the whites. In 1851 Moshesh joined the Republican party in the Sovereignty in an invitation to Pretorius to recross the Vaal. The intervention of Pretorius resulted in the Sand River Convention of 1852, which acknowledged the independence of the Transvaal but left the status of the Sovereignty untouched.

The British Government, which had reluctantly agreed to the annexation of the country, had, however, already repented its decision and had resolved to abandon the sovereignty. A meeting of representatives of all European inhabitants of the sovereignty, elected on manhood suffrage, held at Bloemfontein in June 1852, nevertheless declared in favour of the retention of British rule. But the cabinet in London adhered to the determination to withdraw from the Sovereignty. Sir George Russell Clerk was sent out in 1853 as special commissioner "for the settling and adjusting of the affairs" of the Sovereignty. At that time there were some 15,000 whites in the country, among them numbers of farmers and tradesmen of British (chiefly Scottish) blood.

Independence Forced on the Boers.—The majority of the whites still wished for British rule provided that it was effective and the country guarded against its enemies, but Sir George Clerk announced that, as the elected delegates were unwilling to form an independent government, he would enter into negotiations with other persons. While the elected delegates sent two members to England to try to induce the Government to alter their decision Sir George Clerk came to terms with a committee formed by the Republican party and presided over by J. H. Hoffman.

A royal proclamation had already (Jan. 30, 1854) "abandoned and renounced all dominion" in the sovereignty. A convention recognizing the independence of the country was signed at Bloemfontein on Feb. 23 by Sir George Clerk and the Republican committee, and on March 11, 1854, the Boer Government assumed office and the Republican flag was hoisted. Five days later the representatives of the elected delegates had an interview in London with the colonial secretary, the duke of Newcastle, who informed them that it was impossible for England to supply troops to constantly advancing outposts, "especially as Cape Town and the port of Table bay were all she really required in South Africa." In withdrawing from the Sovereignty the British Government declared that it had "no alliance with any native chief or tribes to the northward of the Orange river with the exception of the Griqua chief Captain Adam Kok." Kok was not formidable in a military sense and in 1861 he sold his sovereign rights to the Free State for £4,000 and removed with his followers to the district now known as Griqualand East.

Constitution of the Republic.—On the abandonment of British rule representatives of the people were elected and met at Bloemfontein on March 28, 1854, and between that date and April 18 were engaged in framing a constitution. The country was declared a republic and named the Orange Free State. All persons of European blood possessing a six months' residential qualification were to be granted full burgher rights. The sole legislative authority was vested in a single popularly elected chamber styled the *volksraad*. Executive authority was entrusted to a president elected by the burghers from a list submitted by the *volksraad*. The president was to be assisted by an executive council, was to hold office for five years and was eligible for re-election. The constitution was subsequently modified but remained of a liberal character. A residence of five years in the country was required before aliens could become naturalized. The franchise was confined to European adult males; the grant of the suffrage to natives was never considered. It may be added here

that subsequently the Free State prohibited the entry into its territory of Asiatics, so that it was never troubled with an Indian question. The first president was J. H. Hoffman, but he was accused of being too complaisant towards Moshesh and resigned, being succeeded in 1855 by J. N. Boshof, one of the *voortrekkers*, who had previously taken an active part in the affairs of Natal.

Distracted among themselves, with the formidable Basuto power on their southern and eastern flank, the troubles of the infant state were speedily added to by the action of the Transvaal Boers. Marthinus Pretorius, who had succeeded to his father's position as commandant-general of Potchefstroom, wished to bring about a confederation between the two Boer States. As peaceful overtures failed Pretorius, aided by Paul Kruger, made a raid in 1857 into the Free State territory. They found, however, little support; Kruger came into Boshof's camp with a flag of truce; and on June 2, 1857, a treaty of peace was signed, each State acknowledging the absolute independence of the other. This experience did not, however, heal the party strife within the Free State. The difficulties of the State were so great that the *volksraad* in Dec. 1858 passed a resolution in favour of confederation with Cape Colony. This proposition received the strong support of Sir George Grey, then governor of Cape Colony, but his view did not commend itself to the British Government and was not adopted. In the same year the disputes between the Basutos and the Boers culminated in open war. As the contest went against them the Free State appealed to Sir George Grey, who induced Moshesh, for a time, to come to terms. President Boshof now gave up the struggle of attempting to rule the country and in Feb. 1859 retired to Natal. His old opponent Marthinus Pretorius was elected president in his stead. Though unable to effect a durable peace with the Basutos, or to realize his ambition for the creation of one powerful Boer republic, Pretorius saw the Free State begin to grow in strength. The fertile district of Bethulie as well as Adam Kok's territory was acquired, and there was a considerable increase in the white population. The burghers generally, however, had not learned the need of discipline, of confidence in their elected rulers, or that to carry on a government taxes must be levied. Wearied like Boshof of a thankless task, and more interested in affairs in the Transvaal than in those of the Free State, Pretorius resigned the presidency in 1863, and after an interval of seven months Mr. (afterwards Sir) John Henry Brand (*q.v.*), an advocate at the Cape bar, was elected president.

Brand's Rule.—President Brand took office in Feb. 1864. His selection proved a turning-point in the history of the country, which, under his beneficent and tactful guidance, became peaceful and prosperous and, in some respects, a model state. But before peace could be established an end had to be made of the difficulties with the Basutos. At length, in 1867 the burghers gained a decisive victory, every stronghold in Basutoland save Thaba Bosigo being stormed. Moshesh now turned to the British at the Cape for preservation and in 1868 he and his country were taken under British protection. Thus the 30 years' strife between the Basutos and the Boers came to an end. The Boers reaped the reward of victory. By the treaty of Aliwal North (Feb. 12, 1869), the country lying to the north of the Orange river and west of the Caledon, formerly a part of Basutoland, was ceded to the Free State. This country, some 100m. long and nearly 30m. wide, lies at an altitude of nearly 6,000ft. and forms one of the richest corn-growing districts in South Africa.

The Basutoland difficulties were no sooner arranged than the Free Staters found themselves confronted with a serious difficulty on their western border. In the years 1870-71 a large number of diggers had settled on the diamond fields near the junction of the Vaal and Orange rivers, which were situated in part on land claimed by the Griqua chief Nicholas Waterboer and by the Free State. The Free State established a temporary government over the diamond fields, but the administration of this body was satisfactory neither to the Free State nor to the diggers. At this juncture Waterboer offered to place the territory under the administration of Queen Victoria. The offer was accepted, and on Oct. 27, 1871, the district, together with some adjacent territory to which the Transvaal had laid claim, was proclaimed, under the

name of Griqualand West, British territory. When the British annexation took place a party in the *volksraad* wished to go to war with Britain, but the wiser counsels of President Brand prevailed. The matter involved no little irritation between the parties concerned until July 1876. It was then disposed of by the 4th Earl of Carnarvon, at that time secretary of State for the colonies, who granted to the Free State £90,000 "in full satisfaction of all claims which it considers it may possess to Griqualand West." One thing at least is certain with regard to the diamond fields—they were the means of restoring the credit and prosperity of the Free State. Moreover, it is doubtful if the Free State could at that time have controlled the diggers. The probability is that the alternative to British sovereignty was an independent diamond field republic. At this time, largely owing to the exhausting struggle with the Basutos, the Free State had drifted into financial straits. A paper currency had been instituted, and the notes—currently known as "bluebacks"—soon dropped to less than half their nominal value. Commerce was largely carried on by barter, and many cases of bankruptcy occurred. But the influx of British and other immigrants to the diamond fields, in the early '70s, restored public credit and individual prosperity to the Free State Boers. The diamond fields offered a ready market for stock and other agricultural produce. "Bluebacks" recovered par value, and were called in and redeemed by the Government.

Relations with the Transvaal.—From 1870 until the time when it became involved in the second struggle between Great Britain and the Transvaal the story of the Free State was one of steady, quiet progress, marked by cordial relations with its neighbours. The State has been described as for 30 years a farmers' and transport riders' paradise. At the time of the first annexation of the Transvaal, Brand and the *volksraad* declined the invitation of Lord Carnarvon to federate with the other South African communities and when the Transvaalers rose against the British in 1880 they had the sympathy of the Free Staters. Indeed, many burghers joined the Transvaal forces in the Majuba campaign and it was due to the tact and statesmanship of Brand that a dangerous situation was prevented from developing. The danger passed and the Free State showed considerable ability in adapting itself to the change, political and economic, which, a few years later, following the discovery of the Rand gold mines, came over the whole of South Africa. Paul Kruger, instead of imitating the liberal policy of the Free State, sought to meet the problem presented by the large *uitlander* population on the Rand by reliance on foreign (*i.e.*, not British) Powers and by an alliance with the Free State. In Oct. 1887 Kruger visited Bloemfontein and tried to induce Brand to enter into an offensive and defensive alliance with the Transvaal "against the common enemy." Brand declined to be drawn into such an engagement. He refused to recognize the British as enemies—indeed, though opposed to federation, he was equally opposed to racial rivalries. He was for full co-operation with the other South African communities, and a few months later arranged with the Cape and Natal for a conference on customs and railway questions. That was in Jan. 1888; in the June following Brand died. He was one of the most upright and enlightened rulers South Africa had known, and he earned the title of peacemaker. The conference he had planned was held in 1889 and resulted in a customs union between Cape Colony and the Free State, while the Cape Government obtained permission to extend the Port Elizabeth railway to Bloemfontein. This agreement was displeasing to the Transvaal, for the ultimate objective of the railway was the Rand, and Kruger had determined that the Rand's outlet to the sea should be through the Portuguese port of Lourenço Marques (Delagoa Bay).

In Brand's successor to the presidency—F. W. Reitz—the Transvaal found an ally. At one time an advocate at the Cape and since 1874 chief justice of the Free State, Reitz had been in 1881—at the time of Majuba—a leading organizer in the State of the Afrikaner Bond (*q.v.*), at that time a bitterly anti-British organization. Reitz was elected president in Jan. 1889; two months later he made a treaty of alliance with Kruger. The alliance looked to a contingency which, however, did not arise during Reitz's presidency and meanwhile the Free State continued to

prosper. From its geographical position it reaped the benefit without incurring the anxieties consequent on the settlement of a large *uitlander* population on the Rand. The Jameson raid, Dec. 1895, re-awakened anti-British feeling in the Free State. Reitz had resigned the presidency a month before the raid and at the election in Feb. 1896 Judge M. T. Steyn, a strong nationalist, was elected president, receiving 41 votes against 19 cast for (Sir) John G. Fraser. Fraser was the most prominent of the burghers of Scots descent, of whom there were a considerable number in the State, and he represented Brand's policy. Many burghers supported Fraser in opposition to entangling engagements with the Transvaal; nevertheless, Steyn, though protesting against many of the manifestations of Krugerism, concluded a new defensive and offensive alliance with Kruger in March 1896.

The South African War and After.—In the four years which followed, the Free State revised its constitution, the period of residence to obtain naturalization being reduced (Dec. 1897) from five to three years; entered (1898) into a new customs union with the Cape and Natal and in other ways tried to live up to its reputation as a model community. It was alarmed at the developments of the *uitlander* troubles in the Transvaal and tried to get Kruger to enact reforms; its ex-president, Reitz, had become State secretary in the Transvaal. Bloemfontein was chosen as the place for the Milner-Kruger conference which met in June, 1899, when Steyn urged Kruger to grant the five-year franchise to the *uitlander* (and thus avoid war) and Kruger retorted by asking Steyn "not to play the tame elephant to get him into the English kraal." But when the war came in the October following, the Free State was solidly by the side of the Transvaal. A resolution had been passed by the *volksraad* on Sept. 27 declaring that the State would observe its obligations to the Transvaal whatever happened. It would probably have sided with its sister Boer republic in any case, alliance or no alliance, for racial ties were strong. The offer of the British Government to respect the independence of the Orange Free State if it remained neutral had no response; and, as is common in these cases, the bitterness against Great Britain—with whom it had no cause of quarrel—was greater in the Free State than in the Transvaal. The events of the war are told elsewhere. (See SOUTH AFRICAN WAR AND SOUTH AFRICA, UNION OF.)

Orange River Colony.—Bloemfontein was occupied by the British under Lord Roberts on March 13, 1900; and on May 28 following the Free State was annexed to the British dominions under the title of Orange River Colony. For nearly two years longer the burghers kept the field under Christian de Wet (*q.v.*), and other leaders, but by the articles of peace signed on May 31, 1902, British sovereignty was acknowledged. A civil administration of the colony was established early in 1901 and in June 1902 a nominated legislative council was set up of which Sir John Fraser and a number of other prominent ex-burghers became unofficial members. In every direction vigorous and successful efforts were made to repair the ravages of the war. Over £4,000,000 was spent by the British Government in the colony on these objects. At the same time efforts were made—with no great measure of success—to strengthen the British element in the country by means of land settlements. Special attention was also devoted to the development of the resources of the country and the education system was reorganized and greatly improved.

Responsible Government.—Having recovered from the worst effects of the war the Boers, both in the Transvaal and Orange Colony, began in 1904 to make organized efforts to regain their political ascendancy. This agitation, as far as the Orange River Colony was concerned, coincided with the return to South Africa of ex-President Steyn. Steyn had gone to Europe at the close of the war and did not take the oath of allegiance to the British Crown until the autumn of 1904. A congress of ex-burghers was held at Brandfort in Dec. 1904, when among other resolutions passed was one demanding the grant of self-government to the colony. This was followed in July 1905 by a conference at Bloemfontein, when it was resolved to form a national union. This organization, the *Oranjerie Unie*, was formally constituted in May 1906.

A counter-organization was formed by ex-burghers who had

whole-heartedly accepted the new order of things. They took the title of the Constitutional party, and Sir John Fraser was chosen as chairman. In Bloemfontein the Constitutionalists had a strong following; elsewhere their supporters were numerically weak. The programmes of the two parties were very similar, the real difference between them being the attitude with which they regarded the British. While the ideal of the *Unie* was an Afrikaner state, the Constitutionalists desired the equality of both white races.

The advent of a Liberal administration under Sir Henry Campbell-Bannerman in Great Britain in Dec. 1905 completely altered the political situation in the late Boer States. The previous (Conservative) Government had in March 1905 made public a form of representative government, intended to lead up to self-government for the Transvaal, and had intimated that a similar constitution would be subsequently conferred on the Orange Colony. The Campbell-Bannerman administration decided to do without this intermediary step in both colonies. It was not, however, until July 1, 1907, that the letters-patent conferring self-government on the colony were promulgated, the election for the legislative assembly taking place in November following. They resulted in the return of 29 members of the *Oranjer Unie*, five Constitutionalists and four Independents. The Constitutionalists won four of the five seats allotted to Bloemfontein, Sir John Fraser being among those returned. A ministry, which included Generals J. B. M. Hertzog and Christian de Wet, was formed by Abraham Fischer, one of the leading members of the old *volksraad*. Steyn's ill-health prevented his taking office, but he wielded almost as much power as when he had been president of the country.

Union of South Africa.—The responsible government entered upon its task in favourable conditions. The seven years of Crown colony administration had achieved remarkable results. Materially the country had been restored to a sound state with every prospect of a prosperous future, and steady progress was made under responsible government, but political developments were rapid, and less than three years after Fischer took office the Orange River Colony, as such, had ceased to exist.

The colony took part in May 1908 in an inter-State conference which determined to renew the existing customs convention and to make no alteration in railway rates. These decisions were the result of an agreement to bring before the parliaments of the various colonies a resolution advocating the closer union of the South African States and the appointment of delegates to a national convention to frame a draft constitution. In this convention Steyn took a leading and conciliatory part, and subsequently the Orange River Colony legislature agreed to the terms drawn up by the convention for the unification of the four self-governing colonies. Under the imperial act by which unification was established (May 31, 1910) the colony entered the Union under the style of the Orange Free State Province. (For the union movement see SOUTH AFRICA, UNION OF.) Fischer and Hertzog became members of the first Union ministry, while Dr. A. E. W. Ramsbottom, formerly colonial treasurer, became the first administrator of the Free State as a province of the Union.

Education Controversy.—During the period in which the province had been a self-governing colony much bitterness had been caused by the educational policy pursued by Hertzog, who was attorney-general and minister of education. From the date of the passing of an education act in the middle of 1908 until the absorption of the colony into the Union, Hertzog so administered its provisions regarding the media of instruction as to compel every European child to receive instruction in every subject, partly in the medium of Dutch. This policy of compulsory bilingualism was persisted in despite the vehement protests of the English-speaking community, and of the desire of many Dutch burghers that the medium of instruction for their children should be English. Failing to obtain redress, the English-speaking section of the community proceeded to open separate schools. It was not until 1912 that through the intervention of the Union parliament the dispute was settled by the provision that in the lower standards the medium of instruction should be the "home language" of the pupil. As to the Boer section, the *taal*, renamed *Afrikaans*, was by ordinance passed in 1920 recognized as a me-

dium of instruction instead of Netherlands Dutch; the Free State Province being the first to adopt officially South African Dutch.

The province followed Hertzog when he parted from Botha on the racial issue and it became the stronghold of the Dutch Nationalists. With the exception of one of the Bloemfontein divisions they had a majority in every parliamentary constituency in the province. Up to his death in 1916 Steyn's influence with the Dutch section of the people continued powerful. In the crisis caused by the World War Steyn, supported by Hertzog, opposed operations against the Germans in South-West Africa. There followed the rebellion of de Wet, who drew his chief strength from the Free State. On Steyn's death Hertzog became the undisputed leader of the Dutch Nationalists and after the general election of 1924 he was chosen as prime minister of the Union. In internal affairs the province has been governed on progressive lines. Its interests remain predominantly agricultural.

ORANGEMEN, members of the Orange Society, an association of Irish Protestants, originating and chiefly flourishing in Ulster, but with ramifications in other parts of the United Kingdom, and in the British colonies. Orangemen derive their name from King William III. (Prince of Orange). They are enrolled in lodges in the ordinary form of a secret society. Their toasts, about which there is no concealment, indicate the spirit of the Orangemen. The commonest form is "the glorious, pious and immortal memory of the great and good King William, who saved us from popery, slavery, knavery, brass money and wooden shoes," with grotesque or truculent additions according to the orator's taste. The brass money refers to James II.'s finance, and the wooden shoes to his French allies. The final words are often "a fig for the bishop of Cork," in allusion to Dr. Peter Browne, who, in 1715, wrote cogently against the practice of toasting the dead. Orangeism is essentially political. Its original object was the maintenance of Protestant ascendancy, and that spirit still survives. The orange flowers of the *Lilium bulbiferum* are worn in Ulster on July 1 and 12, the anniversaries of the Boyne and Aughrim. Another great day is Nov. 5, when William III. landed in Torbay.

ORANG-UTAN ("man of the woods"), the giant red man-like ape of Borneo and Sumatra (*Simia satyrus*). The reddish colour of the long, coarse hair distinguishes the omias, as the Dyaks call it, from African apes; the arms are such that the animal in the upright posture can rest on its bent knuckles. In some races, in the old males, which may stand 5½ ft. high, there is a large

expansion of the cheeks, due to growth of fibrous tissue and producing a broad and flattened type of face. Another peculiarity of the males is the presence of a huge throat-sac on the front of the throat and chest, which may extend even to the armpits; although present in females, it does not reach nearly the same dimensions in that sex. More than half a dozen separate races of orang-utan are recognized in Borneo where the red ape inhabits the swampy forest-tract at the foot of the mountains. These apes are comparatively slow and deliberate in their movements; they construct platforms of boughs in the trees, which are used as sleeping-places, and apparently occupied for several nights in succession. Durian, the tough spiny hide of which is torn open with their strong fingers, forms their chief food. They also consume the mangustin and other fruits. (See PRIMATES.)

ORANIENBAUM, a town of Russia in the Leningrad Area, in 59° 54' N., 29° 48' E., lying 100 ft. above the sea on the south coast of the Gulf of Finland, opposite Kronstadt. Pop.

(1926) 7,061. It was formerly a summer residence of the imperial family. The site was given to Menshikov in 1714 by Peter the Great, and the palace he erected still stands. Confiscated in 1727, it became an imperial residence. In 1743 the empress Elizabeth presented Oranienbaum to the future Tsar Peter III., who built there a castle, now destroyed, for his Holstein soldiers. The palace became a hospital during the 1914-18 war, and is now a rest home for workers. A school of forestry was established in one of the wings in 1918. A railway has been built since the revolution to link the town with the fort of Krasnaya Gorka, which guards the entrance to Kronstadt bay. There are flour-mills and brick works and the saw-milling industry is important.

ORAON, an aboriginal tribe of the Chota Nāgpur plateau, India, also known as Dhāngars. They call themselves *Kurukh*, but being divided into various groups are apt to be designated by group-names (e.g. Modi, "navvy," Kisān, "cultivator"), when they emigrate. A short, sturdy race of Dravidian type, they are in demand as labourers. As Oraon mothers shape their babies' heads their dolichocephaly may be to some extent artificial. The village organization is advanced. Their speech is akin to Kanarese. Their religion is a mixture of nature-worship and magic, thinly overlaid with Hinduism, Dharmes being the supreme god. In recent years a religious movement, influenced by Christianity as well as by Brahmanism, known as the Tana Bhagat movement and manifesting itself in ghost-hunting and the addition of German Bāba to the pantheon, caused some excitement in 1915. It had begun with a crusade against belief in ghosts and was largely a revolt against social degradation and economic depression.

Sarat Chandra Roy, *The Oraons of Chota Nāgpur Ranchi* (1915), gives full history and valuable information; *Man in India* I. (1921).

ORATORIO, the name given to a form of religious music with chorus, solo voices and orchestra, independent of, or at least separable from the liturgy, and on a larger scale than the cantata (*q.v.*). Its history is involved in that of opera (*see* ARIA and OPERA), but its antecedents are more definite. The term is almost certainly (but *see* Schütz's "stilo Oratorio" on p. 844) derived from the fact that St. Filippo Neri's Oratory was the place for which Animuccia's settings of the *Laudi Spirituali* were written; and the custom of interspersing these hymns among liturgical or other forms of the recitation of a Biblical story is one of several origins of modern oratorio. A more ancient source is the use of incidental music in miracle plays and in such dramatic processions as the 12th century *Prose de l'Âne*, which on Jan. 1, celebrated at Beauvais the Flight into Egypt. But the most ancient origin of all is the Roman Catholic rite of reciting, during Holy Week, the story of the Passion according to the Four Gospels, assigning the words of the Evangelist to a tenor, distributing all *ipsissima verba* among appropriate voices, and giving the *responsa turbæ*, or utterances of the whole body of disciples (e.g., "Lord, is it I?") and of crowds, to a chorus. The only portion of this scheme that concerned composers was the *responsa turbæ*, to which it was permitted to add polyphonic settings of the Seven Last Words of the eucharistic utterances of the Saviour. The narrative and the parts of single speakers were sung in the Gregorian tones appointed in the liturgy. Thus the settings of the Passion by Victoria and Soriano represent a perfect solution of the art-problem of oratorio. "Very tame Jews" is Mendelssohn's comment on the 16th century settings of "Crucify Him"; and it has been argued that Soriano's and Victoria's aim was not to imitate the infuriated Jews, but to express the contrition of devout Christians telling the story. On the other hand, ancient tradition ordained a noisy scraping of feet on the stone floor to indicate the departure from the place of the judgment seat! And so we owe the central forms of Bach's Lutheran Passion-oratorios to the Roman Catholic ritual for Holy Week.

With the monodic revolution at the outset of the 17th century the history of oratorio as an art-form wholly controlled by composers begins. There is nothing but its religious subject to distinguish the first oratorio, Emilio del Cavaliere's *Rappresentazione di anima e di corpo* from the first opera, Peri's *Euridice*, both produced in 1600. Differentiation was brought about primarily by the fact that oratorios without stage-presentation gave opportunity

for a revival of choral music. And oratorios on the stage discouraged, by reason of their sacred subjects, whatever vestiges of dramatic realism could survive the ascendancy of the aria (*q.v.*). For lesser composers than Bach and Handel this ubiquitous form represented almost the only possibility of keeping music alive, or at least embalmed, until the advent of the dramatic and sonata styles. The efforts of Carissimi (d. 1674) in oratorio clearly show how limited a divergence from the method of opera was possible when music was first emancipated from the stage. Yet his art shows the corruption of Church music by a secular style rather than the rise of Biblical music-drama to the dignity of Church music. Normal Italian oratorio remains indistinguishable from serious Italian opera as late as *La Batulia liberata*, which Mozart wrote at the age of 15. Handel's *La Resurrezione* and *Il Trionfo del Tempo* contain many pieces simultaneously used in his operas, and they contain no chorus beyond a perfunctory operatic final tune. *Il Trionfo del Tempo* was a typical morality play, and it became a masque, like *Acis and Galatea* and *Semele*, when Handel at the close of his life adapted it to an English translation with several choral and solo interpolations from other works. Yet between these two versions of the same work lies half the history of classical oratorio. The rest lies in the German Passion-oratorios that culminate in Bach; after which the greatest music avoids every form of oratorio until the two main streams, sadly silted up, and never afterwards quite pure, unite in Mendelssohn.

Luther was so musical that while the German Reformation was far from conservative of ancient liturgy, it retained almost everything which makes for musical coherence in a Church service; unlike the English Church, which with all its insistence on historic continuity, so rearranged the liturgy that no possible music for an English Church service can ever form a coherent whole. The four *Passions* and the *Historia der Auferstehung Christi* of H. Schütz (who was born in 1585, exactly a century before Bach) are as truly the descendants of Victoria's *Passions* as they are the ancestors of Bach's. They are Protestant in their use of the vulgar tongue, and narrative and dialogue are set to free composition instead of Gregorian chant, although written in Gregorian notation. The *Marcus Passion* is in a weaker and more modern style and stereotyped in its recitative. It may be spurious. But in the other *Passions*, and most of all in the *Auferstehung*, the recitative is a unique and wonderful language. It may have been accompanied by the organ, though the *Passions* contain no hint of accompaniment at all. In the *Auferstehung* the Evangelist is accompanied by four *viola da gamba* in preference to the organ. The players are requested to "execute appropriate runs or passages" during the sustained chords. A final non-scriptural short chorus on a chorale-tune is Schütz's only foreshadowing of the contemplative and hymnal element of later Passion oratorios.

The *Auferstehung*, the richest and most advanced of all Schütz's works, has one strange convention, in that single persons, other than the Evangelist, are frequently represented by more than one voice. If this were confined to the part of the Saviour, it would have shown a reverent avoidance of impersonation, as in Roman Catholic polyphonic settings of the Seven Words. But Schütz writes thus only in *Die Auferstehung* and there on no particular plan. While the three holy women and the two angels in the scene at the tomb are represented naturally by three and two imitative voices, Mary Magdalene is elsewhere always represented by two sopranos.

Shortly before Bach, Passion oratorios were represented by several remarkable works of art, most notably by R. Keiser (1673-1739). Chorale-tunes, mostly in plain harmony, were freely interspersed in order that the congregation might take part in what was, after all, a church service for Holy Week. The meditations of Christendom on each incident of the story were expressed in accompanied recitatives (*arioso*) leading to arias or choruses, and the scriptural narrative was sung to dramatic recitative and ejaculatory chorus on the ancient Roman plan. On slightly different lines was Graun's beautiful *Tod Jesu*, which was famous when the contemporary works of Bach were ignored.

The difference between Bach's *Passions* and all others is simply the measure of his greatness. Where his chorus represents the

whole body of Christendom it has as peculiar an epic power as it is dramatic where it represents tersely the *responsa turbae* of the narrative.

In the Matthew Passion the part of Christ has a special accompaniment of sustained strings, generally at a high pitch, though deepening at the most solemn moments. And at the words "Eli, Eli, lama sabachthani" this musical halo has vanished. In power of declamation Bach was anticipated by Keiser; but no one approached him in sustained inspiration and architectonic greatness. The forms of Passion music may be found in many of Bach's Church cantatas; a favourite type being the *Dialogue*; as, for instance, a dispute between a fearing and a trusting soul with, perhaps, the voice of the Saviour heard from a distance; or a dialogue between Christ and the Church, on the lines of the Song of Solomon. The Christmas Oratorio, a set of six Church cantatas for performance on separate days, treats the Bible story in the same way as the Passions, with a larger proportion of non-dramatic numbers. Many of the single Church cantatas are called oratorios, a term which by Bach's time seems definitely to have implied dialogue, possibly on the strength of a false etymology. Thus Schütz inscribes a monodic sacred piece "in stilo Oratorio," meaning "in the style of recitative." The further history of oratorio radiates from the heterogeneous works of Handel.

There are various types and several mixtures of style in Handelian oratorio. The German forms of Passion music evidently interested Handel, and it was after he came to England, and before his first English oratorio, that he set to music the famous poetic version of the Passion by Brockes, which had been adopted by all the German composers of the time, and which, with very necessary improvements of taste, was largely drawn upon by Bach for the text of his Johannes-Passion. Handel's Brockes Passion does not appear ever to have been performed, though Bach found access to it and made a careful copy; so Handel must have composed it for his own edification. He soon discovered that many kinds of oratorio were possible. The emancipation from the stage admitted of subjects ranging from semi-dramatic histories, like those of *Saul*, *Esther* and *Belshazzar*, to cosmic schemes expressed entirely in the words of the Bible, such as *Israel in Egypt* and *The Messiah*. Between these types there is every gradation of form and subject; besides an abrupt contrast of literary merit between the mutilated Milton of *Samson* and the amazing absurdities of *Susannah*.

The very name of Handel's first English oratorio, *Esther*, and the facts of its primary purpose as a masque and the origin of its libretto in Racine, show the transition from the stage to the Church; and, on the other hand, Haman's lamentation on his downfall is scandalously adapted from the most sacred part of the Brockes Passion.

We may roughly distinguish three main types of Handelian oratorio, not always maintained singly in whole works, but always available as methods. First, there is the operatic method, in which the arias and recitatives are the utterances of characters in the story, while the chorus is a crowd of Israelites, Babylonians or Romans (e.g., *Athalia*, *Belshazzar*, *Saul*, etc.). The second method retains the dramatic rôles both in solos and in choruses, but (as, for instance, in "Envy, eldest born of Hell," in *Saul*) also uses the chorus as the voice of universal Christendom. Handel's audience demanded plenty of arias, most of which are accounted for by futile, when not apocryphal, love affairs. The haughty Merab and the gentle Michal are characterized with fatal ease, and make parts of *Saul* almost as impossible as most of *Susannah*. The third Handelian method is a series of choruses and numbers on a subject altogether beyond the scope of drama, as, for instance, the greater part of *Solomon* and, in the case of *The Messiah* and *Israel in Egypt*, treated entirely in the words of Scripture, and those not in narrative but in prophecy and psalm.

After Bach and Handel, oratorio fell upon evil days. The rise of the sonata style, which brought life to opera, was bad for oratorio; since not only did it accentuate the fashionable dislike of that polyphony which is essential even to mere euphony in choral writing, but its dramatic power became more and more disturbing to the epic treatment that oratorio naturally demands.

Philip Emanuel Bach's oratorios, though cloying in their softness and sweetness, achieved a true balance of style in the earlier days of the conflict; indeed, a judicious selection from *Die Israeliten in Wüste* (1769) would perhaps bear revival almost as well as Haydn's *Tobias* (1774).

The Creation (Die Schöpfung) and *The Seasons (Die Jahreszeiten)* will always convey to unspoiled music-lovers the profound message of the veteran Haydn, who could not help "worshipping God with a cheerful heart." This spirit was well known to Bach, the composer of "*Mein gläubiges Herze*," and it is compatible with the romantic sound-pictures and Handelian sublimity of the opening Representation of Chaos and the great chord of C major at the words "and there was light." The childlike gaiety of much of the rest ought not to blind us to its fundamental greatness, which brings the naïvely realistic birds and beasts of *The Creation* into line with even the wine-chorus in the mainly secular *Seasons*, and removes Haydn from the influence of the vile taste which henceforth pervaded oratorios, until Mendelssohn effected a partial improvement. Haydn strenuously resisted the persuasion to undertake *The Seasons* which had a close connection with Thomson's poem, as *The Creation* had a distant connection with *Paradise Lost*. He thought the whole scheme "Philistine" (his own word) and, both before he yielded to persuasion and after he had finished the work, said all the hard things about it that have ever been said since.

Roman Catholic oratorio was under the disadvantage that it was not permitted to take Biblical texts except in the Latin language. Jomelli's *Passione* for once had the benefit of a meditative text with some distinction of style; and in closing the first part with a dominant seventh on the word "*pensaci*" he achieved a stroke of genius which at the present day would still startle the listener and leave his mind in the desired frame of meditative astonishment.

But words fail to characterize the libretto of Beethoven's unfortunate *Christus am Oelberge* (c. 1800). The texts of Lutheran church-music had often been grotesque and even disgusting; but their barbarity was pathetic in comparison with the sleek vulgarity of a libretto in which not only is the agony of the garden of Gethsemane represented by an aria (as in Handel's lamentation of Haman), but Christ sings a brilliant duet with the ministering angel. In after years Beethoven had not a good word for this work, which, nevertheless, contains some beautiful music exquisitely scored. And justice demands praise for the idea of making a Hallelujah chorus conclude the work as soon as the betrayal of Christ has been accomplished, thus compensating for the irreverent opening by avoiding all temptation to treat the rest of the passion-story with the same crassness. A well-meant effort was made to provide the *Mount of Olives* with an inoffensive subject in English, but the stupidity of *Engerdi: or David in the Wilderness* passes belief.

Schubert's interesting fragment *Lazarus* is strangely prophetic of Wagnerian continuity and has a morbid beauty that transcends its sickly text. There are signs that the despair of the Sadducee was going to be treated with some power. The result might have been a masterpiece; but fate ruled that the next advance should again be Protestant.

Bach's Passions were rediscovered by the boy, Mendelssohn after a century of ignorance of their very existence; and in *St. Paul (Paulus)* and *Elijah (Elias)* rose upon the early middle 19th century like the sunrise of a new Handel.

To-day *St. Paul* has almost sunk below the horizon; and *Elijah*, which still shares with *The Messiah* the Christmas repertoire of every British urban choral society, is in many points an easy target for criticism. Yet the ascendancy of Mendelssohn is the one redeeming feature in the history of oratorio during the first three quarters of the 19th century. Let us admit the defects of *Elijah*; the all too lifelike tiresomeness of the widow (achieved after strenuous revision), the parochial softness of the double quartet, the Jewishness of the Jews (but is this a defect?), and the snorts of the trombones whose third summons causes the Almighty to capitulate: when all these unconscious profanities are discounted, there remains a vivid and coherent oratorio that, musically and

dramatically, towers above later works by many accomplished composers who despise it. (*See MENDELSSOHN.*)

Spohr is the only contemporary of Mendelssohn whose sacred music is still known. So tremendous a subject as that of *The Last Judgment* ought, indeed, to be treated with reserve; but the softness and slowness which pervades nine-tenths of Spohr's work is not reserve but self-indulgence. Spohr has moments of vision; but an almost random glance at the pages of *St. Paul* shows that even in eclipse Mendelssohn has characterization, movement and the capacity for thrilling dramatic moments.

In England, the influence of Mendelssohn completed the devastation begun by our inveterate habit of praising the inspired literary skill of the sacred narrative, as a preface to our restatement of it in 40 times as many words of our own. Deans and chapters listened in graceful official pride and imperfectly secret glee to the strains in which the cathedral organist celebrated with equal realism the destruction of Sennacherib's hosts and his own octuply-contrapuntal doctorate of music. Before 1880 our composers had, as Dr. Walker says, "set with almost complete indiscriminate well-nigh every word of the Bible." Had they confined themselves to the second chapter of Ezra they would have escaped dangers of unconscious humour that lurk in the opportunities for "naturalness" in declaiming the dialogues and illustrating the wonders of scriptural narrative.

Neither Sterndale Bennett nor Macfarren improved matters; but Parry and Stanford, towards the end of the century, completely changed the situation. Stanford's *Eden* has a libretto by Robert Bridges. The disgruntled professional librettists, who were also musical critics, had the effrontery to say that this magnificent poem would be the better for extensive cuts. The real truth is that Stanford's music, especially in its orchestral introduction, is diffuse. But it has many beautiful features, and achieves a coherent scheme on exactly such lines of Wagnerian continuity as can be applied to oratorio. Parry preferred to be his own librettist, and by this means he achieved more significant results. The lapses of the amateur poet are less distressing than the clichés of the ordinary professional librettist; and the works of Parry and Stanford permanently raised English oratorio from squalor and made it once more an art-form which educated people could enjoy. Some of Parry's architectonic and dramatic ideas will never lose the power to thrill, if only the works as wholes can live in spite of a certain dryness of melody and heaviness of texture. For example, the exploit of Judith is shown with a total avoidance of the cheap and salacious opportunity for a scene between her and Holofernes. Instead, we listen to the watchmen anxiously making their circuit of the city walls in darkness. The music of their march is at a low pitch. It is reaching a normal close when, high above the tonic chord, the cry of Judith bids the watchmen open the gates to her. If this moment cannot thrill, there is no meaning in art. In *King Saul* Parry made a significant discovery as to the emancipation of dramatic oratorio from the stage conditions of time and space. The Witch of Endor prophesies the battle of Gilboa. Her tale becomes real in the telling and is immediately followed by the final dirge.

As with opera, so, but more easily, with oratorio, the method of Wagnerian continuity at last enabled composers to take extant poems and set them to music in their entirety. Thus the fragrant mysticism of Roman Catholic oratorio, dimly adumbrated in Schubert's *Lazarus*, at last came to fruition in Elgar's wonderful setting of Newman's *Dream of Gerontius*, while the old miracle play *Everyman* was very successfully composed by Walford Davies. In his later works, *The Apostles* and *The Kingdom*, Elgar pursues a comprehensive religious design on texts arranged by himself. Oratorio on the basis of Wagnerian continuity and *Leit-motif* is unquestionably a living art-form. Its greatest difficulty is its fatal facility. The oratorio-composer is lost who omits to transcend the limits of the stage; yet when these are transcended only the steadfastness of genius can prevent the composer from sinking to the fashion-storming eclecticism of Honegger's *Le Roi David* which, with the aid of a reciter to read the Bible, takes up the arts of all periods from Handel to 1927 and drops each of them before anything like an art-problem arises.

Why not follow more often the method of *The Messiah* and of *Israel in Egypt*; and deal with religious subjects in terms of prophesy and psalm? Brahms's *Deutsches Requiem* is really an oratorio; and since its production (all but one later movement) in 1866 it continues year by year to tower over all other choral music since Beethoven's Mass in D. Form, disciplined form, is not the only thing needed to save future oratorios from the limbo of vanity; but it is their first need. (D. F. T.)

ORATORY, the art of speaking eloquently or in accordance with the rules of rhetoric (*q.v.*).

ORATORY OF ST. PHILIP NERI, CONGREGATION OF THE, or ORATORIANs, a religious order consisting of a number of independent houses, first organized in 1575 by the Florentine priest, Philip Neri (*see* NERI, PHILIP.)

ORBIGNY, ALCIDE DESSALINES D' (1802-1857), French palaeontologist, was born at Couëron, Loire Inférieure, on Sept. 6, 1802, and was educated at La Rochelle. His first appointment was as travelling naturalist for the Museum of Natural History at Paris. He went in 1826 to South America, and gathered much information on the natural history and ethnology, embodying the results in his great work *Voyage dans l'Amérique Méridionale* (1839-1842). Then, in 1840 he began to publish his *Paléontologie Française, ou description des fossiles de la France*, a monumental work, accompanied by figures of the species. Eight volumes were published by him dealing with Jurassic and Cretaceous invertebrata, and since his death many later volumes have been issued. In 1853 he was appointed professor of palaeontology at the Museum of Natural History in Paris, but died on June 30, 1857, at Pierresitte, near St. Denis.

His works include *Cours élémentaire de paléontologie et de géologie stratigraphiques* (3 vols., 1849-52), and *Prodrome de paléontologie stratigraphique* (3 vols., 1850-52).

ORBIT, in astronomy, is the path of a heavenly body revolving around an attracting centre (from Lat. *orbita*, a track, *orbis*, a wheel); in particular, it denotes the path of a planet or comet around the sun, or of a satellite around its controlling planet.

Kepler's Laws.—In 1609 Johann Kepler announced two laws of planetary motion, and by 1610 he added a third. Kepler's first law is as follows:—A planet moves around the sun in an elliptic orbit, the sun being situated in one focus of the ellipse. If the straight line joining any two points S and T is produced equal distances beyond S and T to A and B, and if P is any point such that the sum of the distances PS and PT is equal to the distance AB, then the aggregate of all such points as P is the curve known as the ellipse. The points S and T are the foci. The curve passes through A and B and AB is called the major axis of the ellipse. If C is the mid-point of AB, the ratio

FIG. 1.—DIAGRAM ILLUSTRATING KEPLER'S LAWS OF PLANETARY MOTION

of the length of CS to the length of CA is called the eccentricity. The ellipse then is specified by means of (i) the semi-major axis and (ii) the eccentricity. If the eccentricity happens to be zero, the two foci must coincide at the centre C and the resulting curve is simply a circle; if the eccentricity is precisely unity, then the curve is known as a parabola. Kepler's first law simply states that if the sun is supposed situated at the focus S, the planet's path around the sun—in other words, its orbit—is an ellipse such as is represented in the diagram above. The time required for a complete revolution in the ellipse is the planet's

revolution period; for example, the earth's period of revolution is a little over 365 days; Mercury describes its orbit in 88 days, and Neptune requires 165 years. At A—the point of the ellipse nearest S—the planet is said to be in *perihelion*, and when it reaches B, the most remote point of the ellipse from S, it is said to be in *aphelion*.

Kepler's second law states that the straight line joining the sun to the planet (the radius vector) sweeps out equal areas in equal times. In the preceding figure let D be the position of the planet in its elliptic orbit a month after it reached perihelion (A); similarly let E F be two positions of the planet separated by an interval of a month; the pair of points X, Y are defined in the same way. The shaded area SDA, for example, is the area swept out by the radius vector in one month and by the second law the three shaded areas are equal. Now it is clear from the figure that the arc AD is greater than the arc XY, for the areas SDA and SXY are equal and SA and SD are less than SX and SY; consequently, the velocity of the planet in its orbit must be greater between A and D than between X and Y. More definitely, the velocity of the planet is greatest at perihelion, decreasing gradually until aphelion is reached and thereafter increasing to a maximum again at perihelion.

The figure also shows that the angles described in equal intervals of time by the radius vector vary throughout the orbit; for example the angle DSA is clearly greater than the angle XSY. The angular velocity is greatest at perihelion and least at aphelion. In one complete revolution around the sun, the radius vector sweeps out 360° and as the period of revolution is accurately known, the average angular velocity is easily deduced. This is known as the "mean motion" and is expressed as so many degrees (or seconds of arc) per day.

Kepler's third law is a relation connecting the semi-major axes of the several planets with their periods of revolution. In Kepler's time, the mean distance of any one planet from the sun was not known in miles but it was known fairly accurately in terms of the earth's mean distance from the sun regarded as the unit of the distance; in other words, the planetary system had been fairly correctly mapped out but the scale of the map was lacking. Also, the periods of the several planets were known with considerable accuracy. The third law expressed in words is: the cube of the semi-major axis of any planetary orbit divided by the square of the period of revolution is the same whatever planet is considered. If the year is regarded as the unit of time and the earth's mean distance from the sun as the unit of distance (this is known as the astronomical unit of distance) the quotient above for the earth is plainly unity and consequently by the third law the cube of the semi-major axis of any other planet (expressed in terms of the astronomical unit) must be equal to the square of the planet's period (expressed in years).

The Orbit in Space.—We have seen that the elliptic orbit of a planet is specified by the eccentricity and the semi-major axis. To apply Kepler's first and second laws to predict the positions of the planet in its orbit at any time it is necessary to know in addition the time when it occupied any definite position in the orbit or the time when it passed through perihelion. The eccentricity, the length of the semi-major axis and the time of perihelion passage constitute three elements of the planet's orbit.

The planetary motions do not all take place in the same plane and consequently the plane of the orbit of a particular planet must be specified with reference to some fundamental plane: the plane chosen is that of the earth's orbit and is called the plane of the ecliptic. Imagine a sphere drawn with the sun at the centre. The plane of the earth's orbit will cut the sphere in a circle (the ecliptic) and the orbital plane of any other planet will cut the sphere in another circle inclined at some definite angle to the plane of the ecliptic. The two circles intersect at two points N and M—called the Nodes. Let V denote a definite reference point on the ecliptic—the direction SV may be thought of as the direction of a particular star as seen from the sun. The point V is known as the "vernal equinox" or "First point of Aries"; it is not necessary here to specify it more particularly. The plane of the planet's orbit is completely specified—with ref-

erence to the ecliptic and the point V—by (i) the inclination of the planet's plane to the plane of the ecliptic and (ii) the position of the node N with respect to the point V. The latter is evidently given by the angle subtended at the sun by the radii SV and SN, and this angle is known as the longitude of the node. One thing more requires to be done and that is to specify the orientation of the orbital ellipse in its plane; this is accom-

FIG. 2.—PLANET'S ORBITAL PLANE IN RELATION TO THE ECLIPTIC

plished by specifying the direction of perihelion—in the figure this is indicated by the direction SA. The sum of the angles subtended at S by the arcs VN and NA is called the longitude of perihelion. It should be noticed that there is an ambiguity as to the meaning of the expression "longitude of the node" for there are two nodes N and M. If the upper hemisphere in the figure contains the north pole of the heavens, the radius vector of the earth's orbit moves in the direction SV towards SN as indicated by the arrow; and if the radius vector of the planet moves in the direction SN towards SA, as indicated by the arrow, then N is called the ascending node and M the descending node and (ii) above more precisely should be "the longitude of the ascending node." The ambiguity consequently disappears.

To summarize; a planet's orbit in space is completely specified by the six elements: (i) the semi-major axis, (ii) the eccentricity, (iii) the time of perihelion passage, (iv) the longitude of the ascending node, (v) the longitude of perihelion, (vi) the inclination of the orbital plane to the plane of the ecliptic.

When the six elements of a planet's orbit are known the position of the planet (the effects of the attractions of the other planets not being taken into account) with reference to the sun and the fundamental plane (the ecliptic) can be calculated for any future date by principles essentially contained in Kepler's laws. The earth's orbit also being known, the position of the planet in the heavens, as seen from the earth, can then be deduced.

The Orbit from Observations.—The reverse problem is to determine the elements of the orbit from actual observations of position made from the earth. When a minor planet or comet is discovered it is important to determine the six elements of its orbit which hold the new body in the secure grasp of mathematical analysis, thus enabling the astronomer to follow subsequently its wanderings even without the aid of observational appliances. A single complete observation of a planet consists in determining its right ascension and declination; three such complete observations at intervals, say, of a month are sufficient to allow the calculation of the six orbital elements.

ORCAGNA (c. 1308–c. 1368), Italian painter, sculptor, worker in mosaic and architect, whose full name was ANDREA DI CIONE, called ARCAIGNUOLO, was the son of a Florentine goldsmith, Maestro Cione, said to have been one of the principal artists who worked on the magnificent silver frontal of the high altar of San Giovanni, the Florentine Baptistery. The result of Orcagna's early training in the use of the precious metals may be traced in the extreme delicacy and refined detail of his principal works in sculpture. His brothers, Lionardo or Nardo, the eldest, a painter; Matteo, a sculptor and mosaicist, and Jacopo, also a painter, were often associated with Orcagna in his varied labours.

From the time of Giotto to the end of the 14th century Orcagna stands pre-eminent among the many excellent artists of that time.

1. *Orcagna as a Painter.*—He was admitted to the guild of the Medici and Speziali, where his name first occurs in the documents of 1344. His chief works in fresco were at Florence, in the church of Sta. Maria Novella. He covered the walls of the retro-choir

with scenes from the life of the Virgin. These, unfortunately, were much injured by damp very soon after their completion, and towards the end of the following century were replaced by other frescoes of the same subjects by Ghirlandaio, who, according to Vasari, made much use of Orcagna's motives and invention. Vasari says that Orcagna also painted the Strozzi chapel in the same church in company with his brother. But Ghiberti attributes these works to his brother Nardo alone. These frescoes still exist though much restored; modern criticism is inclined to attribute them to Nardo. The finest composition is that on the west wall, unbroken by any window. It represents paradise, with Christ and the Virgin enthroned in majesty among rows of brilliantly coloured cherubim and seraphim tinged with rainbow-like rays of light. Here Andrea Orcagna may have had a share in the execution.

In 1357 Orcagna painted one of his finest panel pictures, as a retable for the altar of the same chapel, where it still remains. In the centre is Christ in majesty between kneeling figures of St. Peter and St. Thomas Aquinas, attended by angel musicians; on each side are standing figures of three other saints. It is painted with extreme miniature-like delicacy, and is on the whole very well preserved. This retable is signed, "An. dni. mcccclvii. Andreas Cionis de Florentia me pinxit." It is the only certified painting by Orcagna in existence. According to Vasari, he also painted some very fine frescoes in Sta. Croce. Of these only a small fragment remains. Orcagna's figures are plastically conceived, and clearly defined by a firmly drawn contour. They stand out against the background like statues.

2. *Orcagna as a Sculptor and Architect.*—Orcagna was admitted as a member of the Sculptors' Guild in 1352. His name occurs in the roll as "Andreas Cionis vocatus Arcagnolus, pictor." According to Vasari, Orcagna worked under Andrea Pisano as a pupil in sculpture. His style, however, constitutes an advance on Andrea's art and prepares the way for the coming Renaissance. In 1359 he completed the great marble tabernacle for the chapel of Or San Michele. This, in its combined splendour of architectural design, sculptured reliefs and statuettes, and mosaic enrichments, is one of the most important and beautiful works of art which even rich Italy possesses.

ORCHARDSON, SIR WILLIAM QUILLER (1832–1910), British painter, was born in Edinburgh on March 27, 1832. At 13½ he went to the Trustees' academy. At 20, Orchardson had mastered the essentials of his art, and for seven years after this he worked in Edinburgh, devoting himself partially to "black and white." In 1862 he came to London, and established himself in 37, Fitzroy square, where his friend John Pettie joined him.

The English public was not immediately attracted by Orchardson's work, which was too quiet to compel attention at the Royal Academy, and Pettie, Orchardson's junior by seven years, at first outshone him. Orchardson confined himself to the simplest themes and designs and the most reticent schemes of colour. In 1865 Pettie married, and the Fitzroy square *ménage* was broken up. Orchardson married Miss Helen Moxon in 1873. In 1868 he was elected A.R.A. and in 1877 R.A. He died on April 13, 1910.

Orchardson's first great success was gained in 1881, when he exhibited "On Board the 'Bellerophon'" (now at the Tate gallery) at the Royal Academy, and for the next ten or twelve years his exhibits enjoyed unflinching popularity. "The Voltaire" (1883) (now in the Kunsthalle, Hamburg) is perhaps his finest composition. The "Mariage de convenance" (1884) and "A Tender Chord" (1886) were two of his most famous paintings, and about this time he exhibited a series of period pictures.

Among his portraits are "Master Baby," "The Provost of Aberdeen" and "Sir Walter Gilbey, Bart." Other paintings are "After" (sequel to "Mariage de convenance"), and "The Young Duke."

ORCHESTRA. In ancient Greece the *ὀρχήστρα* was the space between the auditorium and the proscenium or stage, in which were stationed the chorus and the instrumentalists. In its modern acceptance the word means either that portion of a the-

atre or concert-hall provided for the accommodation of the instrumentalists or the body of instrumentalists itself; by extension in the U.S.A. it means the main floor of the theatre.

The modern orchestra is composed of (1) a basis of strings—first and second violins, violas, violoncellos and double basses; (2) flutes, sometimes including a piccolo; (3) the reed contingent, consisting of two complete families, (a) the oboes with their tenors and basses (the cor anglais, the fagotto or bassoon and the contrafagotto or double bassoon), (b) the clarinets with their tenor and basses (the basset horn and the bass and pedal clarinets), with the addition sometimes of saxophones; (4) the brass wind, consisting of the horns, a group sometimes completed by the tenor and tenor-bass Wagner tubas, the trumpet or cornet, the trombones (tenor, bass and contrabass), the tubas (tenor, bass and contrabass); (5) a harp or harps; (6) the percussion instruments, including the kettledrums, bells, Glockenspiel, cymbals, triangle, etc.; to which are sometimes added a celesta and a pianoforte, to say nothing of such "extras" as the rattle employed by Richard Strauss in *Till Eulenspiegel*, the wind machine required by the same composer in *Don Quixote*, the iron chains introduced by Schönberg in his *Gurrelieder*, and so on.

Although most of the instruments from the older civilizations of Egypt, Chaldea, Persia, Phœnicia and of the Semitic races were known to the ancient Greeks, they did not share in any way their neighbours' love of orchestral effects, obtained by combining harps, lyres, guitars, tanburs, flutes, trumpets, bagpipes, cymbals, drums, etc., playing in unison or in octaves. The Greeks only cultivated to any extent the various kinds of citharas, lyres and auloi, and these were seldom used in concert. To the predilection of the Romans for wind instruments of all kinds we owe nearly all the wind instruments of the modern orchestra, each of which had its prototype among the instruments of the Roman empire: the flute, oboe and clarinet, in the tibia; the trombone and trumpet in the buccina; the tubas in the tuba; and the French horn in the cornu and buccina.

The 4th century A.D. witnessed the downfall of the Roman drama and the debasement of instrumental music, which was placed under a ban by the Church. During the convulsions which the migrations of Goths, Vandals and Huns caused in Europe after the fall of Rome instrumental music was preserved from absolute extinction by wandering actors and musicians.

The earliest instrumental compositions extant are certain 15th century dances and pieces in contrapuntal style preserved in the libraries of Berlin and Munich. The late development of notation, which long remained exclusively in the hands of monks and troubadours, personally more concerned with vocal than with instrumental music, ensured the preservation of the former, while the latter was left unrecorded. But indications are not wanting of an independent energy and vitality which must surely have existed in unrecorded mediæval instrumental music, since there is such evidence of this in the instruments themselves. It is, for example, significant of the attitude of the 10th century instrumentalists towards musical progress that they at once assimilated Hucbald's innovation of the *organum*, a parallel succession of fourths and fifths, accompanied sometimes by the octave, for two or three voices respectively, and that they produced in the same century the *organistrum*, named after Hucbald's *organum*.

At the time of the revival of the drama with music, afterwards modified and known as opera, at the end of the 16th century, there was as yet no orchestra in our sense of the word, but merely an abundance of instruments used in concert for special effects, without balance or grouping; small positive organs, regals, harpsichords, lutes, theorbos, archlutes, chittarone (bass and contrabass lutes), guitars, viols, lyras da braccio and da gamba, psalteries, citterns, harps, flutes, recorders, cornets, trumpets and trombones, drums and cymbals.

Monteverde was the first to see that a preponderance of strings is necessary to ensure a proper balance of tone. With the perfected models of the Cremona violins at his disposal, a quartet of strings was established and all other stringed instruments not played with the bow were ejected from the orchestra, with the exception of the harp. Under the influence of Monteverde and his

successors, Cavalli and Cesti, the orchestra won for itself a separate existence with music and laws of its own. As instruments were improved, new ones introduced, and old ones abandoned instrumentation became a new and favourite study in Italy and in Germany, and musicians began to find out the capabilities of the various families of instruments and their individual value.

At first the orchestra was an aristocratic luxury, performing privately at the courts of the princes and nobles of Italy; but in the 17th century performances were given in theatres, and Germany eagerly followed. Dresden, Munich and Hamburg successively built opera houses, while in England opera flourished under Purcell, and in France under Lully, who, with the collaboration of Molière, also greatly raised the status of the entertainments known as *ballets*, interspersed with instrumental and vocal music.

The revival of the drama seems to have exhausted the enthusiasm of Italy for instrumental music and the field of action was shifted to Germany, where the perfecting of the orchestra was continued. Most German princes had at the beginning of the 18th century good private orchestras or *Kapelle*, and they always endeavoured to secure the services of the best available instrumentalists. Kaiser, Telemann, Graun, Mattheson and Handel contributed greatly to the development of German opera and of the orchestra in Hamburg during the first quarter of the century. Bach, Gluck and Mozart, the reformers of opera; Haydn, the father of the modern orchestra and the first to treat it independently as a power opposed to the solo and chorus, by scoring for the instruments in well-defined groups; Beethoven, who individualized the instruments, writing solo passages for them; Weber, who brought the horn and clarinet into prominence; Schubert, who inaugurated the conversations between members of the wood wind—all left their mark on the orchestra, leading the way up to Wagner, Strauss and their successors.

ORCHESTRATION: see INSTRUMENTATION.

ORCHESTRION, a name applied to three different kinds of musical instruments: (1) a chamber organ, designed by Abt Vogler at the end of the 18th century; (2) a pianoforte with organ pipes attached, invented by T. A. Kunz of Prague in 1791; (3) a mechanical wind orchestra, automatically played by means of revolving cylinders, invented in 1851 by F. T. Kaufmann of Dresden.

ORCHHA (also called *Tehri* or *Tikamgarh*), an Indian state in the Bundelkhand agency of Central India. It is the oldest and highest in rank of all the Bundela principalities, and was the only one not held in subjection by the peshwa. Area, 2,080 sq.m., pop. (1921) 284,948. The maharaja, Sir Pratap Singh, G.S.C.I. (born in 1854, succeeded in 1874), took a great personal interest in the development of his state, and bears the hereditary title of "First of the Princes of Bundelkhand." The state exports grain, *ghi*, and cotton cloth, but trade suffers from imperfect communications. The town of Orchha, the former capital, is on the river Betwa, not far from Jhansi. It possesses an imposing fort, dating mainly from the early 17th century, with two magnificent palaces—the Rajmandir, a massive square erection of which the exterior is almost absolutely plain, and the Jahangirmahal, a singularly beautiful specimen of Hindu domestic architecture. Elsewhere about the town are fine temples and tombs, among which may be noticed the Chaturbhuj temple on its vast platform of stone. The town of Tehri or Tikamgarh, where the chief now resides, is about 40 m. S. of Orchha; pop. (1921) 14,096. The maharaja has a salute of 15 guns, with 2 added as a personal distinction.

ORCHIDS, the name given to members of the orchid family (Orchidaceae), one of the most numerous and interesting groups of flowering plants, usually with beautiful and often with exceedingly handsome and highly fragrant flowers. Orchids are found in moist climates very widely throughout the world, except in the polar regions, but they occur in by far their greatest diversity and abundance in humid tropical forests. The orchids are all perennial herbs and are comprised in two groups: (1) terrestrial orchids, which grow in the ground, and (2) epiphytic orchids, epiphytes, which grow perched upon trees, found in the tropics where they form an important feature of the vegetation. Most orchids of the temperate zone are terrestrial.

Floral Structure.—The flowers of orchids, though extremely diverse within certain limits, are all formed upon one common plan, which is only a modification of that observable in such flowers as those of the narcissus. Such flowers consist essentially in the presence of a six-parted perianth, the three outer segments of which correspond to a calyx, the three inner ones to a corolla. These segments spring from the top of the ovary which is inferior instead of superior as in the lily. Within the perianth, and springing from its sides, or apparently from the top of the ovary, are six stamens whose anthers contain powdery pollen-grains. These stamens encircle a style which is the upward continuation of the ovary, and which shows at its free end traces of the three originally separate but now blended carpels of which the ovary consists.

An orchid flower has an inferior ovary, but with the ovules on the walls of the cavity (not in its axis or centre), a six-parted perianth, a stamen or stamens and stigmas. The main distinguishing features consist in the fact that one of the inner pieces of the perianth becomes in course of its growth much larger than the rest, and usually different in colour, texture and form. So different is it that it receives a distinct name, that of the "lip" or "labellum." In place of the six stamens we commonly find but one (two in *Cypripedium*), and that one is raised together with the stigmatic surfaces on an elongation of the floral axis known as the "column." Moreover, the pollen, instead of consisting of separate cells or grains, consists of cells aggregated into "pollen-masses," the number varying in different genera, but very generally two, four or eight. In *Cypripedium* all three stigmas are functional, but in most orchids only the lateral pair form receptive surfaces, the third being sterile and forming the rostellum which plays an important part in the process of pollination, often forming a peculiar pouch-like process in which the viscid disk of the pollen-masses is concealed.

It would appear, then, that the orchid flower differs from the more general monocotyledonous type in the irregularity of the perianth, in the suppression of five out of six stamens, and in the union of the one stamen and the stigmas. In addition to these modifications, which are common to nearly all orchids, there are others generally but not so universally met with; among them is the displacement of the flower arising from the twisting of the inferior ovary, in consequence of which the flower is so completely turned round that the "lip," which originates in that part of the flower, conventionally called posterior, or that nearest to the supporting stem, becomes in course of growth turned to the anterior part of the flower nearest to the bract. Other common modifications arise from the union of certain parts of the perianth to each other, and from the varied and often very remarkable outgrowths from the lip. These modifications are associated with the structure and habits of insects and their visits to the flowers.

Cross-Fertilization by Insects.—In the common orchids of British meadows, *Orchis maculata*, *O. mascula* (Shakespeare's long purples), etc., the general structure of the flower is as described. In addition there is in this particular genus, as indeed in many others, a long tubular spur or horn projecting downwards from the back of the lip, whose office it is to secrete and store a honeyed juice; the forepart of the lip forms an expanded plate, usually larger and more brightly coloured than the other parts of the flower, and with hairs or ridges and spots of various kinds according to the species. The remaining parts of the perianth are much smaller, and commonly are so arranged as to form a hood overarching the "column." This column stands up from the base of the flower, almost at right angles to the lip, and it bears at the top an anther, in the two hollow lobes of which are concealed the two pollen-masses, each with its caudicle terminating below in a roundish gland, concealed at first in the pouch-like rostellum at the front of the column. Below the anther the surface of the column in front is hollowed out into a greenish depression covered with viscid fluid—this is the two united stigmas.

In the process of pollination a bee alights on the lip. There, guided by the hairs or ridges, it is led to the orifice of the spur with its store of honeyed juice. The position of this orifice, as we have seen, is at the base of the lip and of the column, so that the in-

EIGHT VARIETIES OF CULTIVATED ORCHIDS

The orchid family, one of the most interesting groups of flowering plants, comprises upwards of 7,000 species, found most abundantly in the Tropics. Several hundred species are grown in greenhouses; from these, gardeners have developed many varieties and an immense number of hybrid forms

1. Thwaites' Dendrobium (*Dendrobium Thwaitesiae*). 2. Venus Dendrobium (*D. Falconeri* x *nobile*). 3. Moth orchid (*Phalaenopsis Luedemanniana*). 4. Alexander's Cymbidium (*Cymbidium Alexanderi*). 5. Argus lady slipper (*Cypripedium Argus*). 6. Sanders' lady slipper (*Cypripedium insigne Sanderae*). 7. Queen Cattleya (*Cattleya Dowiana aurea*). 8. Triana Cattleya (*Cattleya Trianae*)

sect, if of sufficient size, while bending its head to insert the proboscis into the spur, almost of necessity displaces the pollen-masses. Liberated from the anthers, these adhere to the head or back of the insect by means of the sticky gland at the bottom of the caudicle. Having sipped the nectar the insect withdraws, taking the pollen-masses with it, and visits another flower. The two anther-cases in an orchis are erect and nearly parallel the one to the other; the pollen-masses within them are of course in the like position. Immediately, however, the pollen-masses are removed, movements take place at the base of the caudicle so as to effect the bending of this stalk, bringing the pollen-mass in a more or less horizontal position, or, as in the case of *O. pyramidalis*, the two pollen-masses originally placed parallel diverge from the base like the letter V. The movements of the pollen-masses may readily be seen with the naked eye by thrusting the point of a needle into the base of the anther, when the disks adhere to the needle as they would do to the antenna of an insect, and may be withdrawn. Sometimes the lip is mobile and even sensitive to touch, as are also certain processes of the column. In such cases the contact of an insect or other body with those processes is sufficient to liberate the pollen often with elastic force, even when the anther itself is not touched.

In other orchids movements take place in different ways and in other directions. The object of these movements will be appreciated when it is remembered that, if the pollen-masses retained the original direction they had in the anther in which they were formed, they would, when transported by the insect to another flower, merely come in contact with the anther of that flower, where of course they would be of no use; but, owing to the divergences and flexions above alluded to, the pollen-masses come to be so placed that, when transplanted to another flower of the same species, they come in contact with the stigma and so effect the pollination of that flower. The adaptations of orchid flowers to fertilization by insects are exceedingly numerous and in many cases are remarkably complicated.

Propagation and Growth.—The fruit of orchids is a capsule which usually splits by three lengthwise slits, forming valves that remain united above and below. The seeds, minute and innumerable, are well-adapted to wind-dissemination. In many species the seeds lose their viability after a few months, and often are slow and difficult to germinate after planting, some requiring from three months to two years. The roots of terrestrial orchids are often bulbous and still more frequently more or less tuberous, the tubers being partly radical and partly budlike, so that propagation of new individuals by division from the parent takes place. Often there is a marked alternation in the production of vegetation and flowering shoots; sometimes the flowering shoots are not produced for several years in succession. This accounts for the profusion with which various orchids are found in flower in some seasons and for their scarcity in others.

Tropical orchids are mostly epiphytal—that is, they grow upon trees without deriving nourishment from them. They are frequently provided with "pseudo-bulbs," large solid swellings of the stem, in the tissues of which water and nutritive materials are stored. They derive this moisture from the air by means of aerial roots, developed from the stem and bearing an outer spongy structure, or *velamen*, consisting of empty cells kept open by spiral thickenings in the wall; this sponge-like tissue absorbs dew and rain and passes it on to the internal tissues.

Classification.—In number of species the orchid family is exceeded by only two or three other families of flowering plants. Conservatively stated, it contains at least 7,500 species comprised in 450 genera; some authorities place the number of species as high as 15,000.

The family is divided into two main groups based on the number of the stamens and stigmas. The first Pleonandree, has two or rarely three fertile stamens and three functional stigmas. It contains two small genera of tropical Asia and Africa with almost regular flowers, and the large genus *Cypripedium* containing about 30 species in the north-temperate zone and tropical Asia and America. In *Cypripedium* two stamens are present, one on each side of the column instead of one only at the top, as in the group

Monandree, to which belong the remaining genera in which also only two stigmas are fertile.

The Monandree have been subdivided into 20 tribes, the characters of which are based on the structure of the anther and pollinia, the nature of the inflorescence, whether terminal or lateral, the veneration of the leaf and the presence or absence of a joint between blade and sheath, and the nature of the stem. The most important are the following:

Ophrydeae, terrestrial orchids, mainly north temperate, including the British genera *Orchis*, *Aceras*, *Ophrys*, *Herminium*, *Gymnadenia* and *Habenaria*.

Neottiæe, also terrestrial, contains 13 more or less widely distributed tropical or subtropical subtribes, one, *Cephalanthereæ*, which includes the British genera *Cephalanthera* and *Epipactis*, is chiefly north temperate. The British genera *Spiranthes*, *Listera* and *Neottia* are also included in this tribe, as is also *Vanilla*, the elongated stem of which climbs by means of tendril-like aerial roots.

Coelogyneæ, mostly epiphytes, and inhabitants of tropical Asia. A single internode of each shoot is swollen to form a pseudobulb.

Liparideæ, terrestrial, two, *Malaxis* and *Corallorhiza*, are British and North American. *Liparis* is a large genus widely distributed in the tropics.

Pleurothallidieæ, natives of tropical America, one of which, *Pleurothallis*, contains about 500 species. *Masdevallia* is common in cultivation and has often brilliant scarlet, crimson or orange flowers.

Laelieæ, natives of the warmer parts of America, including three of those best known in cultivation, *Epidendrum*, *Cattleya* and *Laelia*.

Phajeæ, chiefly tropical Asiatic, some—*Phajus* and *Calanthe*—spreading northwards into China and Japan.

Cryptopodieæ, tropical, but extending into north temperate Asia and South Africa; *Eulophia* and *Lissocilus* are important African genera.

Cataseæe, with tropical American genera, two of which, *Cataselem* and *Cynoches*, have di- or tri-morphic flowers.

Dendrobieæ, in the warmer parts of the Old World; the chief genus is *Dendrobium*, with 750 species, often with showy flowers.

Cymbidieæ, in the tropics of the Old World. The leaves are generally long and narrow. *Cymbidium* is well known in cultivation.

Oncidieæ, in the warmer parts of America. *Odontoglossum* and *Oncidium* include some of the best-known cultivated orchids.

Sarcantheæ, in the tropics. *Vanda* (Asia) and *Angraecum* (Africa and Madagascar) are known in cultivation. The flower of *Angraecum sesquipedale* has a spur 18 in. in length.

British Orchids.—The family is well represented in Great Britain by nearly 40 species representative of 18 genera; among these are several species of *Orchis*, *Gymnadenia* (fragrant orchis), *Habenaria* (butterfly and frog orchis), *Aceras* (man orchis), *Herminium* (musk orchis), *Ophrys* (bee, spider and fly orchis), *Epipactis* (helleborine), *Cephalanthera*, *Neottia* (bird's-nest orchis), one of the few saprophytic genera, which have no green leaves, but derive their nourishment from decaying organic matter in the soil, *Listera* (tway blade), *Spiranthes* (lady's tresses), *Malaxis* (bog-orchis), *Liparis* (fen-orchis), *Corallorhiza* (coral root), also a saprophyte, and *Cypripedium* (lady's slipper), represented by a single species now very rare in limestone districts in the north of England.

North American Orchids.—In North America north of Mexico about 140 species of orchids are found, representing some 40 genera (see O. Ames, *An Enumeration of the Orchids of the United States and Canada*, 1925). Many are widely distributed across the continent, some extending to Alaska and even to Greenland, but they occur most numerous in the eastern and especially the south-eastern States. The generic groups having the largest number of species are the rein-orchises (*Habenaria*), 32 species; lady's-tresses (*Spiranthes*), 15 species; lady's-slippers (*Cypripedium*), 10 species; and boy-orchises (*Malaxis*), 8 species. The tropical epiphytes are represented by *Epidendrum*, 9 species, and *Oncidium*, 4 species, found in Florida. Among the many attractive

orchids native to the eastern States and Provinces are the showy lady's-slipper (*C. reginae*), the yellow lady's-slipper (*C. parviflorum*), the moccasin-flower (*C. acaule*); the showy orchis (*Orchis spectabilis*), the round-leaved rein-orchis (*Habenaria rotundifolia*), the white-fringed rein-orchis (*H. blephariglottis*), the yellow-fringed rein-orchis (*H. ciliaris*), the purple-fringed rein-orchis (*H. psychodes*), the rose-pogonia or snake-mouth (*Pogonia ophioglossoides*), the dragon's-mouth (*Arethusa bulbosa*) and the grass-pink (*Limnodorum tuberosum*).

In the Rocky Mountain region and adjacent plains some 40 species of orchids occur; fully half of these are found also in the eastern States and a dozen or more extend northward to Alaska. Among them are the mountain lady's-slipper (*Cypripedium montanum*), the oval-leaved rein-orchis (*Habenaria Menziesii*), and the round-leaved orchis (*Orchis rotundifolia*), which ranges northward to the Yukon and to Greenland. About 35 species of orchids occur in the Pacific States; among these are the California lady's-slipper (*Cypripedium californicum*), the Sierra rein-orchis (*Habenaria leucostachys*), the giant helleborine (*Epipactis gigantea*) and the rare phantom orchis (*Cephalanthera Austinae*).

Cultivation.—The only orchid of substantial economic importance, furnishing a staple article of extensive use is vanilla (*q.v.*). But the number of tropical orchids grown in greenhouses in Europe and North America for the flower markets, and as objects of horticultural and scientific interest is immense. More than 3,000 species, many of them epiphytes, are in cultivation, as well as many thousand hybrid forms derived from them. Among the genera thus represented in orchid culture are *Cattleya*, *Corolla*, *Dendrobium*, *Epidendrum*, *Laelium*, *Odontoglossum*, and *Phalaenopsis*. Propagation of these cultivated forms is by division, cuttings and growth from seed. Many terrestrial orchids practically defy all efforts at cultivation, due to lack of knowledge regarding soil conditions, to saprophytic habits, and to their growth in association with special fungi (see MYCORRHIZA).

ORCHOMENUS (on coins and inscriptions, *Erchomenos*), the name borne by two cities of ancient Greece.

1. A Boeotian city, between the Cephissus river and its tributary, the Melas, on a long, narrow hill projecting south from Mt. Acontium, on every side admirably situated to be the stronghold of an early kingdom. The acropolis is situated at the north end of the ridge.

In prehistoric times Orchomenus is revealed alike by archaeological finds and by legends, as one of the most prosperous towns of Greece, once a continental and a maritime power. It controlled the greater part of Boeotia, especially the fertile lowlands of Lake Copaïs, upon the drainage of which its early kings bestowed great care. Its original inhabitants, the Minyae, were a seafaring people, and Orchomenus remained a member of the Calaurian League of naval States till historical times. Then, however, Orchomenus no longer figures as a great commercial State, and its political supremacy in Boeotia has passed to the people of Thebes. Nevertheless, it long exercised some overlordship over towns of northern Boeotia, and an independent policy within the Boeotian League. In 447 it was the headquarters of the oligarchic exiles who freed Boeotia from Athenian control. In the 4th century Orchomenus was actuated throughout by an anti-Theban policy, partly a recrudescence of old rivalry, but chiefly inspired by aversion to the new democracy at Thebes. In the Corinthian war the city supported Lysander and Agesilaus in their attacks upon Thebes, and Orchomenus again sided with the Spartans in 379. After the battle of Leuctra the Thebans, first, on Epaminondas's

advice, readmitted it into the Boeotian League, but in 368 destroyed the town. By 353 it had been rebuilt, probably by the Phocians, as a bulwark against Thebes. After the subjection of the Phocians in 346 it was again razed by the Thebans, but was restored by Philip of Macedon as a check upon Thebes (338). In 85 B.C. Orchomenus provided the battle-field on which the Roman general Sulla destroyed an army of Mithridates VI. of Pontus. But its later history is obscure, and its decadence is attested by the encroachments of Lake Copaïs. Since mediaeval times the site has been occupied by a village named Skripou. Since 1867 drainage operations have been resumed, and an English company has reclaimed much fertile land. The so-called "treasury of Minyas," outside the ancient city at Mycenae (see MYCENAE), is almost exactly the same size as the "treasury of Atreus." The admiration of Pausanias is justified by the beautiful ornamentation of the roof of the inner chamber brought to light by Schliemann. Excavation by Doctors Furtwängler and Bulle revealed three prehistoric settlements, superposed. The first represents the Neolithic "painted-ware" culture of Thessaly and other parts of north-east Greece; in the second, oval huts replace the earlier round ones, and dull smeared pottery ("Urfirnis") the painted ware; the third has rectangular houses and characteristic grey "Minyan" pottery, finely modelled but without ornament. All these cultures precede the "Late Minoan" occupation, to which the great "Treasury" tomb belongs.

The worship of the Charites (see GRACES) was the great cult of Orchomenus, and the site of the temple is now occupied by a chapel of the Virgin (*Kolunðis rñs Παναγίας*). The Charites were worshipped under the form of rude stones, which had fallen from heaven during the reign of Eteocles; and it was not till the time of Pausanias that statues of the goddesses were placed in the temple. Near this was another temple, dedicated to Dionysus, in whose festival, the *Agriaia* (*q.v.*), are apparent the traces of early human sacrifice.

2. An Arcadian city north of Mantinea and west of Stymphalus. Its district was mountainous, but had two valleys—the northern containing a lake drained by a *katavothron*; the southern below the city, separated from Mantinea by the ridge Anchisia. The old city, in a strong situation, was a ruin in Strabo's time. Till the late 7th century the kings of Orchomenus held some sort of sovereignty over all Arcadia. In the 5th century it was overshadowed by Mantinea, and in 418 B.C. Orchomenus fell for a time into its power; in 370 it held aloof from the new Arcadian League which Mantinea was organizing. About this time it also lost some possessions on the east to the new Arcadian capital, Megalopolis. In the 3rd century it belonged in turn to the Aetolian League, to the Lacedaemonians, and, since 222, to the Achaeans. Its history after it passed under the Roman rule is quite obscure.

ORCINOL, a homologue of resorcinol (*q.v.*), found in many lichens, e.g., *Rocella tinctoria*, *Lecanora*, and formed by fusing extract of aloes with caustic potash. It is 3:5-dihydroxy-1-methylbenzene ($C_6H_3(CH_3)(OH)_2$). It may be synthesized from toluene; or from acetonedicarboxylic ester by condensation with the aid of sodium. It crystallizes in colourless prisms with one molecule of water, which reddens on exposure. Ferric chloride gives a bluish-violet coloration with the aqueous solution. Unlike resorcinol it does not give a fluorescein with phthalic anhydride. Oxidation of the ammoniacal solution gives *orcine*, $C_{25}H_{21}N_2O_7$, the chief constituent of the natural dye archil (*q.v.*). Homopyrocatechol is an isomeride ($CH_3:OH:OH = 1:3:4$), found as its methyl ether (creosol) in beech-wood tar.

ORDEAL, a term of varying meaning but bearing the special sense of the mediaeval Lat. *Dei iudicium*, a miraculous decision as to the truth of an accusation or claim. The ordeal in principle, and often in the very forms used, belongs to ancient culture. Some ordeals, which possibly represent early stages of the practice, are simply magical, being processes of divination turned to legal purpose. Thus in Burma suits are sometimes still determined by plaintiff and defendant being each furnished with a candle, equal in size and both lighted at once—the whose candle outlasts the other being adjudged to have won his cause (Shway Yoe, *The*

Burman, ii. 254). In Borneo, the two parties are represented by two shell-fish on a plate, which are irritated by pouring on some lime-juice, and the one first moving settles the guilt or innocence (as has been before arranged) of its owner (St. John, *Forests of the Far East*, i. 89). The administration of ordeals has been much in the hands of priests, the intervention of a deity being invoked and assumed to take place even when the process is in its nature one of symbolic magic. The ordeal is related to divination (*q.v.*). *Coscinomancy* (the use of a sieve for divination) served anciently to discover a thief when, with prayer to the gods for direction, the names of the suspected persons were called over it (Potter, *Greek Antiquities*, i. 352). When a suspended hatchet was used in the same way to turn to the guilty, the process was called *axinomancy*. The sieve-ordeal is mentioned in *Hudibras* (ii. 3):

... th' oracle of sieve and shears
That turns as certain as the spheres.

In the modern Christian form of the key and bible, a psalter or bible is suspended by a key tied in at Psalm l. 18: "When thou sawest a thief, then thou consentedst with him"; the bow of the key being balanced on the fingers, and the names of those suspected being called over, he or she at whose name the book turns or falls is the culprit (*see* Brand, *Popular Antiquities*).

One form of divination passing into ordeals is the appeal to the corpse itself for discovery of its murderer. Thus the natives of Australia will ask the dead man carried on his bier of boughs, who bewitched him; if he has died by witchcraft he will make the bier move round, and if the sorcerer who killed him be present a bough will touch him (Eyre, *Australia*, ii. 344). Among the negroes of Ashanti, the corpse causes its bearers to dash against the guilty party (R. S. Rattray, *Religion and Art in Ashanti* [1927] p. 167, *see also* B. Malinowski, *Crime and Custom in Savage Society*, H. V. Russell, *Tribes and Castes of the Central Provinces*, [1916] iii. p. 90). The well-known ordeal of the bier in Europe in the middle ages seems founded on a different principle, the imagination that a sympathetic action of the blood causes it to flow at the touch or neighbourhood of the murderer. Apparently the liquefaction of the blood which in certain cases takes place after death may have furnished the ground for this belief. On Teutonic ground, this ordeal appears in the *Nibelungenlied*, where the murdered Siegfried is laid on his bier, and Hagen is called on to prove his innocence by going to the corpse, but at his approach the dead chief's wounds bleed afresh. In Shakespeare (*Rich. III.*, act 1, sc. 2):

O gentlemen, see, see! dead Henry's wounds
Open their congeal'd mouths, and bleed afresh!

Certain ordeals are closely related to oaths, so that the two shade into one another. Let the curse which is to fall on the oath-breaker take effect at once, it then becomes a sign condemning the swearer—in fact, an ordeal. Thus the drinking of water on which a curse or magical penalty has been laid is a mere oath so long as the time of fulfilment is unfixed (*see* OATH). But it becomes an ordeal when, as in Brahmanic India, the accused drinks three handfuls of water in which a sacred image has been dipped; if he is innocent nothing happens, but if he is guilty sickness or misfortune will fall on him within one to three weeks (for accounts of these and other Hindu ordeals *see* Ali Ibrahim Khan in *Asiatic Researches*, i. 389, and Stenzler's summary in *Z. D. M. G.*, vol. ix.). Numbers v. describes the mode of administering to a woman charged with unfaithfulness the bitter water mixed with the dust of the tabernacle floor, with the curse laid on it to cause her belly to swell and her thigh to fall if guilty. The term "bitter" is applied to the water before it has been cursed, which suggests that it already contained some drug, as in the poison-water ordeal still in constant use over a great part of Africa. The result of the ordeal depends partly on the patient's constitution, but more on the sorcerer who can prepare the proper dose to prove either guilt or innocence, and thereby acquires boundless influence. The poison-ordeal is also known to Brahmanic law, decoction of aconite root being one of the poisons given, and the accused if not sickening being declared free (Stenzler, *l.c.*). Theoretically connected with the ordeal by cursed drink is that by cursed food. The ordeal by bread and cheese, practised in

Alexandria about the 2nd century, was practically the same as that known to English law five to ten centuries later as the *corsnaed* or "trial slice" of consecrated bread and cheese which was administered from the altar, with the curse that if the accused were guilty God would send the angel Gabriel to stop his throat, that he might not be able to swallow that bread and cheese. In fact, if guilty and not a hardened offender he was apt to fail, dry-mouthed and choking through terror, to get it down.

The passing through the fire is described in the Hindu codes of Yājñavalkya and others, and in the *Rāmāyana* the virtuous Sītā thus proves her innocence to her jealous husband Rāma (Stenzler, p. 669; Pictet, *Origines Indo-Européennes*, part ii. p. 457). In European law and chronicle, Richardis, wife of Charles the Fat, proves her innocence by going into a fire clothed in a waxed shift, and is unhurt by the fire (Grimm, *Deutsche Rechtsalterthümer*, p. 912). Yet more minutely prescribed in the Hindu ordeal-books is the rite of carrying the glowing hot iron seven steps, into the seven or nine circles traced on the ground, the examination of the hands to see if they show traces of burning, and the binding them up in leaves. In a Scandinavian law it is prescribed that the red-hot iron shall be carried nine steps (Grimm, *op. cit.*, p. 918). In Anglo-Saxon laws the iron to be carried was at first only one pound weight, but Athelstan's law (in *Ancient Laws and Institutes of England*, iv. 6) increased it to three pounds. Another form well known in old Germany and England was the walking barefoot over glowing ploughshares, generally nine. The law-codes of the early middle ages show this as an ordinary criminal procedure (*see* the two works last referred to). Queen Emma, mother of Edward the Confessor, accused of familiarity with Alwyn bishop of Winchester, triumphantly purged herself and him by the help of St. Swithin—each of the two thus acquitted giving nine manors to the church of Winchester, in memory of the nine ploughshares, and the king being corrected with stripes (John Bromton, *see* Freeman's *Norm. Conq.*, vol. ii. App.). To dip the hand in boiling water or oil or melted lead and take out a stone or ring is another ordeal of this class. Some of these fiery trials are still in use, in regions of Africa or further Asia—the negro plunging his arm into the caldron of boiling oil, the Burman doing feats with melted lead, while the Bedouin will settle a conflict of evidence by the opposing witnesses licking a glowing hot iron spoon (Kennett, *Arabian justice*). This latter feat may be done with safety, provided the iron be clean and thoroughly white hot, while if only red-hot it would touch and burn the tongue. Probably the administrators of the ordeal know this, and the possibility of dipping the hand in melted metal; and there are stories of arts of protecting the skin (*see* the recipe in Albertus Magnus, *De Mirabilibus*), though it is not known what can be really done beyond making it horny like a smith's, which would serve as a defence in stepping on hot coals, but not in serious trials like that of carrying a heavy red-hot iron. The fire-ordeals are still performed by mountebanks. Fire walking is still practised by Hindus and was performed in Natal in the autumn of 1925. The Hindu code of Manu (viii. 115) avers that "He whom the flame does not burn, whom the water does not cast up, or whom no harm soon befalls, is to be taken as truthful in his oath." This water-ordeal is well known in Europe, where the accused is thrown bound into the water, which receives him if innocent, but rejects him if guilty. The directions given by Archbishop Hincmar in the 9th century provide that he who is let down into the water for trial is to be fastened by a rope, that he may not be in danger if the water receives him as innocent, but may be pulled out. In the later middle ages this ordeal by "swimming" or "floating" became the most approved means of trying a suspected witch: she was stripped naked and cross bound, the right thumb to the left toe, and the left thumb to the right toe. In this state she was cast into a pond or river, in which it was thought impossible for her to sink (Brand iii. 21). Cases of "ducking" witches which used to occur in England were remains of the ancient ordeal.

When in the warfare of Greeks and Trojans, of Jews and Philistines, of Vandals and Alamans, heroes come out from the two sides and their combat decides the victory, then we have the ordeal by battle. A passage from old German law shows the single

combat accepted as a regular legal procedure: "If there be dispute concerning fields, vineyards, or money, that they avoid perjury let two be chosen to fight, and decide the cause by duel" (Grimm, *Rechtsaltert.*, p. 928). In England, after the Conquest, trial by combat superseded other legal ordeals, which were abolished in the time of Henry III. A lord often sent his man in his stead to such combats, and priests and women were ordinarily represented by champions. The wager of battle died out so quietly in England without being legally abolished that in the court of king's bench in 1818 it was claimed by a person charged with murder, which led to its formal abolition (*Ashford v. Thornton* in Barnewall and Alderson 457; see details in H. C. Lea, *Superstition and Force*, ii.). A distinct connection may, however, be traced between the legal duel and the illegal private duel. (See DUEL.) (E. B. T.; X.)

ORDER, a row or series, hence grade, class or rank, sequence or orderly arrangement (Lat. *ordo*, rank, arrangement). For its various meanings see MINISTRY, THE CHRISTIAN; MONASTICISM; KNIGHTHOOD AND CHIVALRY; ORDER IN COUNCIL; BILL OF EXCHANGE.

For technical mathematical uses of "order" see NUMBER; CURVE; SURFACE; DIFFERENTIAL EQUATION.

ORDER, (1.) in classic architecture, a column or pilaster, with its base, shaft and capital, and the entablature (*q.v.*) above it (sometimes called epistyle), consisting of architrave, frieze and cornice, considered as a single architectural feature; the "orders" are systematized classifications of five different types, Tuscan, Doric, Ionic, Corinthian and Composite. (2.) In mediaeval architecture, in an arched door or other opening, where the opening is larger on the outer face of a thick wall than on the inner face, one of the breaks in the steps in the thickness of the wall, consisting of an arch above and a pier on each side, by which the transition from larger exterior to smaller interior opening is effected.

Classic Orders.—Greek architecture had developed three easily recognizable classes of order which had been adopted by the Romans, with modifications, by the middle of the 1st century, B.C. It was natural, therefore, that Vitruvius, in his remarkable treatise on architecture (last quarter of 1st century, B.C.) should have attempted to give rules for the construction of these three orders. Moreover, as the Etruscan architects had developed a simple order of their own, using a wooden entablature, he added a section dealing with that. With the republication of Vitruvius in the second half of the 15th century, he was at once hailed as the authority on all things architectural, and architectural writers of the later Italian Renaissance attempted to imitate him by giving ideal rules for the orders, which should be efforts to reconcile the standards of Vitruvius with the many varying examples of Roman work that they knew. They added as a fifth order the Composite type of capital. The two most famous of these Renaissance compilations, those of Vignola (Giacomo Barocchio, or Barozzi), published in 1563, and Palladio (1570), exerted a tremendous influence over 17th and 18th century architecture throughout Europe, and gave rise to the idea that these compilations were not merely statements of average usage, but rules to be absolutely followed, an idea contradicted by the architectural work of the two authors themselves. Lacking knowledge of Greek remains, and of the structural systems and details of Etruscan temples, the Tuscan order, which they described, is merely a simplified Roman Doric. Their passion for regularization showed also in the fact that they specify a definite pedestal and even a definite baluster as a part of each order. Various 18th century and modern architectural writers have attempted to simplify the order descriptions of Vignola and Palladio, and have thus perpetuated the Renaissance myth of the immutability of the orders. In general, Vignola's work was followed in France and Palladio's in England. The orders, as thus systematized, are as follows:—

Tuscan.—This is the simplest of the orders. It is characterized by a column seven diameters high, the capital and base each occupying one-half the diameter in height. The base consists of a plain, square plinth (*q.v.*) with a large torus (*q.v.*) and a fillet above. The capital has an astragal (*q.v.*) at the top of the shaft, a necking (*q.v.*), which is merely a short continuation of the line

of the column, and above that an echinus (*q.v.*) consisting of a simple ovolo (*q.v.*) or quarter round with a fillet below it, and carrying a simple, square abacus (*q.v.*). The entablature, as in all the orders, is supposed to be one-quarter of the height of the column, and consists of a plain architrave (*q.v.*), or lower member, with a simple square projection or taenia (*q.v.*) at the top, a plain frieze, or central member, and a cornice with a single moulding as a bed-mould (*q.v.*), an undecorated corona (*q.v.*) or projecting rectangular portion, and a cymatium (*q.v.*) or crowning moulding that is an ovolo.

Doric.—The column is eight diameters high, and carries 20 flutes, separated by arrises (*q.v.*) or sharp edges. The base has two toruses, the lower one larger than the upper, and the capital is given a projecting moulding at the top of the echinus and additional fillets or an astragal below the ovolo. The necking is ornamented with eight rosettes. The architrave in the entablature is sometimes given two faces, the upper one projecting slightly, being wider than the lower. The taenia is decorated with a moulding and beneath each triglyph (*q.v.*) of the frieze, a small block called a regula (*q.v.*), with six guttae, or small conical forms on its under side. The frieze is ornamented by triglyphs, or vertical projections decorated with a series of vertical grooves. Between each two triglyphs is a square metope (*q.v.*), a plain surface carrying sculpture; a triglyph is arranged over the centre of each column. Two forms of cornice are described; the denticular, in which the chief feature of the bed-mould is a row of dentils or little projecting blocks, and the mutular, in which the under side of the corona is decorated with projecting blocks, one over each triglyph. In both cases guttae are used on the soffit or under side of the cornice. In the denticular cornice they ornament square panels over each triglyph; in the mutular, the under side of the projecting blocks or mutules. The cymatium consists either of a cavetto or a cyma recta, a moulding of double curvature, the convex portion below and concave portion above.

Ionic.—The column is nine diameters high. The base is of the type known as an Attic base (*q.v.*) with a plinth carrying two toruses, separated by a scotia or hollow moulding. The capital is characterized by the volutes (*q.v.*) or spiral scrolls that are the ends of a band (usually consisting of a hollow portion called a canal, and a raised fillet) represented as passing horizontally across the top of the echinus, and winding up on either side in a volute or helix. The capital is thus rectangular, and the volutes of the two faces of the capital are connected by a generally cylindrical form known as a cushion. This sometimes takes the form of two vases, end to end, and is sometimes decorated with leaves. The echinus, of ovolo profile, is carved with the egg and dart (*q.v.*), and where, as it follows the curve of the column, it disappears behind the rolls of the volutes, a little half anthemion (*q.v.*) or radiating petalled form hides the intersection. The entablature has an architrave decorated with either two or three bands, each wider and projecting farther than the one below it, and a taenia ornamented with mouldings. The frieze is plain, and the cornice has a bed-mould of three parts—a dentil band separating two mouldings, the lower one a cyma reversa, the upper one an ovolo. The cymatium is a cyma recta with a smaller cyma reversa below it.

Corinthian.—The column is ten diameters in height, and the base resembles the Attic base of the Ionic order, with the exception that in the centre of the scotia there is a third, small torus, with fillets above and below. The capital is much deeper than in the Doric and Ionic orders, and consists of a generally bell-shaped core, carrying a moulded abacus whose sides are concave, so that the corners project. At the bottom of the bell of the capital is an astragal, and the surface of the bell is surrounded by a characteristic decoration of acanthus leaves and scrolls. The lower two-thirds has 16 acanthus leaves in two rows of eight each, the centres of the upper leaves being placed between the joints of the lower leaves. Between the leaves of the upper row are cup-shaped leaf ornaments known as cauliculi (*q.v.*), which grow on stalks, and out of each cauliculus grow two stalks, one large and one small, so arranged that the voluted ends of the two adjacent large scrolls meet under each projecting corner of the abacus,

while the two adjacent smaller stalks come together under the centre of each concave abacus space; above their juncture is a large rosette. The architrave of the entablature, like that of the Ionic, has three bands and a moulded taenia, but additional richness is given by tiny mouldings between the bands. The frieze is plain, though sometimes pulvinated, or given a profile of convex curve. The cornice resembles that of the Ionic order with the addition of the band of modillions (*q.v.*). These are small scrolled brackets under the soffit of the corona, and are usually decorated on the sides with S-scrolls and on the bottom and front face with acanthus leaves. They are crowned by a little cyma reversa moulding. The soffit of the corona is panelled between the modillions, and in each panel there is a rosette.

Composite.—This is, in reality, merely a varied form of the Corinthian order and, like it, the column is fluted and ten diameters high. A special base is given to it by doubling the small torus in the centre of the scotia between the two large toruses. The capital, its main distinguishing feature, consists of a bell surrounded with 16 acanthus leaves, in two rows, arranged similarly to those of the Corinthian capital. But above them, instead of the scrolls and cauliculi, there are volutes, like those of the Ionic order, except that they are on the four sides of the capital and brought out at an angle at the corners. In the bed-mould of the cornice, large rectangular blocks take the place of the modillions, and in some codifications a part of the bed-mould as well.

Scamozzi Ionic.—In addition to the five orders listed above, certain authorities have given a variant of the Ionic order, known as the Scamozzi Ionic after the Italian architect (Vincenzo Scamozzi, 1552–1616), who first codified it. Its chief difference from the ordinary Ionic order is in the fact that its capital is four-sided, the volutes occurring on all four faces, and at the corners brought out in an angle, so that the abacus above is concave-sided, like the Corinthian. Moreover, the bands forming the volutes are not connected on each face by a horizontal line, but curve over and down into the top of the echinus; in the empty space thus left in the centre of each face there is a rosette. At times garlands connect the centres of the volutes.

Purpose.—The object of each codification of the orders is to furnish exact proportionate dimensions for every small feature, so that given the diameter of the column, the entire order may be constructed mechanically. The rules of all these attempted codifications vary slightly. The orders shown on the plate are constructed from the simplified scheme devised by the late William R. Ware, 1832–1915 (*The American Vignola*, 1910).

Origins.—The origin of the earliest of the orders, the *Doric*, was, at least partially, in wooden construction and seems to be a purely Doric, or at least Hellenic, development, as far as the entablature is concerned. The question of the column is, however, more complex. In the Aegean culture, columns were common and their capitals consisted of a square abacus with a convex echinus below. The resemblance of this type, shown not only in wall paintings, but also in certain remains of the stair hall of the palace at Cnossus (*c.* 1500 B.C.), the column on the Lion Gate and those of the tholos of Atreus, both at Mycenae (both *c.* 1200 B.C.) to primitive Greek Doric capitals, is too close to be mere coincidence. On the other hand, Aegean columns universally tapered downward, were principally of wood and sometimes extremely slender in proportion, those at the tholos of Atreus being almost 11 diameters high, while those of the primitive Doric have an extreme taper upward and are short and stumpy. Moreover, the Aegean entablature, as shown in wall paintings, is entirely different from the Greek Doric, its chief features being round, projecting beam ends, close together, supported on a simple girder. The Greek Doric entablature has forms which seem to indicate a wooden origin, but one based on a different system of construction from that employed by the Aegean peoples. The architrave represents the original wooden beam running from post to post; the taenia, a board above this, to give a perfect bearing for the cross beams. The triglyphs are the ends of these cross beams, held in place by pegs through the taenia board, represented by the guttae. The metopes are merely closing boards between the beams. The mutules, or sloping blocks on the under

side of the projecting cornice corona, represent the under sides of slanting roof rafters, supported on a timber or plate, above the cross beams, and perhaps decorated on the under side by flat boards or wooden pegs whose heads become the guttae in the stone version.

It is known that the primitive temple of Hera, at Olympia, had, originally, wooden posts, which were replaced from time to time during historic times, as they rotted, by stone columns. Nevertheless, the extreme taper and squat proportions of early Doric columns seem to demand an origin of masonry, and especially a masonry made of small stones. The origin would thus appear to be triple; the shaft, from early rubble construction; the capital borrowed and adapted from Aegean sources; while the entablature is an interpretation in stone of traditional Dorian wood construction. The earliest example known of the Greek Doric order is that of the temple at Corinth, probably dedicated to Apollo, which must be as early as the 6th century, and may go back to the 7th. Other early examples exist at Segesta, Selinus, Girgenti and Paestum, which are all of uncertain date, but undoubtedly prior to the Persian wars. Two of those at Selinus may go back to the 7th century B.C. The latest ancient example is that of the Agora gate at Athens (12 B.C.–A.D. 2). During these 700 years the basic elements of the Doric order did not change; the development, which was great, was only in the gradual refinement of every feature, and a continual experimentation in the exact treatment of each form, to give the desired result. Columns became taller and more slender, and the entasis (*q.v.*), or curved taper, more and more delicate. The ovolo of the echinus changed from the obese projections of Corinth and Paestum to the extremely refined and subtle curves of the Periclean period. The entablature, which in early examples had been almost half the height of the column, was gradually reduced in size, till in the Parthenon it is approximately one-fifth. The Greek Doric order was probably, in all cases, richly decorated in colour, so that its present appearance of austerity and over-restraint is illusory.

The *Roman Doric* order has plainly a double origin. The differences between it and the Greek Doric are not due entirely to Roman inability to appreciate the subtleties of Greek work, but merely to the fact that the Etruscans, and perhaps the north Italians, generally, had, at a very early period, developed a column and entablature of their own, with a long, slender, wooden column, having an ovolo echinus similar to the Aegean, and an entablature of wood, sometimes decorated with terra-cotta appliques. It is this Etruscan column and entablature which Vitruvius endeavoured to describe, and which was misunderstood by the Renaissance, so that the name Tuscan came to be applied to a simplified Doric. It was also the origin of the unfluted, Roman Doric column, with its simple, quarter round echinus. To this the Romans applied an entablature embodying certain Greek features. In Roman architecture, the use of the Doric was reserved for small scale columns, as in many of the house courtyards at Pompeii (the forum colonnade at Pompeii was originally Greek), and to engaged or attached columns between arches. When used on a larger scale it was frequently much modified. Thus, in the temple of Hercules at Cori (attributed to Sulla, *c.* 80 B.C.), a base has been added, consisting of a single torus, but without a plinth. The entablature is extremely delicate in proportion, and the capital profile approximates that of the Greek Doric. A triglyph occurs on the corner, as in Greek work. In the theatre of Marcellus, at Rome (completed 13 B.C.), there is no base, and in the Colosseum (A.D. 80) there are no triglyphs. The Renaissance codifiers, however, took these two as the most typical, and their order is a sort of average between them. Another Doric order, coming originally from Albano, has no base except a fillet with apophyge, and the mouldings of the capital are richly carved. Other Roman Doric orders of extreme richness, in which the echinus of the capital is formed by a cyma recta instead of an ovolo are those from a temple on the Aventine, probably of the 2nd century A.D., and one from the baths of Diocletian (A.D. 305).

The *Ionic* order had manifestly an Asiatic origin. Its capital is a development from stele (*q.v.*) capitals of Phoenicia and the eastern end of the Mediterranean, which were themselves based

originally on the tri-lobed lotus. A famous example of the primitive type was found at Neandreaia, and another in Messa, in Lesbos. Excavations on the Acropolis at Athens, and elsewhere, have revealed many examples of the intermediate stages between the flaring volutes and awkward proportions of the early type and the refined perfection of the developed Ionic of the temple of Nike Apteros (probably between 440 and 410 B.C.), or the Erechtheum (407 B.C.). The characteristic features of the Greek Ionic order as found in Greece itself are the bold size and exquisite curvature of the volutes, the remarkable perfection of carved ornament that decorates the whole, and the variety of the types of base found.

The treatment of the order at the corners of a portico was difficult. The corner capital was formed with volutes on two adjacent, rather than two opposite, faces; where they met, the volutes were curved out at an angle together under the corner of the entablature. This created a new difficulty on the opposite corner, inside the colonnade, as it brought two half volutes together in an awkward way. It was this difficulty that led to a development of a variation of the Ionic capital with four faces the same and angle volutes. The most beautiful Greek example is that of the temple of Apollo at Bassae, designed by Ictinus, the architect of the Parthenon (probably c. 425 B.C.). In this the columns of the interior of the cella are connected by short walls to the exterior wall, and evidently, in order to have them present the same decorative face toward the entrance as toward the narrow nave between them, Ictinus adopted a four-sided Ionic capital.

A much more virile Ionic at enormous scale was developed in the great Hellenistic temples of the Asia Minor coast, such as those at Miletus and Priene. The archaic temple at Ephesus had set the style as early as the 6th century B.C., and its rebuilding, shortly after 350 B.C., by Dinocrates, while keeping certain of the more archaic features, such as the sculptured drums of the lower portions of the columns, was in the complete new Hellenistic Ionic style. The characteristics of this are: (1) a capital with volutes relatively smaller than in Athenian examples; (2) a cornice whose most striking feature was the very large dentils of the bed-mould, so large and so widely spaced, in fact, that in appearance they became almost separate brackets.

The *Roman Ionic* was based more on the Asia Minor than on the Attic types. Its details, throughout, were heavier than the usual Greek type. This heaviness appears even in the temple of Fortuna Virilis, which is not only the earliest purely Roman Ionic order, but also probably the earliest building in Rome in a good state of preservation to-day. It is variously attributed to the beginning of the 2nd and the beginning of the 1st century B.C. In general, the three chief differences between the Greek and Roman Ionic orders are: (1) the band connecting the volutes is perfectly horizontal, both at top and bottom, in Roman examples, and without the central dip of most Greek capitals; (2) the relative height and importance of the bed-mould of the cornice is much greater in the usual Roman examples. This is true, even in the most delicate and the most Greek of the monumental Roman orders—that of the theatre of Marcellus; (3) the base of the Roman order has, almost always, a square plinth as its lowest member. An exceptional type of Roman Ionic order is that of the temple of Saturn, on the Roman forum, the ancient treasury of Rome, whose ugly heaviness is characteristic of its date, after the great fire of A.D. 283.

Whatever the date of the original invention of the *Corinthian* order, it did not come into general use until the middle of the 4th century B.C. The capital perhaps owes its bell shape to Greek travellers' memories of the campaniform capitals of Egypt. But the Greek expression of this form is characteristically gracious. (For the charming Greek myth of its creation, see Vitruvius, Bk. IV.) Certainly the simplest form of the capital, in which a bell, decorated with flat and delicately pointed leaves, close together, has its lower portion surrounded by eight boldly curving acanthus leaves, suggests a basket around the bottom of which an acanthus plant has grown, as the myth states. The most famous example of this simple type decorated the "Tower of

the Winds," at Athens, originally built in the 1st century B.C. to contain a water clock. The more complicated type, which is well represented by the exquisite capital of the tholos at Epidorus (middle 4th century B.C.), had two rows of leaves below and corner and central scrolls above. An even simpler form of the same type of capital, found alone in the ruins of the temple at Bassae, may be as early as the temple itself. The most popularly known example of the Greek Corinthian order, is that of the little choragic monument of Lysicrates, at Athens (335 B.C.).

The extremely lavish capital is, however, exceptional in many ways, and its silhouette unpleasantly broken. The existing columns and capitals of the great temple of Zeus at Athens were originally considered to be duplicates of the capital that Sulla took to Rome, and which served as a model for early Roman Corinthian. It is now known that the present remains are of the time of Hadrian. The order is, therefore, Roman, and not Greek. The Greeks never developed a separate entablature for the Corinthian order, using, instead, one of purely Ionic type; that of the tholos at Epidaurus owes its peculiar flat cornice to the fact that it was an interior order, rather than to any attempt to develop special entablature forms to crown the Corinthian capital.

Roman tradition found the origin of the *Roman Corinthian* order in a capital of the Athenian temple of Zeus, which Sulla brought with him to Rome. Long before that date, however, the Etruscans had been using forms Corinthianesque in type, and Pompeii also shows capitals which approach the Corinthian. In any case, the use of the Corinthian order on a monumental scale, as the Roman order *par excellence*, was well established by the time of Augustus, and the temple of Mars Ultor, dedicated in 2 B.C. as part of the forum of Augustus, and the portico of Octavia, of approximately the same date, both have completely developed magnificent Corinthian orders. It is noteworthy that in these the modillion (*q.v.*) had already reached a complete form. New light on the origin of this new feature which transformed the Ionic entablature into the Corinthian and which is the great Roman contribution to the development of the orders, is furnished by fragments of the order of the basilica Aemilia (dedicated 29 B.C.). These fragments are of the typically pure Augustan type, and therefore, probably due to this date and not to any of the succeeding rebuildings, and indicate a cornice with modillions which are deeper at the outer end than at the inner; that is, they slope down like the Doric mutules. Their outer ends are, however, scrolled.

The Roman Corinthian order is found in infinite variations. In certain small examples in tombs, gateways and the like, its proportions are thick and stumpy, as in the triumphal gateway at Saintes, of the time of Tiberius. In other cases it is extremely slender, as in the arch of Augustus at Susa. At times there are no modillions in the cornice, as in the temple of Antoninus and Faustina, at Rome (A.D. 141), and in the great temple of Venus, at Rome (A.D. 135), rebuilt by Maxentius (after 307). The modillions are replaced by the square, projecting blocks adopted by the Renaissance for the Composite order. Moreover, many types of capital exist. In some the two rows of leaves are at approximately equal height and kept tight to the bell, so that the effect is very vertical. In others, the lower row of leaves is made tall, so that the projecting leaf ends of both rows are close together and project markedly, giving almost the effect of a wreath around the capital. In other smaller examples, such as many at Pompeii, the ornament is hardly more than a frosting of the stucco surface of the bell. In the colonnade of the temple of Apollo, at Pompeii (rebuilt c. A.D. 63), a Doric entablature is supported by Corinthianesque columns. In some examples, rampant animals take the place of the corner volutes, as in the order of the temple of Concord, at Rome (A.D. 10) and in the capitals of the Roman gateway at Eleusis, in Greece (1st century A.D.). Another type, common in pilasters, substitutes for the cauliculi, with their double scrolls, an S-scroll at each side, turned in to the centre below and out to the corners above. This type gave rise to many 15th century early Renaissance capitals.

The most characteristic examples of the best type of the Roman Corinthian order are those of the round temple of Vesta,

at Tivoli (probably Augustan); the portico of the Pantheon, perhaps from the original building by Agrippa (27 B.C.); the interior of the Pantheon (A.D. 115-125); the portico of Octavia; the temple of Castor and Pollux on the forum (either of the rebuilding under Tiberius A.D. 6, or of the time of Hadrian), which is remarkable for the decoration of the middle band of the architrave and for the large, interlacing, central volutes of the capital; and that of the temple of Jupiter at Baalbek in Syria (time of Hadrian). An interesting order in brick and terra-cotta, evidently never stuccoed, is a doorway from an ancient Roman police station in Rome (early 3rd century); a more elaborate type of cut brick Corinthian with octagonal columns recessed into the wall is in the tomb of Annia Regilla (late 2nd century).

The *Roman Composite* order was actually only one of many variations of the Corinthian, and its erection into another order is a purely Renaissance idea. Vitruvius makes no mention of it and the earliest example known is one from a small garden pavilion in a house court recently (1928) excavated in Pompeii; an early monumental type is that of the arch of Titus, at Rome (completed A.D. 81), in which the exquisite composite capitals carry a normal Corinthian entablature. The bold richness of this type of capital was particularly popular during the later empire and the most magnificent example, remarkably delicate in execution for its late date, is one in the baths of Caracalla (211-216).

Renaissance.—During the middle and late 15th century in Italy and the early 16th century in France, the early Renaissance architects developed modified Corinthianesque orders of the most exquisite delicacy, in connection with doors, tombs and the like. The most characteristic feature of these orders is the general use of S-scrolls instead of volutes and cauliculi, and the use frequently of only small leaves beneath them at the corners of pilaster capitals. In the working out of the details of capitals of this type, the personalities of such sensitive designers as the Della Robbias, Desiderio da Settignano (1428-64) and Mino da Fiesoli (1431-84) achieved some of their most characteristic and delicate expression. At times dolphins, birds and even cherubs' heads replaced the scrolls under the cornice of the capital. The entablatures of these orders are almost always without modillions, but characterized by a jewel-like delicacy in the carving of the ornamented mouldings. In the arrangement of this there is the greatest variety. During the high and late Renaissance the orders tend to become more normal, but little strict archaeology is found and much individuality of design is still present. The work of B. Peruzzi (1481-1537), of D. Bramante (1444-1514), of Vignola and of Palladio is particularly noteworthy. Typically Renaissance variations are rusticated orders like those in the gates of Verona by San Michele (1530) and the banded columns developed by Philibert Delorme for the Tuileries in Paris (1564), and followed in the Grande Gallerie (1578) and twisted columns like those of Bernini's baldacchino in S. Peter's at Rome (1633).

During the Baroque period, especially in Spain, all kinds of forms were used which approximate the orders, but are so broken up and contorted, and so varied in detail, that they can be assigned to no definite classification.

The 20th century has seen a reaction against the archaeological correctness of orders of the revival period. Orders, where occurring, are treated with the utmost freedom, and those styles seem most popular in which a like freedom prevailed, such as the late Georgian style of the Adam brothers, and American colonial, with its slimness and attenuation. In so-called modernist work, the order tends to pass from use as a superfluous ornament. In exceptional cases, however, especially in Scandinavia, extremely free and modified orders are still used, as in the concert hall at Stockholm, by Ivar Tengbom, and in America in portions of the interior of the Nebraska State capitol by B. G. Goodhue and the Goodhue associates, still (1928) under construction. (See, also GREEK ARCHITECTURE; RENAISSANCE ARCHITECTURE; ROMAN ARCHITECTURE.)

ORDERIC VITALIS (1075-c. 1142), the chronicler, was the son of a French priest, Odeler of Orleans, who had entered the service of Roger Montgomery, earl of Shrewsbury, and had received from his patron a chapel in that city. Orderic was sent at the age of five to learn his letters from an English priest, Siward by name, who kept a school in the church of SS. Peter and Paul at Shrewsbury. When eleven years old he was entered as a novice in the Norman monastery of St. Evroul en Ouche. Orderic did not know a word of French when he reached Normandy; his book, though written many years later, shows that he never lost his English cast of mind or his love of England. His superiors rechristened him Vitalis, after a member of the legendary Theban legion. But in the title of his Ecclesiastical History he prefixes the old to the new name and proudly adds the epithet *Angligena*. He became a deacon in 1093, a priest in 1107. He left his cloister on several occasions, and speaks of having visited Croyland, Worcester, Cambrai (1105) and Cluny (1132). For many years he appears to have spent his summers in the scriptorium. His superiors (at some time between 1099 and 1122) ordered him to write the history of St. Evroul. The work grew under his hands until it became a general history of his own age. St. Evroul was a house of wealth and distinction. War-worn knights chose it as a resting-place of their last years. It entertained visitors from southern Italy, where it had planted colonies of monks, and from England, where it had extensive possessions.

Thus Orderic, though he witnessed no great events, was often well informed about them. His narrative gives us much invaluable information for which we should search the more methodical chroniclers in vain. He throws a flood of light upon the manners and ideas of his own age; he sometimes comments with surprising shrewdness upon the broader aspects and tendencies of history. His narrative breaks off in the middle of 1141, though he added some finishing touches in 1142.

The *Historia ecclesiastica* falls into three sections. (1) Bks. i., ii., which are historically valueless, give the history of Christianity from the birth of Christ. After 853 this becomes a bare catalogue of popes, ending with the name of Innocent I. These books were added, as an afterthought, to the original scheme; they were composed in the years 1136-1141. (2) Bks. iii.-vi. form a history of St. Evroul, the original nucleus of the work. Planned before 1122, they were mainly composed in the years 1123-1131. The fourth and fifth books contain long digressions on the deeds of William the Conqueror in Normandy and England. Before 1067 these are of little value, being chiefly derived from two extant sources, William of Jumièges' *Historia Normannorum* and William of Poitiers' *Gesta Guilelmi*. For the years 1067-1071 Orderic follows the last portion of the *Gesta Guilelmi*; hence this is of the first importance. From 1071 he begins to be an independent authority. But his notices of political events in this part of his work are far less copious than in (3) Bks. vii.-xiii., where ecclesiastical affairs are relegated to the background. In this section, after sketching the history of France under the Carolingians and early Capets, Orderic takes up the events of his own times, starting from about 1082. He has much to say concerning the empire, the papacy, the Normans in Italy and Apulia, the First Crusade (for which he follows Fulcher of Chartres and Baudri of Bourgueil). But his chief interest is in the histories of Duke Robert of Normandy, William Rufus and Henry I. He continues his work, in the form of annals, up to the defeat of Stephen at Lincoln in 1141.

The *Historia ecclesiastica* was edited by Duchesne in his *Historia Normannorum scriptores* (Paris, 1619). This is the edition cited by Freeman and in many standard works. It is, however, inferior to that of A. le Prévost in five vols. (*Soc. de l'histoire de France*, Paris, 1838-55). The fifth volume contains excellent critical studies by M. Leopold Delisle, and is admirably indexed. Migne's edition (*Patrologia latina*, clxxxviii.) is merely a reprint of Duchesne. There is a French translation (by L. Dubois) in Guizot's *Collection des mémoires relatifs à l'histoire de France* (Paris, 1825-1827); and one in English by T. Forester in Bohn's *Antiquarian Library* (4 vols., 1853-56). In addition to the *Historia* there exists, in the library at Rouen, a manuscript edition of William of Jumièges' *Historia*

Normannorum which Leopold Delisle assigns to Orderic. (See this critic's *Lettre à M. Jules Lair* [1873].) (H. W. C. D.; X.)

ORDER IN COUNCIL, in Great Britain, an order issued by the sovereign on the advice of the privy council, or more usually on the advice of a few selected members thereof. It is the modern equivalent of the mediaeval ordinance and of the proclamation so frequently used by the Tudor and Stuart sovereigns. In practice it is only issued on the advice of ministers of the Crown, who are, of course, responsible to parliament for their action in the matter. Orders in council were first issued during the 18th century, and their legality has sometimes been called in question. Consequently in several cases parliament has subsequently passed acts of indemnity to protect the persons responsible for issuing them, and incidentally to assert its own authority. At the present time the principle seems generally accepted that orders in council may be issued on the strength of the royal prerogative, but they must not seriously alter the law of the land.

The most celebrated instance of the use of orders in council was in 1807 when Great Britain was at war with France. Orders in council are used to regulate the matters which need immediate attention on the death of one sovereign and the accession of another.

In addition to these and other orders issued by the sovereign by virtue of his prerogative, there is another class of orders in council, viz., those issued by the authority of an Act of parliament, many of which provide thus for carrying out their provisions. At the present day orders in council are extensively used by the various administrative departments of the government, who act on the strength of powers conferred upon them by some Act of parliament. They are largely used for regulating the details of local government and matters concerning the navy and the army, while a new bishopric is sometimes founded by an order in council. They are also employed to regulate the affairs of the crown colonies, and the lord-lieutenant of Ireland, the viceroy of India, the governor-general of Canada, and other representatives of the sovereign may issue orders in council under certain conditions.

In times of emergency the use of orders in council is indispensable to the executive. The Regulation of the Forces Act 1871 empowers the government in a time of emergency to take possession of the railway system by the issue of such an order; and during the World War the use of orders in council was frequent.

ORDERS OF KNIGHTHOOD: see KNIGHTHOOD AND CHIVALRY.

ORDINANCE, in mediaeval England, a form of legislation. The ordinance differed from the statute because it did not require the sanction of parliament, but was issued by the sovereign by virtue of the royal prerogative, although, especially during the reign of Edward I., the king often obtained the assent of his council to his ordinances. Legislation by ordinance was common during the reigns of Henry III. and Edward I. when laws were issued by the king in council or enacted in parliament indifferently. Both were regarded as equally binding. In 1389 the Commons presented a petition to King Richard II. asking that no ordinance should be made contrary to the common law, or the ancient customs of the land, or the statutes ordained by parliament. For this and other reasons this form of legislation fell gradually into disuse, becoming obsolete in the 15th century. The modern equivalent of the ordinance is the order in council, but in the crown colonies legislation is both by orders in council and by local ordinance issued by the governor with the assent of his council (*q.v.*).

In the 17th century the use of the word ordinance was revived, and was applied to some of the measures passed by the Long Parliament, among them the famous Self-denying Ordinance of 1645.

ORDINANCE or **ORDONNANCE**, in architecture, a composition of some particular order or style; not restricted to columnar composition, the term applies to any kind of design which is subjected to conventional rules for its arrangement.

ORDINARY, in canon law, the name commonly employed to designate a superior ecclesiastic exercising "ordinary" jurisdiction (*iurisdictio ordinariam*), i.e., in accordance with the normal organization of the Church. It is usually applied to the bishop of a diocese and to those who exercise jurisdiction in the name of the bishop or by delegation of his functions. In English law,

however, the term ordinary is now confined to the bishop and the chancellor of his court. The pope is the *ordinarius* of the whole Roman Catholic Church, and is sometimes described as *ordinarius ordinariorum*. Similarly in the Church of England the king is legally the supreme ordinary, as the source of jurisdiction.

In England the only instance of the term ordinary being employed in its civil application was that of the office of judge ordinary created by the Divorce Act of 1857, a title which was, however, only in existence for about 18 years owing to the incorporation of the divorce court with the high court of justice by the Judicature Act, 1875. But in Scotland the ordinary judges of the inner and outer houses are called lords ordinary, the junior lord ordinary of the outer house acts as lord ordinary of the bills, the second junior as lord ordinary on teinds, the third junior as lord ordinary on exchequer causes. In the United States the ordinary possesses, in the States where such an officer exists, powers vested in him by the constitution and acts of the legislature identical with those usually vested in the courts of probate. In South Carolina he was a judicial officer, but the office no longer exists, as South Carolina has now a probate court.

ORDINATE: see CO-ORDINATES.

ORDNANCE, a general term for great guns for military and naval purposes, as opposed to "small arms" and their equipment; hence the term also includes miscellaneous stores under the control of the ordnance department as organized. In England the Master-General of the Ordnance, from Henry VIII.'s time, was head of a board, partly military, partly civil, which managed all affairs concerning the artillery, engineers and matériel of the army; this was abolished in 1855, its duties being distributed. The making of surveys and maps (*see* MAP) was, for instance, handed over eventually (1889) to the Board of Agriculture, though the term "ordnance survey" still shows the origin.

HISTORY

The invention of guns may be said to date from the first quarter of the 14th century. At this period gunpowder (*q.v.*), which had been known as an explosive for at least sixty years, appears to have been first used as a propellant. Although incendiary compounds and fire-projecting machines were known to the Greeks, Arabs and Chinese in very early times and were used on the sailing-galleys of Constantine Pogonatus in the year 673 for the destruction of enemy vessels, there is no good evidence that any explosive resembling gunpowder was discovered before the 13th century. Roger Bacon refers, in 1249, to such an explosive and may even have been its discoverer. Nothing is known of the man who first applied gunpowder to the projection of missiles for military purposes and the ascription of the invention of cannon to a German monk, Berthold Schwartz, has with good reason been discredited by reliable historians. The cannon was probably evolved at the beginning of the 14th century from some such engine as the *madfaa* referred to in an anonymous Arabic manuscript of that period. This *madfaa* seems to have

been a small wooden mortar-like instrument on the muzzle end of which a ball rested like an egg in an egg-cup until projected by the firing of the charge. Another primitive machine, from which an arrow-like bolt was shot, is illustrated in the Millemete ms. (1327). The bottle shape of this suggests the name "pot de fer" found in early records. (*See* fig. 1.) It is natural to suppose an evolution by which the narrow neck of this weapon was enlarged until the bottle became a straight tube and the arrow bolt was replaced by a ball. All the early guns were very small and were made of iron or cast bronze; they fired iron or lead balls and there is evidence of their general use in western Europe from about 1325 onwards. They are reported to have been used at a siege of Metz in 1324 and iron balls and metal cannon are mentioned in a Florentine document of 1326. John Barbour, writing in 1375, refers to the "crakys of war" used by Edward III. in

his Scottish campaign of 1327. The same king provided himself with cannon when he invaded France in 1346. Guns were carried in an English ship, the "Christopher of the Tower," as early as 1338 and a "pot de fer" is recorded to have been in one of the French vessels which attacked Southampton in that year. Guns were used in the English fleet at the battle of Sluys in 1340 and in a sea-fight between the Moors of Tunis and the Moorish King of Seville in 1350. The history of guns falls naturally into three epochs; the first being the smooth-bore era, from the 14th century to about 1845; the second, the evolutionary era from about 1845 to 1885; the third, the high velocity smokeless powder era from about 1885 onwards.

THE FIRST EPOCH (EARLY 14TH CENTURY TO 1845)

This period is marked by the use of smooth-bore weapons of low striking velocity. It is notable for the small progress made in five centuries of considerable warfare, beginning with the Hundred Years' War. Wrought iron pieces came largely into use in the latter part of the 14th century, owing, no doubt, to the difficulty of obtaining sufficiently sound metal castings for the bigger guns and to the high cost of copper. These guns were constructed of rods or bars which were beaten and welded together lengthwise and reinforced by iron rings clamped round the outside of the gun. This radically unsound form of construction survived during the 15th century notwithstanding many accidents, the most notable of which caused the death of King James II. of Scotland in 1460.

Stone balls came into general use for the larger pieces during the 14th century; such balls were cheaper than those of lead or iron and, being relatively much lighter, were better suited to the feeble guns of the period as these increased in size. Before the middle of the 15th century guns had developed from small weapons firing a 1 lb. or 2 lb. pellet to large "bombards" capable of throwing balls of 300, 400 and even 700 lb. weight. One of the most famous of these, Dulle Griete, the giant bombard of Ghent with a 25-inch calibre, was built as early as 1382. (See fig. 2.) Exceptionally large bombards were used by the Turks at the siege of Constantinople in 1453. The Turkish bombards were of cast bronze, but wrought iron construction was more general and is exemplified by Mons Meg, a 15th century gun now at Edinburgh Castle. It is noteworthy that many early guns were loaded from the breech end by a detachable chamber. (See fig. 3.) Another interesting feature of primitive gunnery was the common use of the *ribauld* or *ribauldequin* between 1350 and 1400. This was the prototype of the *mitrailleuse* and consisted of a number of small iron gun tubes clamped together in a bundle and fired in quick succession from the breech end, the whole being mounted on a wheeled carriage.

The art of casting improved in the latter part of the 15th century, though not introduced into England until 1521, and the large cast bronze guns of that time were often beautifully ornamented with renaissance workmanship. Cast iron shot came into use at the end of the 15th century and by the end of the 16th century stone shot only survived for use in *petrieros*, *slyngs*, *fowlers*, *murderers* and other relics of the preceding period. As cast iron shot displaced stone, its greater efficiency as a projectile tended to encourage the manufacture of a smaller and stronger type of gun and medium calibre muzzle-loading pieces, made first of forged iron and later of cast iron, came into use. These and cast brass weapons were developed steadily for field and naval service, whereas hitherto siege purposes had been the predominant consideration. It was not until the 17th century that cast iron muzzle-loading guns came into general use and they then continued as the principal weapons ashore and afloat until the end of the epoch. The improvement in the composition and

strength of gunpowder after the introduction of "corned" gunpowder about 1450 had long made these stronger weapons a requirement. The use of cast steel was tried during the 16th and 17th centuries, but was generally found objectionable and finally abandoned, the metallurgical ignorance of the time making it impossible to obtain sound castings.

*See Sir W. Monson's "Tracts" in Churchill's *Voyages*, iii.; "Archæologia," vi. 189, xi. 170, xiii. 27, etc. Tartaglia's "Three Books of Colloques," translated by Lucar (London, 1588); and S.P.Dom. Eliz. cxlii. 64. Hardly any two of these agree.

*Monson puts the length of the guns mentioned by him at 8 ft. 6 in.; but specimens still extant, dating from about his time, indicate that this was not always correct.

†"Cannon Pedro" was the English form of "*canon pierrier*," and means a gun primarily intended for throwing stone shot.

**I.e. couleuvrine—serpent. Compare Basilisk.

‡Named after the Saker hawk. Compare Falcon.

§In the grounds of the Seigneurie, Sark, is a well-preserved brass gun, apparently a falconet, 57 inches in length, and 1½ inches in calibre, bearing the following inscription:—"Don de sa Majesté la Royné Elizabeth au Seigneur de Sarcq, A.D. 1572."

The above table, taken from *The Royal Navy, A History* by Laird Clowes, vol. i., p. 410, shows the guns mounted in ships during Queen Elizabeth's reign.

FIG. 4.—32-POUNDER GUN. WORKING WITH REDUCED CREW OF NINE MEN

FROM H. GABBETT, "NAVAL GUNNERY"
FIG. 5.—32-POUNDER CARRONADE

A column has been added to this table, indicating the weapons in general use in the 17th and 18th centuries, with the classification in terms of the projectile's weight, which was carried out under Cromwell's government when a greater uniformity in the size of shot and in the clearance between the shot and the bore (windage) was demanded.

In the middle of the 18th century progress was made in ordnance by boring from a solid casting instead of relying on hollow casting; this resulted in greater uniformity of bore. Also a more scientific attitude to ballistics (*q.v.*) was adopted. This attitude was mainly due to Benjamin Robins, inventor of the ballistic pendulum, who in 1742 published an important work, *The New Principles of Gunnery*. A result of his research and

experiments was the introduction in 1779 of *carrenades*. These were light short weapons of various calibres from 6 to 68 pounders in which windage was greatly reduced. A contrast between this weapon on its ship's mounting and a gun of the same calibre on a truck carriage is shown in figs. 4 and 5. More attention was also paid to the shape and weight of guns in relation to the stresses to be borne and less to external ornament. Trunnions were placed near the axis of the gun instead of below it, thus lessening the stresses on the carriage.

Hollow shot filled with explosive or incendiary mixtures were used from mortars in the middle of the 16th century, but explosive shell did not come into general use for guns until early in the 19th century. Their advent sounded the death knell of the wooden warship and soon became an incentive to the development of steel through the impetus given to the production of protective armour. The 65 cwt. 8 in. shell gun was introduced into the British Navy after 1838 and took the place of the 32 pounder as the lower deck armament in line of battle ships and the main deck armament of frigates. The gun was 9 ft. long and fired a 56 lb. shell. It formed the principal armament of H.M.S. "Marlborough" as late as 1860.

THE SECOND EPOCH (1845-1885)

This may be described as the "evolutionary era." It is notable for the great advance made in a short period through the introduction of rifling for cannon and of a "built-up" construction involving shrinkage, resulting in medium velocity weapons firing elongated projectiles of considerable penetrative power. This epoch embraced the Russian, American Civil and Franco-Prussian Wars. These contributed to the remarkable developments in ordnance, revived the armament firms of Europe that had gone into obscurity since the Napoleonic Wars, particularly Krupp (Germany) and Schneider (France), and brought others into being, notably Armstrong Whitworth (Britain). The progress in mechanics and engineering of this industrial era, which included the introduction of the Bessemer and Siemens open-hearth method of making steel, was reflected in the advance in gun mechanisms, in recoil appliances and in the application of power to the working of guns. The inventive genius of the time was particularly exemplified by the production of machine guns and automatic guns.

Introduction of Rifling.—The introduction of rifling owes much to Benjamin Robins who, in 1747, wrote: "Whatever state shall thoroughly comprehend the nature and advantage of rifled barrel pieces and . . . shall introduce into their armies their general use . . . will by this means acquire a superiority which will almost equal any thing that has been done at any time by the particular excellence of any one kind of arms."

Rifling, by imparting a spin to the projectile as it travels along the spiral grooves in the bore, permits of the use of an elongated projectile and ensures its flight point first, which greatly increases accuracy. The longer projectile being heavier than round shot has a greater striking energy for the same muzzle velocity. The shape of the head can be designed to reduce air resistance, thereby increasing range. Though Robins was probably the first to give reasons based on sound principles why rifling was desirable, the fact that it was helpful in external ballistics had been appreciated since the early 16th century and a barrel exists at Woolwich, dated 1542, which is rifled with six fine spiral grooves. Straight grooving was applied to firearms (muskets) as early as 1480 and this practice of grooving the bore of a musket without any twist was extensively used during the 16th century. Probably rifling evolved from the early observation of the action of the feathers on an arrow and from the practical experience of cutting channels in a musket, originally to reduce fouling, being found beneficial to the weapon's accuracy. Towards the end of the 18th century the importance of rifled small arms and their necessity had been appreciated. The War of Independence contributed to this result; the Americans early realised the value of the rifled musket. Elongated bullets, however, did not begin to replace spherical until 1838. It was not until a hundred years after Robins' experiments that any attempt to rifle guns was successful. In 1846 a Sardinian officer, Major Cavalli, and a Swedish officer, Baron Wahrendorff,

both independently produced breech-loading rifled iron guns. The Cavalli gun had two grooves cut separately along the bore on opposite diameters, in which two projections, $\frac{1}{4}$ -inch deep, on the 69 lb. cylindro-conical projectile, engaged. Promising results were obtained with both guns, though they were of a somewhat weak construction.

About the same time Charles Lancaster endeavoured to rotate projectiles by giving the gun an elliptical bore of small eccentricity, the spiral increased gradually towards the muzzle, and rotation was effected through rifling "surfaces" instead of by grooves. Guns rifled on this principle were used in gunboats during the Crimean War, but were not a success. An improved form of this principle of rifling was adopted by Joseph Whitworth a few years later. The advantages of an elongated rotating projectile both in range and penetrative properties were now thoroughly established. The muzzle velocity of guns during the last 100 years of the 1st epoch compared favourably with that of the earlier rifled guns; the elongated projectiles of the latter however lost their velocity slowly whereas the smooth bore round shot lost velocity so rapidly that at 2,000 yards' range the striking velocity has only about one third of the muzzle velocity.

Introduction of Shrinkage Construction.—The idea of reinforcing cast iron or bronze guns to reduce the number of accidents with cast pieces had been under investigation from time to time. In 1833 a gun was produced by M. Thiery (France), by whom the virtue of shrinking on hoops was to some extent appreciated. The interior of the gun was made of cast iron, and this was encased in a longitudinal armature of wrought iron bars, which were further reinforced by wrought iron hoops shrunk on.

In 1855 W. G. Armstrong (afterwards Lord Armstrong, *q.v.*) designed a rifled breech-loading gun embodying so many considerable improvements as to be in effect revolutionary. The main feature of the construction was the introduction of hoops and tubes formed by wrought iron bars, which were coiled hot on a mandril and welded into a closed helix, the fibre of the wrought iron running in the direction most suitable for circumferential strength. Longitudinal strength was obtained by a forged hollow breech piece. These helical cylinders were shrunk over a steel tube or liner in the original Armstrong gun. In later construction the steel tube was replaced by a wrought iron helical tube (see fig. 6). The gun was rifled with a large number of grooves and fired lead-coated projectiles, thus eliminating windage; breech-loading was effected by a powerful screw holding a sliding vent-piece tightly against the face of the breech.

Various types of guns, having a built-up form of construction involving shrunk hoops, were produced about the same period as the Armstrong gun, notably Chambers gun (United States, 1849); Treadwell gun (United States, 1855); Blakely gun (Britain,

FIG. 6.—ORDNANCE WROUGHT FROM IRON H.B.L., 40 PR. 35 CWT. MARK I

1855); Parrot gun (United States, 1861). Many rival claims to originality were made after the success of the Armstrong gun, but its superiority was due more to the manner in which the difficulties of manufacture were overcome than to the introduction of new principles. In Britain the gun which competed most successfully with the Armstrong gun was that produced by Whitworth. This distinguished engineer had already become prominent for improvements effected by him in the Enfield rifle. He designed a steel gun of a hoop form of construction which was principally remarkable for the accuracy of its manufacture. Reliance was not

placed on heat shrinkage, but the tension and compression effect was produced by building the members under hydraulic pressure, forcing a slightly larger tube into a cylinder. The improvement in technique of construction owes much to the methods adopted and great accuracy of workmanship insisted on by this scientific engineer, who was also a pioneer in the heat treatment of steel forgings which was later to play such an important part in the strength of guns. Oil-hardening of steel tubes and subsequent tempering came into practice about 1863.

Another gun of this period (1855-63) which calls for mention is the Krupp steel breech-loading monobloc gun which owed its strength to the good quality crucible steel used. A feature of this gun was the breech mechanism which proved more efficient and safer than that introduced by Armstrong. Its general principles have survived in the modern quick-firing Krupp guns of built-up

FIG. 7.—TYPICAL GUNS ILLUSTRATING ADVANCE IN CONSTRUCTION

hoop construction. The British guns of the period 1855-63 were mainly rifled breech-loading guns, designated R.B.L., but in 1864 after repeated experiments and in view of failures and accidents due to defects in breech mechanism, Great Britain reverted to muzzle-loading guns. These were rifled and designated R.M.L. (See fig. 7, A.) Many smooth-bore guns were converted on Sir William Palliser's system by enlarging the bore of the cast iron gun and inserting a rifled barrel of coiled wrought iron. Having reverted to a muzzle-loading policy, Great Britain adhered to it for several years longer than the other great powers, thus falling behind them in efficiency of armament. But in 1880, after a serious accident caused by the inadvertent double-loading of one of H.M.S. "Thunderer's" guns in the previous year, the adoption of an improved system of breech-loading was decided on. Towards the end of the epoch, the advantage of steel as a material for guns was more clearly appreciated as the former difficulties in forging large masses were overcome. Steel hoops were preferred to either steel or wrought iron coils and by 1885 steel tubes were replacing hoops in British construction.

Recoil Appliances.—During this epoch the progress in recoil appliances was remarkable. With the increased power of guns and the greater recoil energy involved by the use of rifling and low windage projectiles it became essential to devise means of limiting the recoil, especially in ships' guns. This had to be done by more effective methods than those hitherto used of surface friction, skids, inclined planes or rope breechings. The "compressor," which now replaced these, consisted of friction plates capable of being set up or released as necessary for firing or subsequent running out. Before the end of the epoch recoil cylinders were introduced in the mounting. In these the recoil is overcome through the resistance offered by a liquid contained in the cylinder to the passage of a piston attached to the gun. The liquid passes through a hole or port in the piston head, the size of the port being controlled by a valve key fitted to the cylinder. The recoil pressure can thus be suitably regulated.

Machine Guns.—Before the end of the epoch the energy of recoil had been applied, in particular by the inventive genius of Hiram Maxim, to automatic guns, i.e., guns in which some of the recoil energy was employed in the work of reloading the gun. After the introduction of the French *mitrailleuse* in 1870, other inventors of the time, notably Gatling, Gardner and Nordenfeldt, had produced machine-guns of increasing effectiveness.

THE THIRD EPOCH (1885 TO THE PRESENT DAY)

This period may be distinguished as the steel era of high velocity guns. The epoch begins with the advent of smokeless propellents (cordite, *q.v.*). The much greater gas yield efficiency of these permitted of lighter charges or higher velocities and required longer and stronger guns for the suitable combustion of the slower burning high pressure powders. (The 68-pounder

FIG. 8.—6-INCH STEEL GUN SHOWING CONSTRUCTION

was fired with 18 lb. of gun powder and gave a muzzle velocity of 1,100 f.s., whereas the 100 lb. projectile fired with 14½ lb. of cordite had a muzzle velocity of 2,630 f.s.) By 1890 nitro cellulose and nitro-glycerine powders (so-called, but in the usual form cords or small cylinders) had generally replaced gun powder in the ordnance of all first class powers. The ordnance developments of this epoch are as remarkable as those of the preceding one, but the advances have been due to the great progress in metallurgical knowledge and practice, in engineering science, and in the technique of construction, rather than to radical innovations such as those for which the previous epoch was conspicuous. This era is notable for the steady advance in the power of guns through the increase in calibre and hence in the weight of the projectile, and increase in muzzle velocity; also for the development in automatic machine guns and semi-automatic quick-firing guns.

Q.F. and B.L. Guns.—The quick-firing (Q.F.) gun is distinguished from the breech-loading (B.L.) gun by the method adopted for obturation or sealing the gases at the breech end. In a B.L. gun this is effected by some feature of the breech mechanism, such as a pad or ring which expands against a seating in the bore of the gun under the pressure of firing. The charge being in a bag such guns are called "bag guns" in U.S.A. In the Q.F. gun obturation is effected, as in a rifle and shot gun, by the expansion of the metal cartridge case which contains the propellant. Such guns are called "case guns" in the U.S.A. If the projectile is attached to the cartridge case, forming one loading unit, the ammunition is called "fixed" to distinguish it from the "separate" type.

All Steel or Wire Construction.—Between 1885 and 1890 "all steel" rifled B.L. and Q.F. guns of considerable length came into general use. They were of built-up construction, steel tubes and hoops being shrunk on at suitably calculated shrinkages. (See fig. 8.) Since 1890, wire wound guns (see fig. 9) have come into use in many countries, particularly Great Britain, Italy and Japan.

FIG. 9.—15-INCH WIRE WOUND GUN SHOWING CONSTRUCTION

Various systems of wire construction had already been put forward during the preceding epoch.

It is noteworthy that Germany adhered throughout to an "all steel" construction and preferred a Q.F. mechanism for all natures of guns. In the Krupp gun of medium and heavy calibre a hoop form of construction is used in preference to tubes. Since the World War an "all steel" construction for medium calibre guns is more general in view of the greatly improved properties of high grade alloy steels. For smaller guns a monobloc form of construction is sometimes preferred, owing to the success of a

cold forging (auto-fretage) process which results in an economical and rapid production of light guns capable of sustaining high pressures. The post-war progress in ordnance has been marked by greater efficiency and simplicity in both the design of the gun and in the mechanism.

GUN CONSTRUCTION

In the early days of ordnance, gunnery was in the realm of the magic arts. It was not until the sixteenth century that it was treated in a scientific spirit by Niccolo Tartaglia. Later Benjamin Robins advanced the study, but results of his research and experiment were not fully applied until the evolutionary epoch, when gunnery passed into the realm of science.

DESIGN CONSIDERATIONS

During the twentieth century much attention has been devoted not only to the structure of the gun, but to its interior design to obtain improved ballistics, so that higher efficiency and greater accuracy might be achieved. The nature and form of rifling, the size and form of chamber, the character (particularly in regard to regularity in combustion and freedom from age deterioration), weight and form (size) of the propellant are matters for research and experiment in which progress still continues to be made. Four important general requirements of a gun are (1) high muzzle velocity; (2) accuracy; (3) good life; (4) rapidity of fire. The relative importance of these depends on the special conditions for which the gun is required. All affect the prospects of hard and frequent hitting which are the main desiderata.

High Muzzle Velocity.—This depends on the pressure developed during the projectile's passage down the bore and the distance through which this pressure acts, and the frictional resistance encountered by the projectile. Limitations in maximum pressure are decided by the strength of the steel of which the gun is constructed, and to some extent by the pressure that can be withstood by the weakest type of shell that the gun is required to fire, such as large capacity high explosive shell. In modern guns this maximum pressure rarely exceeds 22 tons per square inch. Limitations are imposed on the length of the gun by the circumstances of its use, such as considerations of weight and the stresses produced on the mounting or structure which carries it; by requirements in regard to the position of the centre of gravity; and by the amount of deflection or gravitational droop which is permissible in the unsupported chase of the gun. Modern guns are generally between 45 and 55 calibres in length, that is, the length of the bore and chamber of a 50 calibre 6-inch gun is 25 feet. (In some countries the overall length of the gun is referred to.)

Accuracy.—This depends upon the uniformity of pressure and of friction for successive rounds and on the stiffness of the gun structure. Both pressure and friction are affected by the wear which they occasion in the bore and chamber. The wear increases the size of the chamber by allowing the projectile to seat further forward and affects the frictional resistance to the driving band of the projectile and possibly the efficiency of the

gas seal. Uniformity of pressure is also affected by the suitability of the size of chamber and charge used.

Good Life.—This depends on a slow rate of erosion in relation to rounds fired. As the time down the bore is a fraction of a second the actual working life of a heavy gun that could fire 300 rounds is only a few seconds. Erosion is principally "wear" which is a washing away of the surface of the bore, particularly at the commencement of the rifling, by the high temperature and velocity of the gases. This temperature and velocity depend for a given propellant on the rate of combustion, which again is decided by the size of chamber and the weight and form of the charge. The rate of erosion is also affected by the friction of the projectile, which depends on the nature of rifling, type of driving band, and efficiency of centring and seating the projectile and of sealing the gases. Bad sealing results in "scoring."

Rapidity of Fire.—This depends on the efficiency of the mechanism for operating the breech and for absorbing the recoil and replacing the gun in the firing position, and on the loading arrangements. It is of importance that the gun should be kept as cool as possible under rapid fire conditions, particularly in view of the exposure of the charge in the chamber during load-

FIG. 10.—DIAGRAM SHOWING SPACE PRESSURE CURVE FOR TWO CHAMBERS OF DIFFERENT SIZE, GIVING SAME MUZZLE VELOCITY

ing, which also necessitates provision for extinguishing all smouldering residue.

Size of Chamber.—The designer being given a required muzzle velocity and length of gun and a limiting maximum pressure, is confronted with the problem of deciding the most suitable size of chamber. A gun may be viewed as a single stroke internal combustion engine, the piston of which, represented by the projectile, is blown through the open end of the cylinder at each stroke, after being rotated by the rifled walls of the cylinder. The latter engage in the copper driving band, which also serves as a piston packing ring and seals the gases. The same muzzle velocity and maximum pressure can be obtained in the same length of

gun by chambers of different capacity, provided suitable variations are made in the weight and form of the charge. Different sizes of chambers are favoured by different nations; the point is important as it has a direct bearing on the accuracy or regularity of the gun. By means of internal ballistic calculations based on theory and supported by data obtained from experiments with gases in closed vessels, pressure curves can be produced for different sizes of chamber and weight and form of charge. The form of charge or size of the elements of which it is composed, affects through the surface exposed, the rate of burning.

In the diagram (fig. 10) the pressure developed along the bore is given for two different chambers with charges adjusted to give the same maximum pressure and muzzle velocity. In the case of the smaller chamber, the weight of charge is less, but it occupies a relatively larger volume of its chamber and this increase in the "density of loading" results in a more rapid rate of combustion through the greater confinement of the gases. This is modified to some extent by the lighter charge being composed of individual cords or elements of larger size, thereby exposing less surface to the igniting gases and tending to reduce the rate of burning. Features of importance in these pressure curves are the position of maximum pressure in the bore and the extent of the muzzle pressure. Both these features affect the position of the gun's centre of gravity as the pressure curve is reflected in the thickness of the gun walls. At first sight it would appear that all the advantages are with the lighter charge giving the lower forward pressure, which reduces the muzzle vibration and, in combination with the earlier maximum pressure, brings the centre of gravity towards the breech end, but consideration must be given to the effects on the muzzle velocity of usage and of small variations incidental to the gun, the charge and the projectile. The smaller chambered gun is naturally more sensitive to such changes and its regularity in muzzle velocity may be inferior. The life of such a gun may be shorter through loss in accuracy, though the measured wear or enlargement of bore be less than with the larger chambered gun.

The regularity in the muzzle velocity from round to round is an important characteristic of a gun and generally defines the minimum size of chamber and weight of charge. The "form" of the chamber as opposed to its capacity is to some extent influenced (particularly at the forward end) by the type of driving band fitted to the projectiles, and this also affects the character of the rifling. The form of chamber and shot seating is responsible for the centring of the projectile and its initial steadiness which are of importance as affecting both accuracy and wear. Generally modern gun chambers are of medium capacity obtained by length rather than width and with small changes in section.

FUNDAMENTAL PRINCIPLES

During the evolutionary epoch the value of shrinking tubes or hoops over each other to obtain increased circumferential strength in a gun had gradually emerged and been confirmed by experience. It was appreciated that in a monobloc gun such as the cast-iron gun of the early 19th century there was a limit to the increase of

circumferential strength obtained by increasing the thickness of the material (this limit is practically reached when the thickness of the gun walls equals the radius of the bore). Towards the end of the first epoch, Thomas Barlow had shown that the stresses produced by pressure in a cylinder are greatest on the interior surface and diminish in a ratio affected by the square of the distance from the centre to the exterior. Thus, as the thickness of a cylinder increases, the value of the material towards the exterior rapidly diminishes.

Basic Law.—It was further realised that the bore of the gun must not be permanently expanded on firing, in other words, that *the gun must work elastically* and in no circumstances must any of the material be permanently strained (stressed beyond its elastic limit). This is the basic law of gun construction. Steel has a certain elastic range, depending on its quality, both under tension and under compression stress. Thus if it is put in a state of compression it will have an increased elastic range for subsequent tension stresses. The principle of initial tension or compression is the principle of making use of the compressive as well as the extensive elasticity of material such as steel. Initial compression is generally obtained by shrinking one tube on another. This produces compressive stresses in the inner tube at the expense of tension stresses in the outer. The theoretically ideal gun would be one in which the circumferential stresses produced on firing were uniform throughout the thickness of the walls. Such a gun would be in initial tension on the exterior gradually passing to compression in the interior, and on firing, all parts of the gun would be equally stressed circumferentially. This ideal effect can be partially achieved by shrinking a series of thin tubes or hoops over each other.

Wire Winding.—The effect can be more nearly reached through a definite section of the gun by winding wire at varying tensions for successive layers. It can be still more completely achieved in a monobloc steel gun by the cold forging process, sometimes known as "auto-frettage."

Auto-frettage.—This process takes advantage of Barlow's law and by the application of fluid pressure to the bore of the gun or tube permanent expansion is produced through overstraining the inner layers of the material. The pressure is so controlled, however, as not to overstrain the outer layers which remain stressed within the elastic limit. After removal of the pressure the inner layers do not return to their original form, and the outer layers therefore remain in a state of tension and act compressively on the inner. This condition is stabilised by "ageing" the metal by suitable mild heat treatment.

THEORY OF GUN CONSTRUCTION

The important effect already noted is that the shrinkage pressure produces circumferential compression on the inside tube at the expense of circumferential tension in the outside tube. This opposes the radial pressure and circumferential tension which result from radial powder pressure in the bore of the gun.

Circumferential Strength.—A theory of gun construction, which is based on Barlow's law and has stood the test of

experience, is known as Lamé's theory. It relates the radial powder and shrinkage pressures to the induced tensions and compressions with respect to the internal and external radii of the tubes concerned. This relation is known as the gunmaker's formula, and it enables the designer to calculate pressures, tensions or compressions in any position in the walls of the gun both when the gun is in repose, and only affected by shrinkages, and also when it is firing and affected by both shrinkages and powder bore pressures. A design can thus be produced giving the necessary thickness of tubes and degree of shrinkage estimated as of suitable circumferential strength not only to resist fracture longitudinally, but to avoid straining any of the material beyond the elastic limit. Several theories of construction are followed, but in all certain assumptions are made, particularly in regard to the mutual effects of stresses in different directions. To cover any inaccuracies in calculation due to these and to ensure a margin of security in the use of the gun, a suitable safety factor is allowed. The gun is generally designed to stand pressures ranging from twice the normal pressure experienced at the muzzle end to one and a half times at the breech end.

Longitudinal Strength.—Provision must also be made for suitable longitudinal strength in the gun to meet the stresses produced by the pressure of gases on the face of the breech block and on the base of the projectile, forces which stress the material in a direction tending to produce circumferential rupture. Minor longitudinal stresses are also brought into play by the resisting action of the recoil brake. The maximum bore pressure is considered fully effective on the breech surface exposed and it is necessary to distribute the stresses as far as possible to the other members of the gun. This is done in an all-steel gun with a screw breech mechanism through the medium of a screwed breech bush in which the threads of the breech screw engage, while in a gun with a sliding breech mechanism the direct thrust brought on the surface of the sliding block is transmitted to the breech ring and so to the other hoops or tubes which are connected longitudinally by means of shoulders. In a wired gun, the arrangement at the breech end must be such as to connect the tubes inside the wire with those outside, since the wire itself is incapable of contributing in any way to the longitudinal strength of the gun.

Girder Strength.—In addition to the longitudinal and circumferential strength, the gun is required to have a certain degree of girder strength so that the gravitational deflection is kept as small as possible. The gun resting in its mounting may be regarded as a beam supported at a certain distance from one end and its girder strength depends on the rigidity with which the various parts are connected. In a wired gun the wire makes no contribution to this strength, which is therefore dependent upon the tubes and the means taken to connect them rigidly in place.

MANUFACTURE

The design of a post-World War all-steel British gun is shown in fig. 9. This gun is fitted with an inner "A" tube or liner so that when the rifling is considerably worn the gun may be economically repaired by introducing a new liner in place of the old one. (This arrangement is very general but not universal as some guns, usually those of small calibre, have no liners and are repaired by replacing the entire "A" tube.) The liners are usually tapered on the exterior and are driven in to the tapered bore of the outer "A" tube by hydraulic pressure or other suitable means so that when in place there is a certain shrinkage pressure operating. In medium calibre guns, since the World War, "loose" liners have also been tried, i.e., liners with a small clearance or air space. Such liners are necessarily of high quality steel with a large elastic range so that when they temporarily expand on firing they receive support from the walls of the gun before they have been strained beyond their elastic limit. The material of the liner contracts to its original dimensions after firing and is easily removable. The liner is keyed at the ends to prevent rotation under the action of the projectile and is shouldered at the rear end to prevent forward movement. Such a system of ready repair has obvious advantages in connection with guns which wear out rapidly or which, like anti-aircraft guns, are subject to very considerable use in a

short space of time. The repair is of such a simple nature that it can be effected without dismounting the gun. The "B" tube, the jacket and the breech ring are built by shrinkage, which is effected by machining the internal diameter of the tube to be built to a smaller diameter than the surface on which it is built. The difference in diameters must be such as will give the required compression and must permit of sufficient expansion for building at a temperature below that which could affect the temper of the material. Sudden changes in the section of tubes are avoided to obviate longitudinal weakness and to prevent difficulties in building through the thinner section of the tube cooling more rapidly than the thicker and possibly seizing before properly in place. In all guns the aim is to relieve from all longitudinal stress the metal which bears the brunt of the circumferential stress. Consequently, the breech bush is free from the liner and attached to the "A" tube.

Material.—All gun body members are made of steel (*q.v.*) of a specified chemical composition and physical properties. The more important tubes are usually of a high grade alloy steel, the essential physical property being a high yield point to give a good elastic range. The British specification requires the steel to be made by the acid open-hearth process to ensure the pure quality of the ingredients. The steel is cast as an ingot which in the case of large forgings may weigh 100 tons or more. There is a large discard from the top and a small discard from the bottom of the ingot and the core is removed by trepanning before or after shaping up the ingot into a billet.

Forging.—The material is then forged under a hydraulic press on a water-cooled mandrel in a series of heats to draw it into a tube of the required dimensions. In this forging operation the length may be increased five times and the diameter halved. The forging, after straightening and rough machining, is normalized or annealed in a furnace to remove the forging stresses. Oil hardening is then carried out by heating the forging to a suitable degree and immersing it in oil, after which it is tempered as necessary and the required properties are tested mechanically by breaking and bending test pieces taken from the two ends of the tube.

Building and Wiring.—The tubes are machined to the finished dimensions for building, the exterior of an inner tube being turned to conform to the measurements given by the bored interior of the corresponding outer tube, allowing for the design shrinkages. The outer tube is heated sufficiently to obtain the necessary clearance by expansion and is then lowered over the inner tube or gun which is placed vertically in a pit for this purpose and kept cool by water running through the bore. As soon as the outer tube is properly in place, that is, the rear or building shoulder is in contact, it is rapidly cooled from this shoulder which is near the breech end by the application of water. This cooling requires careful control to prevent the tube seizing at any forward position. The forward portion is kept heated by gas rings, which are gradually withdrawn as the cooling proceeds, and the water moves up the exterior of the tube, thus ensuring that the tube is held or drawn towards the breech end throughout the shrinking operation. In the case of a wire wound gun, after insertion of the liner or inner "A" tube, which is slightly conical and a driven fit, the rear end of the "A" tube is threaded inside to take the breech bush (see fig. 9). A stepped collar is shrunk over the rear end of the "A" tube. This reinforces the breech bush and forms the connecting link between the "A" tube and jacket through the medium of the breech ring so that the longitudinal stresses can be suitably distributed. The muzzle stop ring is shrunk over the muzzle of the "A" tube. This ring forms the front support for the wire which is wound over the "A" tube. The wire consists of a steel ribbon $\frac{1}{4}$ in. wide and .06 in. thick. The breaking strength of this material is over 100 tons per square inch and all the wire used is, previous to winding, subjected to a very severe load to ensure that it is perfectly sound. The fact that wire can be so tested throughout is a great merit of this form of construction. It is wound on the gun in a continuous length, the number of turns varying in the case of a 15 in. gun from 20 at the muzzle end to 79 at the breech. Approximately 22 tons of

wire, about 186 miles in length, are required for such a gun. The winding tension is such as to produce the required design tension after completing the winding operation, allowance being made for the effects of subsequent layers of wire on those already wound. This tension is controlled during winding by a readily adjustable friction brake. On completion of the wiring, the external layer of wire is turned with a fine cut to obtain a good building surface for the "B" tube and jacket which are shrunk on. The breech ring is finally screwed and shrunk on. The exterior of the gun is finish machined and the bore and chamber are bored and lapped to size.

Rifling.—The gun is then rifled: the spiral grooves are cut by a special machine, several grooves being cut at the same time, to the required depth and form. The number of grooves, their depth and general form and the relative width of the groove and land (intervening bore surface) vary considerably in different guns. The general form of groove is one of plain section in which the width of "land" is approximately half the width of the groove (see fig. 12 which contrasts different and earlier types of rifling). The twist of rifling is generally uniform, one turn occurring in a length of 30 calibres, but increasing twist is also used and a combination of increasing and uniform twist. A typical modern form of driving band is also illustrated. It has three functions to perform:—(1) To rotate the projectile. (2) To act as a gas seal and so prevent the bore of the gun being scored or guttered by gas escaping over the projectile, which would result in irregularity in the muzzle velocity. (3) To hold the projectile at any elevation after loading so that it does not slip back into the chamber, and to ensure that a certain pressure is generated before the projectile starts to travel.

The copper of the driving band is engraved and pressed by the lands into the grooves as the projectile proceeds. To avoid copper deposition in the bore, which would reduce its diameter and affect the form of grooves, tinfoil is combined with the propellant.

BREECH MECHANISM

A breech mechanism is a mechanical device for closing the rear end of the chamber of a gun. It includes the mechanism for firing the gun, and safety arrangements for preventing the gun from being fired before the breech is fully locked. It also embraces the necessary operating gear which may be "hand" or "power." If the latter, "hand" alternative is generally provided which can be readily connected or clutched in. The chief requirement is safety, with ease and rapidity of operation. Two main types of mechanism prevail:—(1) The "screw plug" with interrupted threads, held in a carrier hinged to the gun, so that the action is a swinging and rotating one. This "swinging" type may be used for both B.L. and Q.F. guns. (2) The vertical or horizontal sliding wedge shaped block, travelling in a mortice across the rear face of the gun. This "sliding" type is only suitable for a Q.F. gun. Other types are:—The sliding and rotary combination, the rotating eccentric block and the sliding bolt. Certain automatic and machine guns employ a "breech action" in which the operations of opening, extracting, reloading and closing are effected by the recoil and counter-recoil motion augmented by springs.

B.L. Mechanism.—For B.L. guns (in which the charge is bagged) the breech screw is fitted with an obturator for sealing the escape of gas to the rear. It requires a channel or vent to convey the flash from the tube to the charge to fire the gun.

The illustrations (figs. 13 and 14) of an Asbury "hand" and "power" mechanism show an example of a modern screw plug type. The screw is of the Welin form, an arrangement in which the surface is divided circumferentially into a number of segments of different radii. The number of plain segments is less than half the total number, thus giving an increased bearing surface compared with a plain cylindrical screw with interrupted threads. The Welin compared with the cylindrical screw allows of equal strength with a reduced length and weight of screw. The reduced length enables the screw to be swung into the breech opening instead of having to be first swung and then entered in a separate movement. Direct swing entry can also be obtained by a breech screw in which the rear portion is cylindrical and the front conical.

Obturation.—The obturator, fitted at the front end of the block and carried on the vent axial bolt, known as the De Bange system, comprises a plastic gas check pad between two steel discs. The pad is statically compressed in manufacture, which gives it semi-elastic properties. It readily conforms to any irregularities in the coned annular seating at the rear end of the gun chamber. The obturator is seated on the closing of the breech with a moderate initial pressure which can be adjusted by discs

FIG. 12.—FORMS OF RIFLING

FIGS. 13 AND 14.—SECTION DETAILS OF BREECH MECHANISM FOR NAVAL ORDNANCE PIECE

behind the pad and which is obtained by the forward movement of the screw on turning. Its gas-sealing efficiency is due to the heavy firing pressure which tends to reduce the thickness of the pad and increase its diameter. The sealing action may therefore be described as due to *compression* as opposed to the sealing action of the metal case in a Q.F. gun which is due to *expansion*. Features of this mechanism are:—(a) The single motion action. The one direction movement of the rack (operated by "hand" or "power") performs both the swinging and rotation required. The system of levers for revolving the breech screw are locked

during the swinging operation and do not come into action until the mechanism has swung clear of the steel segment shown in fig. 15. (b) The momentum of swinging is converted into momentum of rotation through roller on the screw engaging with a cam path on the face of the gun, thereby preventing rebound effects.

Q.F. Mechanism.—In Q.F. guns (in which the charge is in a metal case) the sealing is effected by the expansion of the case

FIG. 15.—Q.F. SLIDING BLOCK FOR SEMI-AUTOMATIC GUN SHOWING ELECTRIC RELEASE OF PERCUSSION FIRING GEAR

and is thus independent of the breech mechanism, which in such circumstances includes extractors for withdrawing the case during the operation of opening the breech.

Sliding Q.F. Mechanism.—The illustrations give an idea of the sliding mechanism used for semi-automatic Q.F. guns of medium calibre. The block which contains the firing mechanism is worked in a wedge-shaped mortise in the breech ring either by hand or automatically. The automatic action of opening the breech and ejecting the case is effected as the gun runs out by a pawl fitted to the mounting engaging a cam connected to the breech block. When rotation has been given to the cam sufficient to open the breech block to the full extent the pawl is thrown off. The opening movement of the block operates extractors which withdraw and eject the empty cartridge case. The extractors hold the block open until the rim of the live cartridge case trips them on reloading, thereby freeing the block which closes under the action of a spring.

Firing Mechanism.—In Q.F. guns the electric or percussion tube or primer is carried in the cartridge case and the breech mechanism is consequently simplified in so far as it is not required to provide for loading the tube. If an electric tube is used, contact is made with the head of the tube when the breech is fully closed and the gun is fired by the completion of an electric circuit, the current heating a platinum silver bridge within the tube and so igniting the surrounding composition, the flash thereby passing to the propellant. If a percussion tube is used, the firing is effected by a blow from the percussion striker exploding the cap in the tube. The striker may be a simple spring action firing pin cocked either by hand or automatically during the opening of the breech mechanism, and released by a trigger action. Percussion strikers may also be released electrically by means of an electro-magnet or solenoid, the movement of the armature operating the trigger, as in the illustration. In the case of B.L. mechanism, arrangement must be made for loading the tube which is inserted in the rear end of the vent axial. A novel method of ignition was adopted in the case of the long range German gun used for bombarding Paris during the World War. By surrounding the rear portion of the charge with gas, more efficient initiation of combustion was obtained.

Safety Arrangements.—In all firing arrangements safety features are introduced designed to prevent the gun from being fired before the breech is closed, and to ensure that the first action of opening the breech prevents the gun from being fired.

A very general method of effecting this is to leave a small idle movement in the breech mechanism operating gear (which also operates the firing mechanism). This movement is used to break or to make contact between the lock and the tube when firing electrically or to lock or unlock the percussion striker. The idle movement may perform another useful safety service in locking the breech mechanism gear thus making it impossible for the breech block to be forced open by the firing pressures.

MILITARY

Artillery (*q.v.*) as employed in land warfare has such a great variety of tasks to perform, that a modern army must necessarily be provided with many different types of artillery weapons. The calibre of these weapons ordinarily varies from about 3" to 15", although calibres outside these limits may be used for special purposes. The pieces themselves may be guns, howitzers or mortars, the name depending mainly on the length, and they are identical with naval ordnance (*q.v.*) as regards design, construction, and general characteristics, though mortars are generally of simplified construction.

General Requirements of a Land Service Artillery Equipment.—An equipment must in the first place provide a stable support for the gun for firing, and secondly, where mobility is required, it must act also as a support for travelling. In addition to these fundamental requirements means must be provided to enable the gun to move laterally, so that it can be readily aligned in any required direction ("Traverse"); to move vertically, so that the elevation required for any particular range may be obtained ("Elevation"); and to move axially when it recoils ("Recoil").

The Structure of a Land Service Equipment.—It is very convenient to consider an artillery equipment as consisting of a *basic structure* and a *superstructure*. The former is the support and the latter provides the necessary gears and instruments which enable the gunner to aim and fire his gun rapidly, accurately and easily. In general, the superstructure provides for traverse, elevation and recoil, and also carries the sights. It consists principally

8. Anti-aircraft battery of the U.S.S. "West Virginia" just before a salvo

of two components called the *carriage body* and the *cradle*.

The carriage body is pivoted to the basic structure so that it can turn in a plane more or less horizontal, and so enable the gun to be traversed to the right or left. It is anchored to the basic structure so that it cannot lift when the gun is fired. The cradle, which houses the recoil system, supports the gun on slides so that the latter may recoil and be returned to the firing position under the control of the recoil system. Small guns are provided with guide-ribs which engage the cradle guide-ways: in larger guns the guide-ribs are separate in the form of a slipper or sleigh to which the gun is secured, as in naval practice. The cradle is provided with trunnions which rest in bearings in the carriage body, so forming the horizontal axis about which the cradle, and so the gun, is elevated.

Traversing and Elevating Gears.—Except in the case of the fixed armament of a fortress, and certain other very special circumstances, power is neither available nor necessary for traversing and elevating land service equipments, and some form of hand operated gear is employed.

Where traverse is limited to a few degrees, as is usual in the case of the wheeled carriage, the traversing gear is generally of a simple nut and screw type, but where more traverse is obtainable, spur gearing in conjunction with a toothed arc is frequently used. The traversing gear is fitted between the carriage body and the basic structure, so that the necessary movement of the former is obtained. The elevating gear is placed between the cradle and carriage body and is generally of the arc and spur pinion type.

In all these gears, some form of self-locking device is necessary, so that there shall be no tendency for the gun to traverse or elevate of its own accord when fired.

The Recoil System.—The recoil system performs two functions: firstly it acts as a brake during recoil, bringing the recoiling gun to rest by absorbing the energy of recoil, and secondly, it returns the gun to the firing position after recoil has ceased. The braking action is supplied by an hydraulic buffer, and the gun is returned to the firing position by the "recuperator," in which either springs or air are compressed during recoil. At the end of recoil, the springs or air expand, so that the gun is forced back to the firing position. The compression of the springs or air in the recuperator assists the buffer in checking recoil.

The recuperator must initially be in a state of compression to prevent the gun slipping back in the cradle when elevated; and its action, moreover, must be controlled, otherwise the speed at which the gun is forced forwards would continually increase, and the gun would finally reach the firing position with such violence as to cause damage to the equipment. Although with pneumatic recuperators it is possible to embody a throttling device to control the action to a certain extent, the control is mainly provided by the buffer.

Many different buffer systems are in use on modern equipments: some are more suitable for short than for long recoil, and, generally speaking, these are the less complicated varieties. One designer or armament firm may favour one particular type of buffer while another will adopt some other system as standard. The chief merit of the *spring recuperator* lies in its simplicity, but the great overall length required prohibits its use on a modern long recoil carriage unless a telescopic system is employed: this, however, has inherent disadvantages and such systems do not work satisfactorily. Spring recuperators to-day are mainly confined to light short recoil equipments such as anti-aircraft guns, light coast artillery, and tank mountings. *Pneumatic recuperators* are complicated owing to the difficulty of preventing the escape of air at the high working pressures required; and for this reason a liquid system is always introduced, for liquid can be sealed satisfactorily at much higher pressures than air. The liquid may be included as an entirely separate sealing system, or it may be arranged so that the air is compressed through the medium of the liquid. In this case the recuperator is referred to as a "Hydropneumatic" system. This latter type is convenient for a long recoil carriage as it can more easily be arranged in a confined space than the pneumatic type. The latter type, however, does

not suffer from aeration of the liquid, which always causes erratic action.

Although the buffer and recuperator are usually entirely separate systems, designs exist in which they are combined. The well known French 75 mm. field carriage uses such a system, which is said to be very satisfactory. It is generally accepted that a combined system is more complicated, more expensive and more difficult to maintain in the field than separate systems.

Buffers of modern design are generally fitted with reservoirs which may feed the system either by gravity or pressure, in order that the buffer may be kept full of liquid. A partially empty buffer will cause erratic and violent action both during recoil and recuperation. Liquids used in recoil systems vary, but that most generally adopted is a high grade mineral oil of low viscosity. Pneumatic recuperators are generally charged with air, but nitrogen has been successfully used in France. The great disadvantage of using air is that its moisture content is sufficient to cause serious corrosion of cylinders and piston rods, from which leakage ensues.

The Position of the Cradle Trunnions.—If the cradle trunnions are situated near the centre of gravity of the elevating parts, natural balance will be obtained, but as the gun is elevated the breech will approach the ground. Where long recoil is employed, as in the case of a mobile carriage, it will be necessary to shorten recoil at the higher elevations and this is done automatically by a device called the "Cut-off gear" which regulates the action of the buffer in the required manner: recoil is then said to be "controlled." Alternatively, the trunnions may be placed so near to the breech that the latter will not sensibly approach the ground when the gun is elevated. Thus, with "rear trunnions" a constant long recoil is possible, but the elevating parts must be artificially balanced by a spring or pneumatic equilibrator. Centre trunnions combined with a cut-off gear are standard in the British service, while rear trunnions are common in other countries.

Shields.—These are provided for light field equipments and for coast artillery, but not usually elsewhere. In the former case, the shield is of light steel plate and is designed to give protection from rifle and machine gun fire. Pieces of a heavier nature normally operate out of effective range of these weapons; their shields would therefore be required to afford protection from shell fire, and the weight involved would be excessive.

Coast artillery equipments, since considerations of weight do not arise, are very heavily armoured, the shield providing front, side and overhead protection.

Sights.—Sighting systems, for field, coast, and anti-aircraft artillery have necessarily developed on distinct lines. With field artillery, except in open warfare, the target is seldom visible from the gun: guns are then laid from some visible aiming point, and laying is said to be "indirect." The target will not, in general, be at the same height above mean sea level as the gun, so that with indirect laying allowance must be made for "angle of sight." Most field artillery targets are stationary except when the battle is moving—when fleeting opportunities are presented.

Two systems of sighting are used for field equipments: the "rocking bar" system and the "independent line of sight." The former has the disadvantage that every alteration in the elevation of the gun throws the sight off the target or aiming point and the layer has to relay every time this happens, corrections to range being constantly required during a shoot. With the independent line of sight changes in gun elevation are not imparted to the sight, so that the service of the gun may be more rapid than with rocking bar sights. A much more complicated elevating gear is, however, necessary. With each of these systems the sight is fitted with holders for a telescope for laying direct, and with a carrier for a prismatic sight for indirect laying.

Coast artillery is chiefly intended for anti-ship work, though guns may be specially sited for repelling land attacks. Their targets, therefore, are generally moving, and, except when obscured by fog or smoke screens, are visible. Laying then is normally direct, and neglecting the effect of tide and curvature of the earth's surface, the gun is always at the same height above the target. On this important fact is based the principle of the

automatic sight, which is fitted to most coast artillery equipments. The cradle and sight are mechanically connected in such a way that the layer has only to elevate the gun until the sight is aligned on the water line of the target: the gun is then layed at the required elevation. This sight loses its accuracy rapidly as the range increases until a range called the "auto-sight limit" is reached, when the sight can no longer be used. The greater the height at which the gun is sited, the longer will be the auto-sight limit. In addition to the automatic sight most coast artillery equipments are fitted with a rocking bar sight.

The anti-aircraft problem is to hit a very rapidly moving target, the course, height and speed of which may be continuously changing. Since alterations to line and range during a shoot will be large, and since rapid service is essential, the independent line of sight is ideal for anti-aircraft artillery, provided it is independent both for line and elevation. Sights on these lines have been designed and are in use, but they involve great complications in the traversing and elevating arrangements. Otherwise, the rocking bar system is used, two sights being fitted, one on each side of the mounting. The sights are cross-connected, one layer laying for line, the other for elevation.

All equipments are provided with some form of range or elevation indicator, which is set at the elevation ordered to the gun. Many modern range indicators are fitted with adjustable readers and specially engraved scales so that the errors in shooting due to wear of the gun may be counteracted without the necessity of calculating and applying a special correction.

Most modern sighting systems embody means for correcting certain other errors in shooting. Thus, a sufficiently accurate correction for "drift," which is the lateral deviation of the projectile due to the spin imparted to it by the rifling of the gun, is obtained by tilting the sight so that the line of sight is deflected in the required direction as the gun is elevated. A correction for the error in line caused by the wheels of a field carriage being on unlevel ground is obtained by providing means for cross-levelling the sight. Automatic sights embody arrangements which give compensation for the error in range due to the rise and fall of tide, and to atmospheric conditions which affect the shooting: a device is also usually fitted which corrects the error in range due to want of level in the mounting.

Sights of modern artillery equipments are invariably fitted to a non-recoiling portion of the carriage, so that the layer need not stand clear at each round and time is saved. In order to improve and maintain accuracy, special attention is given to providing means for taking up wear and play in sighting mechanisms, and the readers, scales, etc., are adjustable.

CLASSIFICATION OF EQUIPMENTS

Land Service Artillery falls conveniently into three categories, viz., (a) mobile equipments, (b) semi-mobile equipments and (c) fixed mountings. These three classes differ radically from one another as regards their basic structure, and also among themselves as regards size and weight.

Mobile Equipments.—Light, horse, field, medium and certain heavy artillery equipments are included in this category. They possess considerable tactical mobility, particularly as regards the lighter natures. The gun carriage is a two-wheeled vehicle and forms the travelling and firing support for the gun.

The basic structure comprises the trail, axletree and wheels, and when in action the end of the trail, which is provided with a spade, rests on the ground. At the first round, the spade digs itself in and prevents the carriage recoiling on its wheels. For travelling the trail is hooked to another two-wheeled vehicle called the limber, which is fitted either with a pole for horse draught, or with an engine draught connector. The combined gun carriage and limber thus form a four-wheeled vehicle having sufficient flexibility to negotiate rough ground. The balance of the equipment when limbered up and the distribution of the weight between gun carriage and limber wheels are matters of importance, and, in view of this, guns of some medium equipments are drawn to the rear for travelling, the breech resting on the rear part of the trail. Field artillery limbers carry a certain amount of ammunition.

A fore-carriage is sometimes used in place of a limber for tractor drawn medium artillery: its steering gear, which is similar to that of a motor car, is connected direct to the tractor, and its wheels are of small diameter.

Stability of the Mobile Carriage in Relation to Mobility.—From the firing point of view the stability is essential for accurate shooting. This demands as much weight as possible on the ground, a low centre of gravity, and a long trail—factors which combine to counteract the tendency for the carriage to overturn to the rear when the gun is fired. A field artillery equipment is, however, restricted as regards weight according to the capacity of a team of six light draught horses; moreover, from the point of view of mobility, the wheels should be of large diameter to give easy draught, and the trail should be short so that the carriage may be manoeuvred easily in a confined space. Although a cranked axletree enables a low centre of gravity to be obtained with large wheels it is evident that the factors upon which stability largely depends are in direct contrast to those which secure mobility, so that the designer of a mobile carriage must effect the best compromise possible, having due regard to particular requirements of each case. This problem applies also to the heavier natures, for even where mechanical transport is used axle loads must be reasonably limited and the equipment must not be too heavy to be man-handled for short distances.

The Mobile Carriage.—The most usual type of mobile carriage in use to-day is one in which the trail is of the "box" pattern, a space being formed between its two side members into which the gun may recoil at high elevations. The carriage body is pivoted to the trail near the axletree, and is capable of being traversed 4° to the right or left by the traversing gear. The cradle supports the gun on slides and rests in trunnion bearings in the carriage body. It is in the form of a trough in which is housed the recoil system, secured to the gun at the breech end.

Some designers, notably Schneider of France, favour what is known as "Cross-axle Traverse" for field carriages. The carriage body is dispensed with and trunnion bearings are fitted in the sides of the trail, which are curved upwards in front for this purpose. The traversing gear causes the trail to slide to the right or left along the axletree, the point of the spade becoming the centre of the traversing circle. The amount of traverse obtainable depends on the length of the axletree which is limited by the overall width of the carriage, and is generally about 4° each way. When traverse in excess of that provided on the carriage itself is required, the spade must be dug out and the trail carried round until the gun is roughly aligned in the required direction. Such a procedure is too slow where moving targets such as tanks or armoured cars are being engaged, and this has led to the introduction of the "split trail," this being made up of two single trails connected to the axletree by ball and socket joints, so that when they are opened out, the spades may adapt themselves to uneven ground. For travelling, the legs are locked together, and one of them carries an eye for the limber hook. Owing to the loose joints between the axletree and trail legs, the carriage body obtains no support from the trail. A somewhat complicated connection between carriage body, axletree and trail legs is therefore essential. With this type of trail about 50° of traverse is obtainable without moving the trail legs.

Wheels.—These are still generally built of wood, except for the heavier natures when steel is used. Steel wheels are frequently of built up construction and resemble the familiar road locomotive wheel, though other types are sometimes employed. The wooden wheel suffers from the disadvantage that even when thoroughly well seasoned materials are used, it is seriously affected by climatic changes, and since the World War considerable attention has been given to the possibility of replacing the wooden wheel by one of steel or aluminium alloy. An important advantage of the wooden wheel is the ease with which it can be repaired in the field. Wheels are usually dishd to give strength to withstand lateral stresses when travelling. They must also be sufficiently robust to withstand the shock when the gun is fired.

Problems Due to Mechanical Draught.—The introduction of mechanical draught for artillery has made possible great increase

GUN TUBE CONSTRUCTION

1. Corrugated Ingot for 16-in. tube
2. Finishing forging of jacket
3. Ingots for brush blocks, breech bushings and locking rings
4. Rough machined hoop forging on car preparatory to being placed in annealing furnace
5. Gun press; gun under press being forged on mandril
6. Battery of engine lathes cutting tube to proper diameter and putting finishing on tube
7. Boring the powder pit with pack-bit
8. Hoop forging indicating locations for physical test specimens on breech end
9. Gun barrel for 16-in. tube

FITTING GUN JACKETS

1. 16-in. gun jacket being lowered into a pit and heated to be expanded to fit gun
2. 16-in. gun being taken out of the pit where jacket has been cooled by water and allowed to shrink, making a tight fit

in speed, particularly in the case of the heavier natures. This in turn has set up excessive strains in the carriage, and with a view to reducing the effect thereof numerous experiments with rubber tyres have been carried out both in Europe and the United States. In order to improve matters still further, considerable attention has recently been given to the question of mounting mobile equipments on springs. Schneider have lately produced a light field equipment in which springs are embodied in the naves of the wheels.

Brakes.—These are an essential feature of mobile artillery equipments both from the firing and travelling aspects. They are applied in action to prevent the carriage running forward on its wheels when the gun is running out to the firing position after recoil. The tyre brake is the normal type in use to-day, but some form of rim or hub brake will be necessitated by the introduction of rubber tyres. Brakes are usually cross-connected and equalized, and in many cases may be operated from either in front or in rear of the axletree. Those of light field equipments are often provided with a rapid acting device for use when firing; this is a particularly desirable feature where cross-axle traverse is employed as the brake must be released on each occasion the gun is traversed.

Pack Artillery.—Equipments for use in mountainous country, or where roads are non-existent are designed to be dismounted for transport, their components being carried by pack mules. When in action, the equipment resembles a mobile carriage of conventional form except that small wheels may be used as it is not intended for draught.

The special requirements of a pack equipment are:—(a) it must be capable of being assembled or packed very rapidly; (b) loads must not be bulky or unwieldy; (c) the weight of each load including saddle should be within the limit which the pack animal can carry without undue fatigue.

In order to keep within the load limit, the guns of pack equipments are generally transported in two parts, which, when assembled, are secured by a nut on the interrupted screw principle. The gun is secured to a slipper which slides on the cradle; this obviates the provision of guide ribs on the gun, which would make it an awkward load to pack.

Semi-mobile Equipments.—This category embraces equipments which, by reason of their size and consequent weight, possess little tactical mobility. It comprises two classes, viz., equipments for artillery designed to travel (a) by road, and (b) by rail.

Road Mountings.—In order to keep each axle load within the recognized limit of roughly five tons, equipments whose total weight would exceed ten tons when limbered up are designed to travel on more than two pairs of wheels. A departure from the conventional form of the mobile carriage is thus necessitated, and the various components of the carriage travel as separate loads. Such a carriage, therefore, does not fire from its wheels and this involves the operation of mounting and dismounting the equipment whenever a new position is taken up.

The basic structure consists of some form of temporary anchorage of wood and steel beams, usually called the holdfast or platform, to which a firing bed is secured. The ground must be prepared for the holdfast, which is prevented from lifting in front when the gun is fired by a mass of earth contained in a steel box or sand-bags, and by pickets driven into the ground. The firing bed contains a pivot in front and at the rear a cross-member carries a toothed arc by means of which about 60° of traverse is obtained by the carriage body. The pivot and the arc both contain roller bearings on which the carriage body is supported so that easy traverse is ensured. The carriage body is comparatively larger than that of an ordinary field carriage, but in other respects the superstructure is of normal design.

The number of loads in which the equipment travels depends on its total weight. Lifting screws and jacks are provided for mounting and dismounting the various loads. Large numbers of these equipments were used by the belligerents of 1914-18, British examples being the 9.2", 12" and 15" howitzers.

Railway Mountings.—These are of two types, viz., (a) those

which are lowered on to the track for firing, and (b) those which fire from their wheels.

In the first the basic structure consists of a truck, the ends of which are raised and supported by bolsters resting upon bogies. The total number of axles depends as before upon the total weight, and is usually limited to about 15 tons for the British standard gauge. In the travelling position the bolsters take the weight through the medium of sliding blocks; when these are drawn clear the ends of the truck may be lowered by lifting screws until the centre portion, or "well," rests on the ends of the sleepers. The truck, now in the firing position with all the weight removed from the wheels, is then anchored by means of steel ropes and pickets or other devices. The carriage body rests on a roller ring in the well of the truck, so that all around traverse is obtainable.

The lateral stability of these mountings is not great, and is usually improved by the use of steel arms which project from the side of the truck and rest on the ground. Where no provision of this kind is made, firing below certain elevations may have to be prohibited except when the direction of the target is close to that in which the truck lies. In the case of howitzers this difficulty is sometimes obviated by increasing the elevation to obtain shorter ranges; for, since maximum range is obtained at an elevation of about 50°, any increase in elevation gives a shorter range. But this solution generally sacrifices accuracy in aim.

In a typical design of the second type of railway mounting, the truck itself forms the carriage body and is provided with bearings for the cradle trunnions. The truck body is supported by a bolster at each end, each bolster resting on one or more bogies; as before, the number of axles depends on the total weight. The bogies and bolsters form the basic structure in this case, and the truck body is allowed a limited amount of traverse on roller bearings across each bolster.

This type of mounting is only made use of in the case of very heavy guns of large calibre. A petrol or similar engine provides power for elevating if required, and the mounting is furnished with an air compressor plant for its pneumatic system. The equipment includes a winding gear for pulling the carriage forwards, for it runs back slightly on the track at each round.

Railway mountings are used for 9.2" and larger guns and for howitzers of 12" calibre and upwards. They possess considerable strategic mobility and are valuable in areas with good railway systems.

Fixed Mountings.—These are permanently emplaced and are mainly used to protect harbours, naval bases, etc., from action by enemy ships and aircraft, and strategic points inland from aircraft.

Generally speaking, all-around traverse is a feature of fixed mountings, and the basic structure is therefore circular in form, consisting of a holdfast or base and a pedestal. The holdfast comprises a concrete bed, the depth and size of which depend on the weight and size of the mounting. Buried in the concrete is a number of long steel bolts which project through a steel ring resting on the top of the concrete. After the concrete has thoroughly set, the pedestal is lowered on to this ring, and is secured to it by nuts screwed on to the long bolts. Pedestals are usually provided with levelling screws to correct any subsidence of the holdfast. In other cases extreme care must be exercised to obtain a truly level foundation for the pedestal.

Power is usually available in some form, and may be used for elevating, traversing and shell hoisting with the heavier natures. Hand operated gear is retained for use should the power fail.

Short recoil is a normal feature of fixed mountings: owing to the massiveness of the basic structure the question of stability does not arise, the chief factor affecting the length of recoil being the maximum stresses which the mounting can withstand. Short recoil has the advantage that it accelerates the service of the gun and simplifies the design of the cradle and recoil system. Apart from this, however, considerations of space would generally prohibit the use of long recoil in a fixed emplacement. The length of recoil for a modern 6" mounting of this nature is about 18".

Anti-aircraft Mountings.—The essential features of these necessitated by their peculiar rôle are:— (a) all-round traverse, (b) elevation up to about 90°, (c) rapid acting and easily operated gears, (d) loading at any angle and (e) short recoil.

Mountings may be mobile, semi-mobile or fixed, depending upon the nature of the holdfast. In other respects they resemble fixed mountings of the ordinary type, except that the pedestal becomes a base ring. This enables the carriage body to be of sufficient height to permit of loading at high angles of elevation, without greatly increasing the overall height of the mounting. The base ring supports the superstructure through the medium of steel rollers.

In the case of the mobile equipment, the holdfast is a motor lorry, and the base ring is secured to the chassis. When in action the latter is supported on long transverse baulks, so that firing stresses are not imparted to the springs of the vehicle, and a certain degree of lateral stability is ensured. This type of equipment possesses considerable tactical mobility, but is only suitable for light guns up to about 3" calibre.

The holdfast of the semi-mobile equipment consists of a travelling platform to which the base ring is secured. The platform is towed behind a tractor and travels on one pair of wheels. It has two steel arms at each end, which when in action are swung outwards. The wheels are then removed and the whole is lowered to the ground by jacks. It is then secured by steel pickets. Heavier weapons can be mounted on this type of platform than on the lorry, but the time taken to get into and out of action is considerably longer.

The base ring of the fixed anti-aircraft mounting is secured to a holdfast identical with that described for other fixed mountings.

Anti-aircraft guns are longer and develop a higher muzzle velocity than field guns and in many cases are provided with semi-automatic breech mechanisms. This entails the provision on the mounting of a device to regulate the speed at which the gun runs forward at the higher elevations. The mountings are not fitted with shields.

Mortars.—The World War saw the reintroduction of the mortar, which up till then had been regarded as an obsolete weapon. The modern mortar is a short range piece giving a low muzzle velocity, so that only a small propellant charge is necessary. This enables a thin-walled bomb of large capacity to be used (*see* AMMUNITION), and the piece itself is short and of light construction.

A number of different designs of mortar of varying calibres were used during the period 1914–18. The mountings in some cases closely resembled those of ordinary field carriages in general character, being provided with traversing and elevating gears and recoil systems: others, such as the "Stokes" mortar were of much simpler design (*see* ARTILLERY). (G. G. T.)

NAVAL ORDNANCE

Naval Ordnance¹ is distinguished from Field Ordnance by the circumstance that the guns are carried on a rapidly moving platform subject to the uncertain oscillations of a ship at sea, and are required to hit a rapidly moving object. This entails special mountings, with very sensitive training, elevating, and sighting gear, suitable for counteracting such motion, and special firing arrangements and means of controlling the fire from favourable positions in the ship. The military artillerist is confronted with a task comparable to that of discharging a projectile from a gun in the Tower of London and placing it in the centre court at Wimbledon. The task of the naval artillerist, however, may be compared to firing from a rapidly moving train to hit another train, many miles away, moving at an unknown speed in an unknown direction. The anti-aircraft gunner has to deal with a rather similar problem, but the difficulties of the naval artillerist are considerably increased by the ship's motion, especially in a heavy sea.

¹The subject is restricted to naval weapons and their mountings for the discharge of projectiles by propellants, and does not include destructive engines which contain their own propelling machinery, such as torpedoes and rockets.

Though the World War developed certain special weapons peculiar to each Service and associated with such special conditions as trench and anti-submarine warfare, the general character of naval service guns is similar to that of land service, the construction of which has been outlined. It is not the gun, but the means of working it, that differs considerably, hence the difference in the design of the mounting and in the fire control system is very marked. The mounting design is further affected by the centralized position of the ammunition supply and the availability of power in a ship—conditions which do not prevail in the field.

The development of naval guns has naturally been in the direction of increase in muzzle velocity and in size, giving greater accuracy, longer range, and greater striking energy. The progress during this century is indicated below:

Year	Gun	Approx. muzzle energy in foot tons
1900	12 in.-42 cal.	40,000
1908-09	12 in.-50 cal.	50,000
1912	13.5 inch	60,000
1915	15 inch	80,000
1925	16 inch	100,000

This increase in power and working pressure means a corresponding increase in the strength of the gun which has been obtained by progressive improvements in the quality of steel and the technique of construction. The power of the gun is decided by the primary purpose for which it is required such as penetration of armour at long range or repelling attacks by destroyers and aircraft. For the penetration of armour the higher the power the better, on the principle that success comes to the ship that can hit hardest and most often at the longest range. For defence from aircraft and both attack and defence in the case of destroyers, rapidity of fire is of greater importance than power.

In the nature of things, the size of the gun is related to the size of the ship, but the World War produced notable exceptions such as submarines armed with 12 in. and monitors with 18 in. guns. Attempts have been made by certain naval powers to reach agreement limiting the size of guns for certain classes of ships. As the result of the Washington conference (*q.v.*) in 1922 it was agreed between the signatories to restrict battleships to 16 in. and cruisers to 8 in. guns. At Geneva in 1927 agreement was reached between Britain, U.S.A. and Japan, to limit destroyers and submarines to 5 in. guns, but failure to solve the cruiser problem left this matter adjourned *sine die*.

NAVAL GUNS

It is convenient to classify naval guns in four categories:—

(1) **Automatic Guns.**—These are small calibre machines guns in which the loading action is entirely performed by the recoil energy. Such guns, of which the 2-pdr. Pom-Pom is typical, are used for anti-aircraft purposes, arming boats and operations on shore.

(2) **Semi-automatic Guns.**—These are light Q.F. guns in which part of the loading operation may be automatically performed by the counter-recoil of the gun. These weapons are used where rapid bursts of fire are specially necessary, as in defence against aircraft and destroyer attack. They form the main armament in many destroyers and the anti-aircraft armament in battleships and cruisers, in the latter case being mounted in special mountings capable of very high elevation. Guns in this class are generally supplied with fixed ammunition but the use of separate ammunition may be entailed by the confined situation.

(3) **Hand-worked Guns.**—These are light and medium calibre Q.F. or B.L. guns and form the main armament in some destroyers and cruisers and the secondary armament in battleships and large cruisers. A 6 in. projectile weighing 100 lb. is the heaviest weight which one man can conveniently load by hand; consequently, this size of gun is very generally adopted by all nations. The difficulty, however, of hand loading such a gun at high angles of elevation, such as are experienced in anti-aircraft defence, has led to it being mounted in power worked mountings in some

warships.

The weight of ammunition which is a consideration of particular importance in small vessels, is less for a B.L. than a Q.F. gun of the same calibre owing to the absence of the metal cartridge case.

(4) **Power-worked Guns.**—These are heavy guns, above 6 in. calibre, and are generally B.L., but may be Q.F. as in the case of German Krupp guns. They form the primary armament in battleships and large cruisers.

NAVAL GUN MOUNTINGS

These may be divided into two main classes:—(A) *Deck Mountings* attached to the ship taking guns in classes (1), (2) and (3). (B) *Turret Mountings* built into the ship to take guns in class (4). These are invariably worked by power, usually hydraulic, though certain nations, among them the United States, prefer electric power, and others a combination of both.

Considerations Affecting the Design of Naval Guns and Mountings.—The gun design is to some extent affected by the mounting conditions particularly as regards the gun's weight and the position of its centre of gravity. If the gun is for a deck mounting and for high angle purposes, it is desirable to keep its axis of suspension as low as possible for reasons connected with the ship's stability and for convenience in hand loading. Consequently, the centre of gravity must be close to the breech end, and the recoil must be short to avoid fouling the deck at high elevation. Also the gun should be heavy rather than light, or severe stresses may be brought on the mounting and deck structure during the short recoil.

If the gun is required for mounting in a turret, its axis of suspension should be as nearly as possible over the roller path on which the turret revolves, to reduce structural stresses incurred by the weight of the gun which in the case of 15 in. guns exceeds 100 tons. The axis should be as close to the front shield as possible, so that the opening in the armour necessary for full elevation is as small as possible. Consequently the position of the gun's centre of gravity may affect the diameter of the turret on account of the length of gun within it and so may affect the beam of the ship. This may be limited by available docking accommodation. The weight of the gun, mounting, and turret armour appreciably affect the ship's displacement, and should be kept as light as possible. This has led to double and triple gun turrets. The turret as a whole must be balanced, hence the weight of the gun must be compensated by the disposition of the loading machinery in the revolving structure. The heavier the gun the greater is the weight entailed in such machinery or in the thickness and overhang of the rear shield. The design of the mounting is affected by the class of ship for which the gun is required and by the position in the ship in which it is mounted.

The first consideration in selecting the position for mounting a gun is to obtain as large an arc of fire as possible. The centre line is naturally the most favourable for this purpose, and this has been universally adopted for the primary armament of battleships since the "Dreadnought" era. The selection of position has a large influence on the arrangement of the ship as in addition to the disposition of magazines and shell rooms, the effects of severe blast on the deck, superstructures and personnel must be met. Freeboard, or height above the waterline, is of importance, and lack of this severely handicapped the British ships in the Coronel action (q.v.).

Important requirements of a naval gun mounting are:—(1) Safety under all conditions of use. (2) Protection by armour from enemy action. For the safety of the ship, it is essential to reduce fire and explosion risk to a minimum, particularly as the gun's ammunition is in close proximity to the gun. This is effected by suitable breaks in the train of ammunition supply between the magazine and gun, also by enclosing the ammunition in flash-proof cases in addition to hoists. For heavy guns, air blast is provided, which operates automatically on opening the breech mechanism, and expels gases out of the muzzle of the gun. Water sprays also are fitted to drown any smouldering residue which may be left in the gun chamber or on the breech block. The safety of the gun's crew in operating turret machinery, and of

the ship's personnel and ship's structure, is effected by suitable interlocking arrangements and automatic danger signals, which ensure the proper sequence of operations, and prevent the gun from being trained on a bearing where the line of fire is masked by ship's fittings, or where blast effects would be serious.

Protection is given by a shield carried on the mounting or by placing the gun in an armoured gun house. In the case of turret mountings, fixed armour surrounds the revolving structure extending below the water line; and the roof and sides of the turret above this armour are made of armour plate. The functions of a gun mounting are (1) to absorb the recoil and replace the gun in the firing position without incurring undue stresses on the deck structure. (2) To enable the gun to be rapidly and accurately laid and trained (*i.e.*, directed in the vertical and horizontal planes) through a wide arc whether the target be in view at the gun position or not. This demands very sensitive control for alignment, effected at the gun either directly through telescopic sights or indirectly as signalled from a control position. (3) To permit of rapid loading and a high rate of fire.

(1) **Recoil Arrangements.**—Guns are generally carried in a cradle in which they are free to recoil, the cradle being pivoted or supported by trunnions in the mounting. In the case of heavy guns the cradle is replaced by a carriage and slide. The carriage may be regarded as part of the gun to which it is rigidly attached, and the slide is pivoted to enable the gun to be laid, and forms a path on which the carriage can travel during recoil. The gun or carriage is attached to a piston which works in a cylinder attached to the cradle or slide. In some cases the piston is connected to the cradle and the cylinder is secured to, and recoils with, the gun. For heavy guns two pistons and cylinders may be employed. The energy of the recoil is absorbed mainly by the resistance offered to the passage of liquid from one side to the other of the piston, either through tapered grooves in the recoil cylinder or through a valve or orifice in the piston. In a 16 in. gun the initial velocity of recoil is 21 ft. and the recoiling mass (approximately 110 tons) is brought to rest in the short travel of 3.8 feet. Efficient buffering is arranged at the end of recoil to bring the gun quietly to rest before it is returned to the firing position either by springs, or by air compressed during the recoil action, and contained in a separate compartment fixed to the cradle. In "recuperator" mountings, the run out is effected by the pressure of air contained in a communicating cylinder or reservoir, acting on the liquid in a "run out" cylinder through a valve which controls the speed of run out. Suitable arrangements are made by a liquid seal to prevent any air from passing into the run out cylinder. In power-worked mountings the gun may be run out by hydraulic pressure acting on a ram or piston attached to the slide. It will be noted that the system of overcoming the recoil is hydraulic, whereas the counter-recoil may be mechanical (*i.e.*, springs), pneumatic, hydraulic or a combination of these systems. The primitive expedient of arranging for the gun to recoil up an inclined plane and to run out by gravity is no longer used.

(2) **Training and Elevating Arrangements.**—The training of a gun is effected by rotating the entire mounting about its vertical axis. In a hand-worked deck mounting which is supported on a live roller ring or pivoted on ball-bearings, this is carried out by worm gear fitted in the mounting which engages in a rack secured to the deck. In the case of light guns, this gear is usually arranged to disconnect, so as to allow the mounting to be trained from a shoulder piece in smooth weather. A turret mounting generally carries with it a hanging chamber and ammunition trunk (*see illustration*). It is supported on a live roller ring which travels on a fixed roller path built into the ship and the turret is rotated by a hydraulic engine which works a driving pinion gearing into a vertical rack fixed to the hull. The great weight of the revolving structure, which may exceed 1,000 tons in triple gun turrets, entails very powerful machinery to obtain the necessary nicety in movement required for accurate training, one minute of arc being of importance at long range.

In double or triple gun turrets, though the guns cannot be trained independently, the elevation or laying is generally inde-

pendent. It is effected by moving the gun slide in the vertical plane by one or two hydraulically operated rams, connected to the slide and working in cylinders fixed to the mounting. Another method of laying a gun commonly adopted in U.S.A. ships is by the rotation of a long screwed shaft driven by an electric motor which takes the place of the ram. Where very high angles of elevation are required involving a large movement the laying may be performed by a hydraulic swash plate engine (*q.v.*). Hand-worked guns are generally laid by the rotation of a pinion geared into a toothed arc attached to the cradle. In all cases the elevating gear is connected to the non-recoil portion of the mounting. In some turrets it is possible to lock the slides so that the guns are elevated together, and in other mountings (known as "twin" mountings) independent elevation is not possible.

(3) **Loading Operations in Turret Mounting.**—The possible rate of fire depends upon the rapidity with which successive rounds can be loaded. The loading cycle for a turret gun involves the following events:—

- (a) The recoil and counter-recoil of the gun.
- (b) Opening the breech and ejecting the fired tube (primer).
- (c) Bringing the gun to the loading position which is a fixed angle varying in different turrets from 4° to 10° of elevation. In some turrets, such as that shown in the illustration, loading can be performed at any elevation through a loading arm at the rear end of the slide, which is designed for the automatic attachment of the ammunition cage, which then moves up and down as the gun is depressed or elevated. This enables the loading operation to proceed without the gun being brought to a fixed position. The loading arm carries on its extreme end a chain rammer for ramming home the projectile and charge, hence this operation also is independent of the angle of the elevation.
- (d) Bringing the ammunition cage with projectile and charge from the waiting position in the chamber to the loading position or loading arm. (Bringing the ammunition from the shell room and magazine by the main trunk and transferring it to the loading cage is an operation which can be performed at any time and is not dependent on the working of the gun.)

(e) Ramming home the projectile and charge. In some mountings, where fixed loading is carried out, telescopic rammers are used and the charge is automatically picked up by the rammer behind the projectile and carried into the gun chamber in the same ramming operation with the projectile.

(f) The withdrawal of the rammer and cage.

(g) Closing the breech with a new tube in position.

When the loading is completed a hand-operated switch is put over. This break in the firing circuit is introduced to ensure safety from firing during the loading operations. The gun is now ready for firing, and this can be performed by completing the firing circuit by pressing a key either in a sighting position in the turret or in the director tower, according to which position is connected up.

NAVAL GUN SIGHTS AND GUNLAYING

Sights fitted with telescopes are attached to the cradle or connected with the trunnions of the slide. Setting the range on the sight gives it an angle of depression with the gun's axis. The movement of the gun necessary to align the sight on the target gives elevation to the gun corresponding to the range on the sight.

It will be appreciated that change in the direction or bearing of the target may entail continuous training to keep on the object, and that change in range may entail constant alterations in the elevation of the gun. Such movements are, however, usually small, and readily adjusted by the responsible members of the gun's crew. A more difficult task in keeping the gun continuously laid is caused by the oscillatory motion of the ship, which, since it is of a harmonic and composite character, is very difficult to compensate. This motion is, as far as possible, discounted by means of "director firing" in which a definite position in the roll can be selected for discharging the gun. In this method of firing, an indicator is operated at the gun by an electrically connected

master sight in the control position. This is followed by the action of the gun-layer, who keeps a pointer attached to the gun in coincidence with the director indicator, thus giving the gun an elevation corresponding to the setting of the master sight.

The setting of this sight involves the rangefinder range, and the "spotting" correction obtained from observation of the fall of the shot, which may be assisted by aircraft observation. This spotting correction is inevitable as the actual muzzle velocity of the gun may differ from that for which the sights are graduated owing to wear of the gun and to the temperature of the charge. Also the retardation of the projectile may differ from the normal on account of its form and weight and because of the density of the atmosphere. Such effects are as far as possible allowed for by calculation in the initial setting of the sight; but there remains a margin of error, which in most cases is chiefly due to the discrepancy between the rangefinder range and the true range.

FIRING GEAR

Under the conditions that prevail in a naval action, it is of great importance that the means of firing the gun should be as instantaneous and as reliable as possible. Where guns are directly fired from a control or director position, it is necessary for the main chain to the gun to be electrical, and the "firing interval" is reduced if this circuit fires an electric tube. Where a percussion tube is employed to fire the gun, the fire control circuit is arranged to release a striker by energising an electro-magnet and attracting an armature which releases the trigger. Owing to the mechanical movements involved, this latter method entails a longer delay.

The firing interval in the case of an electric tube is determined by the following train of events:—(1) Brain impulse interval between the director layer or gunlayer seeing his sight aligned with the target and deciding to fire, and his finger pressing the contact button. (2) Completion of the circuit by the physical movement of the contact button, push or switch. (3) Heating the bridge and burning the powder in the tube. (4) The passage of the tube flash along the vent of the breech screw. (5) Ignition of the primer on the end of charge. (6) Ignition of charge. (7) Time taken by the projectile in passing down the bore.

An efficient firing gear reduces the firing interval to a minimum and makes the prospect of firing as reliable as possible. The possibility, however, of a misfire is usually provided for by some alternative system. In some cases an alternative electrical circuit is fitted which is brought into operation by a switch, and in other cases percussion firing is resorted to by either exchanging the electric tube for a percussion one or by employing a tube which is capable of being fired electrically and by percussion. Electrical firing lends itself very readily to the introduction of safety arrangements, *e.g.*, the circuit can be broken by the recoiling action of the gun and only completed when the gun is out in the firing position. It can be also broken when the breech is not closed and only completed when it is fully closed.

It will be evident from the foregoing that the use of a heavy naval gun entails great proficiency in drill and a considerable amount of organisation and intelligent co-operation in the personnel involved. The machinery and instruments concerned must be kept in a highly efficient condition to ensure that no link in the chain of operations fails. Alternative methods of loading and operating turret guns are provided in many cases, such as mechanical hand-loading or a secondary source of power in the event of the main system being put out of action. These add to the degree of training and skill required in the gun's crew. However great the power and mechanical perfection of the weapons, the spirit, resource, and efficiency of the man behind the gun will continue to be a matter of the highest importance. Other things being equal—the human element will decide the issue.

(J. G. M. McH.)

ORDOS: *see* SHENSI.

ORDOVICIAN SYSTEM, in geology a term introduced by Lapworth in 1879 to include those rocks—well developed in the Welsh region formerly inhabited by the Ordovices,—which had been classed by Murchison as Lower Silurian and by Sedgwick

as Upper Cambrian (*see* SILURIAN). In the early part of last century all the rocks which lie beneath the Carboniferous Limestone were grouped together under the general name of Transition Series and it was not till 1831 that Sedgwick and Murchison made the first serious attempt to reduce them to order. Sedgwick started work in the Snowdon district and Murchison began upon the Welsh borders. By 1835 they had advanced so far that Murchison gave the name of Silurian system to the group of rocks with which he was dealing, while Sedgwick called his group the Cambrian series. At that time it was supposed that the Cambrian lay entirely below the Silurian. Subsequently it was shown that the two formations overlap, the upper part of Sedgwick's Cambrian being the same as the lower part of Murchison's Silurian. A prolonged controversy followed which has left its effects in a confusion of nomenclature even to the present day. It has, however, long been recognised that the Cambrian and Silurian of Sedgwick and Murchison include three natural groups, and in 1879 Lapworth proposed that these groups should be called Cambrian, Ordovician, and Silurian. Murchison's terminology is still often used, especially in Germany, and the three groups are called the Cambrian, the Lower Silurian and the Upper Silurian.

Although under all the variations of terminology the three groups are now universally recognised there are still differences of usage with regard to their precise limits. Whereas in extra-British areas there is a general concurrence of opinion as to the horizon at which the base should be drawn (zone of *Dictyonema flabelliforme*), most British geologists still adhere to the older classification, based largely upon structural considerations, in which the base is taken above instead of below the Tremadoc. There is also some divergence of opinion as to the horizon at which the upper limit should be drawn, the fossil evidence suggesting that it should include beds up to the time of appearance of the true Pentamerids and Monograpti, though mainly on lithological grounds it is generally taken below this level.

The various strata composing the System may be divided into several contemporaneous facies or types of deposit, controlled by different physical conditions at the time of formation, and since these same physical conditions also govern the nature of the organisms living in different parts of the sea, each facies of deposit tends to have a distinctive set of fossils.

The three principal facies can be recognized:

1. Shallow water marine facies
 - (a) grits, sandstones and shales indicative of heavy sedimentation; fossils mainly trilobites and brachiopods.
 - (b) shelly limestones evidently laid down in clean water; fossils mainly brachiopods, cystids, ostracods, and bryozoa.
2. Deeper water marine facies
 - (a) nodular limestones; fossils mainly cephalopods (*Orthoceras*).
 - (b) black shales; fossils, blind trilobites or trilobites with over-developed eyes. Often occurring in association with
 - (c) fine black shales; fossils mainly graptolites.
3. Volcanic facies especially characteristic of British Isles.

The natural relationships of these different types are indicated by their field relations, the shallow water facies of either type may have a considerable lateral extension running parallel with the old coast line, but in a direction approximately at right angles passes into one or other facies of the deeper-water type, the subdivisions of which are often intercalated into one another, though the type with the most widespread development is undoubtedly that of the Graptolite Shale. The graptolites do not really belong to the black shale since it is likely that they were planktonic or pseudo-planktonic, but since quietness of the waters and absence of coarse sediment are the determining factors governing the distribution of both, the two are almost invariably associated.

Life.—The life of the Ordovician period presents a distinct advance in type upon that of the preceding Cambrian; as a whole it may be said to be characterised by three main features: (a) Acme of development of the trilobites. (b) Rise and dominance of the articulate brachiopods over inarticulate types. (c) Incoming in force and great development of the graptolites. The fauna consists on the one hand of a trilobite-brachiopod fauna characteristic of the shallow water facies, and a graptolite fauna characteristic of the deeper water facies, and it is by means of these great groups of organisms that the rocks belonging to the

System have been divided up into a series of life zones. The graptolites utilised as *zone fossils* differ in different parts of the world, but though the *Index Fossil* may be different, there is a very wide agreement in the *General Assemblage* found at the same horizon within the Graptolite Shales all over the world, and there is likewise the same change from the early many branched forms to those with fewer branches, and from the pendent to the scandent direction of growth. The cell form too changes in the same manner from the straight to the slightly sinuous, and eventually to the decidedly sinuous type. Hence *Clonograptus*, *Dichograptus*, *Tetragraptus* and *Didymograptus* are characteristic of the Lower Ordovician; *Nemagraptus*, *Dicellograptus* and *Climacograptus* characterise the Middle Ordovician, and *Dicellograptus*, *Dicranograptus*, *Climacograptus* and *Diplograptus* the Upper Ordovician. The articulate brachiopods include the various subgenera of *Orthis*, *Strophomena* *Leptaena*, and *Plectambonites*, and more particularly towards the top, forms with a definite internal brachial apparatus such as *Atrypa* and *Zygospira* make their appearance.

The trilobites reach their zenith of development and exhibit great variety in form, but whilst *Ceratopyge* is found only at the base, and forms like *Chasmops* and *Phillipsinella* only in certain beds in the Upper Ordovician, many genera or families have a long range; *Ogygia* for example is characteristic of the Lower Ordovician when it occurs, but the nearly allied *Asaphus* is found at all horizons. The forms of commonest occurrence are *Asaphus*, *Ogygia* *Acaste*, *Calymene*, *Placoparia*, *Iliaenus*, *Homolanotus*, *Remopleurides*, *Cheirurus*, *Lichas*, and *Phillipsinella*; there are also blind trilobites such as *Trinucleus* and *Ampyx*, both of which are common, as is also *Aeglinia* with its over-developed eyes.

Various Orthoceratidae are abundantly represented in the Orthoceras Limestone of Scandinavia; taken as a whole however the mollusca (*q.v.*) play a far more important part in the fauna of America than they do in Europe, both gasteropods and lamelli-branchs being abundant at certain horizons, whilst the bryozoa are also important in America, and probably on account of the physical conditions, are far more abundantly represented.

Distribution.—Ordovician rocks have an almost world-wide distribution since they have been recorded from both Arctic and Antarctic regions, Europe, North America, South America (Bolivia), Asia (China, Burma, northern Himalayas, Shan States), northern Africa and Australia. The classic areas of development however are those of Europe and North America, and the other areas may be regarded in terms of these. In Europe they may be considered as having been laid down in two main areas, a northern area and a southern area. The northern area of deposition comprised the British Isles, the greater part of Scandinavia and the Baltic Provinces; it consisted of two gulfs penetrating far into the north Atlantic continent, the outermost of which was probably a true geosyncline and the inner an epicontinental sea; these were partially separated by a long island or peninsula extending from Scandinavia to Britain. The southern area is considered to have lain to the south of a land mass extending through Central Europe and comprising southern France, Spain and Portugal, Thuringia, the Fichtelgebirge, Kellerwald and Bohemia.

The differences in the faunas of these two areas has been regarded as in large measure dependent upon the existence of the separating land barrier, but it is possible that these differences may be due in part to facies, and the possibility of the effect of migration and counter-migration along the shore line must not be overlooked. Towards the close of the period at any rate this difference in faunas disappeared, for a uniform type of fauna characterises all areas of deposition whether they belong to the shallow-water or deeper-water facies.

In America shallow water facies of varied type predominated all along the submerged margin of the Canadian shield (epicontinental sea), but in the east and west, definite geosynclines originated, known as the Cordilleran and Appalachian geosynclines respectively, and it is to these that the Graptolite Shale facies mainly belong.

British Isles.—The British Ordovician rocks have always been much folded since their formation. They were laid down originally within the geosyncline of the northern area of deposition, part of

the northern margin of which appears to have lain along the Highland border, whilst its southern shore-line ran obliquely through the Welsh borderland and thence south into Cornwall. Hence in the neighbourhood of the Highland border (Girvan) and the Welsh borderland there is an extensive development of the shallow-water facies, which traced south-east on the one hand and more generally west and north-west on the other, pass into deposits of the deeper water facies characterised by graptolites. These sediments are however interrupted at different horizons by volcanic rocks though the intensity and duration of vulcanicity varied in different places. It is the folding of the sediments and the occurrence of these volcanic rocks on a grand scale that is responsible for the rugged mountain scenery of both north Wales and the Lake District. There appear in general to have been two main volcanic episodes, an earlier one (Arenig) characteristic more particularly of the marginal areas, of the geosyncline, and a later one (Llandilo-Caradoc) belonging to its more central portions. The table shows the succession in the classic areas of development.

European Continent.—In Scandinavia the Ordovician rocks have escaped the severe tectonic disturbances that have so generally affected the rocks of this age in other regions. In Norway their main development occurs in the Christiania (Oslo) basin, but in Sweden the best sections are those seen in the many table-mountains that have been cut out by circumdenudation, where the rocks can be studied lying horizontally one above the other. The recognition of the different facies of deposition is here particularly important; the classic areas are those of Skåne, Öland, Östergötland, Västergötland and Dalarne, and in these the shallow water and deeper water facies show varying degrees of development. In Skåne is found the most complete development of the Graptolite Shale facies, but this is associated in places with some Trilobite Shales and some thin bands of Orthoceras Limestone. In Dalarne on the other hand the facies is largely shallow water throughout and almost entirely calcareous, a similar facies being found in Öland where however the succession is incomplete above the horizon of the Cystid Limestone, and Dictyograptus Shales largely replace the Ceratopyge Limestone; in Östergötland the Ceratopyge Limestone is again replaced by Dictyograptus Shales but the upper part of the succession is complete, and in Västergötland Graptolite Shales not only replace the Ceratopyge Limestone but also the lower part of the Orthoceras Limestone. Hence the general succession in the different areas may be regarded as dependent upon the degree to which the various limestones are replaced by Graptolite Shale.

In the Baltic Provinces the succession is mainly of shallow water type, and affords perhaps the best development of the rocks of that type recognized in Europe. The succession presents some striking analogies with that of the Scandinavian shallow-water development of which it is no doubt the counter part on the southern shore line; hence the Vaginatenkalk and Echinospaerite Kalk show many features in common with the Orthoceras Limestone and Cystid Limestone of the northern region. It does not appear possible however, to correlate exactly the beds that are said to overlie the Echinospaerite Kalk, namely the Jewe Itfer, and Kuckers Schiefer, beyond the fact that they appear to belong to the Upper Ordovician.

At the base of the Ordovician succession in Bohemia, there is an unconformity of considerable importance so that the basal beds are naturally of a littoral character (D1α); above, Graptolite Shales of Arenig age occur, and the beds of Llanvirn age (D1β) contain a mixed fauna of trilobites and graptolites; the remainder of the succession is formed a richly fossiliferous shallow-water series of sandstones and shales representing everything up to the top of the Ashgillian.

North America.—In the geosynclinal areas of North America, both shallow water and deeper water facies of deposit are found and these are often highly disturbed by the movements in which they have been involved since their deposition; outside these geosynclinal areas the beds show very little signs of any disturbance, are thinner and consist very largely of calcareous beds with different varieties of shallow water faunas.

The Graptolite Shale facies is best known in the area belonging

to the Appalachian geosyncline, but includes also beds now lying outside it in the St. Lawrence valley which have probably been brought by thrusting into their present position. The classic development of the Graptolite Shale facies of the Lower Ordovician is that known as the Levis Shales of the Quebec group seen on the south shore of the St. Lawrence immediately opposite Quebec; the remainder of the Graptolitic facies is best known from New York State where they form the Hudson river Shales of Albany. The shallow water facies is found extensively in the north in the Hudson bay region (Manitoba, Hudson bay and the Arctic archipelago), and in the south or Mississippian region along the margins of the Canadian shield in Michigan, Wisconsin and Minnesota, and on the domes of Cincinnati and Nashville.

Australia.—In Australia the same three facies of the Ordovician are characteristically developed. Beds belonging to the shallow water facies have only up to the present been definitely recorded along the east to west line in Northern Territory in the heart of the continent (Tempe Downs, and Levi Range, south of the MacDonnell Ranges) the dominant type, which is found mainly in the eastern half of the continent, belonging to the Graptolite Shale facies; these are best seen in Victoria where the Lower Ordovician rocks of this type have become well known through their occurrence in the most productive gold field; Upper Ordovician of similar type, though less auriferous, occur east of a line running north from Melbourne, and are also found in New South Wales. Volcanic rocks of the age have an extensive development in central New South Wales and in Tasmania (see AUSTRALIA). (G. L. E.)

ORDU (anc. *Cotyora*, where the "Ten Thousand" embarked for home), the chief town of a vilayet, on the north coast of Asia Minor, between Samsun and Kerasund, connected with Zara, and so with Sivas, by road, and with Constantinople and Trebizond by steamer. Filberts are exported. Pop. (1927), 113,004.

**ORDUIN-NASHCHOKIN, ATHANASY LAVRENT-
EVICH** (?-1680), Russian statesman, was the son of a poor official at Pskov. He was the only Russian statesman of the day with sufficient foresight to grasp the importance to Russia of the Baltic seaboard.

Orduin abolished the onerous system of tolls on exports and imports, and established a combination of native merchants for promoting direct commercial relations between Sweden and Russia. He set on foot a postal system between Muscovy, Courland and Poland, and introduced gazettes and bills of exchange into Russia. With his name, too, is associated the building of the first Russian merchant-vessels on the Dvina and Volga.

See V. Ikonnikov, "Biography of Orduin-Nashchokin" (in *Russkaya Starina*, Nos. 11-12) (St. Petersburg, 1883).

ÖREBRO, a town of Sweden, capital of the district (*län*) of Örebro, lying on both banks of the Svartå a mile above its entrance into Lake Hjelmars. 135 m. W. of Stockholm by rail. Pop. (1928), 37,053. Örebro was in existence in the 11th century. Its castle was erected by Birger Jarl in the 13th century, and twenty diets or important assemblies were held either in the castle or in the town. Such were the Örebro *concilium* of 1537, the diet of 1540 in which the crown was declared hereditary, and that of 1810 when Bernadotte was elected crown prince. In great part rebuilt since a fire in 1854, Örebro has a modern appearance. An ancient castle, however, with four round towers, still remains, and is used as a museum. There may be mentioned also the church of St. Nicholas, of the 13th century; and the King's House (*Kungsstuga*), an old and picturesque timber building. The patriot Engelbrecht (d. 1436) was born here. The Swedish reformers of the 16th century, Olaus and Laurentius Petri, are commemorated by an obelisk. Örebro is the centre of the Swedish shoe industry; trade is carried on, by way of the Örebro canal and lakes Hjelmars and Mälars, with Stockholm.

ORE DEPOSITS. The word "ore" is defined in the Oxford Dictionary as "a native mineral containing a precious or useful metal in such quantities and in such chemical combination as to make its extraction profitable," and this is the sense in which it is used in commerce and by miners, although writers on mineralogy and petrology apply the word to metalliferous minerals without the above-mentioned limitations.

Ore deposits are accumulations in Nature which have arisen by some form of concentration, either chemical or mechanical, or both. Prof. Kemp has made a useful comparison between the average percentages of the metals in the earth's crust and those necessary to constitute an ore suitable for profitable working. The two tabulations, slightly modified in the case of manganese and copper to conform with later improved practice, are here put side by side:—

Metals	Average percentage in Earth's crust	Percentage necessary for profitable working
Aluminium.	8.13	30
Iron	4.71	35-65
Manganese	0.07	25-50
Nickel	0.01	2-5
Tin	0.000X-0.000X	1-5-3
Copper	0.0000X	1-10
Lead	0.0000X	2-2.5
Zinc	0.0000X	5-25
Silver	0.000000X	0.03-0.16
Gold	0.0000000X	0.003-0.00016
Platinum	0.00000000X	0.00005

The letter X indicates some undetermined digit.

A comparison of the two tabulations gives an idea of the degree of concentration that has been instrumental in the formation of ore deposits from the materials of the earth's crust. Research has shown that it is to the igneous magmas that we must look for the original source of these concentrations of the metals. The agents by which the metallic components of the magmas are segregated, or extracted from the rocks to which the magmas consolidate, and finally concentrated, are numerous. In the case of the molten magmas it is by the process known as *differentiation*, or by the escape of gases and vapours carrying volatile metallic compounds to the adjacent rocks—a process which is known as *pneumatolysis*. From the consolidated igneous rocks extraction is effected by hydrothermal solutions, whether of deep-seated or of meteoric origin. Further concentration takes place (1) by oxidation, hydration and solution in the zone of weathering and re-precipitation in the zone of secondary enrichment; (2) by the mechanical agents of erosion and sedimentation, and (3) by chemical and bacterial agents leading to precipitation in seas, lakes and swamps.

It will be seen from these considerations that ore deposits can be divided into two great classes according as they are of *primary* or of *secondary* origin.

The Primary Deposits may be subdivided into:—

- (a) Magmatic differentiations within the boundaries of the igneous mass;
- (b) Deep-seated injections of materials extracted from the magma by differentiation;
- (c) Infillings and replacements at moderate depths by magmatic waters or by meteoric waters heated by descent;
- (d) Infillings and replacements near the surface by waters of meteoric origin.

The Secondary Deposits are:—

- (a) Oxidation and reduction ores in the zones of weathering and secondary enrichment;
- (b) Residual ores;
- (c) Detrital ores;
- (d) Precipitated ores.

The form assumed by ore deposits will be referred to later. As regards their mineral composition, it is necessary in the first place to distinguish between the *ore* and the *gangue*, the latter being the name given to the minerals that accompany the ore.

In the deep-lying parts of the deposit, or what is often called the *primary sulphide zone*, the ore-forming metals occur in combination with sulphur, tellurium, arsenic and antimony (as sulphides, tellurides, arsenides and antimonides of one or other of the metals—gold, silver, mercury, lead, vanadium, zinc, nickel, cobalt, etc.), or as silicates (of iron, manganese), or oxides (of iron, tin, chromium). Occurrence in the native state is in this zone confined to a few of the metals (gold, platinum, iridium, palladium, etc.).

In the upper portion of the lodes, in the *zone of oxidation*, the metals occur as carbonates, sulphates, phosphates, arseniates, anti-

moniates, chromates, silicates, chlorides, oxy-chlorides and hydrates. Where special conditions involving strong reduction prevail certain metals appear in the native state (copper, silver, mercury).

The commonest gangue minerals in the deeper parts of the lodes are quartz and the sulphides of iron (pyrites, marcasite, arsenopyrite). Nearer the surface the hydrated forms of silica (opal and chalcedony), the carbonates of iron, calcium, barium and magnesium (siderite, calcite, aragonite, witherite, dolomite) and the sulphates of calcium and barium (gypsum, anhydrite, barytes) are common.

Important deductions as to the origin of an ore deposit can be drawn from the nature of its mineral associates, always provided that care is taken to distinguish between the different epochs of mineralization, *i.e.*, to say whether the mineral in question belongs to the primary period of mineralization, or has been introduced at a later date from without, or derived from the original mineral by the chemical action of permeating solutions. Thus, for example, the presence of fluorine, boron and phosphorus-bearing minerals, such as fluorspar, apatite, tourmaline and axinite, indicates deposition at a temperature above the critical temperature of water, by the aid of the so-called "mineralizers." Heavy anhydrous silicates such as the pyroxenes, the hornblendes and the dark micas, also imply a deep-seated origin at high temperatures. On the other hand, the presence of hydrated minerals, such as chlorite, opal, chalcedony and members of the zeolite group, points to an origin near the surface at comparatively low temperatures. The association of minerals belonging to the same epoch of formation is connoted by the term *paragenesis*.

MAGMATIC DIFFERENTIATIONS

Concentration by magmatic differentiation gives rise to ore-bodies associated mainly with plutonic rocks. These, because of the slowness with which they cool, offer the greatest facility for such concentration. A marginal segregation of the heavier minerals is brought about in the cooling magma either by fractional crystallization and gravitation of the crystals thus formed or by liquation, the latter process being a separation into two immiscible fluids, the heavier of which sinks to the bottom of the magma basin.

The density increases with the number of molecules of metallic oxides, such as those of iron, chromium, nickel, copper, calcium, magnesium. Hence these molecules will be more abundant in the lower than in the upper portion of a magma basin. In general, therefore, the net result is the formation of a basic peripheral zone and an acid (that is siliceous) central portion. As a rule the ores are concentrated in the peripheral portion, although exceptionally they occur in the heart of the igneous mass itself.

Deep-seated Injections.—The examples referred to in the preceding paragraphs are segregations within the igneous magma itself; but the majority of ores, although derived in the first instance from igneous magmas, are concentrated beyond the limits of the magma basins.

The formation of tin and copper deposits as the result of the consolidation of a granite magma is worthy of consideration in this connection. An undifferentiated granite magma may be considered as a solution containing, among other constituents, a certain amount of water and the chemically active elements boron, fluorine, chlorine, phosphorus, sulphur, tellurium, etc., which are spoken of as "mineralizers," since they possess the property of forming volatile compounds with the heavy metals. As the magma cools it separates into differentiates of varying composition; and consolidation of the different fractions takes place in the order of decreasing viscosity, the final residuum containing an excess of silica, a portion of the alkalis, practically all of the water and compounds of the metals, tin, tungsten, molybdenum, uranium, lead, copper, iron and many of the rarer metals.

In the early stages of consolidation cracks and fissures are formed in the cooling crust, into which the liquid residuum of the magma is injected. The earliest injections give rise to quartz-porphyrates and felsites; later differentiates are pegmatites and aplites; while the most acid extract consolidates as almost pure quartz. While the temperature of the crust is still high and before

it has fallen below the critical temperature of the acid vapours, a proportion of the latter escapes into the surrounding rocks. These gaseous emanations deposit their mineral burden to a minor extent in fissures in the solidified crust of the igneous mass itself; but the main deposition is in the older rocks beyond, to which access is gained through bedding planes, joints, faults and crush-zones.

The tin-ore deposits contain the metal in the form of the oxide, SnO_2 (cassiterite) which is probably derived from the granite in the form of fluoride of tin— SnF_4 —a volatile compound which, emitted at a high temperature, decomposes at a lower temperature in the presence of water vapour to a dioxide of tin, as shown by the following equation:

The deposits are characterized by the presence of the fluorine-bearing minerals—fluorspar (fluoride of calcium) and topaz (a fluoride and silicate of aluminium) and the boron-bearing minerals—tourmaline and axinite; whilst among metallic compounds are found wolfram (a tungstate of iron and manganese), ilmenite (a titanate of iron) and various sulphides and arsenides of copper, iron, lead and silver. Some of these compounds often constitute valuable ore-deposits of the respective metals. For instance, in Cornwall the upper portions of the lodes, to-day being mined exclusively for tin, carried copper in such quantities as to have made that county the world's chief producer of that metal in the early part of the 19th century. This depth-change in mineral content is a function of the temperature and pressure of the ascending mineral-bearing vapours and solutions and is sometimes referred to as the *zonary distribution* of ores. Experience has shown that the order of the zones of ore occurrence in the Cornish lodes from below upwards is tin, tungsten, copper, zinc, lead, silver, and this is the order of increasing solubility of the compounds of these metals in the ascending magmatic waters.

The highly-heated soluble constituents of the intrusions as they pass into the invaded formations profoundly modify their mineral composition. Among the sediments, the aluminous (shales and slates) and the calcareous (limestones) are the most subject to modification. The aluminous rocks develop tourmaline, sillimanite, staurolite, andalusite and topaz—all silicates of alumina, while the calcareous rocks yield garnet, axinite, wollastonite, diopside, scapolite, vesuvianite and epidote—all lime-bearing silicates.

In places these contact phenomena are accompanied by the development of ores, and thus give rise to an important class of ore-bodies generally described as *contact-deposits*. As a rule they are metasomatic replacements of limestone. Excellent examples are found in the so-called porphyry-copper deposits of the Western States of America (e.g., in Arizona, New Mexico and Utah), where copper ores occur in limestone at its contact with intrusive monzonite and quartz-porphyry. The principal contact minerals are garnet (andradite) and epidote. The primary ores are cupriferous iron pyrites and zinc-blende to which must be added the high grade copper sulphides—chalcocite and bornite, in the zone of secondary enrichment. Near the surface, subsequent leaching by meteoric waters generally gives rise to a zone which may be barren, but in places contains oxides and carbonates of copper.

Equally important are the iron-ore deposits, which occur in limestone at its contact with igneous intrusions of an acid or intermediate type. Magnetite is the principal ore mineral, although haematite also occurs but in smaller quantity. Characteristic associates are the iron-garnet (andradite), the iron-pyroxene (hedenbergite), olivine and ilvaite. Deposits of this character are found in the Banat province of Hungary, on the island of Elba and in the Oslo district of Norway.

HYDROTHERMAL DEPOSITS

The part played by water in the formation of ore deposits is of the first importance, for on account of its mobility and solvent action, which is enormously increased at high temperatures and pressures, it is the universal vehicle for the transference of mineral matter.

In the hydrothermal circulation the mineral-bearing solutions are in part directly connected with igneous magmas, namely in so

far as they are formed by the cooling of aqueous vapours given off at a late stage in their consolidation. A considerable proportion, however, are no doubt surface waters (*i.e.*, meteoric in origin), which, descending along fractures, derive their thermal properties from the secular heat of the earth, or by coming in contact with, or into the near neighbourhood of, igneous intrusions.

Of the water that falls as rain one part is the *run-off*, that is to say, water that reaches the rivers without having penetrated the surface. A second part is returned into the atmosphere by *evaporation*; while a third part disappears into the soil and underlying rocks by *percolation*. Under the influence of gravity the water of percolation penetrates into the earth's crust, first through the superficial weathered and disintegrated layers and then through the more solid rocks by way of the fractures of jointing and faulting, the planes of bedding or the pore-spaces between their constituent minerals.

It is a matter of common observation that at a variable depth below the surface, there is a connected body of water, which permanently fills all openings. The surface of this sea of water is called the *level of the ground-water*, the *permanent water level*, or the *water-table*; it is the upper level of the *belt of saturation*.

Above the permanent water level is the *zone of percolation* in which the openings in the rocks are only intermittently filled with water. This water is in active movement and air is present. The thickness of the zone of percolation varies greatly. At sea-level and at, or near, streams or lakes the level of the ground-water reaches the surface; in average areas it is from 10 to 1,000ft. below the surface; in high-lying districts with small rainfall it may be 100 to 300ft. below the surface, and in elevated desert regions as much as 1,000 to 2,000ft. below the surface.

The belt of saturation is divisible into two portions. The upper portion, or that part which has a means of horizontal escape and discharge, is the *zone of discharge*. In general, it lies between the water-table and sea-level. In it the circulation is vigorous, as is evidenced by the vast volume of water discharged by springs.

The bottom part of the belt of saturation is the *static zone*. In it the waters are practically stagnant, or at best move very slowly. Near the bottom limit of the static zone the water gradually diminishes until the *dry zone* is reached. The boundary between these two zones is quite irregular, descending to great depth along fractures and rising high in solid ground. The lower levels of most deep mines are in the dry zone, in some places reached at a depth of not more than 1,000 to 1,500ft. below the surface.

The waters circulating in the zone of percolation are cold, contain free oxygen and are acid with dissolved carbon dioxide. Such waters have been termed *vadose* (Lat. *vadosus*, shallow) by Pošepný. They have a strong oxidizing effect on sulphides, pyrites for instance being decomposed with formation of oxide of iron and sulphuric acid. The net effect of the vadose circulation, therefore, is destruction, and the zone of percolation is practically coincident with the *zone of weathering*, although the latter overlaps the upper portion of the zone of discharge.

In the zone of discharge the waters, as they descend, lose their oxygen and carbon dioxide and deposit material brought from the zone of weathering. When they have access to open channels they penetrate deeper and deeper, absorb heat and thus become powerful solvents of the metallic sulphides and tellurides.

Ultimately these heated waters, together with those of magmatic origin, ascend, and as they cool and mingle with the descending vadose waters deposit their mineral burden, either in the main channels of circulation, thus forming *ore-veins*, or in the pores of the rocks forming the so-called *cemented* ore-bodies.

As the openings become closed by cementation, however, the circulation becomes feeble and ultimately completely stops, although earth movements may refracture the rocks and inaugurate a new circulation. The vertical movement of the water is confined to the zone of fracture and cementation. Below this zone, the pressure is sufficiently great to produce a differential movement of the rock particles, and thus to close all openings by *rock-flow*. For free upward movement the ground must be fissured, fault-fractures, especially when brecciated, and shear-zones are preferentially used by the ground waters, and these, therefore,

frequently become the seat of the deposition of ores. The existence of impervious formations is an important factor in directing the general circulation of underground waters, and in the localization of ore deposits.

The deposition of minerals from solution is brought about in a variety of ways. Solutions which are unsaturated at depth become, as they ascend, saturated by decrease of temperature and pressure. Chemical reactions also come into play—for instance, between solutions of different origin, between solutions and solids and between gases and solutions. Under one or more of these conditions the metallic burden is precipitated, lining and ultimately filling the channels traversed by the solutions. But not only are open channels filled: the wall rocks of the fissures may be affected or the constituent minerals of the rocks attacked by the penetration of the circulating waters. Consequently, two distinct classes of hydrotogenic ore-bodies must be distinguished, namely *cavity-fillings* and *metasomatic replacements*.

Cavities in rocks are due to a variety of causes. The openings may be those of dissection, *i.e.*, fractures of dislocation (faults), or contraction-joints; they may be the interstices of sediments or gas-pores in lavas; they may be due to the folding of sedimentary beds (saddle and trough openings); or they may be solution-cavities in limestone and dolomite, *i.e.*, caves, sink-holes and enlarged joints and bedding planes. The filling of fault-fissures, zones of brecciation, interstitial openings and the vesicular cavities of lavas, gives rise to important ore deposits.

Metasomatic replacement is responsible for the formation of perhaps the largest class of ore-bodies. By metasomatism is meant the replacement molecule by molecule of a constituent of a rock by new mineral matter. Such replacements can be effected not only by water below the critical temperature, as in the hydrothermal circulation, but also by gases, as in the case of pneumatolytic replacement.

Since different minerals are differently affected by solutions, rocks will be more or less completely replaced according as they are made up of aggregates of the same or of different minerals. Limestones and dolomites, which are composed almost entirely of either calcite or the mineral dolomite, are far more liable to extensive and complete replacement than any other type of rock. They lend themselves to replacement both by the facilities they offer for circulation and by the solubility of the carbonates of which they are composed.

Where rocks of differing susceptibility to replacement occur in alternate beds the more soluble will be preferentially replaced, thus giving rise to a bedded type of ore deposit. Impervious beds crossing the paths of vertical fissures retard or stop the flow of solution, with the result that the latter, by spreading out beneath or above the impervious layer, tends to form characteristic pear-shaped replacements. In cases where there is a rapid alternation of impervious and permeable layers, selective action leads to the formation of serrated or tooth-shaped ore-bodies.

In sandstones whose cement is calcareous, the replacement of the calcite by ores is common; but it is sometimes difficult to say whether the disseminated ore particles have been produced by replacement, or by the filling of inter-granular spaces. Disseminated ore-bodies may also be produced by the differential alteration of igneous rocks, since these are aggregates of minerals varying in susceptibility to alteration.

Among the best examples of metasomatic replacement are the lead and zinc deposits found in limestone. Sulphides of lead and zinc are soluble in alkaline sulphides without decomposition. In contact with limestone such solutions deposit these sulphides as galena and zinc blende. Two types are common, *viz.*, *flats* and *pitches*. A flat is a replacement which has progressed outwards into the limestone from bedding planes. On the other hand, a pitch is a replacement which has been effected from joints in the limestone. The names refer to the horizontality, on the one hand, and to the steep dip, on the other, of the respective deposits.

OXIDATION AND REDUCTION ORES

The free circulation in the zone of percolation of waters charged with oxygen and carbon dioxide makes it, in effect, one of oxida-

tion, in which rocks and ore deposits become disintegrated and their component minerals decomposed with removal of the soluble constituents. The chief chemical processes involved are hydration, oxidation and carbonation. Silicates are broken down, the alkalies and alkaline earths being removed as soluble bi-carbonates, whilst silica is set free. Sulphides give place to soluble sulphates or to sulphuric acid.

The soluble compounds are carried down to the belt of saturation. A portion is lost in the waters escaping in the zone of discharge. The remainder is deposited as the descending acid waters become neutralized by the alkaline waters of the lower zone.

The changes produced in ore deposits by the process described above are most striking, and of the greatest economic importance. Those metals that form soluble compounds are removed from the zone of weathering, leaving in most cases an impoverished residual material. On the other hand, the precipitation of new metallic compounds or of the metals themselves at lower levels leads to enrichment at those levels. As a rule oxy-salts, halogen salts and native metals are precipitated above the water-table, while secondary sulphides are deposited below it.

The dictum of the mining camp that lodes become richer in depth, is therefore only true as regards their upper portions. In progressing from the outcrop downwards, a barren or lean portion of the lode is first passed through. As the water-table is approached, the metal content increases, attaining a maximum in a zone of secondary sulphides below it; the grade then falls until a minimum is reached in the unenriched zone of lean primary sulphides.

The *zone of secondary enrichment* is of prime importance for the mining of copper and silver, the bulk of these metals being won from it. Copper mines, rich in their upper levels, become poor in depth and ultimately unpayable when the lean primary ores are reached, unless the deposits are sufficiently large to be worked at a very low cost. The primary ore is almost invariably a cupriferous iron pyrites. On oxidation the copper goes into solution either as sulphate or as a bi-carbonate, and is removed, leaving behind the iron oxides. Consequently a prominent feature of copper lodes is the existence at or near the surface of a *gossan* or *iron-cap* (*chapeau de fer*), from which the valuable copper content has been removed. In wet climates the gossan consists almost entirely of hydrated oxides of iron. In drier climates, the anhydrous oxide (haematite) occurs; and in still drier climates (for instance the rainless regions of Arizona and Chile) gossans contain chlorides and sulphates of copper, which in wet climates are unable to exist in the solid state.

The copper minerals especially characteristic of the upper portion of the zone of secondary enrichment are the hydrated carbonates—malachite ($\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$) and $(2\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2)$, chrysocolla, the hydrated silicates—chrysocolla ($\text{SiO}_2 \cdot \text{CuO} \cdot 2\text{H}_2\text{O}$), and an oxy-chloride—atacamite ($\text{CuCl}_2 \cdot 3\text{Cu}(\text{OH})_2$), together with native copper. Lower down, the sulphides—chalcocite (Cu_2S), bornite ($3\text{Cu}_2\text{S} \cdot \text{Fe}_2\text{S}_3$) and covellite (CuS), are found.

Detrital Ores.—The work of weathering is twofold; namely, mechanical disintegration and chemical change. Comparatively few minerals resist the attack of the chemical agents, but amongst them there are some that are of importance from the economic point of view—*e.g.*, gold, platinum, magnetite, ilmenite, cassiterite, wolfram, monazite, corundum, diamond, etc. The agents of mechanical disintegration are the diurnal and other variations of temperature, the expansion of water on freezing, the erosion due to running water, the sand-blast action of wind, etc. The detritus is carried down the slopes of the hills by running water and distributed according to specific gravity and size of grain.

The transported material accumulates in the valleys of rivers, in lakes or on sea beaches, and the resulting deposits are accordingly classed as alluvial, lacustrine and marine gravels ("placers"). A large proportion of the world's gold has in the past been won from them. On account of its high specific gravity the metal is concentrated in the coarse gravels and among the boulders at the bottom of the placers, the most valuable accumulations being often actually on the bed-rock itself. If the latter happens to con-

sist of steeply-dipping schists or slates, the upturned edges of the latter act as natural riffles, or bars, which catch and retain the gold particles. Accumulation also takes place on what are known as "false bottoms," which are beds of clay or sand cemented by iron ("pan") and alternate with the beds of gravel.

Placer gold is usually associated with a heavy black sand consisting of magnetite, ilmenite and haematite, together with chromite, garnet, zircon, spinel and other heavy resistant minerals; but obviously the particular association is determined by the nature of the parent rock. The character of the gold is variable: it occurs in flat scales and flakes, in rounded particles, and as irregularly-shaped grains and nuggets bearing evidence of much attrition. In size it varies from the finest dust to nuggets weighing thousands of ounces. It is probable that these large nuggets have increased in size since they were first deposited. The fact that auriferous pyrites are found replacing the woody fibre of tree stems in the alluvial drifts of Victoria and California shows that under favourable conditions an enrichment through chemical action (that is, solution and recrystallization) can take place.

The richest gravels are formed by a re-sorting of earlier auriferous gravels, terraces of the latter being often situated several hundred feet above the workable deposits.

Placers occur in the river systems of every part of the world; but the greatest amount of gold has been won from the Recent and Pleistocene gravels of California, Alaska, Australia and Siberia. The older gravels are often deeply buried under a thick cover ("over-burden") of clay, soil, peat and moss, which is sometimes permanently frozen, as in the tundras of Siberia and Alaska; while in Australia and California the ancient river systems are concealed by later flows of lava, their auriferous gravels being then known as "deep leads."

Auriferous beach deposits or marine placers are formed on certain coasts where the conditions are favourable for the separation, by surf action, of the gold and heavy minerals from the sand and lighter stones. Such deposits occur in New Zealand, on the beaches of Oregon, Alaska (Nome and Cape Yagtag), Chile, and Nova Scotia. Usually the gold occurs in a black sand consisting of magnetite, ilmenite and haematite; but these mineral associations are not constant: for instance, while in New Zealand the black sands are so rich in iron that it has been seriously proposed to work them for that metal, in the Cape Yagtag deposit the iron-ores are absent, their place being taken by garnet.

The auriferous conglomerates (locally termed "banket") of the Witwatersrand in the Transvaal, which have produced so large a proportion of the world's gold since their discovery in 1886, are considered by some to be ancient placers. Against this view, and in favour of a secondary origin for the gold, it might be urged that the latter shows no evidence of detrital origin, occurring, as it does, in crystalline particles and minute flakes in close association with pyrites. Moreover, the rest of the cement consists of crystalline quartz which has evidently been introduced, like the pyrites, subsequently to the deposition of the gravels. The only unmistakably primary constituents, besides the quartz pebbles, are diamonds, chromite and zircon, while the following minerals of secondary origin occur in the cement: quartz, chlorite, chloritoid, pyrites, marcasite, pyrrhotite, galena and blende.

If it be conceded that the gold, derived from the denudation of quartz veins in the schists and granite of the Primitive System, was deposited simultaneously with the quartz pebbles of the gravels, it must, on the other hand, be admitted that the original alluvial gold has been completely dissolved and re-precipitated.

Platinum is occasionally associated with gold in the residual and alluvial gravels of California, British Columbia, Brazil, Colombia and Borneo.

In districts where granite prevails the residual and river gravels often contain cassiterite, and such stanniferous gravels form the source of the bulk of the tin production of the world. They occur in Cornwall, the Malay States, Australia, Tasmania and in South Africa (Swaziland and the Transvaal).

RESIDUAL ORES

The residual deposits always attain their greatest develop-

ment in those countries that have been unsubmerged for a vast period of time; and where the weathered products have neither been pared off by glacial erosion, nor the solid rocks protected by superficial accumulations. Under especially favourable conditions of climate and topographic relief, disintegration, accompanied by the removal of soluble material, has progressed to many hundreds of feet below the surface, the whole of this zone consisting then of soft decomposition products that bear no likeness to their parent rock, although certain original structures, such as bedding and foliation, may be retained.

The materials composing the bulk of the residual deposits are gravel, quartz-sand and clay or lithomarge (an amorphous hydrated aluminium silicate, having the composition of kaolinite, viz.: $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 2\text{H}_2\text{O}$ and more exceptionally the mixture of hydrated oxides known as *laterite*. This latter material occurs in tropical and semi-tropical countries like India, the Malay Peninsula, the Dutch East Indies, South America, and East, West and South Africa; in fact, it appears to be one of the commonest residual products of ferruginous and aluminous rocks under suitable climatic conditions.

A great number of analyses of laterite have clearly established the fact that it consists to a large extent of a mixture of oxides and hydrated oxides of iron, aluminium, titanium and manganese: they show also that the water is chiefly combined with the aluminium oxide, the iron oxide being mostly present in the anhydrous or slightly hydrated condition (haematite or turgite). The ratio between the iron oxides and the aluminium oxides may vary to any extent, so that, while some laterites approximate in composition to high-grade iron-ores, others are almost pure bauxite which is the chief source of the metal aluminium. When manganese is present, it usually occurs in nodular concretions of psilomelane, wad or pyrolusite, which are sometimes sufficiently abundant to constitute ores of manganese. Mixed with these oxides in varying proportion are a lithomargic clay and quartz sand.

There has been much discussion and considerable divergence of opinion as to the origin of laterite; but all are agreed that it may result from the decomposition of a great variety of rocks, whether of igneous, sedimentary or metamorphic origin. The generally accepted view is that laterite is a residual accumulation produced by the removal in solution of combined silica, lime, magnesia and the alkalies, assisted by metasomatic replacement with material brought from the underlying rock in periods of desiccation by capillarity, aided perhaps by the rootlets of forest trees.

Laterite, when exceptionally rich in iron, is of considerable economic importance. Such, for instance, are the iron ores of Cuba, which occur as residual mantles on the high-lying plateaux of Malaya and Moa. Similar deposits occur in the Philippines, in Borneo, and in West Africa. The iron ores of Bilbao in North-west Spain are also in part residual deposits.

Workable manganese deposits are nearly always residual concentrations from manganese minerals sparsely distributed through igneous rocks and crystalline schists. Deposits of this character are widespread in India, United States, Brazil, West Coast of Africa and many other places.

The nickel deposits of New Caledonia are of residual origin, the nickel ores being hydrated silicates (garnierite and genthite) occurring as earthy and brecciated masses in a ferruginous and clayey mantle overlying serpentine and peridotite.

Residual gravels containing tinstone and wolfram occur on Bodmin Moor in Cornwall. Others containing galena have been profitably worked in North Wales and again others, containing zinc ores, have been exploited as a source of that metal in Galicia. They have originated by the weathering of veins in limestones, chemical action on the soluble limestone having outpaced the mechanical erosion of the resistant minerals of the veins.

Precipitated Ores.—Many deposits of iron ore owe their origin to the precipitation in seas, lakes and swamps of iron derived from the decay of rocks in the zone of weathering. Iron goes into solution in this zone either by the oxidation of the sulphides of that metal, or by the breaking up of ferro-magnesian silicates. Soluble iron compounds are also formed by the action of certain bacterial organisms present in the soil. Reduced by these organ-

isms to the ferrous state, the iron combines either with the organic acids of the humus, or with the carbonic acid of the atmosphere, to form a soluble bicarbonate.

On exposure to air, or in the presence of plant life, carbon dioxide is given off and iron carbonate is precipitated, as shown by the following reaction:

The ferrous carbonate rapidly oxidizes to ferric hydrate, and is deposited as *bog-iron* or *iron-pan*. A continuous layer of this pan consequently tends to form below insufficiently drained clayey and peaty soils. The formation of ferric hydrate in stagnant swamp water, where ferrous carbonate is undergoing oxidation, may actually be seen in operation, the iridescent films that form on such water being an indication that the reaction is taking place.

When the waters deposit iron in the presence of much carbonic acid, or of decaying organic matter, siderite (FeCO_3) is deposited. In muddy waters the silt goes down with the iron carbonate leading to the formation of *clay-ironstone*. These clay-ironstones or spathic ores as they are also termed, occur in the coal measures of the British Isles and in those of Westphalia and North America, and are an important source of iron. Though the iron content does not on the average amount to much more than 30%, the comparative leanness of the ore is compensated by the low percentage of phosphoric acid, which seldom rises above one per cent. The *black-band* ores of the coal measures are a similar deposit, but differ from the bulk of the clay-ironstones by the high percentage of vegetable or peaty matter they contain; sufficient to furnish the fuel required to calcine them. Such ores represent what was once a carbonaceous mud in which ferrous carbonate was precipitated. The Scandinavian *lake-ores* are an interesting example of precipitated iron ores.

The Jurassic iron ores of England and the similar *minette* ores of Lorraine and Luxembourg on the Continent, which constitute the greatest reserves of iron ore in Europe, form well-defined beds in a sedimentary series of sandstones, shales and limestones. Although low in iron (25 to 40% metallic iron) in many cases their large lime content makes them largely self-fluxing, and having a high percentage of phosphorus they are admirably suited for the production of pig iron for the basic process of steel-making. Their oolitic structure (so named from the resemblance to fish roe) is produced by the deposition of carbonate of lime and carbonate of iron around sand grains or fragments of fossils. In the zone of weathering, the spathic ores are oxidized to limonite, a change in colour from green to red being characteristic. Some secondary enrichment also takes place under favourable conditions. These iron ores are worked in England on three horizons, namely the Inferior Oolite (*Dogger* or *Northampton stone*) the Middle Lias (*Marlstone*) and the Lower Lias (*Frodingham stone*).

The metal content of the copper-bearing sandstones so widely distributed throughout the world, owes its origin, partly to precipitation and metasomatic replacement, partly to sedimentation. The prevalence of these deposits in the red beds of the Upper Carboniferous, Permian and Trias formations indicates sedimentation in the shallow seas of desert regions where evaporation was rapid. The copper was no doubt leached out, from earlier copper deposits in continental areas, by meteoric waters rich in sodium chloride and calcium sulphate. Transported as sulphate or chloride it was precipitated in inland seas or lakes and reduced to chalcocite by decaying organic remains. The replacement of tree-trunks and other plant remains as well as of the cementing material of the sandstones by chalcocite is a feature of these deposits.

The accumulation of cupriferous detritus while sedimentation was in progress, was no doubt a factor of the concentration in some cases, but such material of the original deposit would, of course, be subsequently modified by the circulation of the ground waters. Associated minerals are calcite, gypsum and barytes. In the zone of weathering the copper ores are oxidized to the green and blue carbonates—malachite and azurite.

THE FORM OF ORE DEPOSITS

Ore deposits occur in a multitude of different forms, but for convenience these may be reduced to two types—namely the

tabular or sheet-like and the non-tabular.

Tabular deposits are either beds forming a part of the general stratification of the country, or veins or lodes that have been formed by the filling of fissures, or the replacement of their adjacent "country." As a rule, the veins cut across the stratification; more rarely they conform with the strike and dip of the formation in which they occur and are then termed *bedded veins*. Where a number of parallel fissures are irregularly connected the system is known as a *composite vein* or *lode*. The term *linked veins* is used in a similar sense. A system of closely spaced and parallel veins is spoken of as a *sheeted zone*. *Gash veins* are those that do not extend beyond a given bed of the formation in which they occur, usually limestone.

Although veins have been defined as tabular deposits, the parallelism of their bounding surfaces is only true in a very general sense, for unless they are fissure-fillings they have more often than not only one well-defined wall, and in some cases none at all. In mining, however, it is usual to speak of the hanging wall and the foot wall of a vein to distinguish the limits of the workable deposit whether they are well-defined or not.

Where the filling of the fissure has been followed by differential movement, one or both of the walls are usually smooth and polished (*slickensides* or *friction-planes*), and between the actual vein-filling and the wall of the country rock there is often a thin selvage of comminuted rock or clay known as *flucan*.

Where the fissuring was accompanied by dislocation, as is mostly the case, the veins have a lenticular character along both the strike and dip. This lenticular character is due to the differential movement of curved or warped surfaces. Between the lenses the fissure is often so constricted that no ore occurs at all. When the axes of the lenses lie in one plane the lenses are connected by stringers; when they lie *en échelon* they are usually disconnected.

Not every part of a vein is equally mineralized: the pay-ore tends to localization in certain definite portions of the vein separated by low-grade material or even by barren gangue. The richer portions are termed *ore-shoots*. If they have a tendency towards the horizontal, they are distinguished as *ore-courses* or *ore-horizons*; if, on the other hand, they tend towards the vertical, they are known as *columnar ore-shoots* or *chimneys*. But the term *ore-shoot* is not restricted to the occurrence of high-grade material in a low grade matrix; it is also applied to the development along a fissure of lenticular bodies of pay-ore, separated by barren country rock. It has been proposed to call this latter class of ore-shoot *shoots of occurrence*, and to use the term *shoots of variation* for the former. Shoots of variation are usually distinguished from shoots of occurrence by a gradual diminution of the values near the boundaries of the ore-shoot.

Non-tabular deposits vary greatly in shape and size. They may be large irregular masses or small pockets of solid ore, or they may be *stockworks*, i.e., reticulated masses in which a multitude of small veins traverse a portion of the country rock. Of exceptional character are *chimneys* or *pipes*, which are ore-bodies having a rudely circular or elliptical cross-section with considerable vertical extent. *Saddle-reefs* are a special type of cavity-filling. Those of Bendigo in Victoria, Australia, have resulted from the folding of the Ordovician strata into a series of anticlines and synclines. The deposition of quartz in the openings formed at the crest of the anticline below a sandstone and above a shale bed has given rise to auriferous ore-bodies. Since the sandstone and shale beds alternate repeatedly the saddle-reefs occur, one above the other as disconnected ore-bodies, in what is known to the miners as the "centre country." Thus the New Chum and Victoria mine had 30 superimposed saddle-reefs, down to a depth of 2,300ft. The deepest mines are working at about 4,000ft.

ORE DRESSING is an important process in the field of mining (*q.v.*). It may be defined as mechanical concentration whereby valuable minerals in an ore are separated from worthless impurities or gangue and is distinguished from metallurgy which employs chemical methods for recovering metals and metallic compounds from rich ores or from the concentrated products of the ore dresser. Without this relatively cheap process of enrichment as compared to expensive metallurgical processes, the cost of common metals, such as lead, zinc and copper and many mineral products, would be far above present prices, and, as richer ore deposits continue to be exhausted, ore dressing will become of still greater importance. As an illustration of what ore dressing is doing for copper alone, the so-called porphyry-copper mills may be cited. In some of these mills 100 tons of ore assaying not over 1% copper will yield three tons of concentrates assaying 30% copper and 97 tons of waste tailings assaying about 0.1% copper. Thus the copper lost in the tailings is not over one-tenth of the total copper in the original ore and the expensive metallurgical process has to treat only three tons of concentrates as compared to 100 tons of original ore if concentration were not used. A single mill may treat as high as 20,000 tons of ore in 24 hours. Terms also used more or less as practically synonymous with ore dressing are milling, washing and concentration.

Ores in the majority of cases do not consist of a single mineral in a high degree of purity, but are a more or less complex mixture of different minerals, some valuable and some worthless. Native gold, tin, stone and many gems may occur mixed with gravel in placer deposits. Native copper is found sprinkled through rock masses. Diamonds are enclosed in a matrix of hard rock. Native gold is also found encased in quartz veins. The minerals of base metals, such as lead, zinc and copper, are commonly sulphides, oxides or other chemical compounds of these metals and occur distributed through solid rock or gangue in veins and other types of ore deposits. A given deposit may contain minerals of only one metal, or two or more metals may be represented and in the latter case the problem of the ore dresser becomes harder as he has not only to eliminate the waste gangue but also to separate the minerals of one metal from those of another. Beside minerals of the metals, there are many non-metallic minerals which likewise require elimination of gangue by concentration before these minerals become marketable. Among such minerals are mica, graphite, feldspar, asbestos, fluorspar, phosphate rock and the abrasive minerals garnet, emery and corundum. Even common sand and gravel may be washed to get rid of undesirable constituents and likewise clay to free it from grit and mica. The best examples of ores which do not require concentration are the iron ores of the Lake Superior region. Much of our bituminous coal is also sufficiently free from impurities to be marketed direct but even on iron and coal considerable washing is in use for lower grade deposits and this is bound to increase as the richer deposits are worked out. The subject will be considered in three divisions: (1) Properties of minerals which aid their separation; (2) Individual machines and unit operations; (3) Complete mill systems.

Specific Gravity has been the most important property in concentration. Valuable minerals are usually heavy and gangue minerals light, although there are exceptions. Thus the rate of settling in water or air or the tendency of a mass of grains to stratify when acted on by currents of water or air makes it possible to separate a lighter mineral from a heavier one. Size has to be considered also since a large grain will settle faster

than a small grain of the same mineral and, consequently, large grains of light minerals are equal settling with small grains of heavy minerals. Separation based on specific gravity is commonly called gravity concentration. Colour, lustre and fracture are of aid when valuable minerals are being separated from waste by the process of sorting or picking by hand selection. These properties also enable the operator to make the proper line of division between the products coming off a concentrating machine. Fracture and cleavage will affect the form of the grains produced by crushing. Flat grains settle less readily than rounded or cubical grains. Hardness, toughness, friability and brittleness affect the power used in crushing ores. Decrepitation which causes some minerals to fly to fine pieces when heated enables such minerals to be separated from other minerals which do not decrepitate and thus remain coarse.

Magnetism is a property possessed by certain minerals in a greater or less degree and electro-magnets of varying strength will separate such minerals from one another and from non-magnetic minerals. Some minerals, notably pyrite, are made magnetic by heating and become susceptible to magnets. Pyrite is also made porous by heating or roasting which changes its apparent specific gravity and may aid its separation. Electrostatic charges which are taken on quickly from an electrode by good conductors such as metals and sulphide minerals, except zinc sulphide, cause such minerals to be repelled more quickly from the electrode than gangue minerals and zinc sulphide which are poor conductors and receive the charge more slowly. Adhesion makes gold stick to a copper plate which has been amalgamated or coated with mercury and diamonds stick to a greased plate while associated waste minerals are washed down over the plate in both cases without adhering. The flotation property of minerals is a complex action not fully understood but it involves intermolecular forces of surface tension, adhesion and adsorption along with static electric charges and even chemical action. This process has developed rapidly in recent years and now vies with gravity concentration in importance and is therefore treated under a separate heading.

Crushing.—Unless an ore occurs as a placer or gravel deposit, it must first be crushed to free the valuable minerals from the attached gangue and the amount of crushing necessary will depend on the fineness of dissemination of the mineral. Furthermore, the final separation of the crushed material usually involves preliminary preparation by sizing or classification to yield a series of graded products going to different types of concentrating machines since no one machine can make a satisfactory separation when fed with a mixture of coarse and fine. When all the ore is reduced directly to a fine state, as for flotation, this preliminary grading is unnecessary.

Crushing customarily proceeds in steps and the best practice is to remove from the feed to any one crushing machine all particles which are already as fine as the product of that machine. Some machines, such as stamps, have a screen as an integral part of the machine to guarantee that the product shall all be below a specified maximum size while other machines, such as rolls and ball mills, require that a screen or classifier be connected in "closed circuit" with the crushing device to size out the finished product and return the coarse unfinished material for further reduction. Roughly, the field of coarse crushing involves the use of breakers of the Blake or gyratory type which receive lumps up to 5 or 6 ft. in diameter and reduce in a series of steps, with a reduction in size of about one-quarter at each step, down to a final product 1 or 1½ in. in size. For intermediate crushing, there are rolls, steam stamps, Symons disc crushers, both horizontal and vertical and Symons cone crushers. Rolls handle feeds up to 1 or 2 in., make about one-fourth reduction in size and can crush economically down to ¼ or ⅓ inch. Steam stamps, which are limited to use on the special problem of native copper ore, strike an extremely powerful blow by a steam-driven pestle in a mortar. The feed is 2 or 3 in. in size and the product ½ or ⅓ inch. The Symons machines are relatively new but are finding wide application in the field of crushing between 6 or 8 in. feed and around ½ in. product. In the Symons cone, the central gyrating cone is very flat and is overlain instead of surrounded

by the fixed ring. The Symons disc crushers have a wobbling or tipping disc and a fixed disc. At a given instant, a point on the circumference of the wobbling disc is approaching the fixed disc while a point 180° away or diametrically opposite, is receding. This motion progresses around the circle so that in a complete wobble the space between the discs has opened and closed at every point. Many devices have been used for fine crushing or grinding but the more important are gravity stamps, roller mills, grinding pans, ball mills, rod mills, tube mills, Chile edgestone mills, arrastras and hinged hammer mills. The gravity stamp is discussed under AMALGAMATION: *In Metallurgy*. The grinding pan is a modification of the amalgamation pan which is also referred to under Amalgamation. The arrastra or drag-stone mill grinds the ore by dragging flat stones around a circular stone pavement. Roller mills employ cylinders which roll around inside a circular ring and ore is crushed between the rollers and the ring by pressure developed through centrifugal force or springs. Chile mills have heavy horizontal rollers travelling around a circular path. Hinged hammer mills and other forms of beating mills utilize the crushing effect of blows delivered upon the ore in space by arms or blades revolving at very high speed. Ball mills, rod mills and tube mills are horizontal revolving cylinders in which are iron balls, steel rods or flat pebbles to grind the ore as it passes through the cylinder from end to end. These revolving mills are used almost universally in ore dressing for wet fine grinding of ore for tabling and flotation, in gold and silver milling for preparing ore for cyaniding and in reducing all sorts of commercial products wet or dry, even down to impalpable powder. Feed may be as coarse as 1 or 2 in., but $\frac{1}{4}$ or $\frac{1}{2}$ in. is more economical. Hinged hammer mills are best suited to soft materials. Arrastras are nearly obsolete, as also are grinding pans. Roller mills and Chile mills are no longer used to any extent in ore dressing but find some application in commercial grinding. The use of gravity stamps is confined to gold milling. Fine grinding consumes much power since the power required increases in geometrical ratio with the fineness of the product.

Screens.—To insure a definite maximum size of particle in crushing operations and also to prepare the ore into a series of products for final separation, ranging from coarse to fine, screens are commonly used for wet work above 1 or 2 millimetres. They may be made of parallel bars or grates, of plate with holes punched out or of woven wire cloth. Common types have the form of fixed incline screens, of gently sloping revolving cylindrical screens or trommels, of plane surfaces set nearly horizontal and shaken endwise or sidewise, of horizontal or gently sloping plane surfaces in which the whole screen and frame is given a relatively slow bumping motion, of an inclined woven wire screen which is given a very rapid vibration in a direction perpendicular to the plane of the screen or of an endless travelling belt of woven wire cloth. Fixed inclined screens are used only for coarse work above 1 or 2 in. and belt screens only for fine work below 1 mm. while vibrating screens are the favourite screen to-day for work between 1 mm. and $1\frac{1}{2}$ inches.

Classifiers are used for wet grading of material below 1 or 2 mm. which is the practical limit of wet screening. Hydraulic classifiers consist of a trough with a series of pockets. The ore, carried along by water, is successively subjected to a series of currents of water from pipes. The velocities of these currents decrease in succeeding pockets so that the material discharged from the spigots ranges from coarse heavy particles in the first pocket to fine light particles in the overflow of the last pocket. Box classifiers or spitzkasten use no rising currents but increase the size of successive settling chambers so that finer and finer particles settle out from the horizontal carrying current. Mechanical classifiers employ raking devices which stir up the pulp so that only coarser particles can settle and be raked up an incline and thus removed from the pulp which still contains the finer particles in suspension. Settling tanks and thickeners are large vats in which the water moves extremely slowly so that solids settle out almost completely and are discharged from the bottom while clear water overflows from the top.

Hand Picking is used occasionally to remove either rich

material or waste material by hand from a stream of ore on a conveying belt or moving table. The economical minimum limit of hand picking is around 2 inches. Where hammers are used in connection with hand picking to cleave lumps of mixed values and waste, the operation is called cobbing.

Log Washers and Wash Trommels serve to disintegrate certain types of ores such as nodules of iron oxide in a clay matrix. They agitate the mass of ore and water, thus freeing the nodules from the clay and washing away the clay in the overflow at the lower end of the log washer or in the undersize of the trommel.

Jigs are the almost universal machines for separating ore in sizes ranging from $1\frac{1}{2}$ or 2 in. down to $\frac{1}{16}$ inch. In the movable-sieve type the ore on a screen is stratified by moving the screen up and down in water, while in the fixed-sieve or Harz jig a plunger on one side of the partition causes an alternate up and down current through the ore on a fixed sieve. Heavy minerals settle into the bottom layer of the bed, while lighter minerals are in the top layer. These heavy minerals, if fine enough, pass through the sieve into the hutch below and issue from the spigot outlet at the bottom. If too coarse to pass the sieve the concentrates layer is removed continuously by a device known as an automatic discharge. Fresh water is added continuously. A jig may have from one to six cells in series.

Jerking Tables: Wilfley Table.—These tables take up the work where jigs leave off at about $\frac{1}{8}$ in. and may handle graded material down as fine as $\frac{1}{4}$ millimetre. The Wilfley table represents the original of this type of table and consists of a four-sided plane surface having a slight slope downward. A series of riffles or thin cleats are tacked on a smooth table top and each riffle has its maximum vertical thickness at the right and tapers down to nothing at the left. Ore and water are fed at one end of the upper edge, while wash water is fed along the remainder of the upper edge. The combination of the bumping action moving the ore lengthwise of the table toward the left and of the washing action of the water across the table at right angles to the bump, causes the ore to spread out in the form of a fan with concentrates nearest the upper or wash water side. The concentrates are finally bumped over the end while the tailings are washed over the lower edge.

Vanners and Slime Tables which are suited for finer material ($\frac{1}{2}$ mm. maximum) are much less used since the development of the flotation process. The vanner feeds the ore and water on an endless rubber belt. Wash water, together with the slope of the planes and the speed of the belt travel, determines the character of the grain that can pass over the roller and be washed off into the concentrates tank. All other grains of lighter waste mineral are washed down the planes and into the tailings. A revolving type of slime table consists of a flat cone. Ore and water are fed at the centre over one-half of the circle. Light minerals reach the circumference of the table first and are discharged as tailings. Middlings are carried around by the revolution of the table and are washed off by the curved water jet and concentrates are finally removed by strong jets of water from the straight pipe. Many other forms of vanners and fixed and moving slime tables and buddles with various materials to form the separating surface have been used for concentrating fine slimes.

Electro-magnets are in use in most modern mills to remove metallic iron, such as bolts, nuts and broken drills, which has become mixed with the ore during mining. Magnetic separation is also applied where one of the minerals to be separated possesses magnetic properties. Magnets are of many types to operate on different sizes of ore, wet or dry, or to give high or low strength of field.

Dry or Pneumatic Concentrating Devices may be classifiers, jigs or tables. In every case the separation is by specific gravity, and air currents replace water currents as the separating medium. Flotation machines are described under FLOTATION. Other miscellaneous separators based on principles outside of specific gravity, magnetism and flotation, are not of sufficient importance to warrant any description here.

Accessory Apparatus.—In addition to the machinery for crushing, grading and concentrating, an ore dressing plant includes

other apparatus which is absolutely essential even though performing no actual separation. Under such apparatus may be listed storage bins for ore and products; sampling devices; automatic feeders and distributors or dividers; chutes and troughs or launders for dry and wet material; conveyors, of which the belt and pan types are most common; bucket elevators for dry ore or ore with water; centrifugal pumps for water mixed with sand or slime or for water alone; unwatering devices for recovering water; filters for fine concentrates; driers for removing moisture from ore or from concentrates; dust collecting systems; automatic weighing machines.

Complete milling processes are of wide variety according to the nature of the material to be concentrated. Perhaps the simplest process is the treatment of sands and gravels which contain valuable minerals such as gold, platinum and gems. A long trough or sluice is used on the bottom of which are small depressions called riffles in which the heavy values settle. The rough concentrates thus produced are removed or "cleaned up" periodically and are usually further enriched by some finishing treatment such as amalgamation, hand panning, tabling or magnetic separation.

Sulphide ores consisting of gangue mixed with sulphide of a single metal such as of iron as pyrite or of zinc as sphalerite or of lead as galena or of copper as chalcocite, bornite or chalcopryite, may have the sulphides occurring as relatively large masses in the gangue, in which case the ore is crushed in a series of steps using breakers and rolls or Symons crushers until the sulphide grains are largely freed from the adhering gangue. This size may vary from 1 in. down to 1 mm. according to the ore. The crushed material is next graded by screens and classifiers into one or more coarse sizes for jigs, one or more sand sizes for tables and slimes for flotation. The jigs, tables and flotation each make clean concentrates to be saved and waste tailings to be discarded and usually also a middling product which, if coarse, must be recrushed and retreated or, if fine, needs only retreatment without any crushing. If the sulphides are finely disseminated through the gangue, the ore is crushed down to $\frac{1}{4}$ mm. or finer, using ball mills or rod mills as the last step in crushing and all of it treated by flotation. Occasionally the metals occur, not as sulphides, but as oxides, carbonates or silicates but the process is similar to that for sulphides except that flotation has not yet been found to be applicable to oxidized ores of zinc or iron.

Where ores are complex, that is, containing sulphides of two or more metals, the tendency of modern practice is to discard gravity concentration and separate the different metallic sulphides from one another and from the gangue by differential flotation.

Tin ore in Cornwall contains cassiterite associated with sulphides of other metals, with wolfram and with siliceous gangues. The ore is broken to about 3 in. and hand picked to remove any lumps of clean minerals and the residue is crushed in gravity stamps to about $\frac{1}{2}$ mm. and concentrated by gravity by a rather complex system of jerking tables, vanners and slime tables of various kinds. Wolfram may be removed from the final concentrates by magnets. Sulphides may be separated from cassiterite by flotation as is the common practice on tin ores in Bolivia.

Native copper ores at Lake Superior are crushed in breakers to about 3 in., further reduced in steam stamps to about $\frac{1}{2}$ in. and then graded by hydraulic classifiers into a series of products, usually six. The coarser products are jigged and the finer products are tabled. Coarse middlings are reground in ball mills and retabled. One mill uses flotation for slimes.

Iron is a relatively cheap metal so the concentration of iron ores must be on a large scale and at low cost. If the mineral is magnetite, the process is to crush the ore in breakers and rolls sufficiently to free the mineral and then use low power electromagnets, either wet or dry, to take out the magnetite. On hematite and limonite ores, the concentration of the crushed ore is usually by log washers or similar devices, but sometimes by jigs and tables. Slimes are thrown away without any attempt to recover the iron in them.

Manganese ores containing pyrolusite as the valuable mineral are handled in much the same way as hematite iron ores. For the special problem of the franklinite ores at Franklin, N.J., the ore,

after crushing and sizing is run dry over high power Wetherill magnets which take out the franklinite and send the residue to wet jigs and tables which separate oxide and silicate zinc minerals from the waste limestone tailings. The treatment of gold ores is covered elsewhere under AMALGAMATION and CYANIDE PROCESS.

Many non-metallic minerals require concentration which may involve special processes. Serpentine rock containing asbestos is first cobbled and hand picked for coarse masses of solid asbestos. The residue is disintegrated by a form of hammer mill which reduces the rock to sand and liberates the fibre as a fluffy mass which when sent to a screen remains on the screen as oversize, while the sand passes through as undersize. Diamondiferous rock in South Africa is crushed in breakers and rolls, agitated with water in large circular pans to remove light fine waste material and leave a concentrated residue to go to jigs. The diamonds are recovered from the jig concentrates by hand picking on the coarse and greased table on the fine.

Phosphate deposits in hard rock use crushers and log washers or in soft rock or pebble form only log washers. Graphite ores employ crushing and flotation with special electrostatic process for removing mica from the concentrates. Ores of corundum, emery, ilmenite and such like, generally require a combination of gravity treatment on tables followed by further cleaning on magnets.

Coal preparation is a form of ore dressing which is based on the same fundamental principles as ore dressing, but which employs some additional processes and apparatus to meet the needs of the special problem of saving the light weight coal from the heavier slate impurity on a large scale at a low cost and with a minimum loss of coal. (C. E. L.)

OREGON, popularly known as the "Beaver State," is one of the north-western States of the United States of America, lying on the Pacific slope between 42° and $46^{\circ} 18'$ N. lat., and $116^{\circ} 33'$ and $124^{\circ} 32'$ W. longitude. It is bounded on the north by Washington, from which it is separated in part by the Columbia river and in part by the 46th parallel, on the east by Idaho, from which it is separated in part by the Snake river, on the south by Nevada and California and on the west by the Pacific ocean, upon which it has a tidal shore line, omitting islands, of 429 miles. It has an extreme length E. and W. of 375 m., and extreme width N. and S. of 290 m. and a total area of 96,699 sq. m., of which 1,092 sq. m. are water surface. Spanish, French and Indian sources for the name "Oregon" have been suggested but its definite origin is unknown. The first known use of the word is by Major Robert Rogers in his plans for an exploring expedition to the north-west coast in 1767. He applied it to a river flowing into the Pacific ocean of which he had heard and it was later applied to the Columbia river and then to the entire territory drained by the river. Out of this original territory other States were created until only the present area was left to bear the name.

Physical Features.—The coast of the State extends in a general north and south direction for about 300 m. and consists of long stretches of sandy beach broken occasionally by lateral spurs of the Coast Range, forming small bays. Parallel with the coast and with its main axis about 20 m. inland is an irregular chain of hills known as the Coast Range. It does not attain a height greater than 4,097 ft., but has numerous lateral spurs, especially toward the west.

Several small streams, among them the Nehalem, Coquille, Rogue and Umpqua rivers, cut their way through the Coast Range to reach the ocean. For the northern two-thirds of its length in Oregon, the Coast Range is bordered on the east by the Willamette valley, a region about 200 m. long and about 30 m. wide, and the most thickly populated portion of the State; here, therefore, the range is easily defined, but in the south, near the Rogue river, it merges apparently with the Cascade and the Sierra Nevada mountains in a large complex group designated as the Klamath mountains, lying partly in Oregon and partly in California, and extending from the northern extremity of the Sierra Nevada to the sea. A number of ridges and peaks bearing special names, such as the Rogue river, Umpqua and Siskiyou mountains, belong to this group. The Cascade mountains, the most important range in Oregon, extend parallel with the coast

and lie about 100m. inland. The peaks of this system are much higher than those of the Coast Range, the highest of them being cones of extinct volcanoes. Mt. Hood (11,225ft.), the highest point in the State, Mt. Jefferson (10,200ft.), the Three Sister Peaks, Mt. Adams, Bachelor mountain and Diamond Peak, all have one or more glaciers on their sides.

The Cascade mountains divide the State topographically into two sharply contrasted parts. West of this range the country exhibits a great variety of surface structure, and is humid and densely wooded; east of the range it consists of a broken tableland, arid or semi-arid, with a general elevation reaching 5,000 feet. This eastern tableland, though really very rugged and mountainous, has few striking topographic features when compared with the more broken area to the west. In the north-eastern part of this eastern plateau lie the Blue mountains, which have an average elevation of about 6,000ft. and decline gradually toward the north. A south-western spur, about 100m. in length, and the principal ridge together enclose on several sides a wide valley drained by the tributaries of the John Day river. Draining the eastern slopes of the Cascade Range for the northern two-thirds of its length and flowing into the Columbia a few miles west of the mouth of the John Day river is the Deschutes river, flowing through a valley less arid than the plateau region to the south-eastward. South-east of the Deschutes river and south of the Blue mountains lies the Great Basin region. In Oregon this area extends from the Nevada boundary northward for about 160m. and embraces an area of about 16,000 sq. miles. All of its streams lose their waters by seepage or evaporation. Many of the mountains within the basin region consist of great faulted crust blocks, with a general north and south trend. One face of these mountains is usually in the form of a steep palisade, while the other has a very gradual slope. Between these ridges lie almost level valleys, whose floors consist partly of lava, partly of volcanic fragmental material, partly of detritus from the bordering mountains.

Some large permanent lakes occupy the troughs between faulted blocks in southern Oregon, among them Malheur and Harney lakes in Harney county, Lake Albert, Warner and Summer lakes in Lake county. All of these are salt and shallow, and shrink to small proportions in the dry season. East of the Steens mountains there is, besides a number of small alkaline lakes, a playa, or mud flat, known as the Alvord Desert, which in the spring is covered with 50 to 60 sq.m. of rain water but a foot or two in depth. In the north-western quarter of the basin, occupying a level tract 150m. long and 30-50m. wide, is the Great Sandy desert. Its surface consists of a thick sheet of pumiceous sand and dust, from which arise occasional buttes and mesas. There are no surface streams even in the wet region, and no potable waters have been found. South-west of the basin and draining the southern third of the eastern Cascade slopes is the Klamath valley and river, containing the Upper and Lower Klamath lakes, much noted for their scenic beauty. Near the north-western boundary of Klamath county is Crater lake, whose surface is 6,239ft. above the sea. This lake lies in a great pit or caldera created by the wrecking in prehistoric times of the volcano Mt. Mazama, which according to geologists once had an altitude of about 14,000ft. above the sea and of 8,000ft. above the surrounding tableland; the upper portion of the mountain fell inward, possibly owing to the withdrawal of interior lava, and left a crater-like rim, or caldera, rising 2,000ft. above the surrounding country. The lake is 4m. wide and 6m. long, has a depth in some places of nearly 2,000ft. and is surrounded by walls of rock from 500 to 2,000ft. high. In spite of its great elevation the lake has never been known to freeze, and though it has no visible outlet its waters are fresh.

East of the Great Basin and the Blue mountains is the region tributary to the Snake river. The southern half, drained by the Owyhee river, is much like the Great Basin, being arid and plain-like in character. North of the Owyhee the chief tributaries of the Snake are the Malheur, Burnt, Powder and Grande Ronde rivers flowing through small but beautiful and fertile valleys.

Climate.—Along the coast the climate is humid, mild and uniform; in the eastern two-thirds of the State, from which the moisture-laden winds are excluded by the high Cascade Range, the

climate is dry and marked by great daily and annual ranges of temperature. Along the coast the temperature is never as high as 100° or as low as zero. In the Willamette valley a few degrees may be added to each extreme, but rarely is there freezing weather; flowers bloom at Portland the year round. Along the coast precipitation is 138in. annually; in the valleys east of the Coast Range it varies from about 20in. at the southern end to 45 in. at Portland; along the Columbia valley east of the Cascades, from 10 to 15in.; in the valleys and foothills of the Blue mountains, from 12 to 25in., and, in the plateau region of central and south-eastern Oregon, from 2 to 22 inches. At Portland for 52 years ending 1923 the normal temperature for the summer months was 64° and for the winter months 40°, with extremes of -2° and 102°; average annual rainfall 45.3in., and average annual humidity 74%. In the Columbia river valley east of the Cascades, records for the same period at Walla Walla, Wash., very near the Oregon boundary, show a summer normal of 72° and a winter normal of 35°, with extremes of -17° and 113°; average annual rainfall 17.7in. and average annual humidity 65%.

Government.—Oregon is governed under its original Constitution adopted in 1857, though many amendments have changed it in a number of important respects. This Constitution may be amended: (1) by a majority of the popular vote if the amendment has been passed by a majority vote of the legislature, (2) by direct initiative petition by the people or (3) by a Constitutional Convention, which may not be called, however, unless the law providing for it is approved by popular vote. The legislative power is vested in a legislative assembly of two houses, but limited by the direct action of the people who possess the initiative and referendum. The upper house is composed of 30 senators, and the lower house of 60 representatives (the number in both cases is the maximum allowed by the State Constitution), elected for four and two years respectively. The regular session is held in January of odd-numbered years. A bill not vetoed by the governor in five days becomes a law; if vetoed, it must be re-passed by a two-thirds vote in each house. The governor has a "single item veto" in addition to the general veto.

An amendment to the Constitution, passed in 1902, initiated measures which have become widely known as the "Oregon system." Its distinctive features are: (1) the initiative, (2) the referendum, (3) constitutional amendment by direct action of the voters, (4) direct primary, (5) Corrupt Practices act, (6) presidential preference primary, (7) campaign text-books, (8) the recall. For the initiative 8% of the number voting for justice of the supreme court at the last general election must sign petitions on which the proposed law is printed before it is put upon the ballot at the next election. Five per cent of the voters signing such petitions secure a referendum on any law passed by the legislature, and the legislature may itself refer any law it has approved to the people at the next election for their approval. All public officials are subject to the recall, adopted in 1908. It is rarely put into practice. An important and useful feature of the "Oregon system" is the campaign text-book. In the case of individual candidates the expense is borne partly by the candidates themselves.

The executive power in Oregon is vested in a governor elected for a four-year term. There is no lieutenant governor. The principal administrative officials of the State, all elected, are the secretary of State, treasurer, attorney general, superintendent of public instruction, dairy and food commissioner, and labour commissioner. A greater number of other administrative officers are appointed by the governor, among them the adjutant general, the State forester, State game warden, State health officer, State librarian, three State highway commissioners and three public service commissioners. A large number of State boards and commissions whose members are appointed are also necessary for the administration of Government, among them the board of control, land board, tax commission, board of education, public service commission, industrial accident commission, water board, parole board, board of health, industrial welfare commission and the Oregon State library.

The administration of justice is entrusted to a supreme court, circuit courts, county courts and justices of the peace. There are

also municipal courts in the cities and several special courts in Multnomah county. There are seven supreme court justices elected for a term of six years. The sessions of the court are held both at Salem and Pendleton. Circuit courts are held in 17 judicial districts, many districts having several justices. The Constitution of Oregon provides that in civil cases three-fourths of a jury may render a verdict. The county court is an administrative, not judicial body, consisting of the county judge and two commissioners. The county judge, however, handles probate and juvenile court matters, in addition to his administrative duties.

Population.—The increase in population in Oregon has been as follows: 90,923 (1870); 174,768 (1880); 317,704 (1890); 413,536 (1900); 672,765 (1910); 783,389 (1920). The estimate of the Federal Census bureau is 902,000 inhabitants in 1928. Between 1900 and 1910 the increase was 62.7%, but between 1910 and 1920 it was only 16.4%. The density increased from 4.3 per sq.m. in 1900 to 8.2 per sq.m. in 1920. In 1920 there were 103,001 persons (13.3%) born in foreign lands. Of the foreign born 21,089 were from Scandinavian countries (Swedes predominating), 16,348 from the United Kingdom and Ireland, 13,774 from Canada, 13,740 from Germany, 6,979 from Russia, 6,050 from Finland, 4,324 from Italy and 4,166 from Switzerland. Other countries were represented by less than 2,000 each. There were in addition to the whites, 2,144 negroes, 4,590 Indians, 3,090 Chinese and 4,151 Japanese in the State in 1920.

Urban and rural populations were very closely balanced in 1920, being 391,019 and 392,370 respectively. In 1910 urban population had represented 45.6% of the entire population. With the exception of Washington and Montana, Oregon had in 1924 the lowest birth rate of any State in the registration area—18.8 births per 1,000. Except for 1922 the infant mortality rate from 1919 to 1924 inclusive was lower than that for any other State in the Union. Only 0.4% of the native whites were illiterate as compared with 5.1% of the foreign born.

Portland, the leading city, had in 1925 an estimated population of 282,383. The population of Salem, the capital, was estimated at 19,709. Astoria and Eugene were estimated to contain 16,535 and 11,421 inhabitants respectively. Corvallis, La Grande, Medford, Oregon City, Pendleton, The Dalles, Baker City and Bend were the other cities with a population over 5,000 in 1920.

Finance.—The value of all tangible property in Oregon was estimated in 1912 at \$2,057,000,000, and in 1922 at \$3,419,000,000. The assessed valuation of taxable property was \$1,009,499,000 in 1922 and \$1,110,677,000 in 1926. Receipts of the State treasury for the biennium 1924-26 were \$79,548,279 and expenditures were \$81,710,437. Of this the general fund received \$31,417,282 and disbursed \$32,090,702. There were a great number of special funds also, most important among them being the highway fund which disbursed \$24,236,882 during the biennium, the World War veterans' aid fund disbursing \$11,823,348, the industrial accident fund disbursing \$5,964,369, and the common school fund disbursing \$2,370,946. The general fund is derived largely from a direct property tax, also from fees, licences, and special taxes. The direct property tax for the State general fund amounted to \$2,992,518 in 1925, and \$3,404,949 in 1926.

Oregon was the first State to levy a tax on gasoline as a means of financing highway construction and maintenance. Fees of the motor vehicle department amounted to \$11,337,000 and were also used for highway purposes. The total revenue of the State in 1925 secured by direct and indirect taxation amounted to \$24.20 per capita. Expenditures for current expenses amounted to \$15.01 per capita; the rest was for permanent improvements.

The total indebtedness of the State in 1926 was \$64,171,060, of which \$36,677,750 was for highway bonds; \$25,000,000 for

State veterans' aid, to offset which the State held first mortgages on real property within the State and other assets amounting to \$21,254,863.89; \$2,043,310 for interest paid on irrigation district bonds on which the State was obligated to act as a guarantor, and \$450,000 for farm credits. Provisions were made for the retirement of all these bonds as they came due. County indebtedness in 1926 amounted to \$27,217,848, school districts indebtedness to \$17,787,365 and city and town indebtedness to \$66,950,286.

In 1926 there were 266 banks in the State, 99 of them national banks, with total resources of \$342,417,949. Their total deposits Dec. 31, 1926, were \$296,533,000 of which \$113,776,000 were on savings accounts.

Education.—The school system of Oregon is under the control of a State board of education composed of the governor, secretary of State and the superintendent of public instruction. The progress of education in the State is represented in the following figures: the school enrolment of 134,468 in 1913 increased to 175,510 in 1924 and 185,959 in 1927. High school enrolment increased from 9,000 to 34,719 and 41,258 for the same years. The total cost of education increased from \$6,456,638 in 1913 to \$19,119,271 in 1924 and \$23,783,852 in 1927 while the per capita per pupil attending increased from \$55.10 to \$122.80 and \$141.51.

The average number of days taught increased from 151 per year in 1913 to 161 in 1927, while the number of teachers increased from 5,515 to 7,822. Of the 185,959 pupils enrolled for the year 1926-27, 144,701 were in grade schools and 41,258 in high schools. In that year 15,702 pupils completed the eighth grade and 6,670 were graduated from high school. There were 5,789 grade school teachers and 2,033 high school teachers. There were 2,506 school-houses in operation during the year, 1,560 of them one-room schools and 297 two-room schools. The consolidation of schools is making steady progress, thus eliminating the weaker rural schools.

In 1927 there were 107 consolidated schools, with a cost for transporting pupils of \$466,404.32. There were 278 high schools in the State in 1927, 78 of which were union schools.

State institutions of higher learning are the State Normal school at Monmouth, the Southern Oregon State Normal school at Ashland, the Oregon Agricultural college at Corvallis, and the University of Oregon at Eugene. The first was the only State normal school until 1925 when the legislature appropriated \$175,000 as a special building fund for the Southern Oregon State Normal school and provided an annual tax levy of $\frac{3}{8}$ of a mill for its support and maintenance. It opened in 1926. The Normal school at Monmouth had an average attendance in 1924 of 777 students, but it was unable to meet the demands of the State for trained teachers. Oregon Agricultural college had in 1924-25 an enrolment of 3,158. The distribution was as follows: engineering, 814; agriculture, 452; home economics, 486; commerce, 917; forestry, 112; pharmacy, 157; vocational and educational courses, 220. The Agricultural college also has charge of the eight agricultural experiment stations located at Corvallis, Union, Moro, Hermiston, Talent, Burns, Astoria and Hood River. Its extension service work throughout the State is also of very great importance. The University of Oregon, founded in 1872, had in 1924-25 an enrolment of 2,757 full-time students, though the total enrolment in all departments, including extension work, was 7,522.

Penal and Charitable Institutions.—The Oregon State penitentiary, situated at Salem, is under the control of the governor. Its average daily population increased from 419.8 in the biennium 1922-24 to 499.6 in 1924-26. The prison has the most complete whipping, retting and scutching flax plant in the United States, also a lime plant doing excellent business, and a 43 $\frac{1}{2}$ ac. farm. These industries furnish employment for the prisoners, who are paid a small wage for their labour, and help to support the institution. There is a prison library of 25,000 volumes. Under the direction of the Oregon State board of control are the Oregon State hospital for the insane at Pendleton and similar institutions throughout the State.

Oregon also provides State aid to a number of private charitable institutions in accordance with a law enacted in 1913. Such institutions make application to the board of health and, the application being approved, receive \$20 a month for each charity

GRAPH SHOWING OCCUPATIONS OF MALES OVER 10 YRS. OLD ENGAGED IN GAINFUL OCCUPATIONS, 1920

child under five years of age, and \$16 per month for each child over five and under 17 years. The State child welfare commission passes on all petitions for adoptions, and inspects all institutions and maternity homes for which it issues licences.

Agriculture and Live-stock.—Agriculture is the main industry of Oregon. Of 61,188,480ac., the total area of the State, 23.1% or 14,120,000ac. was in farm land in 1925. This represented an

CLASSIFICATION OF LAND AREA IN OREGON, 1925

increase of 578,000ac. over 1920. Public lands still unappropriated and unreserved amounted to 28,583,778ac. in 1925 and 26,872,218ac. in 1926. This represented over five-twelfths of the State. Homesteads in 1925 amounted to 209,085ac. and in 1926 to 144,962 acres. Of the last named, 98,466ac. was for stock-raising only. The number of farms increased from 50,206 in 1920 to 55,910 in 1925; the average acreage per farm decreased from 269.7 to 252.5 during the same years. The value of farm land dropped from \$586,242,000 in 1920 to \$505,141,430 in 1925 but the value of farm buildings increased from \$88,971,000 to \$110,927,340. Farms operated by tenants, contrary to the general tendency in the United States, decreased from 18.8% in 1920 to 16.8% in 1925. These statistics reveal that Oregon survived the period of agricultural distress following the World War with more success than most States. The good showing of the figures is due largely to steady production in the dairy and diversified farming valleys west of the Cascades. Dry-land farming suffered a serious post-war setback.

Wheat is the principal crop, the acreage increasing from 890,000ac. in 1924 to 1,026,000ac. in 1926, the production from 14,693,000bu. to 19,586,000bu. and the value from \$18,954,000 to \$23,503,000. Wheat is raised mainly in eastern Oregon and north along the Columbia river; west of the Cascades farmers find their land too valuable as a rule to devote to the crop. Oats to the amount of 10,560,000bu. valued at \$5,386,000 was raised on 320,000ac. in 1925. Barley to the amount of 2,378,000bu. valued at \$2,313,000 was raised on 96,000 acres. Indian corn increased in importance, the 1926 yield of 2,475,000bu. grown on 75,000ac. being valued at \$2,475,000. The 1921-25 average yield of corn per ac. was 31.5bu., which was higher than that of Missouri, and higher than the 27.8 average of the United States. Hay is second in importance to wheat only. In 1926 2,034,000 tons valued at \$21,294,000 were raised on 1,147,000 acres. Of this, 688,000 tons were alfalfa. Potatoes valued at \$4,500,000 were raised on 45,000ac. (100bu. per ac.) in 1926.

Oregon is also an important fruit-raising State, and many western valleys are largely given over to the industry, notably the Rogue and the Hood river valleys. Large orchards are found also

in the Willamette valley and in the sheltered valleys of the Blue mountains in the north-east. The apple crop in 1925 amounted to 5,400,000bu. valued at \$6,750,000 and in 1926 to 8,036,000bu. valued at \$5,653,000. There has been a steady increase in pear raising until in 1926 Oregon ranked third among the States with a crop of 2,100,000bu. valued at \$1,785,000. There were 384,000bu. of peaches raised in 1926, and large quantities of cherries and plums. A fair estimate of Oregon's 1927 prune crop is 40,000,000 pounds. The crop of strawberries amounted to 6,209,000qt. valued at \$682,000.

Irrigation is nowhere necessary west of the Cascade Range but is necessary in eastern Oregon except in a few valleys along the Columbia and in the Blue mountains. There were but 1,925,987ac. included in irrigation enterprises in 1920 as compared with 2,527,208 in 1910. However the acreage actually irrigated increased from 686,000 to 986,000. Capital invested increased from \$12,760,214 to \$28,929,151, or from \$15.36 to \$21.52 per acre. The average cost of maintenance was in 1920 \$1.19 per ac. as compared with \$2.43 for all irrigated land in the United States. Crops grown on irrigated land in 1919 averaged \$44.77 per acre.

Great numbers of beef cattle are raised in eastern Oregon, while the Willamette and coast districts are especially favourable to dairying. Cattle of all kinds decreased in number from 796,000 in 1925 to 687,000 in 1927 but increased in value from \$28,073,000 to \$28,830,000, or from \$35.30 to \$40.00 per head. Milch-cows and heifers numbered 214,000 in 1927 with an average value of \$65.00 per head. Creamery butter production increased from 14,228,000lb. in 1920 to 21,575,000lb. in 1925. Cheese production in that year amounted to 9,923,000lb., giving Oregon third place in rank among the States. The market for the products of the dairying industry is found in the growing cities of the Pacific coast. Eastern Oregon is noted for sheep-raising. The number of sheep decreased from 2,250,000 in 1920 to 1,868,000 in 1923, but increased to 2,226,000 in 1927. Their total value in the same years amounted to \$24,035,000, \$8,742,000 and \$23,092,000 respectively. These figures show the depression in the industry shortly after the World War, but an increase in wool prices in 1924 helped in its rapid recovery. The wool production increased from 14,790,000lb. in 1923 to 18,321,000lb. in 1926 and the value of the crop in that year was \$5,514,000. The weight per fleece is generally high, in 1926 averaging 9.3lb. as against 7.8lb. for the entire United States. Swine are slowly increasing in numbers; the 245,000 in 1927 were valued at \$3,920,000. Horses decreased in number from 225,000 in 1925 to 201,000 in 1927, and were valued in that year at \$12,405,000. Poultry-raising is developing into an important industry.

Mining.—The value of the mineral products of Oregon was \$5,496,253 in 1920, \$6,054,487 in 1923 and \$7,826,711 in 1925. The value of gold, silver, copper and lead produced in Oregon in 1926 was \$334,300, a decrease of \$96,453 or 22% as compared with the value of these metals produced in 1925. The production of non-metals showed an increase. Oregon supplies its own needs in building stone, 73 plants in 1925 quarrying sandstone, granite, marble and volcanic tuff to the value of \$1,858,644. The tuff, occurring over a wide area in eastern Oregon and in parts of western Oregon, has proved especially valuable, for it is easily worked, of pleasing appearance, light in weight yet strong and durable. Sand and gravel valued at \$1,998,545 was used in various construction operations in 1925. Clay products of 1925 were valued at \$839,286, the State fully supplying its own demands. There is an abundance of materials for making lime and cement and three Portland cement factories, situated at Portland, Ashland and Lime, were in operation. The Coos bay coal-field is the only notable coal producing district in the State. Iron is found in commercial quantities in Columbia and Washington counties. Between 1860 and 1880 the mining of precious metals was a major industry in Oregon, and responsible for the early settlement of many localities; but by 1920 the total value of all metals mined was but \$1,541,051 and in 1923 it was only \$767,590. In 1926, the output of gold and of silver decreased 28% and 20% respectively, while that of copper and of lead increased 131% and 113% respectively, over 1925. Gold ores

came from eight counties but 88% of all produced was from Baker and Grant counties. Also 90% of all copper ore in the State was produced in these counties.

Fisheries.—The fisheries of Oregon in 1922 employed 5,497 persons, represented an investment of \$4,892,576, and produced 22,371,764 lb. of fish valued at \$1,255,689. In 1923, 4,230 fishermen were employed and the yield was 32,982,678 lb. valued at \$3,500,171. Of the 1923 catch 27,277,000 lb. or about 85% of the total was salmon, valued at \$3,057,937.

Forests and Lumbering.—It is Oregon's distinction that within her borders is more standing timber than in any other State. It amounts to about 400,000 million board feet or nearly one-fifth of the supply of the whole United States. Of this, 10,684,883 ac. are privately or State owned, while 13,216,240 ac. are in the 15 national forests of the State. The national forests include all the higher mountain areas. The backbone of the Cascade Range and its higher slopes from Mt. Hood to California comprises six forests of about 1,000,000 ac. each. In the Coast Range are two forests with a combined area of 1,500,000 ac. while in the Willowa and Blue mountains in eastern Oregon are six more totalling some 5,500,000 acres. On the western slopes of the Cascades especially at the lower elevation are some of the finest stands of timber in the world made up of such species as Douglas fir, western hemlock and western cedar. On the east slopes of the Cascades and in the Willowa and Blue mountains where the climate is much drier the timber is more open, and Ponderosa pine replaces Douglas fir as the chief commercial tree.

Lumber production rose from 2,022,000 board feet in 1919 to 3,966,000 board feet in 1923, and 5,466,500,000 board feet in 1926. In 1926 and 1927 Oregon ranked in output second only to Washington. Of the 4,967,000,000 board feet sawed in 1927 2,803,000,000 were Douglas fir, 1,000,000,000 Ponderosa pine, 725,000,000 hemlock, 125,000,000 Sitka spruce, 105,000,000 red cedar, 100,000,000 Port Oxford cedar, 75,000,000 miscellaneous soft woods, and 35,000,000 hardwoods. Oregon ranked second to Washington in the production of laths and shingles. The lumber industry in all its branches gave employment to about 50,000 men. The value of the cut in 1927 was \$105,000,000.

Manufactures.—In the decade 1914-23 the value of Oregon's manufactures more than tripled. There were, in 1914, 2,320 factories employing an average of 28,829 workers, paying \$20,932,000 in wages, producing goods valued at \$109,762,000, of which \$46,504,000 was added by manufacture. In 1923 there were 1,909 establishments, employing 62,655 workers, paying \$81,769,000 in wages, producing goods worth \$363,715,000 of which \$167,794,000 was added by manufacture.

The 1,908 industrial establishments operated in 1925 gave employment to 59,579 wage-earners and had an output valued at \$352,948,841. The leading products were those of lumber in the manufacture of which Oregon ranked third among the States. There were, in 1925, 364 sawmills, employing 31,217 workers, producing lumber products valued at \$120,570,255. The products next in importance were those of 62 flour and grain mills which were valued at \$28,179,224. The products next in value were: butter, cheese and evaporated milk, \$17,313,481; slaughtering and meat packing products, \$17,215,966; canning and preserving fruits and vegetables, \$12,513,211; foundry and machine shop products, \$10,581,996; printing and publishing, newspapers and periodicals, \$10,406,032; bakery products, \$10,102,706; planing mill products, \$9,926,417; paper and wood pulp, \$9,841,038; furniture, \$6,618,614; construction and repair done in steam railway shops, \$5,264,468; and canning and preserving fish, oysters, crabs, etc., \$5,898,762.

Transportation and Commerce.—The railway mileage of the State increased from 2,413 in 1910 to 4,111 in 1925, of which 754 m. were electric roads operated by nine separate companies. The main steam railway lines were those of the Union Pacific, the Southern Pacific, the Great Northern and the Northern Pacific. The Union Pacific crosses the north-eastern corner of the State to the Columbia river, which it follows to Portland. The Southern Pacific owns the main line between Portland and California, crossing the State north and south along the Willamette, across the

Umpqua and Rogue river valleys and via the Klamath region. The mileage extension between 1910 and 1927 consisted mainly of branches from the Union Pacific into east-central Oregon from the east, and into west-central Oregon from the north; from the Southern Pacific line to the Pacific coast at Tillamook and Coos bay, and from the Willamette valley to Klamath Falls; and a line owned by the Great Northern from the Columbia river up the Deschutes river to a connection with the Southern Pacific Klamath Falls extension and then by common user to the southern border of the State. The Northern Pacific and the Great Northern by a joint line on the Washington side of the Columbia river provide a water grade to Portland, a terminus of both systems.

The development of the State highway system begun in 1917 has been regularly carried forward; at the beginning of the year 1927 the total mileage was 4,468, of which 3,220 m. were surfaced. The total mileage of roads other than State highways was 45,306, of which 7,746 m. were surfaced. Expenditures for State highways in 1925 were \$15,553,000; the added expenditures of counties, townships and districts brought the year's total to \$28,928,000. In 1926 there were 233,568 motor vehicles in Oregon, or 266 per 1,000 population. Receipts for the registration of motor vehicles amounted to \$6,018,000; from the three cent gasoline tax, \$3,334,000.

A deep water channel in the Columbia and Willamette rivers makes Portland accessible for ocean-going vessels, and about 70% of water-borne commerce of Oregon in 1926 was carried to or from that port. The total ocean commerce of Oregon in 1926 was 7,117,400 short tons. Of this amount 6,296,683 tons entered or cleared the Columbia river; the water-borne commerce of Portland alone was 4,834,094 tons.

History.—The Spanish pilot, Bartolomé Ferrello, who in 1543 made the farthest northward voyage along the Pacific coast recorded in the first half of the 16th century, may have sighted the shores of Oregon. So also the famous English captain, Francis Drake, who in 1579 coasted these shores seeking a route home by a north-west passage, is supposed to have reached a point near 43° lat. before giving up the search and turning westward across the Pacific. In 1603 the Spaniards Vizcaino and Aguilar also passed 42° lat., Aguilar claiming to have reached a point of land near 43° which he called Cape Blanco. The Spanish, however, were too interested in the profitable trade between their colonies and the Far East to give much attention to north-west exploration and it was not until 160 years later that the fear of Russian and English encroachment caused them to send out further expeditions. In 1774 Juan Pérez was sent out with orders to proceed to 60° latitude. He turned back at 54° but was the first to sail along the entire coastline of the Oregon country. The following year Bruno Heceta commanded another expedition which near Point Grenville made the first landing in the region. They erected a cross and in formal ceremony took possession for Spain.

The Spaniards made no effort to colonize north-western America or to develop its trade with the Indians, but towards the end of the 18th century the traders of the great British fur companies of the north were gradually pushing overland to the Pacific. Upon the sea, too, the English were not idle. Capt. James Cook in March 1778 sighted the coast of Oregon in the lat. of 44°, and examined it between 47° and 48° in the hope of finding the Straits of Juan de Fuca described in Spanish accounts. Soon after the close of the Revolutionary War American merchants began to buy furs along the north-west coast and to ship them to China to be exchanged for the products of the East. It was in the prosecution of this trade that Capt. Robert Gray (1755-1806), an American in the service of Boston merchants, discovered in 1792 the long-sought river of the west, which he named the Columbia, after his ship. By the discovery of this river Gray gave to the United States a claim to the whole territory drained by its waters.

Land exploration soon followed these discoveries along the coast. Alexander Mackenzie, in the service of the North West Company, in 1793 had explored through Canada to the Pacific coast in lat. about 52° 20' N., and Meriwether Lewis and William Clark, American explorers acting under the orders of President Jefferson, in 1805-06 had passed west of the Rocky mountains

and down the Columbia river to the Pacific ocean. Both British and American adventurers were attracted to the region by the profitable fur trade. In 1808 the North West Company had several posts on the Fraser river, and in 1810 and 1811 they built others south of the 49th parallel. In 1811, also, the Pacific Fur Company, under the guidance of John Jacob Astor of New York, founded a trading post at the mouth of the Columbia which they

BY COURTESY OF THE UNION PACIFIC SYSTEM

AFTER A SKETCH MADE BY STANLEY IN 1854

called Astoria, and set up a number of minor posts on the Willamette, Spokane and Okanogan rivers. On hearing of the war between England and the United States, Astor's associates, deeming Astoria untenable, sold the property in 1813 to the North West Company. The British took formal possession and renamed the post Ft. George.

Soon after the restoration of peace between England and the United States there arose the so-called "north-western boundary dispute" or "Oregon question" which agitated both countries for a generation and almost led to another war. The United States was willing at the time to extend the north-western boundary along the 49th parallel from Lake of the Woods to the Pacific, but to this the British Government would not consent, so in 1818 both nations agreed to a "joint occupation" for ten years of the country "on the north-west coast of America, westward of the Stony (Rocky) mountains." By treaty the following year Spain waived her claim to the territory north of 42° in favour of the United States, and in 1824 Russia likewise agreed to make no settlements south of 54° 40'. In 1827 the agreement of 1818 for joint occupancy by Great Britain and the United States was renewed for an indefinite term, with the proviso that it might be terminated by either party on 12 months' notice.

For the next three decades the history of Oregon is concerned mainly with the British fur traders and the American immigrants. The Hudson's Bay Company absorbed its rival, the North West Company, in 1821, and thus secured a practical monopoly of the trade of the Oregon region. Its policy was to discourage colonization so as to maintain the territory in which it operated as a vast preserve. The company sent to the Columbia river as its governor west of the Rocky mountains Dr. John McLoughlin who ruled the vast empire firmly and wisely for 22 years and became affectionately known as the "Father of Oregon." His capital was at Ft. Vancouver which he built on the north bank of the Columbia opposite the mouth of the Willamette river. In 1829 he also built an establishment at the falls of the Willamette which determined the site of Oregon City. Though it was against the company's interests he generously aided the American colonists who later came to the region, and later in life, after American Government was extended over the country, became himself a citizen of the United States.

The elderly employes of the company were urged by McLoughlin, when they wished to retire from active service, to settle with their families in the Willamette valley. There were a number of

these first settlers, mostly Frenchmen, there by 1835. In 1834 Jason and Daniel Lee arrived from the United States and founded Methodist missions in the valley. In 1837 20 more missionaries arrived and a branch mission was opened at The Dalles. In 1838 Jason Lee started overland for the States, and his lecturing and preaching not only raised money for the mission but aroused great interest in Oregon, with the result that the American element was increased in 1840 by 50 more arrivals by sea. It now numbered 151. In 1842 the first immigrant train over the Oregon trail, headed by Elijah White and piloted by Thomas Fitzpatrick, arrived. The following was the year of the "Great Migration" when nearly 900 men, women and children likewise followed the trail and settled in the Willamette valley. After this the flow of immigrants steadily increased, about 1,400 arriving in 1844 and 3,000 in 1845.

The American settlers set in motion a movement for the immediate and permanent settlement of the Oregon dispute. They had in 1843 established for themselves a provisional Government, but settlement and business undertakings were held back until their future rulers and the nature of their permanent Government were settled. The western States rallied to their support with the result that the Democratic National convention in 1844 declared the title of the United States to "the whole of the Territory of Oregon" to be "clear and unquestionable," and the party made "Fifty-four forty or fight" a campaign slogan. Upon the success of the party, negotiations were entered into which resulted in a compromise treaty (1846) fixing the boundary between Oregon and British possessions at its present position, and giving the United States complete title to all land to the southward.

Territorial status and a Territorial Government were delayed until 1848 owing to opposition from the slavery element in Congress. As then constituted the Territory included the present States of Oregon, Washington, Idaho and parts of Montana and Wyoming. Its area was reduced in 1853 by the creation of the Territory of Washington. The discovery of gold in California drew many Oregon settlers to that country in 1848-50, but this exodus was soon offset as a result of the enactment by Congress in 1850 of the "Donation Land Act" by which settlers in Oregon were entitled to large tracts of land free of cost. The number of claims registered under this act was over 8,000.

In 1857 the people voted for Statehood; in the same year a Constitutional Convention drafted a Constitution which they adopted in November, and on Feb. 14, 1859, Oregon was ad-

THE SETTLEMENT OF ASTORIA, OREGON, IN 1811. FOUNDED BY JOHN JACOB ASTOR AT THE HEAD OF THE COLUMBIA RIVER

mitted into the Union with its present boundaries. Gold had been discovered in paying quantities at Jacksonville in southern Oregon in 1815, and in 1861 was discovered in eastern Oregon along the John Day and Powder rivers. Each of these discoveries resulted in a stampede which settled a region which otherwise would have been settled very slowly. The increase of mining population in Oregon and Idaho encouraged agricultural development in that it provided markets. Permanent settlements were made in all the important valleys of eastern Oregon in the '60s. By 1870 the population of the State was 91,000. In the next 20 years it nearly doubled. This increase was due largely to the opening of railroad

connections with the outside world. Two lines, one on each side of the Willamette river, to connect with a line in California, were begun in 1868, but progress was so slow that the connection was not made until 1884. Meanwhile a line had been built up the Columbia river to meet the northern transcontinental lines being built west through Idaho, and this junction was effected in 1883. Many local lines were also built. During this period grazing spread over eastern Oregon, and developments in other industries began which later decades were merely to expand and enlarge.

The political complexion of the State has been generally Republican, although the contests between the two leading parties were often very close. Since the admission of Oregon into the Union up to 1928 there had been seven Democratic and nine Republican governors, but in only two instances did the State's electoral vote go to the Democratic presidential nominee.

BIBLIOGRAPHY.—The reports of the various State departments and State officials are invaluable for up-to-date general and specific information. Consult also the *Oregon Blue Book*, published biennially by the secretary of State; *The Mineral Resources of Oregon*, published irregularly, 1914 et seq., by the Oregon Bureau of Mines and Geology; *The National Forests of Oregon*, published (1923); by the U.S. Department of Agriculture, forest service. OREGON CITY, a city of Oregon, U.S.A., on the east bank of the Willamette river, 12 m. S. by E. of Portland; the county seat of Clackamas county. It is on the Pacific highway, and is served by the Southern Pacific, the Willamette Valley Southern, and electric railways, and motor-coach lines. Pop. (1920) 5,686 (87% native white); 1928 local estimate 7,000. The river here makes a plunge of 40 ft. over a basalt ridge, and then flows between steep walls of solid rock 20 to 50 ft. high. The abundant water-power is used for the manufacture of lumber, paper and pulp, flour, woollen fabrics and various other commodities. Next to Astoria, Oregon City is the oldest settlement in the State. In 1829 Dr. John McLoughlin, chief agent of the Hudson's Bay Company, established a claim to the water-power at the falls and to land where the city now stands, and began the erection of a mill and some houses. In 1840 he laid out a town and named it Oregon City, but his claim was disputed by a Methodist mission, and in 1850 Congress gave a great part of his claim for the endowment of a university. The Oregon legislature in 1862 restored the land to McLoughlin's heirs. The city was chartered in 1850. In 1924 a commission-manager form of government was adopted.

OREGON-GRAPE (*Mahonia Aquifolium*), a North American evergreen shrub of the family of Berberidaceae, closely allied to the barberry (*q.v.*), found from British Columbia to California and eastward to New Mexico. It grows from 3 to 6 ft. high and bears large pinnate leaves composed of five to nine thick, spiny-toothed, somewhat holly-like leaflets, bright yellow flowers in erect racemes, followed by showy clusters of small blue berries. The plant is the floral emblem or State flower of Oregon, and is widely grown as an ornamental.

OREGON MYRTLE (*Umbellularia californica*), a North American tree of the laurel family (Lauraceae), called also California laurel, native to Oregon and California. It attains a height of 90 ft. and a trunk diameter of 5 ft., and bears lance-

shaped, fragrant leaves, greenish-yellow flowers, in small clusters, and a somewhat olive-like, dark purple fruit (drupe). It yields one of the most valuable cabinet woods produced in the Pacific States. (See LAURACEAE.)

OREGON PINE: see DOUGLAS FIR.

OREGON TEA-TREE (*Ceanothus sanguineus*), a name given to a large shrub of the buckthorn family (Rhamnaceae), called also buck-brush, native from northern California to British Columbia and eastward to Montana. It grows about 10 ft. high and bears reddish branchlets, thin, smooth, ovate, toothed leaves, and compound clusters, 2 to 4 in. long, of small white flowers. As in case of the New Jersey tea (*q.v.*), its leaves have been used as tea. (See CEANOETHUS.)

OREGON TRAIL: see OLD OREGON TRAIL.

O'REILLY, JOHN BOYLE (1844-1890), Irish-American politician and journalist, was born near Drogheda on June 28, 1844, the son of a schoolmaster. After some years of newspaper experience, during which he became an ardent revolutionist and joined the Fenian organization known as the Irish Republican Brotherhood, he enlisted in 1863 in a British cavalry regiment with the purpose of winning over the troops to the revolutionary cause. At this period wholesale corruption of the army, in which there was a very large percentage of Irishmen, was a strong feature in the Fenian programme, and O'Reilly was successful in disseminating disaffection in his regiment. In 1866 the extent of the sedition in the regiments in Ireland was discovered. O'Reilly was tried by court-martial and sentenced to be shot, but the sentence was commuted to 20 years' penal servitude. After confinement in various English prisons, he was transported in 1867 to Bunbury, Western Australia. In 1869 he escaped to the United States, and settled in Boston, where he became editor of *The Pilot*, a Roman Catholic newspaper. He subsequently organized the expedition which rescued all the Irish military political prisoners from the Western Australia convict establishments (1876). He was the author of several volumes of poetry, and of a novel of convict life, *Moondyne*. He died in Hull, Mass., on Aug. 10, 1890.

See J. J. Roche, *Life of John Boyle O'Reilly* (Boston, 1891).

OREL or **ORLOV**, a province of the Russian S.F.S.R., surrounded by those of Bryansk, Kaluga, Tula, Tambov, Voronezh and Kursk. Area 29,973 square kilometres. Pop. (1926) 1,833,423. The province is much smaller than the pre-1917 province of the same name, Bryansk being now a separate province. Orel forms part of the recently constituted Black Earth Area (Central). The province consists mainly of dissected plateau, drained by the Oka and its tributaries, flowing into the Volga, and the Sosna. On the water-partings between the streams, the Kurgans or artificial mounds, some containing burials and some being remains of earthworks, stand out sharply. In the Bolkhov and Dmitrov districts, the soil is podzol (see RUSSIA: Soils), but the rest of the province is covered with black earth. The forests have practically all disappeared and there is a great scarcity of wood and of fuel. For climate, the difficulties of agriculture and general social conditions see VORONEZH. Average January temperature 14.8°, average July 67°.

The chief crops in 1926 were rye, oats, potatoes, millet and hemp. Very little wheat or sunflower seed is grown. Cattle, sheep and pigs are bred; in pre-World-War times Orel was noted for horse breeding, but their numbers diminished greatly owing to war requisitions and they are slow to recover. Livensk and Maloarchangel have however recovered their former position as regards horse breeding. Factory industries include the making of chemical manure from the phosphorites of the province, iron-mining and smelting in the Zinoviev district, near Dmitrovsk, and at Elets, flour-milling, distilling, leather and chalk. Koustar (peasant) industries include the making of ploughs, rope, makhorka tobacco, carpets, and, in the Elets district, lace. The province suffered much during the Civil War 1917-20, and Elets changed hands several times. The chief towns are Orel and Elets.

In the 9th century a Slav tribe, the Vyaticis, was established on the Oka river and paid tribute to the Khazars. They recognized the rule of Rurik from 884 and were later absorbed in the principality of Chernigov. Their wealthy towns and villages were

devastated by the Mongols in 1239-42 and the region was reduced to poverty. The Russians erected forts and established colonies in the 16th century. In 1610 Orel then known as the Ukrayna or Ukraine (i.e., "border region") was the scene of civil warfare under the false Demetrius. From 1917 to 1920 it was again the scene of civil struggles.

Orel, the chief town of the above province, situated at the confluence of the Orlik with the Oka river, and at the junction of roads and railways linking it with Moscow, Bryansk, Kharkov and the east, in 53° N., 36° 8' E. Pop. (1926) 75,698.

O'RELL, MAX, the *nom-de-plume* of PAUL BLOUET (1848-1903), French author and journalist, was born in Brittany in 1848. He is chiefly remembered for his once famous book, *John Bull et son Ile*. He died in Paris, on May 25, 1903.

ORELLANA FRANCISCO DE (c. 1490-c. 1546), Spanish soldier, and first discoverer of the Amazon, was born at Truxillo about 1490. He sailed for Peru in 1535, and in 1540-41 accompanied Pizarro's expedition from Quito to Napo in the capacity of lieutenant. Early in 1541 he was sent ahead of the main party to obtain provisions, but he deserted his charge, either from necessity or choice, and continued his journey down the Rio Napo to the valley of the Amazon, whose course he explored from its source in the Andes to the Atlantic; he reached the coast in Aug. 1541. He is reported to have encountered a tribe of female warriors, of whom he had been told by the Indians, and from whom the name of the river is derived. On his return to Spain he was granted the right to conquer the newly discovered lands, but an expedition, undertaken in 1544 for this purpose, met with little success. Orellana died, probably in Venezuela, about 1546.

See "The Voyage of Francisco de Orellana down the River of the Amazons," trans. C. R. Markham, from A. de Herrera's *Historia general de las Indias occidentales* (Hakluyt Society Publications, vol. xxiv., 1859).

ORELLI, JOHANN CASPAR VON (1787-1849), Swiss classical scholar, was born at Zürich on Feb. 13, 1787. His cousin, JOHANN CONRAD ORELLI (1770-1826), was the author of several works in the department of later Greek literature. From 1807 to 1814 Orelli worked as preacher in the reformed community of Bergamo and published *Contributions to the History of Italian Poetry* (1810) and a biography (1812) of Vittorino da Feltre, his ideal of a teacher. In 1814 he became teacher of modern languages and history at the cantonal school at Chur (Coire); in 1819, professor of eloquence and hermeneutics at the Carolinum in Zürich, and in 1833 professor at the new university, the foundation of which was largely due to his efforts. He had already published (1814) an edition, with critical notes and commentary, of the *Antidosis* of Isocrates. The three works upon which his reputation rests are the following. (1) A complete edition of Cicero in seven volumes (1826-38). (2) The works of Horace (1837-38; 4th ed., 1886-92). (3) *Inscriptionum Latinarum Selectarum Collectio* (1828; revised edition by W. Henzen, 1856). His editions of Plato (1839-41, including the old scholia, in collaboration with A. W. Winckelmann) and Tacitus (1846-48, new ed. by various scholars, 1875-94) also deserve mention. Orelli died at Zürich on Jan. 6, 1849.

See *Life* by his younger brother Conrad in *Neujahrsblatt der Stadt-bibliothek Zürich* (1851); J. Adert, *Essai sur la Vie et les Travaux de J.C.O.* (Geneva, 1849); H. Schweizer-Sidler, *Gedächtnissrede auf J.C.O.* (Zürich, 1874); C. Bursian, *Geschichte der klassischen Philologie in Deutschland* (1883).

ORENBURG, a province of the Russian S.F.S.R., consisting mainly of the former Orenburg and Orsk districts of the much larger pre-1914 province of the same name. Area 57,201 sq. km. Pop. (1926) 674,199. It is a narrow strip lying between Bashkiria on the north and Kazakstan on the south, widening out to the east and west. The province is hilly, except for the valleys of the Ural river and its tributaries, the Sakmara and the Or. It belongs to the region of perennial drought and dry and desert steppe: the soils are chestnut-brown clays and sands with salt efflorescences, on which crops can be raised successfully if drought is not too severe and if careful attention is paid to manuring and to the time of cultivation. Some fertile black

earth occurs in the valleys. The average January temperature is 3.4° F. July 70.9° F, average rainfall 15.2 inches. Coal and rich layers of rock salt are found near Iletsk, in the south of the province and phosphorite exists. The peasants are specially skilled in the preparation of leather and the women knit the famous Orenburg goats' wool shawls.

The district lies on the border region between the territory of the Bashkirs and that of the Kirghiz; the Bashkirs were brought under Russian rule in 1557, and the fort of Ufa was built to protect them from Kirghiz raids. The frequent risings of the Bashkirs and the raids of the Kirghiz led the Russian government in the 18th century to erect a line of forts and blockhouses on the Ural and Sakmara rivers, which were afterwards extended south-westwards towards the Caspian and eastwards towards Omsk, and Orenburg became the central point of these military lines.

ORENBURG, the chief town of the province of Orenburg, situated on the Ural river in 51° 46' N., 55° 7' E. Pop. (1926) 121,975. The opening of the Orenburg-Tashkent railway in 1905 greatly increased its importance, and it has an important railway workshop for this line. Its industries include the making of metal goods and bricks, saw-milling and brewing. Trading caravans from the Central Asiatic Republics bring carpets, silk, cotton, lambskin, wool and dried fruits to Orenburg to exchange against textiles, metal goods, and other products of European Russia. Cattle, horses and sheep from the steppe lands are brought to its market, and animal products including frozen meat, hides, sheepskins, tallow and bristles are sent by rail to Samara and the west. Its population is mixed and includes Russians, Tatars, Kirghiz and Bashkirs, among others. In 1735 a fort was erected at the confluence of the Or and Ural rivers as an outpost of Russia against the Bashkirs and Kirghiz, and was called Orenburg. In 1740-43, the fortress was moved 120 m. down the Ural river to its present position and the former Orenburg was re-named Orsk. Heavy fighting occurred here after the 1917 revolution, and in that year its population was swollen to 140,588 by refugees. During the famine of 1920-1, the town suffered severely and the population dropped proportionately.

ORENDEL, a Middle High German poem, of no great literary merit, dating from the close of the 12th century. The story is associated with the town of Treves (Trier), where the poem was probably written. The introduction narrates the story of the Holy Coat, which, after many adventures, is swallowed by a whale. Orendel, son of King Eivel of Treves, who had embarked with 22 ships in order to woo the lovely Brida, the mistress of the Holy Sepulchre, is wrecked, and falls into the hands of the fisherman Eise, in whose service he catches the whale and recovers the Holy Coat. The poem exists in a single ms. of the 15th century, and in one printed version dated 1512. It has been edited by von der Hagen (1844), L. Ettmüller (1858) and A. E. Berger (1883); there is a modern German translation by K. Simrock (1845).

See H. Harkensee, *Untersuchungen über das Spielmannsgedicht Orendel* (1879); F. Voigt, in the *Zeitschrift für deutsche Philologie*, vol. xxii. (1890); K. Müllenhoff, in *Deutsche Altertumskunde*, vol. i. (2nd ed., 1890), pp. 32 seq.; and R. Heinzel, *Über das Gedicht von König Orendel* (1892).

ORENSE, an inland province of north-western Spain, formed in 1833 of districts previously included in Galicia, and bounded on the north by Pontevedra and Lugo, east by Leon and Zamora, south by Portugal, and west by Portugal and Pontevedra. Pop. (1920) 412,460; area 2,694 sq. m. The surface of the province is almost everywhere mountainous. Its western half is traversed in a south-westerly direction by the river Miño; the Sil, a left-hand tributary of the Miño, waters the north-eastern districts; and the Limia rises in the central mountains and flows west-south-west, reaching the sea at the Portuguese port of Viana do Castelo. The railway from Monforte to Vigo runs through the province. There are iron foundries. The chief towns are Orense (*q.v.*), Allariz (9,043), Carballino (9,541), Viana del Bollo (8,045), Nogueira de Ramon (8,201), Boborás (7,239), Cartelle (7,200) and La Vega (6,027). Eighteen other towns have over 5,000 inhabitants.

ORENSE, an episcopal see and the capital of the Spanish province of Orense, on the left bank of the river Miño, and on the Tuv-Monforte railway. Pop. (1920). 17,581. The river is

here crossed by one of the most remarkable bridges in Spain. It was built by Bishop Lorenzo in 1230, but has frequently been repaired. The image of El Santo Cristo in the Gothic cathedral is celebrated throughout Galicia. The warm springs known as Las Burgas, attract many summer visitors; the waters were well known to the Romans, as their ancient names, Aquae Originis, Aquae Urentes, or perhaps Aquae Salientes, clearly indicate. They named Orense Aurium, probably from the alluvial gold found in the Miño valley. Chocolate and leather are manufactured, and there are saw-mills, flour-mills and iron-foundries.

OREODON (i.e., "hillock-tooth"), an Oligocene genus of North American primitive ruminants related to the camels, and typifying the family *Oreodontidae*. Typical Oreodonts were long-tailed, four-toed, partially plantigrade ruminants with sharp-crowned crescentic molars, of which the upper ones carried four cusps, and the first lower premolar, canine-like both in shape and function. See *TYLOPODA*.

ORESTES, in Greek legend, son of Agamemnon and Clytemnestra. According to the Homeric story he was absent from Mycenae when his father returned from the Trojan War and was murdered by Aegisthus. Eight years later he returned from Athens and revenged his father's death by slaying his mother and her paramour (*Odyssey*, iii. 306; xi. 542). For later forms of the legend of his return, see *ELECTRA*.

In post-Homeric writers, Orestes, after the deed, is pursued by the Erinyes (q.v.). He takes refuge in the temple at Delphi. Apollo sends him to Athens to plead his cause before the Areopagus. The Erinyes demand their victim; he pleads the orders of Apollo; the votes of the judges are equally divided, and Athena gives her casting vote for acquittal. The Erinyes are propitiated by a new ritual, in which they are worshipped as Eumenides (the Kindly), and Orestes dedicates an altar to Athena Areia. According to Euripides, some of the Erinyes were not satisfied, so Orestes was ordered by Apollo to go to Tauris, carry off the statue of Artemis which had fallen from heaven, and bring it to Athens. He repairs to Tauris with Pylades, the son of Strophius and the intimate friend of Orestes, and the pair are at once imprisoned by the people, among whom the custom is to sacrifice all strangers to Artemis. The priestess of Artemis, whose duty it is to perform the sacrifice, is his sister Iphigenia (q.v.). A recognition is brought about, and all three escape together, carrying with them the image of Artemis. After his return to Greece, Orestes took possession of his father's kingdom of Mycenae, to which were added Argos and Laconia. To gain possession of Hermione, whom Neoptolemus had married, he murdered the latter at Delphi. He is said to have died of the bite of a snake. The development of the legend is the result (a) of the post-Homeric horror of bloodshed (Erinyes; to Homer, Orestes does nothing which is not entirely admirable); (b) of the growing interest in cases of conscience (conflict of the duty of revenge and the sacredness of his mother's person); (c) of the development of modern ideas of ethics and jurisprudence (the Areopagus consider motive and mitigating circumstances, instead of merely regarding the act); (d) of the replacement of blood-feud by State intervention and formal trial.

See Jebb, introduction to Sophocles, *Electra*; Höfer in Roscher's *Lexikon*, art. "Orestes."

(H. J. R.)

ORFE or **GOLDEN ORFE**, a variety, originating in Germany, of the ide (*Idus idus*), one of the *Cyprinidae* and allied fairly closely to the roach (q.v.).

ORFILA, MATHIEU JOSEPH BONAVENTURE (1787-1853), French toxicologist and chemist, was by birth a Spaniard, having been born at Mahon in Minorca on April 24, 1787. After studying medicine at the universities of Valencia and Barcelona, he settled in Paris to study under the chemist L. N. Vauquelin. In 1811 he graduated and immediately became a private lecturer on chemistry in the French capital. In 1819 he was appointed professor of medical jurisprudence, and four years later he succeeded Vauquelin as professor of chemistry in the faculty of medicine at Paris. In 1830 he was nominated dean of that faculty. He died in Paris on March 12, 1853. Orfila's fame rests on his *Traité des poisons*, or *Toxicologie générale* (1813).

ORFORD, ROBERT WALPOLE, 1ST EARL OF (1676-1745), generally known as **SIR ROBERT WALPOLE**, prime minister of England from 1721 to 1742, third son of Robert Walpole, M.P., of Houghton in Norfolk, was born at Houghton on Aug. 26, 1676. He was an Eton collegier from 1690 to 1695 and was admitted at King's College, Cambridge, as scholar on April 22, 1696. At this time he was destined, as a younger son, for the church, but the death of two elder brothers made him heir to an estate producing about £2,000 a year, whereupon he resigned his scholarship and was withdrawn from the university.

Walpole sat in parliament at first for the family borough of Castle Rising (1701) and then for King's Lynn, which he represented until he was raised to the peerage. In June 1705 he was appointed one of the council to Prince George of Denmark, the inactive husband of Queen Anne, and then lord high admiral of England. On Feb. 25, 1708, he succeeded Henry St. John as secretary at war, and was thus brought into immediate contact with the duke of Marlborough and the queen. With this post he held for a short time (1710) the treasurership of the navy, and was admitted to the inmost councils of the ministry. He could not dissuade Godolphin from the impeachment of Sacheverell, and when the committee was appointed in Dec. 1709 to draw up the impeachment Walpole was nominated one of the managers for the House of Commons. Walpole shared in the general wreck of the Whig party, and in spite of the flattery, followed by the threats, of Harley he took his place with his friends in opposition. Both in debate and in the pamphlet press he vindicated Godolphin from the charge of peculation, and in revenge for his zeal his political opponents brought against him an accusation of personal corruption. On these charges he was in 1712 expelled from the House and spent a short time in the Tower. His prison cell became the rendezvous of the Whigs, while his praises were sung in popular ballads. In the last parliament of Queen Anne he defended Sir Richard Steele against the attacks of the Tories.

After the accession of George, the Whigs for nearly half a century retained the control of English politics. Walpole, who had supported the Hanoverian succession, obtained the lucrative post of paymaster-general of the forces in the administration which was formed under the nominal rule of Lord Halifax, but of which Stanhope and Townshend were the guiding spirits. Walpole was chairman of the committee appointed to inquire into the acts of the late ministry, and especially into the Peace of Utrecht, with a view to the impeachment of Harley and St. John. Halifax died on May 19, 1715, and after a short interval Walpole became first lord of the treasury and chancellor of the exchequer (Oct. 11, 1715). Jealousies, however, prevailed among the Whigs, and the German favourites of the new monarch quickly showed their discontent with the heads of the ministry. Townshend was forced to resign his secretaryship of state for the vice-royalty of Ireland, but he never crossed the sea to Dublin, and the support which Sunderland and Stanhope, the new advisers of the king, received from him and from Walpole was so grudging that Townshend was dismissed from the lord-lieutenancy (April 9, 1717), and Walpole on the next morning withdrew from the ministry. They plunged into opposition with unflinching energy, and in resisting the measure by which it was proposed to limit the royal prerogative in the creation of peerages (March-Dec. 1718) Walpole exerted all his powers. This display of ability brought about a partial reconciliation of the two sections of the Whigs. To Townshend was given the presidency of the council, and Walpole re-assumed the paymastership of the forces (1720).

On the financial crash which followed the failure of the South Sea scheme, Walpole was regarded by the general public as the indispensable man. Stanhope and James Craggs, the two secretaries of state, died, John Aislabie, the chancellor of the exchequer, was committed to the Tower, and Sunderland, though acquitted of corruption, was compelled to resign. Walpole, at first lord of the treasury and chancellor of the exchequer (April 1721), became with Townshend responsible for the government (though for some years they had to contend with the influence of Carteret), the danger arising from the panic in South Sea stock was

averted by its amalgamation with Bank and East India stock, and during the rest of the reign of George I. they remained at the head of the ministry. The hopes of the Jacobites, which revived with these financial troubles, were disappointed. Atterbury, their boldest leader, was exiled in 1723; Bolingbroke sued for pardon, and was permitted to return to his own country. Peace was assured by a treaty between England, Prussia and France concluded at Hanover in 1725.

In 1727 George I. died, but the confidence which the old king had reposed in him was renewed by his successor, after a brief period of coldness, and in Queen Caroline the Whig minister found a faithful and lifelong friend. For three years he shared power with Townshend, but quarrelled with him in 1730, and Townshend retired into private life. Walpole's administration was based on two principles, sound finance at home and freedom from the intrigues and wars which raged abroad. On the continent congresses and treaties were matters of annual arrangement, and England enjoyed many years of peace. Walpole's influence received a serious blow in 1733. The enormous frauds on the excise duties forced themselves on his attention, and he proposed to check smuggling and avoid fraud by levying the full tax on tobacco and wine when they were removed from the warehouses for sale. His proposals met with violent opposition, and had to be dropped. Several of his most active antagonists were dismissed from office or deprived of their regiments, but their spirits remained unquenched, as the incessant attacks in the *Craftsman* showed, and when Walpole met a new House of Commons in 1734 his supporters were far less numerous. The Gin Act of 1736 led to disorders in the suburbs of London; and the imprisonment of two notorious smugglers in the Tolbooth at Edinburgh resulted in the Porteous riots described in the *Heart of Midlothian*. These events weakened Walpole's influence in the country, but his parliamentary supremacy remained unimpaired, and was illustrated in 1737 by his defeat of Sir John Barnard's plan for the reduction of the interest on the national debt, and by his passing of the Playhouse Act, for the regulation of the London theatres.

That year, however, heralded his fall from power. His constant friend Queen Caroline died on Nov. 20, 1737, and Frederick, prince of Wales, whose request for an increase in his official allowance had been refused, became his active opponent. The prince controlled many boroughs within the duchy of Cornwall, and he attracted Pitt, the Grenvilles and others to his cause. The leading orators of England thundered against Walpole in the House of Commons, and the press resounded with the taunts of the poet and pamphleteer, illustrious and obscure, who found abundant food for their invectives in the troubles with Spain over its exclusive pretensions to the continent of America and its claim to the right of searching English vessels. Walpole long resisted the pressure of the opposition for war, but at the close of 1739, as the king would not allow him to resign, he was forced into hostility with Spain. The Tory minority known as "the patriots" had seceded from parliament in March 1739, but at the commencement of the new session, in Nov. 1739, they returned to their places with redoubled energies. The successes of the troops brought little strength to Walpole's declining popularity, and in the new House of Commons of 1741 political parties were almost evenly balanced. Their strength was tried immediately on the opening of parliament. Walpole was defeated. On Feb. 9, 1742 he was created earl of Orford, and two days later he ceased to be prime minister. A committee of inquiry into the conduct of his ministry for the previous ten years was ultimately granted, but its deliberations came to nothing. Walpole died at Arlington Street, London, on March 18, 1745, and was buried at Houghton on March 25. With the permanent places, valued at £15,000 per annum, which he had secured for his family, and with his accumulations in office, he had rebuilt the mansion at great expense, and formed a gallery of pictures within its walls at a cost of £40,000, but the collection was sold by his grandson for a much larger sum in 1779 to the empress of Russia.

Walpole was twice married—in 1700 to Catherine Shorter (d. 1737) and in March 1738 to Maria Skerret.

Sir R. Walpole's life has been written by Archdeacon William

Coxe (1798 and 1800, 3 vols.), A. C. Ewald (1878) and John Viscount Morley (1889). See also *Walpole, a Study in Politics*, by Edward Jenks (1894); *English Hist. Rev.* xv., 251, 479, 665, xvi., 67, 308, 439 (his foreign policy, by Basil Williams); *Bolingbroke*, by Walter Sichel (1901-02, 2 vols.); the histories, letters and reminiscences by his son, Horace Walpole; and the other lives of the chief political personages of the period.

ORFORD, a small town of Suffolk, England, 16 m. N.E. of Ipswich. Pop. (1921) 818. It lies by the right bank of the river Alde, here confined by a storm beach, near the promontory of Orford Ness. The Decorated church of St. Bartholomew retains a ruined Norman chancel. Of Orford castle the keep remains; it is built of Caen stone and flintwork, and is of Norman date.

ORGAN, in music, the name given to the well-known wind instrument (from Gr. *ὄργανον*, Lat. *organum*, instrument).

EARLY HISTORY

The earliest authentic records of the organ do not extend beyond the second century B.C., but the evolution of the instrument from the syrinx (*q.v.*) or Pan-pipe goes back to a remote period. The hydraulic and pneumatic organs of the ancients were practically the same instrument, differing only in the method adopted for the compression of the wind supply; and the syrinx seems to have been recognized by the ancients as the precursor of both. Thus Hero of Alexandria, in his description of the hydraulic organ, calls it a syrinx. Philo of Alexandria (c. 200 B.C.), mentioning the invention of the hydraulis by Ctesibius, says, "the kind of syrinx played by hand which we call hydraulis."

In the earliest organs there is no doubt that the pipes consisted of lengths of the large reed known as *καλαμος* used for the syrinx, but converted into open flue-pipes. Instead of cutting off the reed immediately under the knot, as for syrinx pipes, a little extra length was left and shaped to a point to form a foot or mouth-piece, which was placed over the aperture in the wind-chest, so that it caused the stream of air to split in two as it was driven through the hole into the pipe by the action of the bellows. A narrow fissure was made through the knot near the front of the pipe, and above it a horizontal slit was cut in the reed, the two edges being bevelled inwards. When the wind was pumped into the chest it found an outlet through one of the holes in the lid, and the current, being divided by the foot of the pipe, became compressed and was forced through the fissure in the knot. It then ascended the pipe in an even stream, as yet silent, until thrown into commotion by another obstacle, the upper sharp edge or lip of the notch, which produced the regular flutterings or pulses requisite for the emission of a note.

In order to convert the syrinx into a mechanically played instrument, the addition of the actuating principle of the bag-pipe was necessary. It is probable that in the earliest attempts the leather bag was actually retained and that the supply of wind was still furnished by the mouth through an insufflation pipe. Such an instrument is described and illustrated by Father Athanasius Kircher, but his drawing should be accepted with reserve. In the instrument, which he calls the *Magrakhetha* or *Mashrokitha* of the Chaldees, the bag is described as being inside the wind-chest, the insufflation pipe being carried through a hole in the side of the box. Little wooden sliders manipulated by the fingers formed a means of controlling the escape of the wind through any given pipe.

Of organs in the next stage of development, namely with bellows, several examples in pottery are extant, and also a description in the Talmud. The quotation as given by Blasius Ugolinius states that the instrument known as the *Magrepha d'Aruchin* "consisted, as the Schilte Haggiborim teaches, of several rows of pipes and was blown by bellows. It had, besides, holes and small sliders answering to each pipe, which were set in motion by the pressure of the organist; the vent-holes being open, a wonderful variety of sounds was produced."

In regard to the hydraulic organ, some writers have considered that the invention of the hydraulis in the 2nd century B.C. by Ctesibius of Alexandria constituted the invention of the organ, and that the pneumatic organ followed as an improvement or variety, but such a suggestion can hardly be accepted. It is most improbable that a man busy with the theory and practice of

hydraulics would *invent* a highly complex musical instrument in which essential parts lying outside his realm, such as the flue-pipes, the balanced keyboard, the arrangements within the wind-chest for the distribution of the wind, are all in a developed state. It would be a case for which no parallel exists in the history of musical instruments, all of which have evolved slowly and surely through the ages. On the other hand, given a pneumatic organ in which the primitive unweighted bellows worked unsatisfactorily, an engineer would be prompt to see an opportunity for the advantageous application of his art. There are two detailed descriptions of the hydraulis extant, both of which presuppose the existence of a pneumatic organ. One is in Greek by Hero of Alexandria, the other in Latin by Vitruvius (*De Arch.* l.b. x. cap. ii.).

The principle of the hydraulis, which long remained a mystery, is now well understood. An inverted funnel, or bell of metal, standing on short feet and immersed in water within the altar-like receptacle forming the base or pedestal, communicated, by means of a pipe, with the wind-chest, placed above it. When the air was pumped into the funnel by the alternate action of two pumps, one on each side of the organ, constructed bucket within bucket and fitted with valves, the water retreating before the compressed air, rose in the receptacle and by its weight held the air in a state of compression in the funnel, whence it travelled through the pipe into the wind-chest. For an interesting discussion of the hydraulic organ, based on a careful first-hand study of the ancient writers see two articles in *The Organ* for Jan. and April, 1923 by D. Bati-gan Verne.

The nature of the hydraulis made it possible to construct large organs of powerful tone more suitable for use in the arena than the small pneumatic instruments, but the hydraulic organ never entirely supplanted the pneumatic, which was probably not so imperfect at the beginning of our era as has been thought, and which was destined to establish its supremacy in the end.

In France and Germany the Romans must have used organs and have introduced them to the conquered tribes as they did in Spain, but the art of making them was soon lost after Roman influence and civilization were withdrawn. Pépin, when he wished to introduce the Roman ritual into the churches of France, felt the need of an organ and applied to the Byzantine emperor, Constantine Copronymus, to send him one, which arrived by special embassy in 757 and was placed in the church of St. Corneille at Compiègne. The arrival of this organ was obviously considered a great event, since it is mentioned by all the chroniclers of the time. Charlemagne received a similar present from the emperor of the East in 812, of which a description has been preserved.

Considerable activity was displayed in England in the 10th century in organ-building on a large scale for churches and monasteries, such as the monster organ for Bishop Alphege at Winchester, which had 400 bronze pipes, 26 bellows and 2 manuals of 20 keys, each governing 10 pipes.

In regard to the details of these early instruments, as represented in contemporary illustrations, it may be noted that there is no miniature on record in which the first action on the keys is indicated, the performer during the 10th, 11th and 12th centuries being depicted in the act of drawing out the stop-like sliders—as for instance, in the 12th-century manuscript Bible of St. Etienne Harding at Dijon, where the organist is playing the notes D and F, the sliders being lettered from C to C. From the 13th century the keys are shown pressed down by means of one finger or of finger and thumb. In the beautiful Spanish ms. said to have been compiled early in the 13th century, known as the *Cantigas de Santa Maria*, a portable is shown having balanced keys, one of which is being lightly pressed by the thumb, the instrument resting on the palm—while the left hand manipulates the bellows. The keys themselves varied in shape, being either like a T; a wide rectangle, with or without the corners rounded off, or a narrow rectangle. The earliest instance of a chromatic keyboard is that of the organ at Halberstadt built in 1361 and restored in 1495. (K. S.)

THE MODERN ORGAN

In former centuries organs were seldom to be found outside places of worship, but at the present day they are built for use

in private residences, concert and public halls, cinematograph theatres, and in many playhouses of the United States and Canada.

The sounds of an organ are produced from pipes of varying shapes and sizes, made to "speak" by means of air under pressure. The sounding of the pipes is determined by the use of the keys, some of which are played by the hands, some by the feet. The keys of the organ resemble those of the pianoforte in appearance; but whereas the pianoforte has only one keyboard or manual the organ may have four or five in addition to a keyboard of foot pedals.

Stops.—Each organ pipe sounds one note only and is a member of a larger unit known as a stop; each stop is a member of a still larger unit known as a sectional or divisional organ; while each sectional organ is a member of the grand organ in its totality.

To the layman the term "stop" usually denotes the knobs grouped on each side of the organist as he sits at his console or control board. In watching the organist pull out or push in these knobs with varying musical results he does not think twice about accepting the term "stop," as popularly understood. To the organ builder, however, it means one thing and one thing only, namely, a rank of pipes.

The pipes of a given stop therefore all produce sounds of similar quality, but necessarily of different pitches. No two stops are exactly similar in quality; on the contrary, they all differ, like the various instruments in an orchestra. Some stops are of high pitch, some of low; some have a thin, some a full quality of tone. The knob at the console is the only part of the stop mechanism that is visible, being merely a handle which actuates the valve admitting wind to the stop itself. Every stop has a separate knob, just as every note has a separate key. Unless one of the knobs were drawn no sound would result when the organ was played.

Sectional Organs.—Passing on to the next size of unit, we come to the sectional organs mentioned. Each of these organs is played from its own clavier or manual and has its own special *timbre* and utility. An organ of five manuals (where found) would commonly comprise a Great Organ, a Swell Organ, a Choir Organ, a Solo (or Orchestral) Organ, and an Echo (or else Bombarde) Organ. Moreover, save only in the tiniest instruments, there is also a Pedal Organ played by the feet of the executant.

The normal range or compass of the manuals is 61 notes, *i.e.*, 5 octaves, from CC in the bass to C''' in the treble (though certain organ builders of the United States have adopted a manual compass of 7 octaves); that of the pedals is 32 notes, *i.e.*, 2½ octaves from CCC in the bass (lowest C on the pianoforte) to the G below middle C. In other words, a manual stop ordinarily comprises 61 pipes and a pedal stop 32 pipes.

Organ-pipes.—These are primarily divisible into two main genera, namely flue and reed. Flue-pipes bear a strong resemblance to the humble "penny whistle," both as to appearance and physical behaviour—except that a flue-pipe does not sound more than one note. In reed pipes the wind vibrates a curved brass tongue over the surface of a reed or shallot, so that the oscillations of the tongue cause the speech of the pipe. Associated with the reed is a metal resonator, which exercises much the same function as the "loud-speaker" horn of a radio-outfit.

Both genera have in common the properties of pitch and quality. With a flue-pipe the pitch is lower as the tube or body is longer; with a reed-pipe pitch depends on the vibrating length of tongue and on the position of the spring wire, which can be made to increase or diminish this length. The quality of a flue-pipe is affected mainly by the diameter (or scale) of the body relative to the length, the wider scale giving the fuller tone and vice versa; the quality of reeds is affected by the length of resonator, their shape and scale, the thickness of the tongues and other factors.

But the souls of organ pipes are all in the hands of the "voicer," and their ultimate character depends more on the process known as "voicing" than on anything else.

Although most of the flue-pipes in an organ are open at the ends to the atmosphere, there is also a considerable class having its bodies closed by a cap or stopper. Known as *gedeckts* or *bourbons*, these pipes are peculiar in that they speak a note nearly an octave lower than an open pipe of the same length. Another

class has the bodies pierced about midway with a small hole, the result being that they sound an octave higher than ordinary pipes of the same length. These are called harmonic pipes.

Voicing and Tuning.—Voicing consists for the most part in adjusting the mouth-pieces of a flue-pipe or the tongue-curvature of a reed in such a manner that the desired quality of tone or timbre is permanently obtained. The final process of voicing is

FIG. 1.—VARIOUS TYPES OF ORGAN PIPES

(a) Section of metal flue pipe; (b) section of wooden flue pipe; (c) section of reed pipe (trumpet) and its component parts; (d) open diapason; (e) Viola da gamba; (f) clarabella, or Hohl-Flöte; (g) Gedeckt; (h) Gemshorn or Spitz-Flöte; (i) trumpet or cornopean (reed). (Not to scale)

known as "regulation" and means the making uniform in power of every pipe in a stop. This the voicer achieves by admitting a greater force of wind through the "foot" of the pipe, if he wishes to louden its tone; or by reducing the foothole and so reducing the wind, if he wishes to soften it.

For tuning various methods are employed, according to the character of the particular class of pipe being dealt with. Thus some flue-stops are tuned by moving up or down a metal sleeve which fits over the top of the pipe, the speaking length of which is in this way increased or diminished. Others—especially "upperwork" stops—have to be coned in or expanded slightly at the ends, according to whether it is intended to flatten or sharpen the pitch. Others again are tuned by pressing in or pulling out a metal piece affixed in or near the tops of the pipes. As for gedeckts the caps or stoppers afford an easy means of altering the pitch.

Names of Stops.—In making the acquaintance of organ stops for the first time many persons fall into the error of putting far too much faith in the names. Organ stops, it is true, resemble orchestral instruments to the extent that they bear names which are supposed to distinguish them from one another; but so far from the "orchestral" analogy holding good generally, it fails for two reasons—first, because organ builders have invented a hundred and one fancy names to denote pretty much the same kinds of stops; secondly, because they do not all agree as to what a

given name is to denote.

Proceeding then on these lines, we may group flue-stops into three broad species—flute, diapason and viol. Flutes are either open or closed (*i.e.*, gedeckts), harmonic (*i.e.*, of double-length) or non-harmonic. Diapason stops on the whole have a natural and normal organ tone, familiar to everybody. Viols are of smaller scale than diapasons and so are of comparatively thin and stringy tone. Several stops stand on the borderland between two species; but the majority can be brought under one of the foregoing heads, quite apart from their loudness and intensity.

In reedwork the French horn is, roughly speaking, the equivalent of the flute, the trumpet of the diapason, the English horn (*cor anglais*) of the viol species. The clarinet corresponds with a gedeckt and has resonators of only half length, just as the harmonic reeds have resonators of double length. For the resonators of reeds are of about the same length on the bodies of flue-pipes giving the same pitch of note and in these two cases at least, they depart similarly from the normal. But at all times the reed stops are much less numerous than the flue, and although often blown by a wind of much heavier pressure do not compete with them on their own ground.

Pitches of Stops.—Organ stops which speak at the pitch indicated by the written notes are called 8ft. or "unison stops" because an open flue-pipe about so long would be needed to sound CC, the lowest note of the manual clavier. By analogy reeds and even gedeckts are 8ft. stops, if they sound at 8ft. or "unison" pitch throughout. So, too, the 16ft. stops are those which sound an octave below the "unison" pitch of the manuals. A gedeckt with a body 8ft. long would still be a 16ft. stop, because of its 16ft. pitch. Stops as grave as of 32ft. pitch appear on the pedal and in very large organs on the manuals, their name signifying a pitch two octaves below that of the manuals.

Of stops which sound higher than the 8ft. pitch of the keys the 4ft. stops give the octave, 2½ft. stops the twelfth, 2ft. stops the fifteenth or super-octave, 1½ft. stops the seventeenth or tierce, 1¼ft. stops the nineteenth or larigot, 1¼ft. stops the flat twenty-first or septième, 1ft. stops the twenty-second, and so (in theory at least) ad infinitum, the interval between the ranks becoming smaller as the ranks themselves are of acuter pitch, in accordance with the natural law of what is known as the *harmonic series*. Practical considerations, however, must always set arbitrary limits, and in this case they rule: (1) ranks above the fifteenth are too small and acute to be carried through the whole compass of the keyboard in an unbroken form; (2) no rank more dissonant than a minor seventh—or at most a major second—is tolerable anywhere in the tonal economy of the organ; (3) for most ordinary purposes ranks sounding octaves, thirds and fifths sufficiently represent the harmonic series. As a matter of practice all stops above the fifteenth form a part of what are called the mixtures, and except for special purposes (*see later under Choir Organ*, where the purpose of independent mutations is discussed) are employed collectively as "upperwork." Manual stops of 16ft., 8ft. and 4ft. pitches, being the most consonant with the unison or standard, are termed "foundation work" (*Fr. fonds*); and thus, in the upper work and in the foundation work respectively, the two complementary ideas of brilliance and gravity are fulfilled. The twelfth and fifteenth are sometimes independent ranks, sometimes part of the mixtures. As a rule, flute and viol stops are confined to the foundation pitches—reeds always. But diapasons being of a tone peculiar to the organ represent upperwork as well as foundation.

And now to consider the stops as grouped in the various sectional organs and the sections themselves as related to the organ at large, premising that letters attached to stop-names in this article indicate their genus, species or tone-quality, *i.e.*, d=diapason, f=flute, v=viol, g=gedeckt, r=reed, echo=lessertoned.

Great Organ.—The Great Organ (*Fr. Grand Orgue*; *Ger. Hauptwerk*) as its name implies is the most important of these, and forms the tonal backbone of the whole instrument.

In English and American organs it is chiefly conspicuous for a diapason quality which pervades it throughout. Especially typi-

cal is the open diapason 8ft. without which scarcely an organ was ever built. To supply the requisite foundation for a large Great Organ there may be as many as three or four open diapasons, though they would not all be similarly scaled and voiced. If the first diapason is a powerful stop of full and round quality, the second is almost sure to be of a lighter and sharper tone; and sometimes in the interests of variety a geigen (dv) or gemshorn (dg) is substituted for the third or fourth.

The double open diapason, 16ft. octave or principal 4ft., twelfth 2½ft., fifteenth 2ft., and mixtures are equally germane to the Great Organ, and may be likened to the roots, branches and twigs of the diapason trunk.

On the other hand the substratum of the French Great Organ is not so much a diapason as a flute one; for flutes are regarded as a kind of neutral canvas on which other and more positive tone colours (especially diapasons) can be laid and mixed. Again, Spanish Great Organs have no open diapasons as understood by English-speaking musicians; instead they have a foundation of hybrid flute-viol kind which is said to be particularly disagreeable. Nor does the average German Great Organ appeal to our ears much more, since its pipes are too often made of thin metal, and as a consequence sound hard and brassy. The gedeckts, e.g., bourdon 16ft., stopped diapason 8ft., flute couverte 4ft., add considerable body to the diapasons besides having their own special value. In the United States a Doppelflöte (gedeckt with two mouths) is very popular. Where neither money nor space can be found for the pipes of actual 16ft. length, a bourdon 16ft. (g) frequently takes the place of a double open diapason.

Open flutes are nearly always present at 8ft. and 4ft. pitches and under a diversity of shapes and names—clarabella, wald flute, tibia, melodia, flute ouverte, etc. Viols, however, are thought to mar the sovereignty of diapason tone, and so are less common on the English Great Organ than abroad.

The usual complement of Great Organ reeds amounts to trumpets, 16ft., 8ft., and 4ft., going by the name of contra (tromba) or bombarde 16ft., tromba, trumpet or posaupe, 8ft.; clarion or octave (tromba) 4ft. For a small Great Organ a single tromba or trumpet 8ft. suffices, or else the reed class may be omitted altogether from this section. To which it may be added that most builders to-day prefer to furnish all their chorus reeds with harmonic or double-length trebles which stand in better tune than the non-harmonic.

Swell Organ.—The Swell Organ (Fr. *Récit*; Ger. *Schwellwerk*) again almost explains itself. For inasmuch as organ pipes are naturally incapable of crescendo and diminuendo, a whole section of stops is played from a separate manual, and made expressive by artificial means. That is to say, all the pipes of the Swell Organ are enclosed in a large box which is faced on one side with a set of balanced shutters, not unlike the *louvre*s of a venetian blind. As the shutters are opened electrically by the organist from the console, the volume of tone increases; as he closes them, it diminishes. Most people can easily recognise the sound of a full swell by the peculiar "tingling" effect it has when the shutters are nearly or completely closed. This effect indeed gives the best indication as to the basis of the Swell Organ: for it is shown to depend almost entirely on reeds and mixtures. Were all other stops omitted, a "skeleton" Swell would suffice for this effect, consisting of double trumpet 16ft., trumpet 8ft. (cor-nopean), clarion 4ft., plus brilliant mixtures to crown the whole.

At the same time a Swell Organ confined to a reed basis would not be practical politics; and so it comes about that other stops, both reed and flue, are required also here. The oboe, for instance (=echo horn), and the unda maris or voix celeste (a pulsating stop made up of two out-of-tune dulcianas) are almost universal. Hardly less so are narrow scale gedeckts of some kind (lieblich or rohr) in the foundation pitches. Nor is the entry of the diapason series delayed, though its stops will be of lighter calibre than those on the Great. The Swell mixtures belong properly to the diapason series, and only by design to the reed chorus, and so should not be voiced to emulate the sound of smashing glass, as sometimes happens. Then salicional (echo vd), spitz flute (dg), aeoline (echo v), wald flute (f), etc., should all be added to the

list of unobtrusives, but usefals.

In a small Swell Organ a contra-oboe or fagotto 16ft. generally appears as its first double; for a reed has the advantage over, say, a bourdon or contra-salicional 16ft. in taking up less room inside the swell-box, while contributing directly to the reed foundation.

Choir Organ.—The Choir Organ (Fr. *Positif*; Ger. *Oberwerk* or *Positiv*) belongs to one or other of two well defined types. It is either an Echo Great Organ in the true sense and in the old style; or else it stands in a swell-box and is less exclusive in caste.

If a miniature Great Organ, it comprises a lightly blown diapason series (16ft. to mixtures), a gedeckt or two, and perhaps even a low-pressure trumpet. In its other capacity it has an ensemble of mild flutes and viols, rather than one of pure diapason complexion, though of course there is no actual ban on diapasons. Viola da gamba, viola d'amore, fugara (v), chimney flute, cor de nuit, quintaten (g), flauto amabile, wald flute, harmonic flute (f) at 8ft., 4ft. and 2ft. pitches, the gemshorn family at all pitches—none of these are out of place so long as the key-note is gentleness and moderation in scales and wind pressures. If the Swell Organ contains a voix celeste of two salicionals (echo dv), occasion is sometimes taken to provide the Choir with a contrasting flute celeste of two gedeckts. The dulciana (echo d), or salicional 8ft., is of course indispensable and in larger instruments it may appear at 16ft., 4ft. and/or 2ft. also. Nor does a delicate mixture of dulciana or salicional pipes ever come amiss, though it is surprising how few organ-builders care about stops of so refined a tone.

An enclosed Choir Organ frequently houses the independent mutation stops, which are found to answer best in the shape of gedeckt pipes. Mutations commonly used are: nazard or twelfth (2½ft.), tierce or seventeenth (1½ft.), larigot or nineteenth (1½ft.), septième or flat twenty-first (1¼ft.) and if it may be termed a mutation, the octavin or twenty-second (1ft.). With these or an even fuller muster to hand immense colouristic possibilities lie in front of the organist. Like a chemist in a laboratory he has only to mix one or two mutations with a 4ft. or 2ft. stop or even with another mutation to create new tonal compounds of rare and surprising piquancy. An excellent "orchestral oboe" can be made from this recipe—viole 8ft., nazard 2½ft. and tierce 1½ft.

Reeds are neither few nor insignificant on the French *Positif*, but in England the Choir is more often than not limited to a clarinet or cor anglais 8ft.

Solo Organ.—The Solo (or Orchestral) Organ differs from the three foregoing sections in one practical respect. Hitherto we have been dealing with units which were designed with the aim of building up a harmonious whole.

It is not perhaps overstating the case to say that the English Solo Organ is considered successful in proportion as it is anomalous in relation to the rest of the instrument. Being largely imitative of orchestral instruments, its stops, both reed and flue, represent extremes of scaling and voicing; and so have a poor blending capacity.

The Orchestral Organ may be regarded as a modern off-shoot of the Solo, which it sometimes includes on the fourth manual. So many solo stops are intended to resemble orchestral instruments, so many "orchestral" or imitative stops are distinctive enough to take a solo melody or melodic part, that the two names must largely overlap. Some builders, however, prefer to assign the Solo and Bombarde to a fifth manual, while retaining the fourth for an Orchestral pure and simple. Or, if there are only four manuals all told, the Choir and Orchestral are made to share the third, Solo and Bombarde the fourth.

Among the most prominent features of the Solo-Orchestral section is a pungent viol family. This may be more or less fully developed from the 16ft. contra-viol or violone, through the unison viol d'orchestre or violoncello to a viol mixture of 3 or more ranks, according to the size of the section.

In complete contrast stand the powerful orchestral flutes, which are invariably harmonic and appear at 8ft., 4ft. and 2ft. pitches. One name for the 4ft. rank is flauto traverso, the 2ft. nearly always being termed piccolo. Of gedeckts a large-scale tibia clausa is at once the most effective and the most vulgar.

Bassoon or fagotto 16ft., clarinet 8ft. (and sometimes 16ft.), orchestral oboe 8ft., orchestral trumpet 8ft., French horn 8ft., English horn 16ft. and 8ft., are all imitative reeds which find an appropriate home in this section. Though probably more valuable as a "timbre-creator" than an imitative stop the vox humana passes for "orchestral" and is included here.

As befits its character, the Solo-Orchestral section must be

FIG. 2.—END SECTION OF ONE STOP IN THE WIND-CHEST. SHOWING THE INITIAL STAGE IN THE PROCESS OF JOINING THE PIPES WITH THE KEYS AND STOP-KNOB

enclosed in its own swell-box and voiced on a fairly heavy wind pressure, so that its stop may tell out clearly.

Echo Organ.—If the principle of *seniores priores* counts for anything, an enclosed Echo Organ ought to occupy the fifth manual, when one is provided: for such is its traditional place. In the churches of the United States Echo Organs are frequently met with, but without a fifth manual in the console. Modern English practice, however, seems inclined to favour the case of a Solo-Bombarde section instead of an Echo Organ for this manual, particularly if tubas are absent from the fourth manual. This would consist of heavy-pressure tubas (r) at the foundation pitches, and a chorus mixture of 6 ranks or more, the whole forming a forte-fortissimo ensemble. A stentorphone 8ft., i.e., a monstrosous solo diapason is often included.

Pedal Organ.—The Pedal Organ supplies a general bass to the whole organ, its stops therefore being pitched an octave lower than those of the manuals having the same nomenclature. Thus the "unison" stops are 16ft. instead of 8ft. A pedal double diapason would be 32ft. instead of 16ft. pitch, a pedal fifteenth 4ft. instead of 2ft., a pedal tierce 3½ft. instead of 1½ft., and so on.

A minimum Pedal Organ could consist of gedeckt or bourdon (16ft. closed wood) and from these the 8ft. and 4ft. pitches could be derived to form three stops in all. After which the Pedal Organ increases *pari passu* with the numerical growth of the manual stops. Soon one or more open diapasons 16ft. become imperative to balance the Great diapasons. Next a double open diapason 32ft. is the proper offset to 5 or 6 ranks of Great mixtures. From which it is but a short step to establish a diapason series from 32ft. to mixtures, thus making the Pedal Organ a complete entity on its own account. Large French Pedal Organs are especially rich in mixtures and mutation ranks, which contribute of course to reinforce the foundation. Other stops which are required as bass counterparts to manual tones include tibia (f), salicional (echo vd), geigen (vd), contrabass or violone (v), quintaten (g), etc.; and all these are amenable to extension into higher pitches.

Turning to the reeds we see the same rule of balance and expansion working itself out. As soon as an organ is large enough to contain either a tuba or Great trumpets 16ft., 8ft. and 4ft., there enters inevitably a heavy-pressure Pedal trombone, ophicleide or bombarde 16ft. Any further increase of powerful reed tone on the manuals is met by enlisting the aid of the Pedal contra (bombarde) 32ft., the clarion or octave (trombone) 8ft. and occasionally the octave clarion 4ft. A well equipped Pedal Organ would also have one or two lighter reeds such as cor anglais, clarinet, waldhorn and bassoon, "borrowed" from the manuals.

Windchest.—If we may regard all intermediary mechanisms which join the fingers of the organist with the sounding of the pipes as links in a chain, the first "link" claiming our attention is

the windchest.

Now, a windchest has this double function: on the one hand it carries the pipes themselves; on the other it contains within it an apparatus for distributing wind to these pipes. (Each chest carries not more than nine stops.) In shape it is a box of thick pine about 8ft. long \times 9in. deep, divided into as many longitudinal compartments as there are stops to be accommodated. Over its top surface (called the "table") are the "upperboards" on which the pipes stand. Over the upper boards and raised about 4½" above them are the rackboards which keep the pipes in an upright position. Fig. 2 shows a form of windchest, which has already enjoyed a wide vogue in the United States having been largely popularized by the Skinner Organ Co., of Boston, Mass. For the sake of simplicity it has been thought desirable to indicate one key action and one stop action only—e.g., tenor F. and open diapason; but the reader must imagine the same mechanism multiplied to the extent of n stops \times 61 times. The *raison d'être* of all windchests is the same—to enable the pipes to sound when the pallets below them have collapsed and have allowed the wind to flow through the orifices commanded by the pallets. This point is stressed, because it should be stated that what has been described is known as a modern "sliderless" chest (for the obsolescent "slider" windchest, see the Bibliography).

Relay Machine.—After the windchest itself comes the relay machine, which may be looked upon as the next link in our "chain." This serves to keep the key channels charged with pressure-wind, or to open the same to the atmosphere when the keys are pressed; also it is the place where the pneumatic portion of the "chain" joins the electric, and one motive force is substituted for another. Its component elements are as illustrated.

To each of the longitudinal stop channels in the windchest is attached an exactly similar apparatus; so that henceforward both key and stop "chains" continue in the form of electric wires from the magnets as shown in the illustration. These wires may be regarded as the third link in the "chain."

Console.—At the other end of the "chain" is the console or composite keyboard at which the organist sits. Here the "chain" terminates in the outward and visible keys, stop-knobs and other accessories, used by the player to control the organ. In the United States scarcely two builders work to the same plan of console, and as a result hardly two consoles are alike. Fig. 4 shows a typical English model of dignified and not unprogressive design. This would consist of 2-5 manuals according to the number of sectional organs, and a radiating-concave pedal clavier lying about 31 inches under the surface of the lowest manual. By English

FIG. 3.—SECTION OF RELAY MACHINE (KEY OR STOP ACTION) The second stage of process of joining the organ-pipes with keys and stop-knobs is shown, with the machine "off," the key or stop action being at rest

convention the Choir manual is the lowest, the Great the next, the Swell the third, the Solo (or Orchestral) the fourth, and the Echo (or Bombarde) the topmost. The stop-knobs are shown projecting from the jambs to right and left of the console. On the face of each knob is engraved the name of the particular stop and its approximate pitch-length in terms of feet—e.g., clarinet 8ft., twelfth, 2½ft., bourdon 16ft.—so that a moderate knowledge of technical nomenclature combined with the habit of seizing the meaning of such figures on the stop handles will be found to suffice as a key to the complexities of all consoles. The stop-knobs controlling the various sectional organs are, of course, grouped

together systematically so as to avoid any confusion, and in a 5-manual organ would be disposed thus:—

Left Jamb.
Swell Organ.
Solo (or Orchestral) Organ.
Bombarde (or Echo) Organ.

Right Jamb.
Great Organ.
Pedal Organ.
Choir Organ.

Over the top manual are ranged the ivory tilting-tablets, which operate the couplers. These provide for the coupling of almost any one clavier to another, at unison (8ft.) pitch, and also at

FIG. 4.—DETACHED CHURCH ORGAN CONSOLE, SHOWING THREE MANUALS AND PEDAL

sub-unison (16ft.) and octave (4ft.). Moreover, any manual except the Great may be duplicated *on itself* at sub-octave and octave pitches. Sometimes too there is a "unison silent" coupler which cuts out the 8ft. pitch of every stop drawn on the manual in question. Only the Great Organ remains constant, except as against the Pedal to which all manuals can be coupled.

Unless the action be tubular pneumatic or tracker—both older and non-electrical methods of forming our figurative "chain"—it is customary to detach the console and place it at some distance from the organ, connection being made by electric cables. For descriptions of pneumatic and purely mechanical actions, see G. A. Audsley's *The Art of Organ Building*.

But to revert to the key action "chain." Every manual and pedal key in the console has a thin bar of copper attached to it, so that when pressed it bridges the gap in the "return" wire and closes the circuit. The stop action "chain" operates on an identical principle and need not be further described.

Except the combination piston action, the sole remaining "chain" is the coupler action. This has its beginning and end in the console itself, and is merely a cut-out switch intercepting the 61 key circuits simultaneously. Every new coupler means an extra switch and an extra "return" wire in the key contacts, all "mains" throughout being permanently conjoined with the + terminal. The reader should appreciate, however, that the moving in or moving out of a coupler-switch is a purely local and external process. Although actually performed by means of solenoids or electro-pneumatic motors, it might just as well be done by hand, could the organist only reach out to the switchboard at the back of the console.

Controls.—The combination pistons under each manual control not individual stops of that manual, but groups of stops. When pressed by the organist's thumb they have the effect of throwing out whatever combination of stops he may have selected, without his having to touch the knobs. The Pedal Organ combination pistons are pressed by the right foot of the organist. On luxuriously equipped consoles it has become customary to fit also four or five general pistons, *i.e.*, having a jurisdiction over every stop and coupler in the organ. In an up-to-date console all pistons should be readily adjustable by the player, so that he may set them to operate whatever selections of stops he pleases.

Unit System.—Nearly all organs designed for cinematograph theatres are built on what is known as the unit or extension system; and in this respect are to be distinguished from the orthodox type which has been described. The distinction lies in the fact that whereas an orthodox organ has separate and individual stops

for each manual and pedal, a unit organ employs the same rank of pipes again and again at various pitches and (rather misleadingly) under various names. By way of illustration take the case of a series of four gedeckt stops—bourdon 16ft., tibia clausa 8ft., zauberflöte 4ft., piccolo 2ft. Under the orthodox system each stop would be a separate rank consisting of 61 pipes, the total number of pipes being 244. Under the unit system there would be one master rank of only 97 gedeckt pipes (eight octaves), and from this rank the four "stops" would be derived at the four different pitches and under the four different names.

The unit system has been mentioned here, because at the heart of it all is the coupler switch just described. What has really happened is that couplers acting at the various pitches have taken the place of independent stops, and the electric wiring has been done for a wholesale adoption of switches instead of draw-stop actions. If so many "stops" are to be extracted from one parent rank, a corresponding number of electric switches will be needed, together with an equal number of return wires on each of the key contacts.

At the switch-board is effected also "duplexing," or rendering a stop available on more than one clavier—a necessary facility in the theatre organ and even in the Pedal section of an otherwise "straight" church organ.

Mention may also be made of the "double-touch" device now frequently incorporated in the modern cinematograph or concert-hall organ. Its operation is quite simple and may be explained in a word. A clavier having this device is one of which the keys, when played, fall not only to the standard depth of touch, but also—on extra pressure being applied by the finger—another $\frac{1}{8}$ " or so deeper. The purpose of the second touch is to enable any key to make a second electric contact at the lower level, and so to engage a second circuit when it reaches that point. As a rule this circuit brings into action a powerful solo stop, a coupler or occasionally some "percussion" (*e.g.*, cymbals); but in any case it is plain that a clavier so equipped has the potentialities of two claviers in itself.

Organs designed for secular use are freely equipped with other means of making sounds than pipes. On a theatre instrument one may expect to find chimes, bird-whistle, xylophone, marimba, etc., in addition to drums, cymbal, triangle, castanets and many other "traps," as they are called, for the greater delectation of King Demos. Even in church organs of the United States 8ft. and 4ft. harps to the Choir and cathedral chimes to Great or Solo play an important part, and are by no means deemed out of place; whereas British practice, restrained by more sensitive church traditions, admits in this way nothing more fanciful than a tremulant to the enclosed sections.

Wind Supply.—It but remains to add that wind is supplied to the organ by a form of rotary fan (not unlike a steam turbine), driven by an electric motor. From this fan the wind is conveyed in a zinc duct called a trunk to a junction-box, whence smaller trunks branch out to the reservoirs of each windchest. The dynamo, generating current for the action, may be driven off the main motor by a "whistle-belt" and should be properly over-compounded so as to maintain a steady voltage under varying loads. Gone are the proverbial bellows and still more proverbial "blow-boy," save in remote country districts where there is no electric power; for they have long been ousted by these all-metal machines of greater endurance and fewer vagaries.

Compared to other pneumatic machines, the organ operates on a very light wind pressure. Seldom are even the most powerful reeds voiced on a wind exceeding the weight of 30 inches of water, while a large majority of stops speak on only 4–6 in. pressure.

BY COURTESY OF THE SKINNER ORGAN COMPANY

PARTS OF A MODERN ORGAN

1. Large organ at Finney Chapel, Oberlin College, Oberlin, Ohio, showing casework and display pipes. The console is in the foreground
2. Same organ shown in fig. 1, with casework and display pipes removed, showing interior, with manual and pedal pipes and swell boxes
3. Giant pipes known as Bombardes, set up in the factory for voicing and tuning
4. Assembling room showing organs in process of construction with another view of the Bombardes shown in fig. 3
5. Rear view of a console with rear and side panels removed
6. View looking down upon the stop and combination action of a register panel, showing how the movement of the stops is changed from an angle of 45 degrees to a direction parallel to the side of the console. This assembly is arranged to bring the trace rods of all the stops to a common level so that they may be controlled by the combination action which moves them collectively
7. Side view of fig. 6, showing how the various perpendicular groups are brought to a common level
8. View of a standard four manual console, similar to the instrument shown in fig. 1

ORGANIC SENSATIONS, a term for all the bodily sensations except those derived from the skin. In addition to the four special senses, sight, hearing, taste and smell, there is the common sensibility or somesthesia, which includes cutaneous sensations (*q.v.*) and organic sensations. Organic sensations may be subdivided into kinaesthetic sensations, vestibular or static sensation, and visceral sensations. The deep sensibility that comes from the impulses it is impossible to control the movements accurately.

Kinaesthetic sensation, so named because it mediates the perception of bodily movement as well as the perceptions of weight, resistance and posture, arises in the muscles, tendons and joints, all of which are supplied with sense-organs. Its nervous mechanism has also been called the proprioceptive system, whose function it is to furnish the afferent cues necessary for precise movement. Without these kinaesthetic sensations or proprioceptive nerve-impulses it is impossible to control the movements accurately.

The vestibular or static sense has to do with the maintenance of balance and of bodily position and with the perception of rotation. It arises either in the vestibule or the semi-circular canals of the ear. Ernst Mach's theory, to which recently objection has been raised, relates the perception of rotation to these canals, which seem peculiarly well-adapted by their structure to mediate this perception.

The visceral sensations include the sensory bases for such experiences as hunger, nausea, appetite and sex, if indeed the last two are to be understood in terms of their sensory nature. (See VISCERAL SENSATIONS.)

The importance of organic sensations has been emphasized by the James-Lange theory of emotions, which asserts that an emotion differs from other consciousnesses in that it includes the perception of a violent organic reverberation. For example, a fear may be characterized by the kinaesthesia of running away, and the sensations that arise from the dryness of the throat and from the viscera. Against the theory it has been argued that internal state and bodily posture are insufficient completely to account for emotion. See EMOTION; JAMES-LANGE THEORY OF EMOTIONS. (E. G. BOR.)

ORGANO-METALLIC COMPOUNDS are chemical substances containing a metal or metalloid in direct association with one or more hydrocarbon radicals. These compounds never arise by natural processes in the vegetable and animal kingdoms, being produced synthetically by the art of the chemist. They have played an important part in the development of modern chemistry and among them are several substances of great practical utility. Lead tetraethyl (*see p. 898*), a most effective anti-detonant in motor gasoline or petrol, and salvarsan, a specific remedy in syphilis, are two outstanding examples of organo-metallic compounds of proven worth. Included in this group of carbon compounds are the organic derivatives of magnesium known after their discoverer as Grignard reagents (*q.v.*). The application of these reagents in chemical synthesis has proved to be one of the most fruitful and far-reaching improvements in practical organic chemistry since the end of the 19th century.

Brief references to organo-metallic compounds have been given under the headings of certain of the metals and metalloids, and the present article affords a general survey of the whole group. The arrangement adopted below follows the natural sequence of the elements according to the periodic law (*q.v.*).

First Series. Alkali Metals.—Although the production of alkyl derivatives of sodium was claimed by Buckton in 1859, the existence and properties of these substances remained doubtful until comparatively recently (W. Schlenk and others, 1913-17). Lithium ethyl, $\text{Li}\cdot\text{C}_2\text{H}_5$, is prepared by the action of metallic lithium on mercury diethyl; it crystallizes from benzene or high-boiling petroleum in colourless, six-sided plates melting at 95°C . Lithium methyl, $\text{Li}\cdot\text{CH}_3$, and lithium phenyl, $\text{Li}\cdot\text{C}_6\text{H}_5$, are crystalline powders obtained by double decomposition between lithium ethyl and mercury dimethyl and diphenyl respectively (Schlenk and Holtz, 1917). Sodium triphenylmethyl, $\text{Na}\cdot\text{C}(\text{C}_6\text{H}_5)_3$, a convenient starting point in the preparation of simpler sodium alkyls, is obtained by the action of 1% sodium amalgam on triphenylchloromethane, $(\text{C}_6\text{H}_5)_3\text{CCl}$, dissolved in dry ether in an at-

mosphere of oxygen-free nitrogen. The product, a brownish-red substance, when allowed to react with mercury dimethyl in inert media, furnishes sodium methyl, $\text{Na}\cdot\text{CH}_3$, as a white powder which burns in air with explosive rapidity. Sodium ethyl, $\text{Na}\cdot\text{C}_2\text{H}_5$, sodium *n*-propyl, $\text{Na}\cdot\text{C}_3\text{H}_7$, and sodium phenyl, $\text{Na}\cdot\text{C}_6\text{H}_5$, are colourless solids having similar properties.

Currency Metals.—Cuprous phenyl, $\text{Cu}\cdot\text{C}_6\text{H}_5$, obtained by the interaction of cuprous iodide and magnesium phenyl bromide in ethereal solution, is a white powder decomposing at 80°C into copper and diphenyl. Silver phenyl, $\text{Ag}\cdot\text{C}_6\text{H}_5$, an even more unstable substance obtained from phenyl magnesium bromide and silver bromide, is a yellow solid, exploding on rubbing, on gentle warming or on treatment with acids.

An ethereal solution of auric bromide and magnesium ethyl bromide yields on evaporation colourless crystalline diethyauric bromide, $(\text{C}_2\text{H}_5)_2\text{AuBr}$, melting at 58°C and exploding at 70°C . Bromine in chloroform converts this monobromide into the ruby-red ethyauric dibromide, $\text{C}_2\text{H}_5\cdot\text{AuBr}_2$ (W. J. Pope and C. S. Gibson, 1907).

Second Series.—The organic derivatives of beryllium are referred to under this metal and the organo-magnesium compounds are described in a special article. (See GRIGNARD REAGENTS.) The organo-zinc compounds were discovered by E. Frankland in 1849, and from his study of similar compounds he was led to the conception of chemical valency. In conjunction with Duppa (1863) he applied them in many organic syntheses which were extended by Freund (1861), Butlerow (1867) and others. Zinc dimethyl (b.p. 46°C) and zinc diethyl (b.p. 118°C) are colourless malodorous liquids, spontaneously inflammable in air. They are prepared by distilling the products of the interaction of methyl and ethyl iodides with a zinc copper couple. More recently zinc phenyl bromide, as a crystalline dietherate (Blaise, 1911), and zinc diphenyl (A. Job and R. Reich, 1923) have been obtained by the interaction of magnesium phenyl bromide and anhydrous zinc chloride.

The cadmium dialkyls (dimethyl, diethyl, dipropyl, dibutyl, etc.) are procurable in good yields from anhydrous cadmium bromide and the appropriate magnesium alkyl bromide. Cadmium dimethyl, $\text{Cd}(\text{CH}_3)_2$, is a colourless liquid boiling at 105°C (E. Krause, 1917). Mercury possesses a remarkable capacity for combination with the carbon of hydrocarbon groups and of organic radicals in general. Sodium amalgam acts directly on ethyl iodide and bromobenzene, giving respectively mercury diethyl, $\text{Hg}(\text{C}_2\text{H}_5)_2$ (b.p. 159°C), and mercury diphenyl, $\text{Hg}(\text{C}_6\text{H}_5)_2$ (m.p. 120°C). With certain reactive substances such as aromatic bases or phenols, mercury derivatives are obtained merely by boiling with mercuric acetate; aniline yields *o*- and *p*-aminophenylmercuriacetates, whereas *m*-toluidine takes up two and even three mercuriacetate residues. Phenol gives rise to *o*- and *p*-hydroxyphenylmercuriacetates and hydroxyphenyl-2:4-dimercuriacetate. In addition to the foregoing processes, organo-mercury compounds are conveniently prepared through the agency of Grignard reagents. Mercury dimethyl, a colourless liquid boiling at 89 – 92°C , is obtained from magnesium methyl iodide and mercuric chloride, and the homologous mercury dialkyls are prepared similarly.

Third Series.—Aluminium trialkyls and triaryls have been recorded, and the production of these substances is facilitated by the use of Grignard reagents. Magnesium ethyl bromide and anhydrous aluminium chloride interact in dry ether to produce aluminium triethyl etherate, $4\text{Al}(\text{C}_2\text{H}_5)_3\cdot 3(\text{C}_2\text{H}_5)_2\text{O}$, as a colourless mobile liquid boiling at $112^\circ\text{C}/16\text{ mm.}$ It fumes in air, takes fire spontaneously and is decomposed explosively by cold water, (E. Krause and B. Wendt, 1923). Aluminium diethyl iodide (b.p. 118 – $120^\circ\text{C}/4\text{ mm.}$) and aluminium ethyl diiodide (m.p. 35 – 37°C ; b.p. 158 – $160^\circ\text{C}/4\text{ mm.}$) were obtained by V. Grignard and R. L. Jenkins (1925) from the liquid product of the interaction of aluminium and ethyl iodide.

Organic derivatives of indium and thallium are obtainable through the Grignard reagents. Thallic bromide, but not thalious bromide, yields both dialkyl and diaryl compounds. Thallic dimethyl bromide, $(\text{CH}_3)_2\text{TlBr}$, forms silvery-white leaflets (R. J.

Meyer and A. Bertheim, 1904), whereas thallic diphenyl bromide, $(C_6H_5)_2TlBr$, is obtained in colourless transparent microscopic needles (D. Goddard and A. E. Goddard, 1922).

Fourth Series.—Organic derivatives are known of silicon (*q.v.*), germanium (*q.v.*), tin and lead. The commercially important lead tetraethyl, variously known as ethyl, tetraethyl lead, and lead ethide, was formerly obtained by the interaction of Frankland's reagent, zinc diethyl, and lead chloride. It is now manufactured in the U.S.A. by the action of gaseous ethyl chloride under pressure on a powdered alloy of lead and sodium contained in an autoclave with heat control. The liquid lead tetraethyl is drained from the by-product, sodium chloride, and distilled in steam. It is thus obtained as a colourless liquid, stable in air and boiling at $200^\circ C$. For use as an antidetonant, lead tetraethyl (54.5%) is mixed with ethylene dibromide (36.4%) and Halowax oil (9.0%) containing a distinctive red aniline dye, and this "ethyl fluid" has a specific gravity of $1.79/20^\circ C$.

Lead tetramethyl, obtainable by similar processes to its tetraethyl homologue, is a colourless liquid boiling at $110^\circ C$. These two lead tetraalkyls and their homologues are obtainable through the appropriate Grignard reagents

but this reaction goes smoothly only in the case of lead tetramethyl, for with the homologous alkyl compounds unsaturated lead trialkyls, PbR_3 , are formed as by-products. The four alkyl groups attached to lead can be removed in stages by the action of halogens, and different alkyls can then be substituted for the halogen atom. In this way many mixed lead tetraalkyls have been prepared (G. Grüttner and E. Krause, 1917). When prepared from magnesium phenyl bromide, lead tetraphenyl, $Pb(C_6H_5)_4$, is accompanied by lead triphenyl, $Pb(C_6H_5)_3$, and lead tri-*p*-tolyl, $Pb(C_7H_7)_3$, and lead tri-*p*-xylyl, $Pb(C_8H_9)_3$, have also been described (Krause and M. Schmitz, 1919).

Grüttner and Krause have prepared a cyclic lead compound, diethylcycloplumbipentane,

from diethyl lead dichloride and the dimagnesium compound of 1:5-dibromopentane. Stannous chloride and magnesium ethyl bromide give tin diethyl, $Sn(C_2H_5)_2$, as an oxidisable oil insoluble in water (P. Pfeiffer, 1911), whereas tin diphenyl, $Sn(C_6H_5)_2$, a bright yellow powder melting at $130^\circ C$ to a dark red liquid, is obtained from stannous chloride and magnesium phenyl bromide. When excess of Grignard reagent is used, this diaryl compound loses half its tin and passes into hexaphenyldistannane, $3Sn(C_6H_5)_2 = Sn + (C_6H_5)_2Sn \cdot Sn(C_6H_5)_3$, obtained in colourless plates melting at $237^\circ C$ (E. Krause and R. Becker, 1920). Tin tetramethyl, $Sn(CH_3)_4$, and tin tetraethyl, $Sn(C_2H_5)_4$, boiling at $78^\circ C$ and $175^\circ C$ respectively, are prepared in good yields from stannic chloride and the appropriate Grignard reagents; in the latter case triethylstannic chloride, $(C_2H_5)_3SnCl$, is obtained as a by-product.

Magnesium benzyl chloride and stannic chloride give tribenzylstannic chloride, $(C_7H_7)_3SnCl$, (m.p. $143\text{--}145^\circ C$) and tin tetrabenzyl (tetrabenzylstannane), $Sn(C_7H_7)_4$, (colourless needles, m.p. $42\text{--}43^\circ C$). The former compound when acted on by iodine furnishes dibenzylstannic chloride $(C_7H_7)_2SnCl_2$ in colourless crystals melting at $163\text{--}4^\circ C$ (Smith and Kipping, 1912).

Fifth Series.—Certain of the more outstanding examples of organic derivatives of arsenic and antimony are described briefly in the articles on these metalloids and further information can be gained from the monographs mentioned below in the bibliography. Both trialkyl- and triaryl-bismuthines have long been known and were formerly prepared by the interaction of alkyl or aryl halides and sodium or potassium bismuthides.

The use of Grignard reagents has considerably enlarged the bismuth series of organic compounds. Diphenyl- α -naphthylbismuthine and tri- α -naphthylbismuthine (melting points $118\text{--}119^\circ C$ and $235^\circ C$) have been prepared in this way (F. Challenger, 1914), and a cyclic bismuth compound, ethylcyclobismuthopen-

tane has been prepared by the successive action on bismuth tri-bromide of magnesium ethyl bromide and the dimagnesium compound of 1:5-dibromopentane (G. Grüttner and M. Wiernik, 1915); it is a yellow viscous oil boiling at $108\text{--}112^\circ C/18\text{--}20\text{ mm.}$ with an unpleasant odour and oxidising rapidly in air.

Sixth Series.—Organic derivatives of selenium (*q.v.*) and tellurium (*q.v.*) are mentioned under these headings. A remarkable series of organic chromium compounds has been described by F. Hein (1919-24), who by the action of magnesium phenyl bromide either on chromyl chloride or on anhydrous chromic chloride obtained chromium pentaphenyl bromide, $Cr(C_6H_5)_5Br$, an orange-brown amorphous substance converted by alcoholic potash into chromium pentaphenyl hydroxide,

crystallising in golden-yellow leaflets. This basic hydroxide on treatment with acids loses a phenyl group giving rise to salts of the general type $[Cr(C_6H_5)_4]X$ (where X is the acid radical). Moreover, the mother-liquors from chromium pentaphenyl hydroxide contain chromium triphenyl hydroxide, which gives the corresponding salts $[Cr(C_6H_5)_3]X$. These organic derivatives indicate that chromium has valencies of 6, 5 and 4.

Eighth Series.—Platinic chloride was mixed with dry ether and the syrupy mixture added slowly to magnesium methyl iodide in ether. After adding water and extracting with benzene, the concentrated extract yielded yellow crystals of trimethyl platinic iodide, $(CH_3)_3PtI$, which is converted by moist silver oxide into trimethyl platinic hydroxide, $(CH_3)_3Pt \cdot OH$, a colourless base insoluble in water but dissolving in nitric acid to form the readily soluble nitrate, $(CH_3)_3Pt \cdot NO_3$. The corresponding chloride, $(CH_3)_3Pt \cdot Cl$ crystallises from chloroform in colourless rhombic dodecahedra (W. J. Pope and S. J. Peachy, 1909).

(G. T. M.)

ORGANON, the name given to Aristotle's logical treatises (Gr. *δργανον*, instrument). They are so called because logic is itself neither a speculative science nor a practical art in the ordinary sense, but an aid or instrument to all scientific thought. Francis Bacon gave to his own treatise the name *Novum Organum* in the belief that he had discovered a new inductive logic.

ORCY, a term originally denoting the secret rites or ceremonies connected with the worship of certain deities. The word is derived from Lat. *Orgia*, Gr. *δργια*, a post-Homeric word used of the secret rites of Demeter (*q.v.*), at Eleusis, of the Cabeiri, Orpheus and Eumolpus (*qq.v.*), but most commonly of the rites of Dionysus-Bacchus, with their dedications and purifications. The word has been connected with **εργω=εργω, δέσω*, in the sense of performing sacred rites; Lat. *operari*, to perform sacrifice. The Dionysiac orgies, which were restricted to women, were celebrated in the winter among the Thracian hills or in spots remote from city life. The women met, generally at night, clad in fawn-skins, with hair dishevelled, swinging the thyrsus and beating the cymbal; they danced and worked themselves up to a state of mad excitement. A bull, the representative of the god, was torn in pieces by them as Dionysus-Zagreus had been torn. The women tore the bull with their teeth, and the eating of the raw flesh was a necessary part of the ritual. The most famous festival of the kind was the *ρτερπλις*, the triennial festival, celebrated on Parnassus by the women of Attica and Phocis. The

celebrants were called Maenads or Bacchae. The wild dances and other "orgiastic" ceremonies have given rise to the use of the word "orgy" for any wild revel or festivity. (See DIONYSUS and MYSTERY.)

ORIBI or **OUREBI**, a small South African antelope (*Oribia scoparia*), standing about 24 in. at the shoulder, and characterized by a bare glandular spot below the ear, the upright horns of the bucks, which are ringed for a short distance above the face, and the tufted bushy tail. The name is extended to include the other members of the same genus.

ORIEL, in architecture, a projecting bay window carried by corbels or mouldings. It is usually polygonal or semicircular in plan, but at Oxford, in some of the colleges, there are examples which are rectangular and rise through two or three storeys. In Germany it forms a favourite feature, and is sometimes placed at the angle of a building, carried up through two or three floors and covered with a lofty roof. The oriel is also said to have been provided as a recess for an altar in an oratory or small chapel. In the 15th century oriels came into general use, and are frequently found over entrance gateways.

The earliest meaning of the word seems to be a gallery, portico or corridor, and the application of the term to a particular form of window apparently arose from such a window being in an "oriel." In Cornwall "orrel" is still used of a balcony or porch at the head of an outside staircase leading to an upper storey in a fisherman's cottage. The name of Oriel college, Oxford, comes from a tenement known as Seneschal Hall or La Oriole, granted to the college in 1327. (See BAY; WINDOW.)

ORIENTAL COOKERY is characterized by the use of many condiments, often making the food very "hot," and by the use of very sweet dishes. In general, the Orient prefers main dishes in which many food materials have been combined into one appetizing whole, and this means cutting into small pieces. Confucius refused to eat food that was not "chopped up properly," and also ruled that there must never be more flesh food than vegetables in the mixture. A Japanese rule calls for the five tastes of sweet, salt, sour, bitter and acrid in each meal, and another for something in each from both sea and mountain. The most widely used meat is lamb or mutton. In China pork is common. The *kebob* of Turkey and India is meat, fish or poultry cut small and strung on a skewer, often with alternating slices of vegetable. It is usually broiled. *Pilaf* or *pilau*, the national dish of Turkey and much eaten in India, is a dish of rice (usually browned in fat before cooking in stock), to which flesh foods or vegetables or both are added, either cooked with the rice or served on it, and the mixture highly seasoned. The Armenian *herissa* and the Arabian *couscous* are similar dishes made with cracked wheat instead of rice. The Turkish *dolma* is a vegetable stuffed with rice and minced meat or olive oil. Vine leaves are also used for this. Birds, domestic and wild, vary the diet. Fish and shellfish furnish more of the flesh food than does meat, being in most places abundant and cheap. All flesh foods and vegetables are preserved by drying as well as in other ways. "Bombay duck" is dried salted fish. Flesh foods eaten in the East not used in the West include buffalo, cat, dog, field rat, snake, lizard, beetle, cockroach, larvae, ant, worm, shark fin and whale, some of these being held to be great delicacies.

For fat, India uses *ghee* (clarified butter), China peanut oil, Turkey and adjacent countries olive oil, and many sesame oil. Eggs are cooked in many ways. Bread is not in as general use as in the Occident, though in Japan it is growing in popularity. The *chapati* of the Indian peasant is a thin wafer made of whole wheat flour, "pan" fried in *ghee*. The main vegetable food of the Orient is rice, which is almost everywhere served with every meal, and is generally cooked in stock. Cracked wheat, barley, buckwheat, sesame and the millets are used in some countries. Noodles are eaten, and Italian pastes, though not native, are now in Eastern markets. Milk is used in Turkey and kindred countries when curdled (*matzoun*) as a beverage and in sauces. Tea is the universal beverage of the Orient, and in some countries coffee is common. Turkish coffee is made from the following formula: For four small cups, $\frac{3}{4}$ cup water, 3 teaspoons sugar, 3 teaspoons

pulverized coffee. Melt the sugar in the water over the fire, remove from fire, add coffee, stir one minute, return to fire and bring to boiling point three or four times. This is not strained, but sipped from the cup after the coffee has settled to the bottom.

Fruits are usually cooked, except that dates, the staple food of the lands of the Near East, are rarely cooked except in puddings and confections. In China pineapple is often cooked with chicken and other meats. Pastries, sweet with sugar syrup and often with nuts, or a sweet fruit compote, are the usual ending for a Turkish meal. The Chinese and Japanese use sweet cakes, confections and puddings, or cooked or preserved fruits. Salads are much eaten in the Near East, usually of a combination of vegetables and perhaps fruits. Seasonings used in the Orient not common in the Occident include cummin, saffron, coriander seed, tamarind, chilis in variety, curry powder and soy sauce. Vegetable foods form the greater part of the diet.

The most famous dish of India is the curry, in which material cooked with curry powder or in a curry sauce is served in a ring of rice. The epicure insists on curries made from spices ground fresh each day, but curry powder and essence may be made ahead in the home or may be bought bottled. A good formula for curry sauce, hot enough for the average Western taste, but not for that of India, uses 2 tablespoons minced onion, fried a little in $\frac{1}{4}$ cup butter, $1\frac{1}{2}$ tablespoons curry powder, mixed to a paste with a little of 2 cups of stock or milk, 2 teaspoons curry essence, $\frac{1}{4}$ teaspoon salt, 1 tablespoon rice flour, 1 cup cocoanut or almond milk (made by soaking an hour in 1 cup milk, $\frac{1}{2}$ cup freshly ground cocoanut or blanched almonds ground fine, and used with or without straining), 1 teaspoon scraped green ginger, 1 teaspoon currant jelly. The meat, fish, shellfish, poultry or vegetables are cooked in the sauce. With a curry is served chutney, a sauce or conserve made of sweet and sour fruits and vegetables, highly spiced.

Chinese and Japanese food are similar, though not the same. Young bamboo sprouts, bean sprouts, water chestnuts, dried mushrooms and *pe-tsai* (Chinese cabbage) are favourite vegetables. The soy bean is used not only in soy sauce, but for the delicate bean curd that adds an agreeable texture and flavour to so many dishes. The famous bird's nests of China are used in dishes with chicken and pigeon as well as for soup. They are a luxury, as are the equally famous ancient eggs. Almonds are used in many combinations. Chop suey is a dish unknown in China. The Japanese serve many foods cooked in deep fat after being dipped in a very delicate batter. In Japan the diner in a restaurant often cooks his own food in an iron skillet set on the dining table.

(I. E. L.)

ORIENTAL SORE, a form of ulcer. (See KALA-AZAR.)

ORIENTATION, a term expressing the angular relation of any object to the points of the compass; in architecture, used to express the relation of the main dimensions of a building, with reference to the points of the compass, and especially with reference to the east. In Mesopotamia and Egypt, as well as in primitive Central America, orientation of buildings was common from an early date, with important features, entrances, passages and the like designed to point in the direction of the rising sun. In north Europe the same custom evidently prevailed. As Stonehenge, near Salisbury, England, is carefully orientated. Many Greek temples were also designed to face the rising sun.

In the earliest Christian basilicas at Rome, the apse was placed at the west end, so that the priest who served the altar from behind, facing the congregation, himself faced the east and the rising sun. This orientation has sometimes been traced to the influence of the churches of the Holy Sepulchre at Jerusalem and of the Nativity at Bethlehem. It is more probable, however, that this orientation was due to an underlying tradition whose roots go far back beyond the origin of Christianity.

In St. Sophia, Constantinople, and all the Byzantine churches, the apse was placed at the east end, and the same custom obtains in the early churches in Syria and the Coptic churches in Egypt. During the 6th and 7th centuries this orientation gradually came into use in Italy and the west generally. Orientation of this type, with the apse or altar toward the east, is generally carefully observed in Spain, Germany and England, and

less carefully in France and Italy. It is so common, however, that in an architectural or ecclesiastical description of a church building, the "east end" is always the end with the apse or altar. In Mohammedan mosques the mihrab or prayer niche is so placed that the worshipper looks towards Mecca.

Orientation is an important consideration in the placing of any building, as exposure to the sun, or lack of it, prevailing winds and similar facts in climate must be considered in designing a building for any purpose. Thus in the northern temperate zone, living rooms are usually arranged to get large amounts of south light; studios are arranged with north light, and, in general, buildings like schools, with rooms on both sides of a corridor, are placed, if possible, with the corridor running north and south, so that the rooms on both sides may receive the sun.

ORIENTE or LA REGION ORIENTALE, a large undefined territory of Ecuador, comprising all that part of the republic lying east of the Andes. Pop. (1920 estimate), 100,000. The territory was formed in 1884 from the older territories of Napo, Canelos and Zamora, but its boundaries with the neighbouring republics of Colombia and Peru are disputed. The territory is covered with great forests, inhabited by wild Indians, and its climate is hot and exceptionally humid. There are some mission settlements and trading stations in the Andean foothills and on some of the rivers, one of which is Archidona, the nominal capital.

ORIGEN (c. 185–c. 254), the most distinguished and most influential of all the theologians of the ancient church, with the possible exception of Augustine.

Origen was born, perhaps at Alexandria, of Christian parents in the year 185 or 186. His father Leonidas gave him an excellent education. At a very early age, about the year 200, he listened to the lectures of Pantaenus and Clement in the catechetical school. This school, of which the origin (though assigned to Athenagoras) is unknown, was the first and for a long time the only institution where Christians were instructed simultaneously in the Greek sciences and the doctrines of the holy Scriptures. Asia Minor and the West developed the strict ecclesiastical forms by means of which the church closed her lines against heathenism, and especially against heresy; in Alexandria Christian ideas were handled in a free and speculative fashion and worked out with the help of Greek philosophy. The line between heresy and orthodoxy was less rigidly drawn there than at Ephesus, Lyons, Rome or Carthage.

In the year 202 a persecution arose, in which the father of Origen perished. Origen began about the same time to earn his bread by teaching; and in 203 he was placed, with the sanction of the bishop of Demetrius, at the head of the catechetical school. He regularly attended the lectures of Ammonius Saccas, and made a thorough study of the books of Plato and Numenius, of the Stoics and the Pythagoreans. At the same time he endeavoured to acquire a knowledge of Hebrew, in order to be able to read the Old Testament in the original. His manner of life was ascetic; the sayings of the Sermon on the Mount and the practical maxims of the Stoics were his guiding stars. Four oboli a day, earned by copying manuscripts, sufficed for his bodily sustenance. A rash resolve led him to castrate himself that he might work unhindered in the instruction of women.

He commenced his great work on the textual criticism of the Scriptures; and at the instigation of his friend Ambrosius, who provided him with the necessary amanuenses, he published his commentaries on the Old Testament and his dogmatic investigations. He worked at Alexandria for 28 years (till 231–232). This period, however, was broken by many journeys to Rome, to Arabia, to Antioch, and, in 216, when the imperial executioners were ravaging Alexandria, to Palestine. There the bishops of Jerusalem and Caesarea got him to deliver public lectures in the churches. In the East, especially in Asia Minor, it was still no unusual thing for laymen, with permission of the bishop, to address the people in the church. In Alexandria, however, this custom had been given up, and Demetrius took occasion to express his disapproval and recall Origen to Alexandria.

Probably the bishop was jealous of the high reputation of the teacher; and a coolness arose between them which led, fifteen years later, to an open rupture. On his way to Greece (apparently in the

year 230) Origen was ordained a presbyter in Palestine by his friends the bishops. This was undoubtedly an infringement of the rights of the Alexandrian bishop; at the same time it was simply spite on the part of the latter that had kept Origen so long without orders. Demetrius convened a synod, at which it was resolved to banish Origen from Alexandria. A second synod, composed entirely of bishops, determined that Origen must be deprived of his status as a presbyter. This decision seems to have been justified by referring to the self-mutilation of Origen and adducing objectionable doctrines which he was said to have promulgated. No formal excommunication of Origen appears to have been decreed; the sentence of deprivation was approved by most of the churches, in particular by that of Rome. At a later period Origen sought to vindicate his teaching in a letter to the Roman bishop Fabian, but, it would seem, without success.

In these circumstances Origen retired from Alexandria (231–232) to Palestine, where his condemnation had not been acknowledged by the churches. He settled in Caesarea, and established a flourishing school there. Enthusiastic pupils sat at his feet (see the *Panegyric* of Gregory Thaumaturgus), and the methodical instruction which he imparted was famous all over the East. He made frequent journeys. He was for two years together at Caesarea in Cappadocia, where he was overtaken by the Maximilian persecution; here he worked at his recension of the Bible. We find him again in Nicomedia, in Athens, and twice in Arabia. He was called there to combat the unitarian christology of Beryllus, bishop of Bostra, and to clear up certain eschatological questions. As he had formerly had dealings with the house of Alexander Severus, so now he entered into a correspondence with the emperor Philip the Arabian and his wife Severa. But through all situations of his life he preserved his equanimity, his keen interest in science, and his indefatigable zeal for the instruction of others. In the year 250 the Decian persecution broke out, Origen was arrested, imprisoned and maltreated. But he survived these troubles and lived a few years longer in active intercourse with his friends. He died, probably in the year 254 at Tyre.

Writings.—Origen is probably the most prolific author of the ancient church. "Which of us," asks Jerome, "can read all that he has written?" The number of his works was estimated at 6000, but that is certainly an exaggeration. Owing to the increasing unpopularity of Origen in the church, a comparatively small portion of these works have come down to us in the original. We have more in the Latin translation of Rufinus; but this translation is by no means trustworthy, since Rufinus, assuming that Origen's writings had been tampered with by the heretics, considered himself at liberty to omit or amend heterodox statements. Origen's real opinion, however, may frequently be gathered from the *Philocalia*—a sort of anthology from his works prepared by Basil the Great and Gregory Nazianzenus. The fragments in Photius and in the *Apology* of Pamphilus serve for comparison. The writings of Origen consist of letters, and of works in textual criticism, exegesis, apologetics, dogmatic and practical theology.

1. Eusebius (to whom we owe our full knowledge of his life) collected more than a hundred of Origen's letters, arranged them in books, and deposited them in the library at Caesarea (*H.E.* vi. 36). In the church library at Jerusalem (founded by the bishop Alexander) there were also numerous letters of this father (*Euseb.* *H.E.* vi. 20). But unfortunately they have all been lost except two—one to Julius Africanus and one to Gregory Thaumaturgus. There are, besides, a couple of fragments.

2. Origen's textual studies on the Old Testament were undertaken partly in order to improve the manuscript tradition, and partly for apologetic reasons, to clear up the relation between the LXX and the original Hebrew text. The results of more than twenty years' labour were set forth in his *Hexapla* and *Tetrapla*, in which he placed the Hebrew text side by side with the various Greek versions, examined their mutual relations in detail, and tried to find the basis for a more reliable text of the LXX. The *Hexapla* was probably never fully written out, but excerpts were made from it by various scholars at Caesarea in the 4th century; and thus large sections of it have been saved. He worked at the text of the New Testament, although he produced no recension.

3. The exegetical labours of Origen extend over the whole of the Old and New Testaments. They are divided into *Scholiaz* (*σημειώσεις*, short annotations, mostly grammatical), *Homilies* (edifying expositions grounded on exegesis), and *Commentaries* (*τόμοι*). In the Greek original only a very small portion has been preserved; in Latin translations, however, a good deal. The most important parts are the homilies on Jeremiah, the books of Moses, Joshua and Luke, and the commentaries on Matthew, John and Romans. With grammatical precision, antiquarian learning and critical discernment Origen combines the allegorical method of interpretation—the logical corollary of his conception of the inspiration of the Scriptures. He distinguishes a threefold sense of scripture, a grammatico-historical, a moral and a pneumatic—the last being the proper and highest sense. He thus set up a formal theory of allegorical exegesis, not quite extinct in the churches even yet, and in his own system of fundamental importance.

4. The principal apologetic work of Origen is his book *κατὰ Κέλσον* (eight books), written at Caesarea in the time of Philip the Arabian. It has been completely preserved in the original. This work is invaluable as a source for the history and situation of the church in the 2nd century; for it contains nearly the whole of the famous work of Celsus (*Λόγος ἀληθής*) against Christianity. What makes Origen's answer so instructive is that it shows how close an affinity existed between Celsus and himself in their fundamental philosophical and theological presuppositions. The real state of the case is certainly unsuspected by Origen himself; but many of his opponent's arguments he is unable to meet except by a speculative reconstruction of the church doctrine in question. Origen's apologetic is most effective when he appeals to the spirit and power of Christianity. In details his argument is not free from sophistical subterfuges and superficial reasonings.

5. Of the dogmatic writings we possess only one in its integrity, and that only in the translation of Rufinus, *Περὶ ἀρχῶν* (On the Fundamental Doctrines). This work, which was composed before 228, is the first attempt at a dogmatic at once scientific and accommodated to the needs of the church. The material is drawn from Scripture, but in such a way that the propositions of the *regula fidei* are respected. This material is then formed into a system by all the resources of the intellect and of speculation. Origen thus solved, after his own fashion, a problem which his predecessor Clement had not even ventured to grapple with. The first three books treat of God, the world, the fall of spirits, anthropology and ethics. "Each of these three books really embraces, although not in a strictly comprehensive way, the whole scheme of the Christian view of the world, from different points of view, and with different contents." The fourth book explains the divinity of the Scriptures, and deduces rules for their interpretation. It ought properly to stand as first book at the beginning. The ten books of *Stromata* (in which Origen compared the teaching of the Christians with that of the philosophers, and corroborated all the Christian dogmas from Plato, Aristotle, Numenius and Cornutus) have perished, with the exception of fragments; so have the tractates on the resurrection and freewill.

6. Of practical theological works we have still the *Προτρεπτικός εἰς μαρτύριον* and the *Σύνταγμα περὶ εὐχῆς*. For a knowledge of Origen's Christian estimate of life and his relation to the faith of the church these two treatises are of great importance. The first was written during the persecution of Maximinus Thrax, and was dedicated to his friends Ambrosius and Proctetus. The other also dates from the Caesarean period; it mentions many interesting details, and concludes with a fine exposition of the Lord's Prayer.

7. In his own lifetime Origen had to complain of falsifications of his works and forgeries under his name. Many pieces still in existence are wrongly ascribed to him; yet it is doubtful whether a single one of them was composed on purpose to deceive. The most noteworthy are the *Dialogues* of a certain Adamantius "de recta in Deum fide," which seem to have been erroneously attributed to Origen so early as the 4th century.

Outline of Origen's View of the Universe and of Life.—The system of Origen was formulated in opposition to the Greek philosophers on the one hand, and the Christian Gnostics on the

other¹. But the science of faith, as expounded by him, bears unmistakably the stamp both of Neo-Platonism and of Gnosticism. As a theologian, in fact, Origen is not merely an orthodox traditionalist and believing exegete, but a speculative philosopher of Neo-Platonic tendencies. He is, moreover, a judicious critic. The union of these four elements gives character to his theology, and in a certain degree to all subsequent theology. It is this combination which has determined the peculiar and varying relations in which theology and the faith of the church have stood to each other since the time of Origen. That relation depends on the predominance of one or other of the four factors embraced in his theology.

As an orthodox traditionalist Origen holds that Christianity is a practical and religious saving principle, that it has unfolded itself in an historical series of revealing facts, that the church has accurately embodied the substance of her faith in the *regula fidei*, and that simple faith is sufficient for the renewal and salvation of man. As a philosophical idealist, however, he transmutes the whole contents of the faith of the church into ideas which bear the mark of Neo-Platonism, and were accordingly recognized by the later Neo-Platonists as Hellenic². In Origen, however, the mystic and ecstatic element is held in abeyance. The ethico-religious ideal is the sorrowless condition, the state of superiority to all evils, the state of order and of rest. In this condition man enters into likeness to God and blessedness; and it is reached through contemplative isolation and self-knowledge, which is divine wisdom.

As a means to the realization of this ideal, Origen introduces the whole ethics of Stoicism. But the link that connects him with churchly realism, as well as with the Neo-Platonic mysticism, is the conviction that complete and certain knowledge rests wholly on divine revelation, i.e., on oracles. Consequently his theology is cosmological speculation and ethical reflection based on the sacred Scriptures. The Scriptures, however, are treated by Origen on the basis of a matured theory of inspiration in such a way that all their facts appear as the vehicles of ideas, and have their highest value only in this aspect. That is to say, his gnosis neutralizes all that is empirical and historical, if not always as to its actuality, at least absolutely in respect of its value. The most convincing proof of this is that Origen (1) takes the idea of the immutability of God as the regulating idea of his system, and (2) deprives the historical "Word made flesh" of all significance for the true Gnostic. To him Christ appears simply as the Logos who is with the Father from eternity, and works from all eternity, to whom alone the instructed Christian directs his thoughts, requiring nothing more than a perfect—i.e., divine—teacher. In such propositions historical Christianity is stripped off as a mere husk. The objects of religious knowledge are beyond the plane of history, or rather belong to a supra-mundane history.

On this view contact with the faith of the church could only be maintained by distinguishing an exoteric and an esoteric form of Christianity. This distinction was already current in the catechetical school of Alexandria, but Origen gave it its boldest expression, and justified it on the ground of the incapacity of the Christian masses to grasp the deeper sense of Scripture, or unravel the difficulties of exegesis. On the other hand, in dealing with the problem of bringing his heterodox system into conformity with the *regula fidei* he evinced a high degree of technical skill. An external conformity was possible, inasmuch as speculation, proceeding from the higher to the lower, could keep by the stages of the *regula fidei*, which had been developed into a history of salvation. The system itself aims in principle at being thoroughly monistic; but, since matter, although created by God out of nothing, was regarded merely as the sphere in which souls are punished and purified, the system is pervaded by a strongly dualistic element. The immutability of God requires the eternity of the Logos and of the world. At this point Origen succeeded in avoiding the heretical Gnostic idea of God by assigning to the Godhead the attributes of goodness and righteousness. The pre-

¹The opposition to the unitarians within the church must also be kept in mind.

²Porphphy says of Origen, *κατὰ τὰς περὶ πραγμάτων καὶ τοῦ θεοῦ δόξας* *λλ' Ἐλληνίζων* (Euseb. *H.E.* vi. 19).

existence of souls is another inference from the immutability of God, although Origen also deduced it from the nature of the soul, which as a spiritual potency must be eternal. From this follows the necessity for the created spirit, after apostasy, error and sin, to return always to its origin in God.

The actual sinfulness of all men Origen was able to explain by the theological hypothesis of pre-existence and the premundane fall of each individual soul. He holds that freedom is the inalienable prerogative of the finite spirit; and this is the second point that distinguishes his theology from the heretical Gnosticism. The system unfolds itself like a drama, of which the successive stages are as follows: the transcendental fall, the creation of the material world, inaugurating the history of punishment and redemption, the clothing of fallen souls in flesh, the dominion of sin, evil and the demons on earth, the appearing of the Logos, His union with a pure human soul, His esoteric preaching of salvation, and His death in the flesh, then the imparting of the Spirit, and the ultimate restoration of all things. The doctrine of the restoration appeared necessary because the spirit, in spite of its inherent freedom, cannot lose its true nature, and because the final purposes of God cannot be foiled. The end, however, is only relative, for spirits are continually falling, and God remains through eternity the creator of the world. Moreover the end is not conceived as a transfiguration of the world, but as a liberation of the spirit from its unnatural union with the sensual.

The old Christian eschatology is set aside; no one has dealt such deadly blows to Chiliasm and Christian apocalypticism as Origen. It need hardly be said that he spiritualized the church doctrine of the resurrection of the flesh. But, while in all these doctrines he appears in the character of a Platonic philosopher, traces of rational criticism are not wanting. Where his fundamental conception admits of it, he tries to solve historical problems by historical methods. Even in the christology, where he is treating of the historical Christ, he entertains critical considerations; hence it is not altogether without reason that in after times he was suspected of "Ebionitic" views of the Person of Christ.

Although the theology of Origen exerted a considerable influence as a whole in the two following centuries, it certainly lost nothing by the circumstance that several important propositions were capable of being torn from their original setting and placed in new connections. It is in fact one of the peculiarities of this theology, which professed to be at once churchly and philosophical, that most of its formulae could be interpreted and appreciated *in utramque partem*. By arbitrary divisions and rearrangements the doctrinal statements of this "science of faith" could be made to serve the most diverse dogmatic tendencies. This is seen especially in the doctrine of the Logos. On the basis of his idea of God Origen was obliged to insist in the strongest manner on the personality, the eternity (eternal generation) and the essential divinity of the Logos¹. On the other hand, when he turned to consider the origin of the Logos he did not hesitate to speak of Him as a *κρίσμα*, and to include Him amongst the rest of God's spiritual creatures. A *κρίσμα*, which is at the same time *ὑποούσιον τῷ Θεῷ*, was no contradiction to him, simply because he held the immutability, the pure knowledge and the blessedness which constituted the divine nature to be communicable attributes.

In later times both the orthodox and the Arians appealed to his teaching, both with a certain plausibility; but the inference of Arius, that an imparted divinity must be divinity in the second degree. Origen did not draw. With respect to other doctrines also, such as those of the Holy Spirit and the incarnation of Christ, etc., Origen prepared the way for the later dogmas. The technical terms round which such bitter controversies raged in the 4th and 5th centuries are often found in Origen lying peacefully side by side. But this is just where his epoch-making importance lies, that all the later parties in the church learned from him. And this is true not only of the dogmatic parties; solitary monks and ambitious priests, hard-headed critical exegetes, allegorists, mystics, all found something congenial in his writings. The only man who tried to shake off the theological influence of Origen was

Marcellus of Ancyra, who produced no lasting effect on theology.

The attacks on Origen, which had begun in his lifetime, did not cease for centuries, and only subsided during the time of the fierce Arian controversy. It was not so much the relation between *pistis* and *gnosis*—faith and knowledge—as defined by Origen that gave offence, but rather isolated propositions, such as his doctrines of the pre-existence of souls, of the soul and body of Christ, of the resurrection of the flesh, of the final restoration, and of the plurality of worlds. Even in the 3rd century Origen's view of the Trinity and of the Person of Christ was called in question, and that from various points of view. It was not till the 5th century, however, that objections of this kind became frequent. In the 4th century Pamphilus, Eusebius of Caesarea, Athanasius, the Cappadocians, Didymus and Rufinus were on the side of Origen against the attacks of Methodius and many others. But, when the zeal of Epiphanius was kindled against him, when Jerome, alarmed about his own reputation, and in defiance of his past attitude, turned against his once honoured teacher, and Theophilus, patriarch of Alexandria, found it prudent, for political reasons to condemn Origen—then his authority received a shock from which it never recovered.

There were, doubtless, in the 5th century church historians and theologians who still spoke of him with reverence, but such men became fewer and fewer. In the West Vincent of Lerins held up Origen as a warning example (*Communio*. 23), showing how even the most learned and most eminent of church teachers might become a misleading light. In the East the exegetical school of Antioch had an aversion to Origen; the Alexandrians had utterly repudiated him. Nevertheless his writings were much read, especially in Palestine. The monophysite monks appealed to his authority, but could not prevent Justinian and the fifth oecumenical council at Constantinople (553) from anathematizing his teaching.

BIBLIOGRAPHY.—Next to the works of Origen (*see* Redepenning, "Des Hieronymus wiederaufgefundenen Verzeichnis der Schriften des Origenes," in *Zeit. f. d. hist. Theol.* [1851], pp. 66 seq.) the most important sources are: Gregory Thaum., *Panegyricus in Orig.*; Eusebius, *H.E.* vi.; Epiphanius, *Haer.* 64; the works of Methodius, the Cappadocians, Jerome (*see* *De vir. ill.* 54, 61) and Rufinus; Vincent. Lerin. *Communio*. 23; Palladius, *Hist. Laus.* 147; Justinian, *Ep. ad Mennam* (Mansi, ix. p. 487 seq.); Photius, *Biblioth.* 118, etc. The best of the older editions is that of Delarue (1733-59, 4 vols. fol.; pub. by Migne in *Patrol. Gr.* vols. xi.-xvii.). A critical edition is being brought out by the Preussische Akademie der Wissenschaften; it is not yet completed. Amongst the older works on Origen those of Huetius (printed in Delarue, vol. iv.) are the best; but Tillemont, Fabricius, Walch (*Historie d. Ketzereien*, vii. pp. 362-760) and Schröckh also deserve to be mentioned. In recent times the doctrine of Origen has been expounded in the great works on church history by Baur, Dörner, Böhringer, Neander, Möller (*Geschichte der Kosmologie in der griechischen Kirche*) and Kahnis (*Die Lehre vom h. Geist*, vol. i.); compare with these the works on the history of philosophy by Ritter, Erdmann, Ueberweg and Zeller. Of monographs, the best and most complete is Redepenning, *Origenes, eine Darstellung seines Lebens und seiner Lehre* (2 vols., 1841, 1846). Compare Thomasius, *Orig.* (1837); Krüger, "Über das Verhältnis des Orig. zu Ammonius Sakkas," in the *Zeitschr. f. hist. Theol.* (1843), i. p. 46 seq.; Fischer, *Comment. de Orig. theologia et cosmologia* (1846); Ramers, *Orig. Lehre von der Auferstehung des Fleisches* (1851); Knittel, "Orig. Lehre von der Menschwerdung," in the *Theol. Quartalschr.* (1872); Schultz, "Christologie des Orig.," in the *Jahrb. f. protest. Theol.* (1875); Mehlhorn, "Die Lehre von der menschlichen Freiheit nach Orig.," in *Zeitschr. f. Kirchengesch.* vol. ii. (1878); Freppel, *Origène*, vol. i., 2nd ed. (Paris, 1875). A full list of the later bibliography will be found in Bardenheuer's *Geschichte der altkirchlichen Literatur* (2nd ed. 2 vols., 1914) and de Faye *Origène*, vol. i. (1923). (A. HA.)

ORIGINAL PACKAGE, a legal term in America, meaning the package in which goods, intended for inter-State commerce, are actually transported wholesale. The term is used chiefly in determining the boundary between Federal and State jurisdiction in the regulation of commerce, and derives special significance by reason of the conflict between the powers of Congress to regulate commerce and the police legislation of the States with respect to commodities considered injurious to public health and morals.

By the Federal Constitution Congress is vested with the power "to regulate commerce with foreign nations and among the several States, and with the Indian tribes," and each State is forbidden, without the consent of Congress, to "lay any imposts or duties on imports or exports, except what may be absolutely necessary

¹"*Communis substantiae est filio cum patre; ἀνθρώπου enim ὑποούσιον ὡς videtur, i.e., unius substantiae cum illo corpore ex quo est ἀνθρώπου.*"

for executing its inspection laws," and the basis of the law on the subject of "original package" was laid when, in 1827, Chief Justice Marshall interpreted these clauses in his decision of the case of *Brown v. Maryland* (12 Wheaton 419), which tested the constitutionality of an act of the legislature of Maryland requiring a licence from importers of foreign goods by bale or package and from persons selling the same by wholesale, bale, package, hogshead, barrel or tierce. After pronouncing such a licence to be in effect a tax, the chief justice observed that so long as the thing imported remained "the property of the importer, in his warehouse, in the original form or package in which it was imported," a tax upon it was too plainly a duty on imports to escape the prohibition of the Constitution.

Later decisions agree that the right to import commodities or to ship them from one State to another carries with it the right to sell them, and have established the boundary line between Federal and State control of both foreign imports and inter-State shipments at a sale in the original package (*Waring v. Mobile*, 8 Wall. 110) or at the breaking of the original package before sale for other purposes than inspection (*May v. New Orleans*, 178 U.S. 498). A State or a municipality may, however, tax while in their original packages any commodities which have been shipped from another State, provided there be no discrimination against such commodities.

The term occasioned considerable confusion prior to the adoption of the 18th (prohibition) amendment to the Constitution in 1919. The Supreme Court in Jan. 1847, in the licence cases, upheld the constitutionality of Massachusetts, New Hampshire and Rhode Island laws requiring licences for the sale of intoxicating liquors, the liquor having been shipped in the inter-State commerce (5 Howard 504). The justices based their decisions on different opinions and did not even agree that the power of Congress to regulate inter-State commerce included the power to authorize a sale after shipment. The Supreme Court held in *Leisy v. Hardin*, in 1889, where a keg of beer sold in Iowa, a prohibition State, had been shipped from Illinois by order of an agent of an Illinois firm, that so long as it was sold in the original package, it remained a matter for Federal regulation only (135 U.S. 100). This overruled in part the doctrine in the licence cases. Congress passed in 1890 the Wilson Act, which provided that where intoxicants were shipped into a State or Territory, they were subject to the police laws of such State or Territory. Even with this act, however, a State was not permitted to interfere with an inter-State shipment of liquor direct to the consumer. The Webb Act, passed by Congress in 1913, did prohibit the shipment of liquor into any State in violation of its police laws.

What constitutes an original package was the principal question in the case of *Schollenberger v. Pennsylvania* (171 U.S. 1), the court deciding that the State of Pennsylvania could not prohibit the sale of oleomargarine by retail when it had been shipped from Rhode Island in packages containing only ten pounds each, and the original package doctrine has been sharply criticized because of the difficulty in determining what constitutes an original package, as well as because of the conflict between the doctrine and the police powers of the several States.

See J. B. Uhle, "The Law Governing an Original Package," in *The American Law Register*, vol. xxix. (Philadelphia, 1890); Shackelford Miller, "The Latest Phase of the Original Package Doctrine," and M. M. Townley, "What is the Original Package Doctrine?" both in *The American Law Review*, vol. xxv. (St. Louis, 1901); also F. H. Cooke, *The Commerce Clause of the Federal Constitution* (1908).

ORIHUELA, a town and episcopal see of eastern Spain, in the province of Alicante; 13 m. N.E. of Murcia and about 15 m. from the Mediterranean Sea, on the Murcia-Elche railway. Pop. (1920) 37,180. Orihuela is situated in a beautiful and exceedingly fertile *huerta*, on both sides of the river Segura, which divides the city into two parts, Roig and San Augusto, and is spanned by two bridges. Orihuela was captured by the Moors in 713, and retaken by James I. of Aragon, for his father-in-law Alphonso of Castile, in 1265. It was sacked during the disturbances at the beginning of the reign of Charles V. (1520), and again in the War of Succession (1706). Local annals specially

mention the plague of 1648, the flood of 1651 and the earthquake of 1829. The university of Orihuela, founded in 1568 by the archbishop of Valencia, was closed in 1835. The trade in fruit, cereals, oil and wine is considerable. There are also tanneries, dye and silk works, linen and woollen fabrics, leather and starch.

ORILLIA, a town and port of entry of Simcoe county, Ontario, Canada, situated 84 m. N. of Toronto, on Lake Couchiching and on the Canadian National and Canadian Pacific railways. Pop. (1921) 8,774. It is a favourite summer resort, and has an extensive trade in lumber and farm produce. It contains an asylum, saw and grist mills and iron foundries.

ORINOCO, a river and river system of northern South America. Its basin embraces about one-half of the eastern plains of Colombia and nearly all of Venezuela south and east of the Andes; it ranks third in area among the South American river basins. The main river is about 1,500 m. long from its source in the Sierra Parima on the Venezuela-Brazil boundary to the Atlantic ocean, and, except for a stretch of about 200 m. between the mouths of the Guaviare and Meta rivers, where it forms a part of the Venezuela-Colombia boundary, it is in Venezuela. At about 150 m. from its source it bifurcates into the Casiquiare canal to the Río Negro of the Amazon system, affording a through water way to the Amazon basin. Three major rapids and numerous minor ones obstruct the upper river. At the mouth of the Apure the Orinoco is 2 m. wide in the dry season and often 7 m. wide in time of floods, and narrows to 800 ft. at the city of Ciudad Bolívar. Large steamers can navigate as far as the Cariben rapids, 700 m. from the ocean and only 6 m. from the mouth of the Meta. At the Cariben rapids the difference between high and low water averages 32 ft., while at the Angostura, at Ciudad Bolívar, the average rise is 50 ft. and has been known to reach 60.

The Orinoco enters the ocean by a delta of approximately 700 sq.m. of islands and swamps covered with dense vegetation and so little above sea-level that they are periodically flooded. The Boca Grande at the mouth of the Corosimi river (the southernmost channel of the delta) is the deepest outlet; but the Caño Macareo, one of the outlets of the Vagre river (the westernmost channel of the delta), is usually taken by steamers because it is the most direct navigable route to the Gulf of Paria.

Ordaz, whose expedition (1531-32) entered the Orinoco by the Boca de Navíos and, with much loss of life, ascended to the mouth of the Meta, was the first to explore any part of the river, although Columbus, while exploring the Gulf of Paria in 1498, noticed the freshness of its waters without investigating their source, and Ojeda, following closely the track of Columbus in 1499, probably passed in sight of one or more of the mouths of the river. There have since been many expeditions and surveys.

Except for a few outliers which form isolated hills north of the lower river, the Orinoco is the dividing-line between the llanos and the highlands of Venezuelan Guiana. The tributaries from the Guiana highlands are little known. They all have their sources in the divide which carries the Venezuela-Brazil boundary. The largest, the Ventuari, joins the Orinoco about 90 m. above the mouth of the Guaviare. The Caura, the next large stream to the east, is much obstructed by falls and rapids, while the lower Caroni is more or less navigable for some 400 miles. The llanos are divided into a broad, well-watered western section and a narrower and much drier eastern section. North of the upper Guaviare and its tributaries the western section rises gently from an elevation of about 130 ft. at the mouth of the Apure to about 700 ft. at the border of the Andes. Its principal rivers have their sources in innumerable mountain torrents that rise in the eastern ranges of the Eastern Cordillera of Colombia. From the Guaviare north to 6° 30' N. lat. these streams are fed so abundantly by the condensation of moisture from the north-east trade winds that they have headed far back toward the high savannas of the Eastern Cordillera.

The most important tributaries of the Orinoco in this section are the Apure, Arauca, Meta and Guaviare. The Apure was, until recently, formed by the junction of the Uribante and Sarare, but the latter has now dammed its lower channel and flows to the Arauca, leaving the Uribante, an important stream with 16 large

affluents, and the Nula, formerly a tributary of the Sarare, as the chief sources of the Apure. The Apure is about 650 m. long from the Uribante-Nula junction. It is in large part navigable for large craft but is obstructed by rapids about 100 m. from its mouth. The northern tributaries drain the eastern and southern slopes of the Venezuelan Andes. Of these the Portuguesa, which the cattle route from San Fernando to Puerto Cabello follows, and a few others, are navigable for short distances. The Arauca parallels the Apure on the south. When in flood, the additional water now brought to the Arauca by the Sarare causes it to overflow and send part of its surplus water by several *caños* to the Capanaparo, a tributary which joins the Orinoco about 18 m. S. of the mouth of the Arauca.

The main stream of the Guaviare, southernmost of the great western tributaries of the Orinoco, is known as the Guayabero from its source to the mouth of the Ariari, a large tributary from the north-west. It marks in a general way the dividing line between the low savannas of the north and the higher and more varied topography of the south. The main stream and many of its tributaries after leaving the piedmont cut their way through four distinct zones: (1) a dissected sandstone plateau, the crests of which rise 1,500 ft. above the *llanos*; (2) a zone east of the escarpment of the plateau of sandstone remnants separated by clayey depressions; (3) a crystalline peneplain where the granites and gneisses are mostly covered with lateritic clays; and (4) a low plain on which stand isolated massifs of the dome-like form characteristic of crystalline mountains in wet tropical climates. The Ariari tributary is navigable for large barges for a considerable distance. About 300 m. of the Guayabero-Guaviare are said to be navigable but narrows and rapids which mark the passage of the river from one zone to another offer serious obstacles.

(R. R. P.)

ORIOLE, the name applied in Europe to the members of the family *Oriolidae*. The golden oriole (*Oriolus oriolus*) is an occasional spring visitor to the British Islands, but has rarely bred there. On the continent of Europe it is a well-known bird; its range in summer extends east to Irkutsk, while in winter it is found in Natal and Damaraland. In India it is replaced by an allied form, *O. kundoo*, the mango-bird, and both in Asia and Africa are several other species, some of which have a black head, or even a glowing crimson, instead of the ordinary yellow colouring, while others exhibit the dingy type of plumage seen in the female of the more normal form. Among these last are the species of the group, *Mimeta*, belonging to the Australian region, which mimic friar-birds (see A. R. Wallace, *Malay Archipelago*; HONEY-EATER). Another genus which has been referred to the *Oriolidae* is *Sphecotheres*, peculiar to the Australian region, and distinguishable by a bare space round the eye. Orioles are shy and restless birds, frequenting gardens and woods, and living on insects and fruit. The nest is pocket-shaped, of bark, grass, and fibres, and the eggs are white or salmon-coloured with dark spots. The name is applied in America to the *Icteridae* family.

ORION (or OARION), in Greek mythology, son of Hyrieus or Poseidon, a mighty hunter of great beauty and gigantic strength. He is also sometimes represented as sprung from the earth. He was beloved of Eos, the dawn-goddess, who carried him off to Delos; but Artemis slew him with her arrows (*Odyssey*, v. 121). According to other accounts which attribute Orion's death to Artemis, the goddess herself loved him and was deceived by the angry Apollo into shooting him by mistake; or he paid the penalty of offering violence to her, or of challenging her to a contest of quoit-throwing (Apollodorus i. 4; Horace, *Odes*, iii. 4, 71). In the lower world his shade is seen by Odysseus driving the wild beasts before him as he had done on earth (*Odyssey*, xi. 572). After his death he was changed into the constellation which is called by his name. It took the form of a warrior, wearing a girdle of three stars and a lion's skin, and carrying a club and a sword. When it rose early it was a sign of summer; when late, of winter and stormy weather; when it rose about midnight it heralded the season of vintage.

See Kientzle's article in Roscher's *Lexikon*; Preller-Robert, *Griechische Mythologie* (1894), pp. 448-454.

Orion is one of the most conspicuous constellations, containing many bright stars. Of these Betelgeuse is easily distinguished by its yellowish-red colour in contrast to all the other important stars of the constellation which are white B-type stars. Betelgeuse is an irregular variable sometimes above and sometimes below the first magnitude. It was the first star for which the apparent diameter was measured by Michelson's interferometer method (1920). Rigel at the opposite corner of the quadrilateral is rather brighter; and the third brightest star is Bellatrix. The Orion nebula can be seen with the naked eye just below the belt; faint extensions of it have been photographed filling practically the whole constellation. The multiple star θ Orionis is near the centre of the nebula. There is no doubt that the principal stars of the constellation form a single system, and are involved in the nebulosity whose luminescence is stimulated by their intense radiation rich in light of short wave-length. The distance of the nebula is estimated at 180 parsecs.

ORION and **ORUS**, the names of several Greek grammarians, frequently confused. The following are the most important. (1) Orion of Thebes in Egypt (5th century A.D.), the teacher of Proclus the neo-Platonist and of Eudocia, the wife of the younger Theodosius. He taught at Alexandria, Caesarea in Cappadocia and Byzantium. He was the author of a partly extant etymological Lexicon (ed. F. W. Sturz, 1820), largely used by the compilers of the *Etymologicum Magnum*, the *Etymologicum Gudianum* and other similar works; a collection of maxims in three books, addressed to Eudocia, also ascribed to him by Suidas, still exists in a Warsaw ms. (2) Orus of Miletus, who, according to Ritschl, flourished not later than the 2nd century A.D., and was a contemporary of Herodian and a little junior to Phrynichus. His chief works were treatises on orthography; on Atticisms; on the names of nations.

See F. Ritschl, *De Oro et Orione Commentatio* (1834); R. Reitzenstein, *Geschichte der griechischen Etymologika* (1897); and article "Orion" in Smith's *Dictionary of Greek and Roman Biography*.

ORISKANY (ō-ris'kă-nī), a village of Oneida county, New York, U.S.A., about 7 m. N.W. of Utica. Pop. (1925) 1,177. Oriskany is served by the New York Central railway. In a ravine, about 2 m. west of Oriskany, was fought on Aug. 6, 1777 the battle of Oriskany, an important minor engagement of the American Revolution. On Aug. 4, Gen. Nicholas Herkimer had gathered about 800 militiamen at Ft. Dayton (on the site of the present Herkimer, N.Y.) for the relief of Ft. Schuyler (see *ROME*, N.Y.) then besieged by British and Indians under Col. Barry St. Leger and Joseph Brant. On the 6th Gen. Herkimer's force, on its march to Ft. Schuyler, was ambushed by a force of British under Sir John Johnson and Indians under Joseph Brant in the ravine above mentioned. The rear portion of Herkimer's troops escaped from the trap, but were pursued by the Indians, and many of them were overtaken and killed. Between the remainder and the British and Indians there was a desperate hand-to-hand conflict, interrupted by a violent thunderstorm, with no quarter shown by either side. On hearing the firing near Ft. Schuyler (incidental to a sortie by Lt.-Col. Marinus Willett) the British withdrew, after about 200 Americans had been killed and as many more taken prisoners, the loss of the British in killed being about the same. Gen. Herkimer, though his leg had been broken by a shot at the beginning of the action, continued to direct the fighting on the American side, but died on Aug. 16, as a result of the clumsy amputation of his leg. The battle, though indecisive, had an important influence in preventing St. Leger from affecting a junction with Gen. Burgoyne. The battlefield is marked by a monument erected in 1884. The sesquicentennial of the battle of Oriskany and Ft. Stanwix was celebrated on Aug. 6, 1927, by a pageant. The Oneida Historical Society then presented to the State the battle monument and about 5 ac. of land to be maintained as a State park.

See *Orderly Book of Sir John Johnson during the Oriskany Campaign* (Albany, 1882), with notes by W. L. Stone and J. W. De Peyster; *Publications of the Oneida Historical Society*, vol. i. (Utica, N.Y., 1877); and Phoebe S. Cowen, *The Herkimers and Schuylers* (Albany, 1903).

ORISSA, a tract of India, in the province of Bihar and Orissa, consisting of a British division and 24 feudatory states. The

historical capital of Cuttack is the headquarters; and Puri, with its temple of Jagannath, is world-famous. Orissa is inhabited by a distinctive race, the Oriyas, with a separate language, Oriya. The language is archaic in form and vocabulary, and the written character has been determined by an archaic writing material. This, till little over a century ago, consisted of strips of palm leaves on which the scribes wrote with an iron stylus. The country was long isolated from the rest of India. In 1899 it was brought into communication with Bengal and Madras by means of the railway.

The DIVISION OF ORISSA consists of five districts, viz., Cuttack, Puri and Balasore, which constitute the delta of the Mahanadi, Brahmani and Baitarani, and the inland districts of Sambalpur and Angul. Total area 13,736 sq.m.; pop. (1921) 4,968,873. Of these Sambalpur was a state which lapsed to the British government in 1849 on the death of the chief without heirs, and in accordance with his own wishes. Part of Angul was another small state which was confiscated in 1847 on account of the Raja's misrule and disloyalty. The other part, the Khondmals, was notorious for the human sacrifices offered by the aboriginal Khonds; it was nominally under the Raja of Baud and was annexed in 1855. The other three districts have a distinct history. They were under Hindu kings till their conquest by the Mohammedans in the 16th century and developed a civilization and culture of their own. Splendid memorials of the art attained between the 8th and 13th centuries are found in the temples at Bhubaneswar, Konarak and Puri, which are distinguished for grandeur of design, fine elaboration of details and beautiful stone carving. The Orissan style of architecture of which they are specimens, has been described by Fergusson as "one of the most complete and interesting styles of Indian architecture." Orissa remained under the rule of Mohammedan deputy governors, subject to the nawab of Bengal, with their capital at Cuttack, till 1751. It was then ceded by Ali Vardi Khan to the Marathas and for nearly half a century was subject to their tyranny and oppression. It was invaded and conquered by the British in 1803 during the second Maratha war.

In 1866 it suffered from an appalling famine, followed by destructive floods, during which a million persons are estimated to have perished, largely owing to the isolation of Orissa, for the unbridged roads were impassable in the rains, and supplies brought by sea could not be landed on its surf-beaten coast. The danger of the recurrence of such a famine has been averted by the Orissa canal system and the railway, as well as by the increased prosperity of the people. The occurrence of floods still occasionally causes distress. The beds of the deltaic rivers have been raised by the volumes of silt brought down and their outlets are obstructed by shoals and sand bars. Consequently, when high floods occur they are not discharged by the natural channels and are liable to burst the embankments and inundate the low-lying country on either side. Orissa differs from Bihar in having temporary settlements of land revenue: the "permanent settlement" of Bengal had been made ten years before it came under British rule. The last settlement was made in 1900, for 30 years.

The FEUDATORY STATES OF ORISSA occupy the hills between the British districts on the south-east, and the Central Provinces on the west, and Chota Nagpur on the north. Area, 28,046 sq.m.; pop. (1921) 3,807,172. The States may be classed in five groups, according to situation, viz., (1) to the north-east Keonjhar, Mayurbhanj and Nilgiri; (2) to the north-west, Bonai and Gangpur; (3) to the west, Bamra, Kalahandi, Patna, Rairakhol and Sonpur; (4) the central States of Athmallik, Baud, Pal Lahara and Talcher; (5) to the south-east, Athgarh, Baramba, Daspalla, Dhenkanal, Hindor, Khondpara, Narsinghpur, Nayagarh, Ranpur and Tigiria. Bamra, Kalahandi, Patna, Rairakhol and Sonpur were formerly attached to the Central Provinces, and Bonai and Gangpur to Chota Nagpur. The other 17 states, which used to be called the Tributary Mahals, or Garhjats, were ceded to the British by the Marathas after the conquest of Orissa in 1803. A political officer assists the Chiefs in the administration, general supervision being exercised by the governor of Behar and Orissa as agent of the governor-general.

• **ORISTANO**, a town and archiepiscopal see of Sardinia, 23 ft.

above sea-level, about 3 m. from the eastern shore of a gulf on the west coast, to which it gives its name, and 59 m. N. by W. of Cagliari by rail. Pop. (1921) 10,151. The town has remains of the walls (1290), and two gates, the Porta Manna, with a lofty square tower (Torre S. Cristoforo) and the Porta a Mare. The low houses are largely constructed of sun-dried bricks. Two miles south of Oristano is the village of S. Giusta, with a beautiful Romanesque church of the Pisan period dedicated to this saint, containing several antique columns. The lagoons on the coast are full of fish, but are a cause of malaria. In the environs garden produce is grown; good wine (*vernaccia*) is made, and ordinary pottery. It is also a centre of the cattle trade. A mile south of the mouth of the river Tirso is the landing-place for shipping. The large orange groves of Milis lie 13 m. N. of Oristano at the base of Monte Ferru. The inhabitants of Milis manufacture reed baskets and mats, which they sell throughout Sardinia.

Oristano occupies the site of the Roman Othoca, the point at which the inland road and the coast road from Carales to Turrus Libisonis bifurcated. The mediæval town (1070) was the seat onwards of the *giudici* (judges) of Arborea, one of the four divisions of the island. Almost the last of these judges was Eleonora (1347-1403); after her death Oristano became the seat of a marquisate, which was suppressed in 1478.

ORIZABA (Indian name *Ahuakilizapan*, pleasant waters), a city of Mexico in the State of Vera Cruz, 82 m. by rail W.S.W. of the port of Vera Cruz. Pop. (1920) 41,684 including a large percentage of Indians and half-breeds. The Mexican railway affords frequent communication with the City of Mexico and Vera Cruz, and a short line (4½ m.) connects with Ingemo, an industrial village and a branch line connects with the Tehuantepec National. Orizaba stands in a fertile, well-watered and richly wooded valley of the Sierra Madre Oriental, 4,025 ft. above sea-level, and about 18 m. S. of the snow-crowned volcano that bears its name. It has a mild, humid and healthful climate. The public edifices include the parish church of San Miguel, a chamber of commerce, a handsome theatre and some hospitals. The city is the centre of a rich agricultural region which produces sugar, rum, tobacco and Indian corn. In colonial times, when tobacco was one of the crown monopolies, Orizaba was one of the districts officially licensed to produce it. It is also a manufacturing centre of importance, having good water power from the Rio Blanco and producing cotton and woollen fabrics. Its cotton factories are among the largest in the republic. The forests in the vicinity are noted for orchids and ferns. An Indian town called *Ahuakilizapan*, subject to Aztec rule, stood here when Cortes arrived on the coast. The Spanish town that succeeded it did not receive its charter until 1774. In 1862 it was the headquarters of the French.

ORIZABA, in Aztec, *Citlatetpetl*, "star mountain," an extinct or dormant volcano, on the boundary between the Mexican states of Puebla and Vera Cruz and very nearly on the 19th parallel. It rises from the south-eastern margin of the great Mexican plateau to an elevation of 18,314 ft., according to Scovell and Bunsen's measurements in 1891-92, or 18,250 and 18,200 ft. according to other authorities, and 18,701 (5,700 metres) by the Comisión Geográfica Exploradora. It is the highest peak in Mexico and the second highest in North America. Its upper timber line is about 13,500 ft. above sea-level, and Hans Gadow found patches of apparently permanent snow at an elevation of 14,400 ft. on its south-east side in 1902. The first ascent of Orizaba was made by Reynolds and Maynard in 1848. Its last eruptive period was 1545-66, and the volcano is now considered to be extinct.

ORKHON INSCRIPTIONS, ancient Turkish inscriptions of the 8th century A.D., discovered near the river Orkhon to the South of Lake Baikal in 1889. They are written in an alphabet derived from an Aramaic source and recount the history of the northern branch of the Turks or Tu-kiue of Chinese historians. See **TURKS**.

ORKNEY, EARL OF, a Scottish title held at different periods by various families, including its present possessors the Fitzmaurices. The Orkney islands (*q.v.*) were ruled by jarls or earls under the supremacy of the kings of Norway from very early times to about 1360, many of these jarls being also earls of Caith-

ness under the supremacy of the Scottish kings. Perhaps the most prominent of them were a certain Paul (d. 1099) who assisted the Norwegian king, Harald III. Haardraada, when he invaded England in 1066; and his grandson Paul the Silent, who built, at least in part, the cathedral of St. Magnus at Kirkwall. They were related to the royal families of Scotland and Norway.

In its more modern sense the earldom dates from about 1380, and the first family to hold it was that of Sinclair, Sir Henry Sinclair (d. c. 1400) of Roslin, near Edinburgh, being recognized as earl by the king of Norway. He ruled the islands almost like a king, and employed in his service the Venetian travellers Nicolo and Antonio Zeno. His son Henry (d. 1418) was admiral of Scotland and was taken prisoner by the English in 1406, together with Prince James, afterwards King James I.; his grandson William, the 3rd earl (c. 1404-80), was chancellor of Scotland and took some part in public affairs. In 1455 William was created earl of Caithness, and in 1470 he resigned his earldom of Orkney to James III. of Scotland, who had just acquired the sovereignty of these islands through his marriage with Margaret, daughter of Christian I., king of Denmark and Norway. In 1567 Queen Mary's lover, James Hepburn, earl of Bothwell, was created duke of Orkney, and in 1581 her half-brother Robert Stewart (d. 1592), an illegitimate son of James V., was made earl of Orkney. Robert, who was abbot of Holyrood, joined the party of the reformers and was afterwards one of the principal enemies of the regent Morton. His son Patrick acted in a very arbitrary manner in the Orkneys, where he set the royal authority at defiance; in 1609 he was seized and imprisoned, and, after his bastard son Robert had suffered death for heading a rebellion, he himself was executed in Feb. 1614, when his honours and estates were forfeited.

In 1696 Lord George Hamilton was created earl of Orkney. He married Elizabeth Villiers, and was succeeded by his daughter Anne (d. 1756), the wife of William O'Brien, 4th earl of Inchiquin. Anne's daughter Mary (c. 1721-91) and her granddaughter Mary (1755-1831) were both countesses in their own right, the younger Mary married Thomas Fitzmaurice (1742-93), son of John Petty, earl of Shelburne, and was succeeded in the title by her grandson, Thomas John Hamilton Fitzmaurice (1803-77), whose descendants still hold the earldom.

See *Records of the Earls of Orkney, 1299-1663*, ed. by J. S. Clouston (1914).

ORKNEY ISLANDS, group forming a county off the north coast of Scotland. The islands are separated from the mainland by the Pentland firth, which is 6½ m. wide between Brough Ness in the island of South Ronaldshay and Duncansbay Head in Caithness-shire. The group consists of 67 islands (not including rocky islets) of which 29 are inhabited, four of them only with lighthouse attendants. They measure 50 m. from north-east to south-west, and 29 m. from east to west, and cover 240,847 acres. Excepting on the west coasts of the larger islands, which present rugged cliff scenery, the group lies somewhat low and is of bleak aspect, owing to the absence of trees. The islands are built up wholly of Old Red Sandstone. The Old Man of Hoy is a fine stack of rock standing detached from the north-west cliffs. The only other islands containing heights of any importance are Pomona, with Ward hill (880 ft.), and Wideford (740 ft.) and Rousay. Erratics of distant origin (e.g., from Moray firth) give evidence of glacial action. Nearly all of the islands possess lakes, the largest being Loch Harray and Loch Stenness in Pomona. The rivers are merely streams. Excepting on the west fronts of Pomona, Hoy and Rousay, the coast-line of the islands is deeply indented, and the islands themselves are divided from each other by straits, generally called *sounds* or *firths*, though off the north-east of Hoy is *Bring Deep*, south of Pomona is *Scapa Flow* and to the south-west of Eday is the *Fall* of Warness. The topographical names are Norse, and the common terminal of the names of the islands, *a* or *ay*, is the Norse *ey*, meaning "island." The islets are usually called *holms* and the isolated rocks *skerries*. The tidal currents, or *roost* (as some of them are called locally, from the Icelandic), off many of the isles run very fast and whirlpools are frequent.

History.—The Orkneys were the *Orcades* of classical writers,

and the word is probably derived from the Norse *Orkn*, seal, and *ey*, island. Evidences of prehistoric occupation include numerous weems or underground houses, chambered mounds, barrows or burial mounds, brochs or round towers, and stone circles and standing stones. Three of the most famous are the corbelled tomb at Maeshowe, and the circles of standing stones at Brogar and Stennis with an early village discovered in 1928. If, as seems likely, the Dalriadic Scots towards the beginning of the 6th century established a footing in the islands, their success was short-lived, and the native inhabitants regained power and kept it until dispossessed by the Norsemen in the 9th century. The Celtic missionaries, companions of St. Columba, followed about 565. As the Norse pirates made raids on Norway from the islands, as well as on Scotland, Harold Haarflager ("Fair Hair") subdued the rovers in 875 and added the Orkneys and Shetlands to Norway. They remained under the rule of Norse earls until 1231, when the line of the earls became extinct. In that year the earldom of Caithness was granted to Magnus, second son of the earl of Angus, whom the king of Norway apparently confirmed in the title. In 1468 the Orkneys and Shetlands were pledged by Christian I. of Denmark for the payment of the dowry of his daughter Margaret, betrothed to James III. of Scotland, and as the money was never paid, their connection with the crown of Scotland has been perpetual. In 1471 William, earl of Orkney, exchanged his earldom for lands in Fife, and the islands were annexed to the Scottish crown. In 1581 Lord Robert Stewart, natural son of James V., was created earl of Orkney, but in 1615 the earldom was again annexed to the crown. The islands were the *rendezvous* of Montrose's expedition in 1650 which culminated in his imprisonment and death. In 1707 the islands were granted to the earl of Morton in mortgage, but in 1766 his estates were sold to Sir Lawrence Dundas, ancestor of the earls of Zetland.

In early times both the archbishop of Hamburg and the archbishop of York disputed with the Norwegians ecclesiastical jurisdiction over the Orkneys; but ultimately the Norwegian bishops, the first of whom was William the Old, consecrated in 1102, continued the canonical succession. The see, left vacant on several occasions, was finally abolished in 1697, although many of the clergy refused to conform. The Norse tongue, at last extinguished by the constant influx of settlers from Scotland, lingered until the end of the 18th century. When the islands were given as security for the princess's dowry, there seems reason to believe that it was intended to redeem the pledge, because it was then stipulated that the Norse system of government and the law of St. Olaf should continue to be observed in Orkney and Shetland. Thus the *udal* succession and mode of land tenure (or, that is, absolute freehold as distinguished from feudal tenure) still obtain to some extent, and the remaining *udallers* hold their lands and pass them on without written title.

Agriculture and Industries.—The soil generally is a sandy loam or a strong but friable clay, and very fertile. Less than half the total area is under cultivation, but farming is now up to the general Scottish standard. The crofters' houses have been rebuilt of stone and lime, and are superior to those in most parts of the Highlands. The holdings run small, less than one-fifth being over 50 acres. The grain crops are oats and barley, while the favoured root crops are turnips (much the most extensively grown) and potatoes. Numbers of cattle and sheep are reared on the fine pasture of the islands; pigs are also kept on several of the islands, and the horses—as a rule hardy, active and small, though larger than the famous Shetland ponies—are very numerous. The woollen, linen, straw-plaiting and kelp industries have all successively failed, though the last named has been recently revived. Sandstone is quarried on several islands, and distilleries are found in Pomona (near Kirkwall and Stromness). About half the population is engaged in agriculture. Apart from this, the principal industry is fishing. For several centuries the Dutch practically monopolized the herring fishery, but when their supremacy was destroyed by the salt duty, the fisheries were almost totally neglected. The industry, however, is now of considerable importance, particularly the herring fishery, followed by the cod, ling and lobster fisheries. There is a regular communi-

cation by steamer between Stromness and Kirkwall, and Thurso, Wick, Aberdeen and Leith, and also between Kirkwall and Lerwick and other points of the Shetlands.

Population and Administration.—The population was 24,111 in 1921, including 61 persons who spoke Gaelic and English, but none who spoke Gaelic only. Orkney unites with Shetland to send one member to parliament. Kirkwall, the county town, is the only royal burgh. Orkney forms a sheriffdom with Shetland and Caithness, and is under the school-board jurisdiction.

The Inhabited Islands.—From south to north, the islands (population in brackets) include Sule Skerry (lighthouse, 3), Pentland Skerries (lighthouse, 9), Swona (26), South Ronaldshay (1,545), Hoy (964). On Hoxa Head, is a *broch*, or round tower, and the island contains, besides, examples of Picts' houses and standing stones. The famous Dwarfie Stone, an enormous block of sandstone with rooms hollowed out in it, lies in a valley near Ward Hill. Flotta (349), east of Hoy, was the home for a long time of the Scandinavian compiler of the *Codex Flotticensis*, which furnished Thormodr Torfaeus (1636–1719), the Icelandic antiquary, with many of the facts for his *History of Norway*. Pharay (60) also lies east of Hoy. Burray (518) is famous for the *broch* from which the island takes its name (Borgarey, Norse, "island of the broch"). The tower stands on the north-western shore, is 15 ft. high, has walls from 15 to 20 ft. thick, built of layers of flat stones without cement or mortar, and an interior diameter of 40 feet. Between Hoy and Pomona are Hunda (3), Cava (15), and Graemsey (147). The isle, surrounded by shoals, has two lighthouses. The cliffs of Copinshay (4) are a favourite haunt of sea-birds. Half a mile to the north-east is the great rock which, from a fancied resemblance to a horse rearing its head from the sea, is called the Horse of Copinshay.

Pomona (*q.v.*) is the principal island and is known as Mainland. Shapinshay (618) was the birthplace of William Irving, father of Washington Irving. It possesses several examples of Pictish and Scandinavian antiquities and Balfour Castle, built in 1848. Gairsay (28) was the home of Sweyn Asleifson, the rover. At Lamb Head is a *broch* and Pictish pier, and on Odin Bay, is a round pit in the rocks called the Vat of Kirbuster. Papa Stronsay (30) commemorates the Celtic *papae*, or missionaries, who preached before the arrival of the Northmen. The adjacent Veira or Wire has a population of 54; Egilshay (103) is the island on which St. Magnus was murdered by his cousin Hacco in 1115. It derives its name (*ecclesia*) from the little church of St. Magnus, now in ruins. The round tower resembles similar ones found beside Irish churches of the 7th and 8th centuries and has walls 3 ft. thick. Eday (474) contains weems, mounds and standing stones. Carrick village was named after the earl of Carrick. It was off this island that John Gow, the pirate, was taken in 1725. Stronsay (1033) and Rousay (488) are other large islands.

Sanday (1403), one of the largest northern islands, has an area of 19 sq.m. It produces potatoes and grain, and has harbours at Otterswick and Kettletoft. The antiquities include a *broch* in Elsness. Pharay (47). Westray (1507), has a harbour at Pier-o'-wall. Noltland castle was proposed as the refuge of Queen Mary after her flight from Loch Leven. It was at one time the property of Sir Gilbert Balfour, the master of Queen Mary's household. At the westerly point, there is the Stack of Noup. Gentleman's Cave afforded shelter to five followers of Prince Charles Edward during the winter of 1745–46. Papa Westray (247) and North Ronaldshay (349) are the most northerly islands. The latter is only reached from Sanday over a dangerous firth 2½ m. wide. The monumental stone with Ogham inscription, discovered in the *broch* of Burrian, must date from the days of the early Christian missionaries.

ORLANDO, VITTORIO EMANUELE (1860–), Italian politician and jurist, was born at Palermo on March 19, 1860. Becoming a barrister and a law professor, he was first elected deputy for Partinico in Sicily in 1898. He was minister of education in the Giolitti-Tittoni Cabinet of 1903–05, and of justice in the Giolitti Cabinet of 1907–09, and again under Salandra in November 1914. Although a Giolittian at heart, he was in favour of Italian intervention in the World War. On the

resignation of the Salandra Cabinet in June 1916 he remained in office under Boselli as minister of the interior, and when the latter resigned Orlando was entrusted with the formation of a new Cabinet. After the Armistice he went to Paris as president of the Italian peace delegation. When President Wilson launched his appeal on Fiume to the Italian people over the heads of their delegates, he returned to Rome, where he was triumphantly received, but after his return to Paris without the guarantees he was supposed to have secured, and without obtaining any satisfactory solution of the Adriatic problem, the chamber voted against him and he resigned on June 19, 1919.

On Dec. 2, 1919, he was elected president of the chamber. He at first supported Fascism and the Mussolini government, and was re-elected deputy in 1924 on the government list; but after the Matteotti affair he withdrew his support, without, however, abandoning the chamber. At the municipal elections of Palermo in August 1925 he mobilised all his adherents in favour of the anti-Fascist list but upon the subsequent triumph of the Fascists Orlando retired from Parliament.

See L. Hauteceur, *L'Italie sous le ministère Orlando, 1917–19* (1919); R. Lansing, *The Big Four* (1922).

ORLANDO, a city of Florida, U.S.A., the county seat of Orange county; 125 m. S. of Jacksonville, on Federal highways 92 and 441 and served by the Atlantic Coast Line and the Seaboard Air Line railways. Pop. 22,255 in 1925 (State census), of whom 6,462 were negroes; estimated locally at 35,500 in 1928. The region is devoted to citrus fruits, is dotted with lakes (over 1,000 in the county), and is a centre for tourists. At Winter Park, 4 m. N.E., is Rollins college (1885), beautifully situated on Lake Virginia. Orlando, founded in 1843, was incorporated in 1875.

ORLÉANAIS, formerly a French province, comprised the country around Orleans, the *pagus Aurelianensis*; it lay on both banks of the Loire, and for ecclesiastical purposes formed the diocese of Orleans. It had formed part of the territory possessed by the ancestors of Hugh Capet and long remained an important part of the royal demesne. In 1344 Philip VI. gave it with the title of Duke to Philip (d. 1375), one of his younger sons.

See A. Thomas, *Les États provinciaux de la France centrale* (1879).

ORLEANISTS, a French political party which arose out of the Revolution. It took its name from the Orleans branch of the house of Bourbon, the descendants of Philippe, duke of Orleans, younger brother of Louis XIV., who were its chiefs. Its aim was to reconcile the monarchical principle with the "rights of man," as proclaimed by the Constituent Assembly in 1789. The Orleans princes were traditionally marked out as the leaders in such a policy. Enormously rich, within measurable distance of the succession to the throne, but cut off by the jealousy of the crown from all share in public affairs, they had long been the centres of opposition to the encroachment of the royal power. Louis, duke of Orleans, had headed the protest of the princes against the policy of Maupeou in suppressing the *parlement* of Paris; his son later earned the style of Philippe Égalité by adopting—with ulterior objects—extreme revolutionary views (see ORLEANS, LOUIS PHILIPPE J., duke of); and Égalité's son, Louis Philippe (afterwards king of the French) fought, as duc de Chartres, at Jemappes, under the republican tricolour. The generation of Orleanists, the immediate supporters of Philippe Égalité, were swamped in the turmoil of the Revolution. But they came naturally to the front when another revolution overthrew the restored legitimate monarchy of Louis XVIII. and Charles X. During the Restoration, 1815–30, everything tended to identify the Liberals with the Orleanists. It is true that Louis XVIII. had been induced to grant (*octroyer*) a constitutional charter; but he and his successor claimed to rule by divine right and to confer liberties upon their subjects of their own will. The difference between the Legitimists, and the Orleanists, was thus fundamental. So was that between the Orleanists and the Bonapartists; for the former aimed at securing political liberty, in addition to equality before the law and in social life, while the latter aimed at subjection to a military despotism.

The revolution of 1830 brought the Orleanists into power, and

they marked the profound change made in the character of the government by styling Louis Philippe not "king of France and Navarre by the grace of God," but "king of the French by the grace of God and the will of the people." The Orleanists were led by men eminent in letters and in practical affairs—Guizot, Thiers, the Broglies, the banker Lafitte, and many others—and the 18 years of their rule were, on the whole, profitable to France. That they ended in another "general overturn" in 1848 was due mainly to the fact that the Orleanist conception of what was meant by the word "people" led the Government to offend the deeply-rooted love of the French for equality. On the model of the English constitution they instituted a *pays légal* of about a quarter of a million of voters by whom all the rest of the country was to be "virtually represented." But the nation outside of the *pays légal* soon discovered that it was being governed by a privileged class, less offensive perhaps, but also less brilliant, than the aristocracy of the old monarchy.

The revolution of 1848 swept the Orleanists from power for ever. They continued indeed throughout the Second Republic and the Empire (1848–70) to enjoy a marked prestige, due to the wealth and capacity of some of their members, their influence in the French Academy and the ability of their organs in the press. But their weakness was demonstrated when the Second Empire was swept away by the German War of 1870–71. The country, in its disgust at the Bonapartists and its fear of the Republicans, chose a great many royalists to represent it in the assembly which met in Bordeaux on Feb. 12, 1872. In this body the Orleanists again exercised a kind of leadership by virtue of individual capacity, but they were counterbalanced by the Legitimists. They defeated Thiers on May 24, 1873, as punishment for his dexterous imposition of the Republic on the unwilling majority of the assembly. Their real occupation was to endeavour to bring about a fusion between themselves and the Legitimists. As far back as 1850 Guizot had proposed, or had thought of proposing, such a fusion, but it was on the condition that the comte de Chambord would resign his divine pretensions. The fusion arranged in 1873 was on quite another footing. After much exchange of notes and many agitated conferences, the comte de Paris, the representative of the Orleanists, sought an interview with the comte de Chambord at Frohsdorff, and obtained it by giving a written engagement that he came not only to pay his respects to the head of his house, but also to "accept his principle." Orleanists have declared that the engagement was given, with mental reservations; but the country believed that the liberal royalists had been absorbed in the divine right royalists, and returned republicans at by-elections till it transformed the Assembly. The Orleanist princes had still a part to play, particularly when the death of the comte de Chambord in 1883 left them heads of the house of France, but the Orleanist party ceased to exist as an independent political organization.

BIBLIOGRAPHY.—The Orleanists are necessarily more or less dealt with in all histories of France since 1789, and in most political memoirs, but their principles can be learnt and their fortunes followed from the following: A. Sorel, *L'Europe et la révolution française* (1885–1904); F. Guizot, *Histoire parlementaire de la France* (1819–48), and *Mémoires pour servir à l'histoire de mon temps* (1858–67); P. de la Gorce, *Histoire du second empire* (1894–1904); and G. Hanotaux, *Histoire de la fondation de la 3^{me} République* (1925). For the attitude of the Orleans princes towards the crown under the old régime, see Amédée Britsch, *La Jeunesse de Philippe Égalité* (1927).

ORLEANS, DUKES OF. The title of duke of Orleans was first created by King Philip VI. in favour of his son Philip, who died without legitimate issue in 1375. The second duke of Orleans, created in 1392, was Louis, a younger son of Charles V., whose heir was his son, the poet Charles of Orleans. Charles's son Louis, the succeeding duke, became king of France as Louis XII. in 1498, when the duchy of Orleans was united with the royal domain. In 1626 Louis XIII. created his brother, Jean Baptiste Gaston (d. 1660), duke of Orleans, and the title was revived in 1661 by Louis XIV. in favour of his brother Philip. Descendants of this duke have retained the title until the present day, one of them becoming king of France as Louis Philippe in 1830. Two distinguished families are descended from the first house of Orleans: the counts of Angoulême, who were descended from

John, a son of Duke Louis I., and who furnished France with a king in the person of Francis I.; and the counts and dukes of Longueville, whose founder was John, count of Dunois, the bastard of Orleans, a natural son of the same duke. In addition to the dukes of Orleans the most important members of this family are: Anne Marie Louise, duchess of Montpensier; Francis, prince of Joinville; Louis Philippe Albert, count of Paris; and the traveller Prince Henry of Orleans. See table **BOURBON**.

ORLEANS, CHARLES, DUKE OF (1391–1465), commonly called Charles d'Orléans, French poet, was the eldest son of Louis, duke of Orleans (brother of Charles VI. of France), and of Valentina Visconti, daughter of Gian Galeazzo, duke of Milan. He was born on May 26, 1391. He married (June 29, 1406), Isabella, his cousin, widow of Richard II. of England. She died three years later. He was already duke of Orleans, for Louis had been assassinated by the Burgundians two years before (1407). He was now the most important person in France, except the dukes of Burgundy and Brittany, the king being a cipher. He was, however, only nominally one of the leaders of the civil war; the real guidance of his party resting with Bernard VII., the great count of Armagnac, whose daughter, Bonne, he married, or at least formally espoused, in 1410. Five years of confused negotiations, plots and fightings passed before the English invasion and the battle of Agincourt, where Charles was joint commander-in-chief. He was taken prisoner and carried to England, where he remained for a full quarter of a century. He hunted and hawked and enjoyed society amply, though the very dignities which secured him these privileges made his ransom great, and his release difficult to arrange. Above all, he had leisure, however, for literary work which consisted of short poems in the artificial metres, then fashionable in France. Besides these a number of English poems have been attributed to him, but without certainty. For practical purposes his work consists of some hundreds of short French poems, a few in various metres, but the majority either ballades or rondels. Charles d'Orléans is the last representative of the poetry of the middle ages, in which the form was almost everything, and the personality of the poet, save in rare instances, nothing. He has the urbanity of the 18th century without its vicious and prosaic frivolity. His best-known rondels—those on Spring, on the Harbingers of Summer, and others—rank second to nothing of their kind.

The agreement for his release from captivity was concluded on July 2, 1440. He was actually released on Nov. 3, and then married Mary of Cleves, who brought him a considerable dowry to assist the payment of his ransom. After his return to France he maintained at Blois a miniature court, at which the best-known French men-of-letters at the time—Villon, Olivier de la Marche, Chastelain, Jean Meschinot and others—were residents or visitors or correspondents. His son, afterwards Louis XII., was born in 1462. Charles died on Jan. 4, 1465, at Amboise.

The best edition of Charles d'Orléans's poems, with a brief but sufficient account of his life, is that of C. d'Héricault in the *Nouvelle collection Jannet* (Paris, 1874). For the English poems see the edition by Watson Taylor for the Roxburghe Club (1827). See also C. Bruneau, *Charles d'Orléans et la poésie aristocratique* (Lyons, 1924).

ORLEANS, FERDINAND PHILIP LOUIS CHARLES HENRY, DUKE OF (1810–1842), born at Palermo on Sept. 3, 1810, was the son of Louis Philippe, duke of Orleans, afterwards king of France, and Marie Amélie, princess of the Two Sicilies. Under the Restoration he bore the title of duke of Chartres, and studied classics in Paris at the Collège Henri IV. At the outbreak of the Revolution, which in 1830 set his father on the throne, he was colonel of a regiment of Hussars. He assumed the title of duke of Orleans, and was sent by the king to put down the riots at Lyons (1831), and then to the siege of Antwerp (1832). He was appointed lieutenant-general, and made several campaigns in Algeria (1835, 1839, 1840). On his return to France he organized the *chasseurs d'Orléans*. He died after an accident at Neuilly, near Paris, on July 13, 1842.

The duke of Orleans had married (May 30, 1837) Helène Louise Elisabeth of Mecklenburg-Schwerin, and had by her two sons, the count of Paris and the duke of Chartres. On Feb. 24, 1848, after the abdication of Louis Philippe, the duchess of

Orleans went to the Chamber of Deputies in the Palais Bourbon in the hope of having her eldest son proclaimed and of obtaining the regency; the attitude of the populace forced her to take refuge in England, and she died at Richmond on May 18, 1858.

ORLEANS, HENRI, PRINCE OF (1867-1901), eldest son of Robert, duke of Chartres, was born at Ham, near Richmond, Surrey, on Oct. 16, 1867. In 1889, at the instance of his father, he undertook, in company with MM. Bonvalot and Dedeken, a journey through Siberia to Siam. They crossed the mountain range of Tibet, and the fruits of their observations, submitted to the Geographical Society of Paris and later incorporated in *De Paris au Tonkin à travers le Tibet inconnu* (1892), brought them conjointly the gold medal of that society. In 1892 the prince made a short journey in East Africa, and shortly afterwards visited Madagascar, proceeding thence to Tongking. From there he set out for Assam, and found the sources of the Irrawaddy, which secured the medal of the Geographical Society of Paris and the cross of the Legion of Honour. In 1897 he revisited Abyssinia, and political differences arising from this trip led to a duel with the comte de Turin, in which both combatants were wounded. While on a trip to Assam he died at Saigon on Aug. 9, 1901.

ORLEANS, HENRIETTA, DUCHESS OF (1644-1670), third daughter of the English king, Charles I., and his queen, Henrietta Maria, was born during the Civil War at Exeter on June 16, 1644. A few days after her birth her mother left England, and she lived at Exeter under the care of Lady Dalkeith (afterwards countess of Morton) until the surrender of the city to the parliamentarians, when she was taken to Oatlands in Surrey. In July 1646 she rejoined her mother in Paris, where her girlhood was spent and where she was educated as a Roman Catholic. Henrietta was mentioned as a possible bride for Louis XIV., but she was betrothed to his only brother Philip. After the restoration of her brother Charles II., she returned to England with her mother, but a few months later she was again in Paris, where she was married to Philip, now duke of Orleans, on March 30, 1661. The duchess was very popular at the court of Louis XIV., and was on good terms with the Grand Monarch, but she was soon estranged from her husband, and her conduct was very imprudent. In 1670, at the instigation of Louis, but without Philip's consent, she visited England and obtained the signature of Charles II.'s ministers to the treaty of Dover. Shortly after returning to France, Henrietta died at St. Cloud on June 30, 1670, and it was asserted that she had been poisoned by order of her husband. She left two daughters, Marie Louise, wife of Charles II. of Spain, and Anne Marie, wife of Victor Amadeus II. of Savoy.

ORLEANS, JEAN BAPTISTE GASTON, DUKE OF (1608-1660), third son of the French king Henry IV., and his wife Marie de Medici, was born at Fontainebleau on April 25, 1608. Known at first as the duke of Anjou, he was created duke of Orleans in 1626, and was nominally in command of the army which besieged La Rochelle in 1628. On several occasions he was obliged to leave France for conspiring against the government of his mother, of Cardinal Richelieu, and of Louis XIII. Orleans stirred up Cinq-Mars to attempt Richelieu's murder, and then deserted him. In 1643, on the death of Louis XIII., Gaston became lieutenant-general of the kingdom, and fought against Spain on the northern frontiers of France; but during the wars of the Fronde he passed from one party to the other. Exiled by Mazarin in 1652 he remained in Blois until his death on Feb. 2, 1660. Gaston's first wife was Marie (d. 1627), daughter and heiress of Henri de Bourbon, duc de Montpensier (d. 1608), and his second wife Marguerite (d. 1672), sister of Charles III., duke of Lorraine. By Marie he left a daughter, ANNE MARIE, duchesse de Montpensier (q.v.); and by Marguerite he left three daughters, Marguerite Louise (1645-1721), wife of Cosimo III., grand duke of Tuscany; Elizabeth (1646-1696), wife of Louis Joseph, duke of Guise; and Françoise Madeleine (1648-1664), wife of Charles Emmanuel II., duke of Savoy.

ORLEANS, LOUIS, DUKE OF (1372-1407), younger son of the French king, Charles V., was born on March 13, 1372. Having been made count of Valois and of Beaumont-sur-Oise, and then

duke of Touraine, he received the duchy of Orleans from his brother Charles VI. in 1392. In 1389 he married Valentina (d. 1408), daughter of Gian Galeazzo Visconti, duke of Milan, who brought the county of Asti to her husband and her claim upon Milan, which she transmitted to her descendants, and which furnished Louis XII. and Francis I. with a pretext for interference in northern Italy. When Charles VI. became insane in 1392, Orleans opposed his uncle Philip II., duke of Burgundy, who was conducting the government; and this quarrel was the dominating factor in the affairs of France. Continued after Philip's death in 1404 with his son and successor, John the Fearless, it culminated in the murder of Orleans by one of John's partisans on Nov. 23, 1407. He had eight children by Valentina Visconti, including his successor, Charles of Orleans the poet, and one of his natural sons was the famous bastard of Orleans, John, count of Dunois.

See E. Jarry, *La Vie politique de Louis d'Orléans* (1889).

ORLEANS, LOUIS, DUKE OF (1703-1752), only son of Duke Philip II., the regent Orleans, was born at Versailles on Aug. 4, 1703. He took very little part in the politics of the time, although he was conspicuous for his hostility to Cardinal Dubois in 1723. In 1730 Cardinal Fleury secured his dismissal from the position of colonel-general of the infantry. He retired and spent his time mainly in translating the Psalms and the epistles of St. Paul. Having succeeded his father as duke of Orleans in 1723, he died in the abbey of St. Geneviève at Paris on Feb. 4, 1752. His wife Augusta (d. 1726), daughter of Louis William, margrave of Baden, bore him one son, Louis Philippe, who succeeded him.

ORLEANS, LOUIS PHILIPPE, DUKE OF (1725-1785), son of Louis, duke of Orleans, was born at Versailles on May 12, 1725, and was known as the duke of Chartres until his father's death in 1752. He served with the French armies in the campaigns of 1742, 1743 and 1744, and at the battle of Fontenoy in 1745, retiring to Bagnolet in 1757, and occupying his time with theatrical performances. He died at St. Assise on Nov. 18, 1785. The duke married Louise Henriette de Bourbon-Conti, who bore him a son Philip (Égalité), duke of Orleans, and a daughter, who married the last duke of Bourbon. His second wife, Madame de Montesson, whom he married secretly in 1773, was an authoress of some repute. He had two natural sons, the abbot of St. Far and the abbot of St. Albin.

See *L'Automne d'un prince*, a collection of letters from the duke to his second wife, ed. J. Hermand (1910).

ORLEANS, LOUIS PHILIPPE JOSEPH, DUKE OF (1747-1793), called PHILIPPE ÉGALITÉ, son of Louis Philippe, duke of Orleans, and of Louise Henriette de Bourbon-Conti, was born at St. Cloud on April 13, 1747. Having borne the title of duke of Montpensier until his grandfather's death in 1752, he became duke of Chartres, and in 1769 married Louise Marie Adélaïde de Bourbon-Penthièvre, daughter and heiress of the duke of Penthièvre, grand admiral of France. Her wealth made him the richest man in France, and he determined to play a part equal to that of his great-grandfather, the regent, whom he resembled in character and debauchery. As duke of Chartres he opposed the plans of Maupeou in 1771, and was exiled to his country estate of Villers-Cotterets (Aisne). When Louis XVI. came to the throne in 1774 Chartres still found himself looked on coldly at court. In 1778 he served in the squadron of D'Orvilliers, but the Queen obtained his removal from the navy and he was given the honorary post of colonel-general of hussars. He then abandoned himself to pleasure; he often visited London, becoming an intimate friend of the prince of Wales (afterwards George IV.). He made himself very popular in Paris by his gifts to the poor in time of famine, and by throwing open the gardens of the Palais Royal to the people. Before the meeting of the notables in 1787 he had succeeded his father as duke of Orleans, and advertised his liberalism so boldly that he was believed to be aiming at becoming constitutional king of France. In November he was again exiled to Villers-Cotterets. He was elected to the States-General and led the minority of 47 noblemen who seceded from their own estate (June 1789) and joined the Tiers État. The part he played during the summer of 1789 is one of the most debated points in the history of the Revolution. The court accused him

of being at the bottom of every popular movement, and saw the "gold of Orleans" as the cause of the Revellion riot and the taking of the Bastille. The best testimony for his behaviour during this summer is that of an English lady, Mrs. Grace Dalrymple Elliott, who shared his affections with the comtesse de Buffon; her statement shows that at the time of the riot of July 12 he was on a fishing excursion, and was rudely treated by the king on the next day when going to offer him his services. La Fayette persuaded the king to send the duke to England on a mission and he remained in England from Oct. 1789 to July 1790. On July 7, he took his seat in the Assembly, and on Oct. 2, both he and Mirabeau were declared by the Assembly entirely free of any complicity in the events of October. He now tried to avoid politics, but the court suspected him, and his friends talked about his being king. He made no attempt to get himself made king, regent or lieutenant-general of the kingdom at the time of the flight to Varennes in June 1791, but again tried in vain to make his peace with the court in Jan. 1792. In the summer of that year he was present for a short time with the army of the north, but had returned to Paris before Aug. 10. After that day he ran great risks in saving fugitives; in particular, he saved the life of the count of Champcenetz, the governor of the Tuileries, his personal enemy, at the request of Mrs. Elliott. After accepting the title of Citoyen Égalité, conferred on him by the commune of Paris, he was elected 20th and last deputy for Paris to the Convention. In that body he sat as quietly as in the National Assembly, but at the king's trial he had to speak, and then only to give his vote for the death of Louis. Nevertheless when the news of the desertion of his eldest son, the duke of Chartres with Dumouriez became known in Paris all the Bourbons remaining in France, including Égalité, were arrested April 5. He remained in prison until October, when the Reign of Terror began, and was decreed "of accusation" on Oct. 3. He was tried on Nov. 6, and guillotined on the same day. Personally Orleans possessed the charming manners of a polished grand seigneur; he was debauched and cynical, but never rude or cruel, full of gentle consideration for all about him but selfish in his pursuit of pleasure.

R(ousselet), *Correspondance de Louis-Philippe Joseph d'Orléans avec Louis XVI.* (1800); Rivarol, *Portrait du duc d'Orléans et de Madame de Genlis*; Tournois, *Histoire de Louis Philippe Joseph duc d'Orléans* (1842).

ORLEANS, LOUIS PHILIPPE ROBERT, DUKE OF (1869–1926), eldest son of the comte de Paris, was born at York House, Twickenham, on Feb. 6, 1869. The law of exile against the French princes having been abrogated in 1871, he returned to France and was educated at Eu and at the Collège Stanislas, Paris. On the death of the comte de Chambord, the comte de Paris became head of the Bourbons; and in 1886 he and his son were exiled from France by the new law of 1886. He then passed through the Royal Military College, Sandhurst, and received a commission in the 4th battalion of the 60th Rifles, then quartered in India. In January 1888 the duke joined his regiment for a few months. On attaining his majority, he went to Paris (February 7, 1890), and, proceeding to the *mairie*, expressed his desire, as a Frenchman, to perform his military service. He was arrested in conformity with the law of 1886, tried, and sentenced to two years' imprisonment; but he was liberated by President Carnot after a few months' nominal incarceration (June 4), and conducted to the Swiss frontier. This escapade won for him the title of "Le Premier Conscrit de France." After the comte de Paris's funeral (September 12, 1894) the duke received his adherents in London, and was accepted as the head of his house. On Nov. 5, 1896, he married the archduchess Maria Dorothea Amalia of Austria; there was no issue of the marriage. The duke of Orleans was interested in exploration, and published *Une croisière au Spitzberg* (1905). He died on March 28, 1926.

ORLEANS, PHILIP I., DUKE OF (1640–1701), son of the French king Louis XIII., was born at St. Germain-en-Laye on Sept. 21, 1640. In 1661 he was created duke of Orleans, and married Henrietta, sister of Charles II. of England; but the marriage was not happy, and the death of the duchess in 1670

was attributed to poison. Later he married Charlotte Elizabeth, daughter of Charles Louis, elector palatine of the Rhine. Having fought with distinction in Flanders in 1667, Orleans returned to military life in 1672, and in 1677 gained a great victory at Cassel and took St. Omer. Louis XIV., it was said, was jealous of his brother's success; Orleans never commanded an army again. He died at St. Cloud on June 8, 1701, leaving a son, Philip, the regent of Orleans, and two daughters: Anne Marie (1669–1728), wife of Victor Amadeus II., duke of Savoy; and Elizabeth Charlotte (1676–1744), wife of Leopold, duke of Lorraine. His eldest daughter, Marie Louise (1662–1689), wife of Charles II. of Spain, died before her father.

ORLEANS, PHILIP II., DUKE OF (1674–1723), regent of France, son of Philip I., duke of Orleans, and his second wife, the princess palatine, was born on Aug. 2, 1674, and fought at the siege of Mons in 1691. His marriage with Mlle. de Blois, the legitimized daughter of Louis XIV., won him the favour of the king. He fought at Steinkerke, Neerwinden and Namur (1692–1695). During the next few years he studied natural science. He was next given a command in Italy (1706) and in Spain (1707–1708) where he gained some important successes, but his suspected desire to succeed Philip V. on the throne of Spain gained him Louis XIV.'s disfavour. In his will, however, he appointed him president of the council of regency of the young King Louis XV. (1715). After the death of the king, Orleans had the will annulled by the parlement, and himself invested with absolute power. At first he made a good use of this, counselling economy, decreasing taxation, disbanding 25,000 soldiers and restoring liberty to the persecuted Jansenists. But the inquisitorial measures which he had begun against the financiers led to disturbances. He also countenanced the risky operations of the banker John Law (1717), whose bankruptcy led to a disastrous crisis.

A conspiracy under the inspiration of Cardinal Alberoni, first minister of Spain, to transfer the regency from Orleans to Philip V. of Spain was discovered and defeated in 1718. Dubois, formerly tutor to the duke of Orleans and now his all-powerful minister, caused war to be declared against Spain, with the support of the emperor, and of England and Holland (Quadruple Alliance). Philip V. made peace with the regent in 1720.

On the majority of the king (Feb. 15, 1723), the duke of Orleans resigned the supreme power; but he became first minister to the king, and remained in office till his death on Dec. 23, 1723. The regent had great qualities, both brilliant and solid, but his dissolute manners found only too many imitators, and the regency was one of the most corrupt periods in French history.

See J. B. H. R. Capefigue, *Histoire de Philippe d'Orléans, régent de France* (2 vols., 1838); A. Baudrillart, *Philippe V. et la cour de France*, vol. ii. (1890); and L. Wiesener, *Le régent, l'abbé Dubois et les Anglais* (3 vols., 1891–99).

ORLEANS (ORLEANS), a city of France, the chief town of Loiret, on the Loire, 77 m. S.S.W. of Paris by rail. Pop. (1926) 62,862. Les Aubrais, a mile to the north, is one of the chief railway junctions in the country. An early trading post among the Gauls, Orleans was known as *Genabum* by the Romans, and led the revolt against Julius Caesar in 52 B.C. In the 5th century it had taken the name *Aurelianum* from either Marcus Aurelius or Aurelian. It was vainly besieged in 451 by Attila, and by Odoacer in 471, but Clovis took it in 498 and held there in 511 the first ecclesiastical council assembled in France. It then became the capital of a separate kingdom, but was united with that of Paris in 613. In the 10th century the town was given in fief to the counts of Paris, who in 987 ousted the Carolingians. Philip, fifth son of Philip VI., was the first duke of Orleans. After the assassination of his successor Louis the people of Orleans sided with the Armagnacs, and thus brought upon themselves the attacks of the Burgundians and the English. Joan of Arc relieved the city in 1429. In 1562 it became the headquarters of Louis I. of Bourbon, prince of Condé, the Protestant commander-in-chief. In 1563 Francis, duke of Guise, laid siege to it, but was assassinated. Orleans was surrendered to the king, who raised the fortifications. It was held by the Huguenots from 1567 to 1568. The St. Bartholomew massacre there in 1572 lasted a week. It

was given as a *lieu de sûreté* to the League under Henry III., but surrendered to Henry IV. in person in 1594. The town is surrounded by boulevards, and is connected with the suburb of St. Marceau by an 18th century stone bridge of nine arches. The river is canalized on the right, and serves as a continuation of the Orleans Canal.

In the Place du Martroi is a statue of Joan of Arc. A simple cross marks the site, on the left bank of the Loire, of the *Fort des Tourelles*, captured by Joan of Arc in 1429. The cathedral of Ste. Croix, begun in 1287, was burned by the Huguenots in 1567 before its completion. Henry IV., in 1601, laid the first stone, the building of which continued until 1829. The church of St. Aignan mutilated by the Protestants consists of a transept and choir of the second half of the 15th century; it contains in a gilded and carved wooden shrine the remains of its patron saint. St. Euvverte, dedicated to one of the oldest bishops of Orleans (d. 391), is an early Gothic building dating from the 13th, completely restored in the 15th century. The church of St. Paul (15th and 16th century) has an isolated tower, and Notre-Dame de Recouvrance was rebuilt between 1517 and 1519 in the Renaissance style and dedicated to the memory of the deliverance of the city. The *hôtel de ville*, built under Francis I. and Henry II. and restored in the 19th century, was formerly the residence of the governors of Orléans, and was occupied by the kings and queens of France from Francis II. to Henry IV. The public library comprises among its manuscripts a number dating from the 7th century. The *salle des fêtes*, formerly the corn-market, stands within a vast cloister formed by 15th-century arcades, once belonging to the old cemetery. Among old houses are that of Agnes Sorel (15th and 16th centuries), containing objects relating to Joan of Arc, that of Francis I., of the first half of the 16th century, that occupied by Joan of Arc during the siege of 1429, and that known as the house of Diane de Poitiers (16th century), which contains the historical museum. The anniversary of the raising of the siege in 1429 by Joan of Arc is celebrated yearly. Orleans is the seat of a bishopric under the archbishop of Paris, a prefect, a court of appeal, and a court of assizes and headquarters of the V. army corps.

The more important industries are the manufacture of tobacco (by the state), blankets, pins, vinegar, machinery, agricultural implements, hosiery, tools and ironware, and the preparation of preserved vegetables. Wine, wool, grain and live stock are commercial staples, round which there are important nurseries.

ORLEANS CAMPAIGN OF 1870

Orleans was the pivot of the second phase of the Franco-German War, called the "People's War," when the new armies began their attempt to relieve Paris. After the fall of the empire, the Government of National Defence, deciding to remain in Paris, delegated three of its members, Crémieux, Glais-Bizoin and Fourichon, proceeded to the provinces to hasten the levy of troops. General de la Motte-Rouge was appointed to command the "territorial division of Tours." From many scattered units, most of them ill equipped, he formed the XV. corps. The Germans, however, were only able to spare the I. Bavarian corps and three cavalry divisions (2nd, 4th and 6th), the investment of Paris and Metz occupying their forces. On October 5 the German 4th cavalry division was forced to retire before a French detachment under Reyau. Von der Tann, commanding the I. Bavarian corps, was reinforced by the 22nd infantry and 2nd and 6th cavalry divisions. Reyau was attacked at Artenay on October 10 and was thrown back in disorder, Orleans being captured in the evening of the following day, whereupon the French fell back on Sologne. Meanwhile Gambetta, Minister of Defence, arriving at Tours by balloon from Paris, assumed virtual control on Oct. 11, being aided by de Freycinet, the Deputy Minister. He forthwith appointed General d'Aurelle de Paladines in place of La Motte-Rouge. The change gave impetus to the training and re-organization of the troops and by October 23 a further force was concentrated at Blois, which formed the XVI. corps.

After the withdrawal of the 22nd infantry division from Von der Tann, its commander, General Wittich advanced to Châteaudun which he captured on October 18. He now made for Chartres,

which also fell into his hands. The resistance he had met with led the Germans to believe in the existence of a new army as the French who defended them did not belong to either the XV. or XVI. corps. The "Army of the West," as they called this phantom force, originated from the defenders of Chateaudun and Chartres and was never formed into a fighting unit.

The French command decided to advance against the Germans massed around Orleans whom it mistakenly estimated at 60,000 men, whereas they barely numbered 26,000. As a mystification empty trains were run to Le Mans to confirm the Germans in their belief in the existence of an army west of Paris. But the contemplated offensive was postponed owing to bad weather and the discouraging news of Bazaine's capitulation with his 150,000 troops at Metz.

Moltke directed the II. Army, released from the siege of Metz, towards Bourges, sending it by Chalon-sur-Saône, while he formed a new detachment under the Grand Duke of Mecklenburg-Schwerin consisting of the I. Bavarian army corps, 17th and 22nd infantry and 2nd, 3rd and 4th cavalry divisions. This force was to concentrate between Chateaudun and Chartres.

The French advance began auspiciously, the German cavalry retiring before them on November 8. The following day, moving across the country in battle formation, the French attacked Von der Tann who was drawn up at Coulmiers, forcing him to retreat unpursued. The 2,500 Germans guarding Orleans thereupon evacuated the city and joined Von der Tann at Angerville.

Meanwhile, the Grand Duke with his detachment had not encountered any strong hostile forces and by November 19 Moltke began to believe that after all the French must still be concentrated in the neighbourhood of Orleans to the number of 150,000 men. He fully realised the gravity of the situation—the expected sortie from Paris coupled with the advance of the Army of the Loire. The king of Prussia was prepared, as he said to Waldersee at Versailles, to raise the siege of Paris if the II. Army sustained a defeat.

The members of the Government in Paris urged Trochu, the Governor, to attempt a sortie towards Fontainebleau, thereby joining hands with the army of the Loire. The sortie was to begin November 29, but the balloon carrying the message to Gambetta alighted in Norway, which caused a delay. D'Aurelle still remained on the defensive near Orleans though pressed by Freycinet to advance.

The battle of Beaugency took place on November 28, General Crouzat's XX. corps attacking the German X. corps between Turanville and Beaugency, while Billot's XVIII. corps pushed back the Prussian left. In the afternoon Crouzat was himself assailed in the rear from Pithiviers by a cavalry and infantry division, Billot also falling back. After further operations in which the French sustained defeat, the Germans moved towards Orleans on December 3 in a scythe-like line of battle 40 miles long. Serious resistance was only encountered at Chilleurs. Orleans was entered on Dec. 4th. (See further FRANCO-GERMAN WAR.)

ORLEY, BERNARD VAN (c. 1490–1540), Flemish painter, son of the painter, Valentyn van Orley, was born at Brussels about 1490. The date of his birth is estimated from his portrait by Dürer painted in 1521, now in the Dresden gallery. It represents an attractive and intelligent man of about 30. In 1515 he was employed by Margaret of Austria, then regent of the Netherlands, and three years later he was appointed her court painter. He died in 1540. His earliest important work is the altarpiece of S.S. Thomas and Matthias, of which the centre-piece is at Vienna and the wings at Brussels painted about 1512. The style of the picture seems to be inspired by the school of Autrey. From 1516–22 Bernard van Orley imitated Mabuse—to this period belongs the "Madonna" in the Wied Collection and the "Holy Family" in the Louvre. In the "Holy Family" in the Prado (1522) the influence of Mabuse has given way to that of Raphael. In the altarpiece representing the "Patience of Job," (1521) now in the Brussels gallery, we find the two influences combined. The artist had many opportunities to see designs by Raphael whose tapestry cartoons were in Brussels for many years. Important works of his later period are the "Hanneton

Family" altarpiece in the Brussels gallery; the "Last Judgment" (1525) at Antwerp; and the "Crucifixion" at Rotterdam. He painted several portraits; the one of Dr. Georg Zelk in the Brussels gallery is the only one which is signed and dated (1519). Van Orley was a designer of tapestries; for instance, "Hunts of Maximilian," in the Louvre, and "Victory of Pavia" at Naples.

See M. Friedlander, *Annual of Prussian Museums* (1908-09).

ORLOV, ALEXIS FEDOROVICH, PRINCE (1787-1862), Russian statesman, grandson of Count Theodore Grigorievich Orlov, took part in all the Napoleonic wars from 1805 to the capture of Paris. For his services as commander of the cavalry regiment of the Life Guards on the occasion of the rebellion of 1825 he was created a count, and in the Turkish War of 1828-29 rose to the rank of lieutenant-general. Orlov was the Russian plenipotentiary at the Peace of Adrianople, and in 1833 was appointed Russian ambassador at Constantinople, holding at the same time the post of commander-in-chief of the Black Sea Fleet. He was one of the most trusted agents of Nicholas I., whom in 1837 he accompanied on his foreign tour. In 1854 he was sent to Vienna to bring Austria over to the side of Russia, but without success. In 1856 he was one of the plenipotentiaries who concluded the Peace of Paris, and was rewarded with the dignity of prince, and the presidency of the imperial council of state and of the council of ministers. In 1857 he presided over the commission formed to consider the question of the emancipation of the serfs, to which he was altogether hostile.

ORLOV, ALEXIS GRIGORIEVICH, COUNT (1737-1808), brother of Gregory, Count Orlov (q.v.), was remarkable for his athletic strength and dexterity. In the revolution of 1762 he played an even more important part than his brother. He conveyed Peter III. to the château of Ropsha and is said to have murdered him there. In 1770 he was appointed commander-in-chief of the fleet sent against the Turks, whose far superior navy he annihilated at Cheshme (July 5, 1770), a victory which led to the conquest of the Greek archipelago. He devoted himself to horse-breeding, and produced the finest race of horses then known by crossing Arab and Frisian, and Arab and English studs. In the war with Napoleon during 1806-07 Orlov commanded the militia of the fifth district, which was placed on a war footing almost entirely at his own expense. He left an estate worth five millions of roubles and 30,000 serfs.

See article, "The Associates of Catherine II.," No. 2, in *Russkaya Starina* (Rus.) (St. Petersburg, 1873).

ORLOV, GREGORY (GRIGORII) GRIGORIEVICH, COUNT (1734-1783), Russian statesman, was the son of Gregory Orlov, governor of Great Novgorod. While serving in the capital as an artillery officer he caught the fancy of Catherine II., and was the leader of the conspiracy which resulted in the dethronement and death of Peter III. (1762). Catherine made him a count and adjutant-general, director-general of engineers and general-in-chief. At one time the empress thought of marrying her favourite, but the plan was frustrated by Nikita Panin. Orlov's influence became paramount after the discovery of the Khitrovo plot to murder the whole Orlov family. Gregory Orlov entered with enthusiasm, both from patriotic and from economic motives, into the question of the improvement of the condition of the serfs and their partial emancipation. He was their advocate in the great commission of 1767. One of the earliest propagandists of the Slavophil idea of the emancipation of the Christians from the Turkish yoke, he was sent as first Russian plenipotentiary to the peace-congress of Focsani (1771), but he failed in his mission, owing partly to the obstinacy of the Turks, and partly (according to Panin) to his own insolence. He was superseded in the empress's favour by Vasil'chikov.

See A. P. Barsukov, *Narratives from Russian History in the 18th Century* (Rus.) (St. Petersburg, 1885).

ORLOV, NIKOLAI ALEKSYEYEVICH, PRINCE (1827-1885), entered the diplomatic service, and represented Russia successively at Brussels (1860-1870), Paris (1870-1882) and Berlin (1882-1885). As a publicist he stood in the forefront of reform. His articles on corporal punishment, which appeared in *Russkaya Starina* in 1881, brought about its abolition. He also

advocated tolerance towards the dissenters. He wrote a *Sketch of Three Weeks' Campaign in 1806* (St. Petersburg, 1856).

ORLOV, THEODORE (FEDOR) GRIGORIEVICH, COUNT (1741-1790), Russian general, participated with his elder brothers, Gregory (q.v.) and Alexis (q.v.), in the *coup d'état* of 1762, after which he was appointed chief procurator of the senate. His naval exploits in the first Turkish War were commemorated by a triumphal column, crowned with naval trophies, erected at Tsarskoe Selo. He retired in 1775.

ORM or **ORMIN**, the author of an English book, called by himself *Ormulum* ("because Orm made it"), consisting of metrical homilies on the gospels read at mass. The unique ms., now in the Bodleian library, is certainly Orm's autograph, and contains abundant corrections by his own hand. On palaeographical grounds it is referred to about A.D. 1200, and this date is supported by the linguistic evidence. The dialect is midland, with some northern features. The orthography of the *Ormulum* is the most valuable existing source of information on the development of sound in Middle English. On the whole, the language of the *Ormulum* seems to point to north Lincolnshire as the author's native district. There are reasons for thinking that Orm and the Walter to whom it is dedicated may have been inmates of the Augustinian priory of Elsham, near the Humber, which was established about the middle of the 12th century by Walter de Amundeville.

The *Ormulum* is written in lines alternately of eight and seven syllables, without either rhyme or alliteration. The rhythm may be seen from the opening couplet:

Nu, broðerr Wallter, broðerr min
Afterr þe flashess kinde.

The extant portion of the work, not including the dedication and introduction, consists of about 20,000 lines. But the table of contents refers to 242 homilies, of which only 31 are preserved; and as the dedication implies that the book had been completed, and that it included homilies on the gospels for nearly all the year, it would seem that the huge fragment which we possess is not much more than one-eighth of this extraordinary monument of pious industry.

The *Ormulum* was edited for the first time by R. M. White in 1852. A revised edition, by R. Holt, was published in 1878. Many important corrections of the text were given by E. Kölbing in the first volume of *Englische Studien*. With reference to the three forms of the letter *g*, see A. S. Napier, *Notes on the Orthography of the Ormulum*, printed with *A History of the Holy Rood Tree* (Early English Text Society, 1894).

ORME, ROBERT (1728-1801), English historian of India, was born at Anjengo on the Malabar coast on Dec. 25, 1728, the son of a surgeon in the Company's service. Educated at Harrow, he was appointed to a writership in Bengal in 1743. He returned to England in 1753 in the same ship with Clive, with whom he formed a close friendship. From 1754 to 1758 he was a member of council at Madras. His great work was *A History of the Military Transactions of the British Nation in Indostan from 1745* (3 vols., 1763-78). This was followed by a volume of *Historical Fragments* (1781), dealing with an earlier period. In 1769 he was appointed historiographer to the East India Company. He died at Ealing on Jan. 13, 1801. His valuable collections of mss. are in the India Office library. Not a few of the most picturesque passages in Macaulay's Essay on Clive are borrowed from Orme.

ORMER, the name given in the Channel Isles and on the coasts of France to *Haliotis tuberculata*, a gastropod mollusc. It has a shell with a widely open aperture, more or less resembling a human ear in outline. The animal lives beneath stones and rocks close to the low-water mark of spring tides. For a sedentary organism it can move remarkably fast, and observers have commented on its strength and agility. The ormer is an article of human food in the Channel Isles and elsewhere (see ABALONE). The States of Guernsey introduced legislation in 1926 for its protection.

See T. A. Stephenson (1924), *Journ. Marine Biol. Assocn.*, xiii. No. 2, p. 480.

ORMEROD, ELEANOR A. (1828-1901), English entomologist, the daughter of George Ormerod, F.R.S., author of *The History of Cheshire*, was born at Sedbury Park, Gloucestershire,

on May 11, 1828. The opportunity afforded for entomological study by the large estate upon which she grew up and the interest she took in agriculture soon made her an authority upon this subject. In 1868, she aided the Royal Horticultural Society in forming a collection of insect pests of the farm for practical purposes, and was awarded the Flora medal of the society. In 1877 she issued a pamphlet, *Notes for Observations on Injurious Insects*, which was distributed among persons interested in this line of inquiry, who readily sent in the results of their researches, and was thus the beginning of the well-known *Annual Series of Reports on Injurious Insects and Farm Pests*. In 1881 Miss Ormerod published a special report upon the "turnip-ily," and she was consulting entomologist to the Royal Agricultural Society from 1882 to 1892. For several years she was lecturer on scientific entomology at the Royal Agricultural college, Cirencester. Eleanor Ormerod died at St. Albans on July 19, 1901.

Her works include: *The Cobden Journals*; *Manual of Injurious Insects*; *Handbook of Insects Injurious to Orchard and Bush Fruits*; and her *Autobiography and Correspondence* (1904). See also: *Canadian Entomologist*, vol. 33, 1901; *Royal Agric. Soc. Journ.* vol. 62, 1901.

ORMOC, a municipality (with administration centre and 16 barrios or districts), of the island and province of Leyte, Philippine islands, on the west coast about 35 m. S.W. of Tacloban, the provincial capital. Pop. (1918), 38,174, of whom 20 were whites. Ormoc is in a great abaca-producing region and is open to coast-wise trade, its commerce being especially with Cebu. In 1918, it had 343 household industry establishments, with outputs valued at 96,400 pesos. Of its 12 schools, 11 were public. The language spoken is a dialect of Bisayan.

ORMOLU, an alloy of copper and zinc, sometimes with an addition of tin. The name is also used to describe gilded brass or copper. The tint of ormolu approximates closely to that of gold; it is heightened by a wash of gold lacquer, by immersion in dilute sulphuric acid or by burnishing. The principal use of ormolu is for the mountings of furniture. With it the great French *ébénistes* of the 18th century obtained results which, in the most finished examples, are almost as fine as jewellers' work. The mounts were usually cast and then chiselled with extraordinary skill and delicacy. (See also **SILVERSMITHS' AND GOLDSMITHS' WORK**.)

ORMOND, a town of Volusia county, Florida, U.S.A., on the Halifax river (an arm of the Atlantic ocean extending along the east coast for 25 m.) just N. of Daytona Beach. It is on Federal highway 1 (which between Ormond and Jacksonville runs over the old King's road, built by the English 1763-83) and is served by the Florida East Coast railway. The resident population was 1,852 in 1925 (State census), of whom 1,052 were negroes. It is a winter resort with large hotels and beautiful residences. The hard, compact Ormond-Daytona beach (200 ft. wide and 20 m. long) is the scene of many automobile races and speed tests. Ormond was incorporated in 1880.

ORMONDE, EARL AND MARQUESS OF, titles still held by the famous Irish family of Butler (*q.v.*), the name being taken from a district now part of co. Tipperary. In 1328 James Butler (*c.* 1305-37), a son of Edmund Butler, was created earl of Ormonde, one reason for his elevation being that his wife Eleanor Bohun was a granddaughter of Edward I. His son James, the 2nd earl (1331-82), was four times governor of Ireland; the latter's grandson James, the 4th earl (*d.* 1452), held the same position several times, and won repute not only as a soldier, but as a scholar. His son, James, the 5th earl (1420-*c.* 1461), was created an English peer as earl of Wiltshire in 1449. He was lord high treasurer of England in 1455 and again in 1459, and was taken prisoner by the Yorkists after the battle of Towton in 1461. He and his two brothers were then attainted, and he died without issue, the exact date of his death being unknown. The attainder was repealed in the Irish parliament in 1476, when his brother Sir John Butler (*c.* 1422-78), who had been pardoned by Edward IV. a few years previously, became 6th earl of Ormonde. John, who was a fine linguist, served Edward IV. as ambassador to many European princes. His brother Thomas, the 7th earl (*c.* 1424-1515), a courtier and an English baron under Richard III. and Henry VII., was ambassador to France and to

Burgundy; he left no sons, and on his death in August 1515 his earldom reverted to the crown.

Margaret, a daughter of this earl, married Sir William Boleyn of Blickling, and their son Sir Thomas Boleyn (1477-1539) was created earl of Ormonde and of Wiltshire in 1529. He arranged the preliminaries for the Field of the Cloth of Gold; he was lord privy seal from 1530 to 1536, and served the king in many other ways. He was the father of Anne Boleyn.

Meanwhile in 1515 the title of earl of Ormonde had been assumed by Sir Piers Butler (*c.* 1467-1539), a cousin of the 7th earl. He was lord deputy, and later lord treasurer of Ireland, and in 1528 he surrendered his claim to the earldom of Ormonde and was created earl of Ossory. Then in 1538 he was made earl of Ormonde, this being a new creation; however, he counts as the 8th earl of the Butler family. In 1550 his second son Richard (*d.* 1571) was created Viscount Mountgarret, a title still held by the Butlers. The 8th earl's son, James, the 9th earl (*c.* 1490-1546), lord high treasurer of Ireland, was created Viscount Thurles in 1536. In 1544 an act of parliament confirmed him in the possession of his earldom, which, for practical purposes, was declared to be the creation of 1328, and not of 1538.

Thomas, the 10th earl (1532-1614), a son of the 9th earl, was lord high treasurer of Ireland. He was a Protestant, and threw his great influence on the side of the English queen and her ministers in their efforts to crush the Irish rebels, but he was perhaps more anxious to prosecute a fierce feud with his hereditary foe, the earl of Desmond, this struggle between the two factions desolating Munster for many years. His successor was his nephew Walter (1569-1633), who was imprisoned from 1617 to 1625 for refusing to surrender the Ormonde estates to his cousin Elizabeth, the wife of Sir R. Preston and the only daughter of the 10th earl. He was deprived of the palatine rights in the county of Tipperary, which had belonged to his ancestors for 400 years, but he recovered many of the family estates after his release from prison in 1625.

Walter's grandson, James, the 12th earl, was created marquess of Ormonde in 1642 and duke of Ormonde in 1661 (*see below*); his son was Thomas Butler, earl of Ossory (*q.v.*), and his grandson was James Butler, 2nd duke of Ormonde (*see below*).

When Charles Butler, earl of Arran (1671-1758), the brother and successor of the 2nd duke, died in December 1758, the dukedom and marquessate became extinct, but the earldom was claimed by a kinsman, John Butler (*d.* 1766). John's cousin, Walter (1703-83), inherited this claim, and Walter's son, John (1740-95), obtained a confirmation of it from the Irish House of Lords in 1791. He is reckoned as the 17th earl. His son Walter, the 18th earl (1770-1820), was created marquess of Ormonde in 1816, a title which became extinct on his death, but was revived in favour of his brother James (1774-1838) in 1825, and was retained by his descendants.

See J. H. Round on "The Earldoms of Ormonde" in *Joseph Foster's Collectanea Genealogica* (1881-83).

ORMONDE, JAMES BUTLER, 1ST DUKE OF (1610-1688), Irish statesman and soldier, eldest son of Thomas Butler, Viscount Thurles, and of Elizabeth, daughter of Sir John Poyntz, and grandson of Walter, 11th earl of Ormonde (*see above*), was born in London on Oct. 19, 1610. On the death of his father by drowning in 1619, the boy was made a royal ward by James I., removed from his Roman Catholic tutor, and placed in the household of Abbot, archbishop of Canterbury, with whom he stayed until 1625, residing afterwards in Ireland with his grandfather. In 1629, by his marriage with his cousin, the Lady Elizabeth Preston, daughter and heiress of Richard, earl of Desmond, he put an end to the long-standing quarrel between the families and united their estates. He succeeded his grandfather in 1632.

His active career began in 1633 with the arrival of Strafford, whom he supported consistently. In 1640 during Strafford's absence he was made commander-in-chief of the forces, and in August he was appointed lieutenant-general. On the outbreak of the rebellion in 1641 he rendered great service in the expedition to Naas, and in the march into the Pale in 1642, though much hampered by the lords justices, who were jealous of his power and

recalled him after he had succeeded in relieving Drogheda. On April 15, 1642, he gained the battle of Kiltrush against Lord Mountgarret. He was created a marquess, and lieutenant-general with a commission direct from the king. He won the battle of New Ross (March 18, 1643) against Thomas Preston, afterwards Viscount Tara. In September, the civil war in England having meanwhile broken out, Ormonde, in view of the successes of the rebels and the uncertain loyalty of the Scots in Ulster, concluded (Sept. 15) with the latter, in opposition to the lords justices, the "cessation" by which the greater part of Ireland was given up into the hands of the Catholic Confederation, leaving only small districts on the east coast and round Cork, together with certain fortresses in the north and west then actually in their possession, to the English commanders. He subsequently, by the king's orders, despatched a body of troops into England (shortly afterwards routed by Fairfax at Nantwich) and was appointed in January 1644 lord lieutenant, with orders to keep the Scotch army occupied.

In the midst of all the plots and struggles of Scots, Old Irish, Catholic Irish of English race, and Protestants, and in spite of the intrigues of the pope's nuncio, as well as of attempts by the parliament's commissioners to ruin his power, Ormonde showed the greatest firmness and ability. He assisted Antrim in his unsuccessful expedition into Scotland. On March 28, 1646, he concluded a treaty with the Irish which granted religious concessions and removed various grievances. Meanwhile the difficulties of his position had been greatly increased by Glamorgan's treaty (Aug. 25, 1645) with the Roman Catholics, and it became clear that he could not long hope to hold Dublin against the Irish rebels. He thereupon applied to the English parliament, signed a treaty on June 19, 1647, gave Dublin into their hands upon terms, and sailed for England at the beginning of August. He attended Charles during August and October at Hampton Court, but subsequently, in March 1648, in order to avoid arrest by the parliament, he joined the queen and prince of Wales at Paris. In September of the same year, he returned to Ireland to endeavour to unite all parties for the king. On Jan. 17, 1649 he concluded a peace with the rebels on the basis of the free exercise of their religion; on the execution of the king he proclaimed Charles II. and was created a knight of the Garter in September. On the conquest of the island by Cromwell he returned to France in December 1650.

Ormonde accompanied Charles to Aix and Cologne when expelled from France by Mazarin's treaty with Cromwell in 1655. In 1658 he went disguised, and at great risk, upon a secret mission into England. He attended the king at Fuenterrabia in 1659 and had an interview with Mazarin; and was actively engaged in the secret transactions immediately preceding the Restoration. On the return of the king he was at once appointed a commissioner for the treasury and the navy, and received other important places, together with an English peerage, and (1661) the dukedom of Ormonde in the Irish peerage. On Nov. 4, 1661 he once more received the lord lieutenantship of Ireland. The act of Explanation (on land settlement) was passed through the Irish parliament by Ormonde in 1665. His heart was in his government, and he vehemently opposed the bill prohibiting the importation of Irish cattle which struck so fatal a blow at Irish trade; and retaliated by prohibiting the import into Ireland of Scottish commodities, and obtained leave to trade with foreign countries. He encouraged Irish manufactures and learning to the utmost, and it was to his efforts that the Irish college of Physicians owes its incorporation.

Faced by the loss of royal favour, Ormonde declared "However ill I may stand at court I am resolved to lye well in the chronicle." His irresponsible government was no doubt open to criticism. He had billeted soldiers on civilians, and had executed martial law. The impeachment, however, threatened by Buckingham in 1667 and 1668 fell through. Nevertheless by 1669 constant importunity had had its usual effect upon Charles, and in March Ormonde was dismissed. That year, he was however, elected chancellor of Oxford university. On Dec. 6, 1670 an attempt was made to assassinate the duke by Thomas Blood. He was dragged out of his coach, and taken on horseback along Piccadilly with the intention of hanging him at Tyburn. Ormonde, however, succeeded in overcoming the horseman to whom he was bound, and his

servants coming up, he escaped. The king pardoned Blood, and even treated him with favour after his apprehension while endeavouring to steal the crown jewels.

In 1671 Ormonde successfully opposed Richard Talbot's attempt to upset the act of Settlement. In 1667 he was restored to favour and reappointed to the lord lieutenantancy. On his arrival in Ireland he placed the revenue and the army upon a proper footing. In 1682 Charles summoned Ormonde to court. On Nov. 9, 1683 an English dukedom was conferred upon him, and in June 1684 he returned to Ireland; but he was recalled in October in consequence of fresh intrigues. Before, however, he could give up his government to Rochester, Charles II. died; and Ormonde's last act as lord lieutenant was to proclaim James II. in Dublin. Subsequently he lived at Cornbury in Oxfordshire. He refused the king his support over the Indulgence but James held him in respect. He died on July 21, 1688, and was buried in Westminster abbey.

ORMONDE, JAMES BUTLER, 2ND DUKE OF (1665-1745), Irish statesman and soldier, son of Thomas, earl of Ossory, and grandson of the 1st duke, was born in Dublin on April 29, 1665, and was educated in France and afterwards at Christ Church, Oxford. He commanded a regiment of horse in William's army at the battle of the Boyne. In 1691 he served on the continent under William, and after the accession of Anne he was placed in command of the land forces co-operating with Sir George Rooke in Spain. He succeeded Rochester as viceroy of Ireland in 1703, a post which he held till 1707.

On the dismissal of the duke of Marlborough in 1711, Ormonde was appointed captain-general in his place, and allowed himself to be made the tool of the Tory ministry, whose policy was to carry on the war in the Netherlands while giving secret orders to Ormonde to take no active part in supporting their allies under Prince Eugene. Though he had supported the revolution of 1688, Ormonde was traditionally a Tory, and Lord Bolingbroke was his political leader. During the last years of Queen Anne he almost certainly had Jacobite leanings, and corresponded with the duke of Berwick. He joined Bolingbroke and Oxford, however, in signing the proclamation of King George I., by whom he was nevertheless deprived of the captain-generalship. In June 1715 he was impeached, and fled to France, where he for some time resided with Bolingbroke, and in 1716 his immense estates were confiscated to the crown by act of parliament, though by a subsequent act his brother, Charles Butler, earl of Arran, was enabled to repurchase them. After taking part in the Jacobite invasion in 1715, Ormonde settled in Spain, where he was in favour at court and enjoyed a pension from the crown. He died on Nov. 16, 1745, and was buried in Westminster abbey.

See Thomas Carte, *Hist. of the Life of James, Duke of Ormonde* (6 vols., Oxford, 1851), which contains much information respecting the life of the second duke; Earl Stanhope, *Hist. of England, comprising the Reign of Queen Anne until the Peace of Utrecht* (1870); F. W. Wyon, *Hist. of Great Britain during the Reign of Queen Anne* (2 vols., 1876); William Coxe, *Memoirs of Marlborough* (3 vols., new edition, 1847).

ORMSKIRK, a market town, urban district, Ormskirk parliamentary division, Lancashire, England, 11 m. N.E. of Liverpool by the L.M.S. railway. Pop. (1921) 7,405. The name and church existed in the time of Richard I., when the priory of Burscough was founded, whose prior obtained from Edward I. a royal char-

ORNAMENTAL DETAIL IN ARCHITECTURE

1. Taj Mahal, Agra, India; alabaster screen inlaid with precious stones enclosing the tombs of Shah Jahan and his empress, Mumtaz Mahal, for whom Jahan built (c. A.D. 1631) the Taj Mahal. 2. Models of ornament for the Telephone Building, Washington, D.C., an illustration of modern vertical design. 3. Sarcophagus from the tomb of Caecilia Metella, Augustan era; now in the court of the Farnese Palace, Rome. 4. Interior of *La Sainte-Chapelle*, Paris, built 1246-58 by Louis IX. (Saint Louis). (See *Gothic Architecture*, Plate I.). 5. Pillars of the Confucius Temple at Chü Fu, Shantung Province (Yuan dynasty, 1280-1368), with the Chinese dragon and other forms in high relief. 6. Entrance to the Transportation Building,

Chicago World's Fair, 1893. Louis Sullivan, architect. 7. The Alhambra, Granada, Spain, 13th and 14th centuries; *mihrab* or prayer niche in the private mosque, adorned with lace-like carvings in stone of Arabic inscriptions, delicate arabesques, and geometric designs; and with horseshoe and lobed arch forms and coloured tiles, characteristic of Moorish art in Spain. 8. St. Mark's, Venice. Two isolated marble columns, near the arcades of the south side, brought in the 18th century, from St. Jean d'Acre, Palestine, by Tiepolo. 5th century. Hellenistic style. 9. Detail of a marble altar, by Benedetto da Rovezzano (1476-1556), in the Church of the Holy Trinity (Santa Trinità), Florence

ter for a market at the manor of Ormskirk. On the dissolution of the monasteries the manor was granted to the earl of Derby.

The church of SS. Peter and Paul is a spacious building in various styles, principally Perpendicular. It possesses two western towers, the one square and embattled, the other octagonal and bearing a short spire. There are various Norman fragments, including a fine early window in the chancel. To the south-east of the church, is the Derby chapel, the property of the earls of Derby, whose vault is contained within. A grammar school was founded about 1614. Rope and twine making, iron-founding and brewing are carried on. The town has long been famous for its gingerbread, and is the centre of an important potato-growing district.

ORNAMENT, ARCHITECTURAL. In decorative art ornament is that element which supplies beauty in detail by the addition of anything which gives an aesthetic pleasure.

In all beginnings of primitive culture man shows a marked tendency to decorate his utensils, fabrics and ceramics with some sort of ornament. These early designs, consisting largely of overlapping stitches, lines, triangles, dots, zigzags, spirals and crosses, are purely linear even when colour is used to heighten the effectiveness of the designs. All have very similar motifs, and crude as this early ornament is, it still persists as a basis for much of the so-called abstract ornament in use to-day. These forms may be due to a lack of handicraft ability. For whether or not these early designs in the cultural growth of a people are representative of natural objects—the scales of fishes, the feather patterns of birds, plants and things of common everyday experience—the technical difficulties in the way of making free designs in the art of basketry, weaving or pottery tend to make the designs geometric in character. It is also possible that such designs may have lost their pure form through the tendency to standardize that comes of the endless copying by craftsmen of different degrees of skill. It is evident to the casual observer that more culture is necessary to produce free designs than is the case with the use and development of geometric art, because of the greater technical difficulties, and that naturalistic ornament while deriving its sources from nature tends to become abstract owing to the conventionalization of the motifs employed. At the same time, the abstract ornament tends to revert back to the natural as it takes on complexity.

The theory of the evolution of the natural to the geometric, while not accepted by all the authorities on primitive art, has, if the psychology of the designer or artist is taken into consideration, much to commend it. A conventionalization of design takes place without fail in any art due to the very great difficulty in inventing new motifs and to the natural inclination of the average craftsman to be content with imitation, and finally the design motifs conventionalize in primitive art because of a special symbolic meaning associated with the religion and customs of the tribe and so become difficult to change. In fact, it is this very conventionalization of ornament for all uses, for whatever reason, that formalizes into the standards which we call styles. Historically, these styles mark the evolution of ornamental design and are definitely related to the customs and civilization of the people who produced them. Furthermore, a style is known not by its beginnings but by its decadence, and is named not by its creator but by historians.

Influences.—All ornament is affected very strongly by the philosophy and thought of the time in which it is designed. It is interesting in that respect that primitive art fundamentally shows a clear desire on the part of the group design to express a complete and definite sense of fulfilment, a straightforward expression of a thing or things of the present only. Each unit or repeat in primitive design is wholly complete in itself and only establishes its relation as part of the whole through a very simple rhythm of the necessary repetition. And while it is true that primitive design may be very elaborate it is rarely complex but rather indicates a desire for richness. The slight degree of complexity that is gained is by the use of different primary colours added to the same linear motif or by increasing the number of rows of different patterns, each simple in itself.

Historically, all ornament has passed through this primitive

stage to a period of larger viewpoint, when the artist becomes more interested in a sense of a lack of completeness and the design motifs gather or lose a quality of freshness and time appreciation in ratio to the existence or lack of that sense. For example, architectural ornament of the nature of the chevron, the dentil, the egg and dart, and the bead and reel, are primitive forms, each complete in itself, in which as a repetition the timebeat, the interval and the rhythm are uniform and are therefore rigid and mechanical, easily comprehended, and lacking in time appreciation; whereas such motifs as the arabesque, the vine and flamboyant tracery are without that limited sense of completeness, and in so far as the rhythm interacts with the interval and against the timebeat, they lose the quality of the mechanical and become more enduring in interest. (See GREEK ARCHITECTURE and ROMAN ARCHITECTURE.)

Appreciation of any art presupposes sufficient leisure for its enjoyment, so that in designing ornament it would seem necessary to consider a time element as well as whether or not it is proper both as to position and technical fitness. This time element engenders space elements by means of which appreciation must be led from one detail to another, and as all ornament is static in nature it should include, therefore, within the design a stimulus toward, and an opportunity for, fresh viewpoints, and so encourage a more continuous period of appreciation. It is the thought or emotion behind the ornament that lives, while its surface aspects, because of the always evident desire to change, must become out-moded in time.

As all ornament is designed to form a pattern, whether it is composed of repeat units or as a general composition, the rhythms and interrelations of the structural background on which the ornamental detail is composed are as important as the primary functions of the design itself. It is this structure which gives coherence, unity and the sense of space and time to the ornamental design. In the consideration that all ornament must bear the repetition of being seen not only once but many times, the longer the element of time appreciation that is consciously set up within the design the more enduring in interest it will become. Yet it must not be so extended and involved as to be incomprehensible upon close inspection. It seems evident that a design whose rhythmic quality is purely mechanical, even though colour is used to superimpose an additional rhythm, must fail in possessing a sustained interest. The design motif fulfills its sole purpose when it creates a longer time interest in the object ornamented through its added beauty. This growth in time interest in appreciation of ornament is closely allied with the same growth in the complexity of the manners and philosophy of the people who are creating or modifying the ornamental design. A very clear conception of this interrelation of thought and design can be obtained from the study of the differences in growth of oriental and occidental ornamental motifs; the differences remain even when there are signs of influence of one thought upon the other, or through the gradual change from simplicity to complexity which is evident in the difference between the early ornament and thought of the Gothic period (see GOTHIC ARCHITECTURE) and its later development. And while it is evident that the technical ability of the craftsman has contributed a great deal as to whether the design motifs are simple or complex—for instance, compare the wood carving of the Jacobean craftsmen with the work of Grinling Gibbons and the later English wood carvers—it would seem that the technical skill had but kept pace with the civilization with which it is associated, for as a civilization advances it is apparent that ornamental design becomes more complex rather than less, that the design motifs become fuller in nature, richer in detail and more nearly perfect in technique.

Materials.—It is generally thought that the treatment of ornament is definitely limited by and related to processes and materials, although throughout the history of ornament motifs and technique have been freely translated from one material to another without loss of harmony. The architectural motifs, for example, both structural and ornamental have always been used as pure ornament in the furniture and accessories of the same style. Ornamental design in which the design is not inherently manufactured

can be considered apart from the material it embellishes. The material of which the structure is built limits only the coarseness or fineness of the technique of the detail employed, although, for example, most stones or woods may be carved crudely or delicately according to the effect desired by the designer, the scale desired, or the technical ability of the craftsman. This being so, the actual design motif may be thought of for its effect as such and is only limited in its possibilities by the thought and ability of the creator who might use it to obtain a difference in texture as a help in making a transition between two materials, or to create the pattern interest that comes from employing detail. In its relations to the material employed, it may be either structurally inherent or applied. Structural ornament is either integral, that is part of the structure as in weaving or where a structural member is changed for added grace, or as in veneers where the inherent pattern of wood or marble is used; whereas applied ornament may have little or no relation to the structure other than being placed upon it, and as its name implies is added later for pure embellishment.

Modern Tendency.—The ornament of the present, because of the almost immediate world-wide communication of ideas, is breaking away from the local or national boundaries and is becoming more universal in its characteristics. This will not necessarily lead to a tighter standardization because the means by which design is produced has undergone a great change. Since ornament has always had a very definite relation to the tools and technical ability of the period in which it is produced, it would seem natural that ornament, which is becoming more and more dependent upon the machine for its production and upon designers of greater perceptibility, will become less standardized because of the ease with which the tools are changed and improved, and as the self-consciousness of the designer in designing for the machine becomes less as the communities become more completely industrialized. This loss in standardization will tend to give a sense of greater freshness and creativeness in design and will give, because of the freedom in execution, a maximum individuality to the work of the designer.

For a complete list of the various architectural subjects treated in this work see ARCHITECTURAL ARTICLES.

ORNAMENTS, PRIMITIVE. The term "ornament" is strictly applied to objects worn from a sense of aesthetic value and intrinsic beauty either in gratification of the personal taste of the wearer, or in accord with fashion. But it can also be applied to objects which are worn for other reasons, such as the various objects worn for magico-religious reasons, as indications of social distinction and status, for the purpose of protection, as amulets and charms, or even as curatives. As Professor Radcliffe Brown points out, the desire for protection and the desire for display "are very intimately related and are really both involved in every kind of ornament. All ornament in some way marks the relation of the individual to the society." (*Andaman Islanders*, p. 319.) Classes of ornaments in primitive society mark distinctions of sex and social status, the unmarried having ornaments peculiar to their status which differ conspicuously from those allowed to or required of married people. Articles worn as dress, that is, either for protection against climatic conditions, or from modesty may become ornaments if an element of aesthetic appreciation helps to determine individual choice or fashionable vogue. Decorations may be worked on or fashioned to plain materials to make the whole ornamental. In communities of a more permanent order, ornament and embellishment, external and internal, is applied to architecture in personal rivalry or in

token of social status. To religious zeal is due the wealth of ornament often found in the Men's House—the centre of the communal life, the repository of the cult objects of the community, the origin of the temple.

The objects worn as ornaments are sometimes of a considerable degree of elaboration. Wings of butterflies, gorgeous tropical beetles, seeds, berries, flowers, variegated leaves, bright stones, all sorts of natural products are employed. The manufacture of ornaments as prescribed by the social order is an occupation of importance. Thus, "The Akamba wear a great number of ornaments (*mapa*) of various kinds, especially metal ones, but they never overload their bodies with them on ordinary occasions. On account of the composition and choice of colours these ornaments are attractive even to European ideas of beauty, and the fine execution of the work must arouse admiration." (G. Lindblom, *Akamba*, 1920, p. 375.) Nature provides the materials and the models. The sense of colour is expressed by using different coloured earths, the quest for which is a stimulus towards economic development. Conventionalization, vulgarization, degradation and imperfect, unintelligent, imitations are notable in primitive art but at one and the same time in one community there may be artists of very different capacities.

ORNE, a department of the north-west of France, about half of which formerly belonged to the province of Normandy and the rest to the duchy of Alençon and to Perche. Pop. (1926) 277,637. Area, 2,371 sq.m. West of the Orne and the railway from Argentan to Alençon lie primitive rocks connected with those of Brittany; to the east begin the Jurassic and Cretaceous formations of Normandy. The district of the newer rocks is rich agriculturally, that of the older rocks poor, but the whole department is relatively high land, by far the greater portion being over the 600 ft. contour (highest point, forest of Écouves, 1,368 ft.). It forms a centre whence rivers diverge in all directions, traversing deeply-cut and picturesque valleys, in many cases well-wooded with fine oaks.

Horse-breeding is very important in the rural districts; there are three breeds—those of Perche, Le Merlerault and Brittany. The great government stud of Le Pin-au-Haras (established in 1714), with its school of horse-breeding, is situated between Le Merlerault and Argentan. A large number of lean cattle are bought in the neighbouring departments to be fattened; the farms near Vimoutiers, on the borders of Calvados, produce the famous Camembert cheese, and others excellent butter. The bee industry is very flourishing. Oats, wheat, barley and buckwheat are the chief cereals, and fodder in great quantity and variety, potatoes and some hemp are grown. The variety of production is due to the great natural diversity of the soils. Small farms are the rule, and the fields are surrounded by hedges relieved by pollarded trees. Along the roads or in the enclosures are numerous pear and apple trees, the latter yielding cider, part of which is manufactured into brandy. Orne has iron mines and freestone quarries; a kind of smoky quartz known as Alençon diamond is found. The hot springs of Bagnoles, which contain salt, sulphur and arsenic, are famous. In the forest of Bellême is the chalybeate spring of La Hesse, which was used by the Romans.

Cotton and linen weaving, notably at Flers (*q.v.*) and La Ferté-Macé (pop. 3,775), forms the staple industry of Orne. Alençon and Vimoutiers make linen and canvas. Vimoutiers has bleacheries, which, with dye-works, are found in the textile centres. At Alençon only a little of the lace which takes its name from the town is still made. There are foundries and wire-works in the department, and articles in copper, zinc and lead are manufactured. Pins, needles, wire and hardware are produced at Laigle (pop. 4,624), and hardware also at Tinchebray. There are glass-works, paper-mills, tanneries (the waters of the Orne being reputed to give a special quality to the leather), and glove-works. Coal, raw cotton, metals and machinery are imported. The exports include woven and metal manufacture, live stock and farm produce.

The department is served by the Ouest-Etat railway. There are two arrondissements, with Alençon, the capital, and Argentan, as their chief towns, 36 cantons and 513 communes. The department forms the diocese of Sées (province of Rouen) and part of

the *académie* (educational division) of Caen, and the region of the IV. army corps; its court of appeal is at Caen.

ORNITHOLOGY is the science of birds. We begin with the records of birds made by Aurignacian man during the last glacial epoch of the Ice age in France and Spain—paintings on the walls of caves, or figures or incisions carved on bits of horn, bone or stone. The birds that have been identified thus far from this remote Palaeolithic art include the crane, duck, goose, grouse, owl, partridge and swan. In the more recent Neolithic period, outlines of birds are more common, so that in the cave at Tajo Segura, in the province of Cadiz, southern Spain, Col. Willoughby Verner has found figures of 12 species of birds, the great bustard, crane, duck, goose, raven, spoonbill, flamingo, purple gallinule, glossy ibis, stork, eagle and marsh harrier. To these archaeologists assign an antiquity of 6-8,000 years. The Palaeolithic designs are much older.

From a painting and a statuette of the common fowl from Egypt, made about 4400 B.C., it is believed that this bird was even then kept in captivity, while knowledge of the domesticated pigeon in the same country, according to Canon Tristram, goes back to the 5th dynasty, about 3500 B.C. Record of the use of pigeons as carriers of messages is found a little later. In a tomb of the 4th dynasty of about 3700 B.C., at Meidoum, in Egypt, Mariette discovered a fresco showing red-breasted and white-fronted geese, whose painted colours are said to be exactly like those seen in the two species to-day.

Early Writings.—There are many incidental references to birds in the Bible, those in the Old Testament being of considerable antiquity. The writings of Aristotle (384-322 B.C.), though they do not attempt to give a connected account, include statements (according to Sundevall) that concern about 170 species of birds. He obtained part of his information from still earlier writers whose works are lost. Pliny the elder (d. A.D. 79), in his *Historia Naturalis*, devoted Book X. to birds, taking much from Aristotle. Aelian (d. about A.D. 140) made various notes on birds, compiled in part from older authors.

Early Saxon poets mention the gannet and several other birds of uncertain identity in songs current during the 6th and 7th centuries, and during the latter came the first records of falconry, apparently introduced by the Saxons into Britain. About the middle of the 8th century the *Epistolæ Sancti Bonifacii* informs us that Boniface, archbishop of Mons in Belgium, presented to Ethelbert, king of Kent, a hawk and two falcons. In the laws of Howel, king of Cambria, supposedly in the 10th century, there is statement of the hunting of the pheasant, and allusion to hawking. Incidental references to hunting with hawks are found in accounts of the activities of Athelstan, and of Edward the Confessor. Aelfric's *Vocabulary*, a list of words prepared in the 10th century, possibly for educational use, and another of somewhat later date, contain names of more than 100 birds, while in the *Colloquy of Aelfric*, a series of dialogues between a master and his pupils, are references to hunting with and training of hawks. In the writings and manuscripts of the 12th and 13th centuries are many references to hawking, descriptions of decoys in which ducks were captured alive, records of heronries, and an account of a great flight of crossbills into England in the year 1251.

Following the invention of printing, William Turner published in 1544 a commentary on the birds of Aristotle and Pliny, prepared in accordance with treatment that was the forerunner of modern methods. This was followed in 1555 by Conrad Gesner's *Historia Animalium*, whose third book dealt with birds and contained many original observations, as the author travelled extensively and recorded his impressions first-hand. Pierre Belon, whose *Histoire de la Nature des Oyseaux* appeared also in 1555, had considerable knowledge of the anatomy of birds, and seems to have been the first to correlate the various parts of the avian skeleton with those of man's.

In the joint observations of Francis Willughby and John Ray, published by the latter in 1676, after the death of Willughby, there is found a division of all known birds into two great groups of "land-fowl" and "water-fowl," an arbitrary classification that has been current to the present generation, though now super-

seded by a more modern grouping based on structural characters.

Linnaeus, the founder of the modern system of scientific names used in systematic zoology, began publication of his *Systema Naturæ* in 1735. His attempt was to be terse and concise, and in 1758, in the 10th edition of his work, he proposed that each species be designated by two names, the first of generic significance applying in most cases to a number of somewhat similar allied forms, and the second specific in nature and used in connection with the genus name for the species in question alone. (See ZOOLOGICAL NOMENCLATURE.) In recent years, sub-species, or geographic races, are designated by a third Latin term or sub-specific name.

Natural history collections made in connection with the many exploring expeditions of the late 18th and early 19th centuries brought to Europe, particularly to England and France, many specimens of birds that greatly broadened knowledge of the ornithology of the world. In early explorations paintings or drawings were made of birds, or specimens were preserved in spirits, or sometimes dried as mummies. At the beginning of the 19th century, as travellers increased and interest in natural objects expanded, methods of preparing skins of birds were evolved that led finally to the making of what are known as scientific specimens, where the skin, with the feathers intact, is removed from the bird, leaving only the bones of the skull, wings, feet and base of the tail. The inner surface of the skin is poisoned, usually with arsenic, filled with cotton, tow or other light vegetable substance, and dried after being wrapped or otherwise arranged so that it resembles a dead bird. By means of such preparations it is possible to assemble collections of birds that may be preserved indefinitely for continued study and examination. The growth of such collections and their expansion into museums, where birds were mounted in natural positions, changed completely the style and method of published treatises dealing with ornithology. To this time these had been mainly accounts and descriptions written from hearsay or memory, and involving constant repetition of the writings of previous authors. Such accounts were now in large measure supplanted by detailed statements regarding specimens secured during voyages, or monographs that brought together all available knowledge concerning genera, families, or larger groups of birds. The art of illustration was amplified, and many works contained series of coloured representations that delineated the bird under discussion more definitely than words. Among early writers of such illustrated works or monographs may be mentioned Daubenton, whose *Planches Enluminées* contained 1,008 plates mainly on birds, Le Vaillant who published on hornbills, cotingas, birds of paradise, and many others; Vieillot, who produced an array of volumes that dealt with the majority of the known birds of the world; and Temminck, who wrote on the pigeons and gallinaceous birds.

Audubon's *Birds of America*, in 4 vols. of elephant folio size, containing 435 plates, was published in London between 1827 and 1838, and was followed by his *Ornithological Biography*, in which, with the aid of William MacGillivray, he gave accounts of the habits of North American birds. The writings of John Gould, which began in 1832, covered descriptions and beautiful paintings in colour of birds of all parts of the world and included in all more than 40 folio volumes illustrated by upwards of 3,000 plates.

Modern Contributions.—After the middle of the 19th century ornithological publications increased to a point where it is impossible in brief space to enumerate them. In 1874 there appeared the first of the great series of volumes comprising the *Catalogue of Birds in the British Museum*, begun by R. Bowdler Sharpe, and completed in 27 vols. in 1898 with the assistance of a number of other writers. This, with Sharpe's *Handlist of the Birds of the World*, in 5 vols. (1899 to 1909), has had profound influence.

In America increase of knowledge in ornithology subsequent to Audubon and Wilson (who was a contemporary of Audubon in the study of American birds and published an excellent and painstaking account of them) came rapidly with the appointment of Spencer Fullerton Baird as assistant-secretary of the Smithsonian institution. Baird's early years in this new position

were coincident with the initiation of the great exploratory surveys, including the Hayden surveys and the survey of the 40th parallel of latitude, undertaken by the Government to develop the western part of the United States. Baird established the U.S. National Museum as a depository for specimens of all kinds belonging to the American Government, and arranged to send naturalists with the different survey parties, with the result that large collections, particularly of birds and mammals, came to Washington, furnishing the material for many important reports.

At the same time Baird initiated the preparation of a complete review of the birds of America, a project that he had perforce to turn over finally to Robert Ridgway because of increasing administrative duties. The final result has been the publication by the U.S. National Museum since 1901 of 8 vols. under the title, *Birds of North and Middle America*. Two more volumes are expected to bring this work to completion.

Ornithological Societies.—As ornithologists increased in number desire for discussion of their problems grew, to take shape finally in serials devoted to birds alone. Among the early periodicals that continue to-day there may be mentioned especially the *Journal für Ornithologie* begun in 1853, the *Ibis*, founded by the British Ornithologists' Union in 1859, and the *Auk*, originated by the American Ornithologists' Union in 1883. The last mentioned is a direct continuation of the *Bulletin* of the Nuttall Ornithological Club, established by that organization in April 1876. The Zoological Society of London, especially in its earlier years, has had a profound influence on the development of ornithology through the labours of its prosectors, particularly A. H. Garrod, W. A. Forbes and Frank E. Beddard, and through its publications, especially the *Proceedings* of the Zoological Society of London, and its precursor the *Proceedings* of the Committee of Science and Correspondence of the Zoological Society (1830, etc.).

Today, there is an ornithological or similar society in most of the principal countries of the world. At the present time there are more than 30 periodicals devoted to various phases of bird study alone. Of these the most important to the ornithologist has been the *Zoological Record*, published annually since 1864 by the Zoological Society of London. The section devoted to *Aves* now annually contains reference to more than 1,000 separate papers.

Bird Protection.—Another phase of ornithological interest that has obtained extended popular support in the past two decades is that of the protection of useful or harmless birds. (See *BIRDS, PROTECTION OF; BIRD SANCTUARIES*.) Legislation intended to restrict the killing of ducks, grouse and other birds considered as game, began in very early times, indication of recognition of the propriety of such action being found in the Old Testament (Deuteronomy, xxii., 6-7) where there is a prohibition against the killing of a bird on the nest.

In the laws of the Welsh king, Howel of Cambria, about the 10th century A.D., there are definitions of the various kinds of hunts, including the hunting of the pheasant. Such penalties as the loss of both eyes were provided by William, duke of Normandy, for peasants who had the temerity to kill game reserved for the nobility. Game protection was thus one of the early tenets of Anglo-Saxon law, and so came early to the New World, particularly to the United States, though, unfortunately, it has not been possible to show clearly the need for rigid protective measures until the destruction of game had greatly reduced valuable species of birds. In America protective measures to conserve valuable birds antedate the coming of the Caucasian, however, since the Inca rulers recognizing the value of the sea birds of the coasts of Peru as producers of fertilizers, forbade anyone under penalty of death to enter or disturb their rookeries during the breeding season. For many years in America legislation for the protection of game-birds was considered a local matter and was applied by States or territories individually. It has become recognized recently that this procedure, through lack of uniformity, did not give proper protection to ducks, geese and other migratory game-birds, which has led finally to assumption by the Federal Government of control over non-sedentary species, and a covenant with Canada known as the Migratory Bird treaty, arranged in 1916, which provides uniform regulations for the

two countries concerned. The success of this measure has been so pronounced that it has attracted wide attention and will lead to similar measures between other nations.

As human interest in birds spread, there has arisen considerable feeling against the killing of small birds for food or game. It was realized that insectivorous birds were of benefit to man through their assistance in keeping down the abundance of insects injurious to agriculture, to which was coupled the aesthetic appeal of birds in general, through their beauty of form, colour and note, to the sympathetic and understanding mind. Use of the feathers of birds in decorative dress has been the custom from remote times, a custom that at the close of the last century culminated in a fashion that required the placing of stuffed skins or parts of skins of birds in more or less grotesque attitudes upon women's hats. The resultant demand for feathers led to the destruction of birds by the hundred thousand. Plume-hunting became a lucrative business, and led to search for strange and beautiful feathers throughout the world. Terns, gulls, herons, birds of paradise, hummingbirds, to say nothing of countless familiar song-birds, were slaughtered to supply an unthinking and somewhat senseless desire for decoration, a course that led to great diminution in numbers in many species of birds. The destruction wrought was especially rapid in species that breed in colonies. Herons, terns and grebes, brought together by the paramount instinct for reproduction, were held by their eggs or young to a limited area, and so were easy to kill in large numbers. As this killing entailed the loss of eggs and the starvation of young, these species suffered to such an extent that some almost disappeared as living forms. As understanding of the results of such brutal methods arose, there resulted a revulsion against this fashion which led to the formation of such bird-protective organizations as the Audubon Society that have brought forcibly to public attention the evils of plume-hunting. This has resulted in a partial change in fashion, and in legislation against plume importation and traffic. It is now generally recognized in England and the United States that bird protection is meritorious, a sentiment spreading rapidly to other countries so that international conventions have been held to promote it.

In connection with protective measures it is realized that the Caucasian race in its present civilization has modified natural environments to such an extent that many avian inhabitants of our earth are being crowded out of existence. To procure the continuance of interesting forms, some for their economic worth and some for their aesthetic interest, reservations or sanctuaries have been formed which birds may frequent without molestation. In Europe such preserves were made primarily to protect upland game birds, and are thrown open to hunting at the proper season. In the United States reservations have been established to cover areas where herons, terns, or similar birds nest and consist of low coastal islands, or swamp and marsh lands of little monetary value. Both types of sanctuary are now found in many countries.

The result of such protection, enforced in most instances by paid wardens, has been to increase the numbers of many birds. The egret and snowy heron, at one time reduced from a vast multitude whose breeding colonies were so populous that, from a distance, they appeared like vast white blankets, to a condition where it was unusual to see a single individual, have become again common in extensive areas. Terns have returned to colonies that were deserted for years, and the pelican maintains its numbers in spite of much unthinking persecution.

In the United States there are at the present time 76 bird reservations under jurisdiction of the Department of Agriculture, ranging in size from a few acres to several hundred square miles, while light-house reservations, national parks, and similar tracts under supervision of other governmental departments have also been designated as bird preserves. In addition, various States are now developing the idea of game sanctuaries which are also refuges for birds. Pennsylvania, at the present time, has 88 sanctuaries of this kind, including nearly 73,000 acres. Private sanctuaries also are multiplying and afford much protection; many have been established as local enterprises by cities, towns, or by groups of private individuals.

Economic Studies.—Early information on the economic value of birds was based largely on field observation of living birds and many of the data obtained were erroneous. The method should be checked by the stomach examination, as developed largely by the Bureau of Biological Survey, of the U.S. Department of Agriculture. In this a series of stomachs of any given species of bird is secured, so far as practicable, at intervals throughout the year, under as many varying conditions of life as possible. These contents are examined under a microscope with low magnification, and the different kinds of insects, seeds, bones or other materials sorted. There is thus afforded a picture of the actual food preferences of the species concerned and the status of the bird is decided on this basis as useful or harmful. These data have been of great use in arranging protection for species that assist in the war on insects injurious to crops, or that are proved to be harmless, since such information offers a certain check against observations on living birds in the field. (See publications of the Biological Survey [q.v.] of the U.S. Department of Agriculture.) With few exceptions, the destruction of birds as a means of protecting crops, has been found to be an unsound policy.

Aviculture.—Aviculture (see AVIARY), or the keeping of birds alive, goes back to a remote period, of unknown date, when primitive man brought young birds of various kinds to his rude domicile, partly through curiosity and partly to use as food. Parrots are mentioned by Ctesias, a Greek writer, a century before the time of Aristotle, as birds that spoke the language of man, and that a little later the Romans are known to have kept them in ornate, silver-wired cages of tortoise-shell and ivory.

The domestication of falcons for hunting is recorded in Persia as early as 1700 B.C., and is said to have antedated that period in China. Falconry (q.v.) is believed to have spread to Europe as early as three centuries before the Christian era. In America the Pueblo Indians of New Mexico and Arizona held the turkey (*Meleagris gallopavo*) in captivity at least 1,000 years ago, and probably at a much earlier period, not for use as food, but for the feathers, which were plucked from the living bird and burned in prayer offerings to propitiate Deity. The accumulations of turkey bones in a number of pueblo ruins indicate the numbers maintained.

The original canary (*Serinus serinus canarius*) is believed to have come from the Canary islands, but in its original grey, olive-green and yellowish plumage, with sides and flanks streaked with dusky, is so similar to the serin finch (*Serinus serinus serinus*) of southern Europe that it is probable that both these closely-related geographic races have furnished the stock from which have come our modern birds. Canaries were known in a domesticated state at the close of the 14th century, though they seem at that time to have been rare, as Gesner, in 1555, mentions that he had never seen one. Variation in colour among them began early, as partly yellow canaries were known at Nuremberg in 1614, and in 1677 pure yellow canaries as well as white ones were recorded at Augsburg. There are now at least 14 distinct strains and numerous varieties. Modern interest in canaries is shown by the fact that from 1905 to 1914 more than 3,250,000 were imported into the United States, mainly from Germany and England. There are many societies of canary breeders and several journals that deal their needs.

The keeping in captivity of exotic birds of all kinds originally was the field of zoological gardens, but has engaged the attention of many individuals, and in the past 25 years has gained greatly in vogue, particularly in western Europe and in the United States. Aviaries have been brought to a high state of perfection, and the requirements of many delicate species of birds studied with the utmost care to permit success in their breeding and rearing in confinement, the highest goal of achievement of the bird fancier. Among journals dealing with the pursuit is the *Avicultural Magazine*.

TYPES OF LIVING BIRDS

Mammals have specialised for life on land (as the deer and mouse), in water (as the whale), in the air (as the bat), for night life (as the lemur), and in the earth (as the mole). But birds

specialise for existence or progression through the air. Though it is common for birds to nest in holes or tunnels in the earth, which, in many cases, are excavated specially for this purpose, no bird has been able to adapt itself to continuous life underground, probably because its covering of feathers is not designed to withstand the constant abrasion that would take place in burrowing. Also, though many birds frequent the water, none are so wholly adapted to life beneath the surface as the whales. The bird thus has failed to utilize completely the ecological environments that have been available for it—a manifestation of its inferior adaptability compared to the mammal.

Birds adapted to a terrestrial existence are found in many widely separated groups, as for example ostriches, bustards, plovers, larks and pipits. Most of these adopt a terrestrial habit to secure food and safety from enemies. They run about on the earth, and though the greater number retain power for flight, often trust to their legs to avoid or escape ordinary pursuit. Most of them show greatest variety in regions of extensive plains, prairies or broad, open downs. The wholly terrestrial forms that have entirely lost the power of flight are comparatively few, and (so far as Continental areas are concerned) are birds of considerable size and strength. Among living forms they include the ostriches of Africa, which extend into Eurasia as far as southern Persia, the cassowaries of New Guinea and adjacent areas, the emus of Australia, the kiwis of New Zealand and the rheas of South America. These birds, though united by certain peculiarities, differ widely from one another, and seem to represent ancient types of bird that were formerly more abundant, as a number of fossil forms are known. It will be noted that large flightless birds exist in modern times in all of the continents except North America, where they have not been represented since the Eocene.

The kiwis (*Apteryx*) of New Zealand, the queerest and most unbirdlike of living birds, are nocturnal and have different habits from the other species mentioned. They have long bills with the nostrils at the extreme tip, and move about by using the bill to test the ground before them as a blind man uses a cane, noting their surroundings partly by touch and partly by smell. On casual examination they seem to have no wings, but on investigation the wing is found concealed beneath the feathers, a tiny structure, a little more than 3 in. long when fully extended, and entirely without flying function, as the bird is heavier than an ordinary fowl. The cassowaries, like the kiwis, inhabit forest areas, but are far less peculiar. The wings are small, with heavy, naked quills nearly concealed beneath the long, hair-like feathers, and there is a curious casque on the head. It is said that the bird uses both casque and wing-quills to fend off entangling vines in travelling through the jungle.

Ostriches and rheas have larger wings and may extend them while running, but are wholly without power of flight. In all these birds the body is heavy and the legs are large and strong. With those fleetest in running there is a tendency to reduction in the number of toes, so that the rhea has three and the ostrich only two. That these birds have come from flying ancestors is apparently indicated by the wing, which, while small and weak, has the bones formed as in flying species. All the species discussed have the external surface of the breast bone smooth without the great keel so characteristic of the flying birds, there being no necessity for such attachment, as in flightless birds the muscles usually concerned in flying have little development.

There is another type of terrestrial bird that has developed more recently than those just discussed, found mainly on oceanic islands. This includes various species of flightless rails, and some other birds that have lived under conditions in which they had no enemies from whom it has been necessary to escape by flying, so that through disuse the power of flight has been lessened until, finally, the birds are not able to rise from the ground, though the wing retains the same form encountered in flying birds and the breast bone still has a keel, though this may be greatly reduced in size. The weka rails of New Zealand are the most striking living examples of this group; they are nearly as large as a fowl, and run with great ease and rapidity. Some other flightless rails are much smaller, for example the Laysan

rail (*Porzanula palmeri*), of Laysan island in the Hawaiian islands, which is not much larger than a newly-hatched chicken. In running fast this bird extends its wings and flaps them rapidly, but is unable to rise from the ground. Many other insular birds show a tendency to degeneration of the wing but can still fly.

Among birds adapted to life in the water the penguins are pre-eminent. These include about 17 species found in southern seas, ranging in size from the great emperor penguin (*Ap'endytes forsteri*), which is 48 in. long and weighs up to 78 lb., to the little blue penguin (*Endyptula minor*) of New Zealand and the Chatham islands, which is only 16 in. in length. Penguins have thick, heavy bodies, more or less elongated, and are covered uniformly with dense, short feathers, without the bare spaces or apteria that in other birds divide the feather-growths into distinct tracts. The wing is a short, broad paddle, without developed quills, the feathers being close-set and stiff, almost like the scales of a reptile. In the water the penguin rests comparatively low. Beneath the surface it progresses literally by flying, the flattened wings driving the bird through its aquatic medium swiftly and gracefully, while the feet are extended behind and serve as a rudder. Penguins have possessed their present type of body since early Tertiary times; but they came originally from a flying stock.

Other types of birds developed for life in the water include loons or divers and grebes, whose progress beneath the surface is accomplished, usually, by the use of the broad feet alone, the wings being held close to the sides, except when the birds are frightened or under other unusual circumstances. The downy young dive, by use of both wings and feet, indicating that flying under water is a primitive method. The many species of auks and guillemots use the wings beneath the surface as in the air above. The cormorant and the snake-bird progress by use of feet alone. Mergansers, scaups, redheads, pochards and golden-eyes among ducks dive regularly with the feet alone, while in the same group old squaws, scoters and eiders as regularly use both wings and feet beneath the surface. The curious diving petrels (*Pelecanoides*) of the southern hemisphere fly swiftly beneath the water, and may burst out through the surface in full flight.

Birds adapted for life at night are fairly numerous, and are typified especially by members of the nightjar and owl families, though specialized forms occur among a number of other families. Most nocturnal birds have large eyes that usually reflect light with a prominent reddish colour so that the eyes of many nightjars glow like dull coals of fire by the reflected light of an electric torch, and may be seen for a considerable distance. One of the American night-hawks (*Chordeiles acutipennis*) is an exception, as the eye is said to shine with a pale green hue. Most nocturnal birds actually see at night by a specialized eye adapted to collect the faintest rays of light. Only the kiwis (*Apteryx*) among habitually nocturnal species appear wholly blind.

GEOGRAPHIC DISTRIBUTION

The laws governing geographic distribution (see DISTRIBUTION OF ANIMALS; ZOOLOGICAL DISTRIBUTION), through which each faunal area has its own peculiar forms, apply to birds as to all other animals, in spite of the easy method of travel possible for the bird. Very few birds are cosmopolitan. As an example may be mentioned the sanderling (*Crocethia alba*) that at some season may be found along water almost anywhere on the Earth, but that nests only in the Arctic regions, passing southward in migration throughout the world, to return in spring to its breeding area. The barn owl (*Tyto*), resident through wide areas in the temperate and tropical regions of the earth so that it reaches all the continents, has reacted to its environment in such a way that 25 geographic forms, some sufficiently distinct to be called species, are now recognized. In contrast to this, many species are confined within very narrow limits, as the very distinct Laysan teal (*Anas laysanensis*), found only about the shores of one small lagoon in Laysan islands in the Hawaiian Bird Reservation, where it has a range of only about 1 sq. mile.

Every continent has its peculiar forms of life, so that the earth's surface has been divided into great regions, each charac-

terized by certain groups or by the lack of some found elsewhere. According to a usually accepted classification, these are given the following names: Nearctic region, for North America south to include the Mexican tableland; Neotropical region, for southern Mexico, Central and South America, and the West Indies; Palaearctic region for Europe, Algeria and Morocco, and Asia north of the Himalayas and the Gobi desert; Ethiopian region, for the remainder of Africa; Oriental region, for India, Indo-China, China, the Philippine islands, and the East Indian islands to, and including, Bali; Australian region, for Australia, and the Pacific islands south of the Tropic of Cancer; and New Zealand region, for New Zealand. The life of the northern hemisphere is so evidently allied that what are here designated Nearctic and Palaearctic regions are frequently united under the term Holarctic, a vast area that extends throughout the entire north temperate and Arctic area.

These great regions, which cover continents, are divided into life-zones, where temperature and certain other general conditions control the distribution of species within narrower limits. The life-zones are more sharply delimited in temperate regions than in tropical and sub-tropical areas, and to some extent are more easily distinguished in the northern hemisphere than in the southern. They change with difference in altitude on the slopes of mountains, as they do with difference in latitude in travelling north or south, and are most easily perceived on the slopes of steep mountains, where the successive zonal bands may be compared without great difficulty. Life-zones to the present time have been most intensively studied in North America. By the student the life-zone is further divided into faunas, where conditions imposed by rainfall, geological formation and similar factors produce sections characterized by aggregations of species or sub-species.

Birds, in general, have attained a vast distribution over the surface of the globe because of their ability in flight and their specialization for life on both land and water. As a result of this versatility and adaptability some form of bird is found at some season everywhere over the world, except perhaps in the centre of the great unexplored Antarctic continent. Broad areas of the sea, away from the great ocean currents that flow like rivers through this aquatic medium, may appear birdless for days and weeks, but are crossed at certain seasons by some of the petrels in their wanderings. The seas and lands within the Arctic Circle are visited by many birds, some of which, as the raven and snow bunting, nest far north in Greenland, and some, as ducks and gulls, in summer traverse the solitudes of the north polar sea.

As individuals, birds may be tremendously abundant in temperate regions, but it is within the Tropics that the greatest variety of forms occur within small limits. The largest aggregations are found in regions of diversified topography, where the life-zones change within a comparatively few miles from tropical to alpine. The greatest number of forms at present recorded from a limited area is that reported by Dr. Frank M. Chapman from Ecuador, where within approximately 75,000 sq.m., an area less in extent than Great Britain, there are at present known 1,508 forms of birds, and it is said that this list is far from complete.

THE AVIAN LIFE-CYCLE

The circle of annual activities of any bird, in general, includes a period for nesting, the rearing of the young to maturity, and a subsequent resting time when a moult occurs to renew the covering of feathers. With many birds there is included in this programme a migration or journey to some other region, and a subsequent return to the native area at the coming of a new breeding period. The cycle of activities thus corresponds to the seasonal round of the year, as the necessities of the bird are influenced by climatic conditions, which change from month to month, except in limited areas in the Tropics, and even there the life of birds is influenced to a greater extent than might be imagined through the incidence of wet or dry seasons.

REPRODUCTION

With the approach of the breeding season there is instituted at once a conflict, active or passive, as the case may be, between males of the same kind for a breeding area in which, later, the

nest will be located. (See also BIRD, *Reproductive Habits*.) Each male selects some section suited to nesting needs and remains within or near it until a mate appears, if he is not already mated, and protects this tract against encroachment by others that may be considered rivals. In the case of gregarious species, like the sooty tern (*Sterna fuscata*) that nests in great colonies on islands in the sea, the nesting territory for each pair may be only a yard square, or even less, being a space in which the egg may be located, so that the incubating bird and her mate, on guard beside her, cannot quite reach the adjacent pair with whom, and with any others that intrude, they spar and fight on the slightest provocation. The male red-winged blackbird (*Agelaius phoeniceus*) of North America, also gregarious, selects an area of marsh or swamp, with his neighbours situated at a distance of a few feet or a few yards, and remains on guard, forbidding entrance of another male in that limited space. Solitary species hold larger areas, so that a red-eyed vireo (*Vireo virens*) may hold a clump of three or four trees, or a blackbird (*Turdus merula*) may preempt a small section, including thickets, trees and open ground. Possession of such a breeding ground at the beginning of the nesting season is a paramount passion with each male, and to retain possession he will battle fiercely, even until death, with any others of his kind that may attempt definitely to locate within what have been selected as his limits. Under this urge, sanguinary combats are not unusual among species whose individuals live for the rest of the year wholly at peace with their kind.

Mating.—At the mating season the male bird resorts to a variety of artifices to attract attention on the part of the female, and to arouse her interest to the end that a nest be established. (See also COURTSHIP OF ANIMALS; SELECTION, SEXUAL; BIRD, *Reproductive Habits*.) Among perching birds this is first indicated by song (*q.v.*), by which the male not only gives expression to the pleasant sensations of merely living, but also, when established on his breeding ground, gives notice to rivals of his presence as a guard over his territory and notice to females that he is in search of a mate. The song may range from the polished effort of an expert, like many thrushes, the nightingale, or the mockingbird, to sounds that, to some human ears, may be merely disagreeable noise, as the chatter of the house sparrow, or the strange music of the plant-cutter of South America (*Phytotoma rutila*), whose song is a curious squeaking that resembles exactly the rubbing produced by tree-limbs touching in the wind. The rhea booms, the hawk screams and the owl hoots, each producing music in the estimation of others of its kind.

Actual mating may be accompanied by a great variety of strange and unusual actions which the male alone, both sexes, or more rarely the female alone, may undertake (see COURTSHIP OF ANIMALS). The male ruffed grouse (*Bonasa umbellus*), of North America, selects a stand on some sheltered log or stump, to which he resorts each day to "drum," a resonant love-call for which he draws himself fully erect and begins a steady beat of his short, stiffly-feathered wings. The action of these against the air between wing and body is so strong and abrupt that a dull thumping sound is produced, at first slowly, and then with increasing rapidity, until the sound comes as a steady, pulsating roar. The display of the peacock, in which the long, ornamented upper tail-coverts (mistaken by many for the tail, which is short, stiff and dull in colour, entirely concealed beneath the longer feathers) are erected and fully spread, to be shaken finally with a dry rattle as the male faces the apparently indifferent female, is another well-known example of activity on the part of the male alone.

The great crested grebe has been found by Julian Huxley to have a complicated courtship-display in which both sexes participate. A pair approach, facing one another with head wagging from side to side, then raise one wing and preen the feathers beneath, an action varied in many ways to culminate finally in a weird "dance" in which the pair rise erect, treading water, and remain bolt upright with breasts nearly touching for a brief space. In some species of albatross mutual courtship-displays have progressed to a point where they have far exceeded mere mating antics, and have become social customs that continue through a period of months, beginning with the arrival of the birds on the

breeding grounds, and continuing until the young are grown. In the Laysan albatross (*Diomedea immutabilis*) of the Leeward islands of Hawaii, the display begins with two birds approaching with quick bows, shaking their heads rapidly from side to side, raising the wing to preen the feathers beneath, and finally throwing the head and neck fully erect, with the bill pointing perpendicularly to the sky, while both birds emit a hollow groan. This action is of daily occurrence when the birds are on land, from October to May, and is participated in by mates or neighbours. It has thus developed into an interesting racial custom.

As an example of the third type of display there may be mentioned the courtship of the phalaropes, in which the female has brighter plumage than the male, and takes much of the initiative. In Wilson's phalarope (*Phalaropus tricolor*) both birds bow and nod, but in the culmination of this action the male flees with one, or sometimes two, females in close pursuit.

The site for the nest that is to contain the eggs is sometimes chosen by the female, sometimes indicated by the male, though the female may exhibit certain supposed prerogatives of her sex in such matters by modifying considerably the original plans proposed by her mate. The male house sparrow (*Passer domesticus*) selects some hollow suitable for a nest, and rests beside the entrance, calling and chattering until a female comes to inspect the premises. If these appear suitable, nest-construction may proceed. With birds that nest in trees or bushes, or on the ground, where there is greater latitude of site, various locations may be examined before definite selection is made, both male and female apparently exhibiting directive impulse in choice. When suitable sites are numerous it is probable that final selection comes frequently through the chance that directs the placing of the first nesting-material when the courtship shall have proceeded to the point of actual nest construction. In some instances, where numerous sites all exactly alike are available, as where barn swallows (*Hirundo*) make their nests of mud on the rafters of a building, there is often confusion, so that birds may carry pellets of mud to a dozen rafters until, finally, one of the several foundations assumes more importance in their eyes than the others and a nest is brought to completion. In such species as the ruby-throated hummingbird (*Archilochus colubris*) and prairie-hen (*Tympanuchus americanus*), where mating takes place at a point away from the nest and the male does not visit the nest-site, selection of a suitable spot rests entirely with the female.

With most birds mating is temporary, and may be for the period of a single brood, or, where two or more families are reared, for one nesting season. Some interesting information has been secured recently on this subject through marking birds with numbered bands which serve to distinguish such individuals from others of their kind. Experiments made by S. P. Baldwin on the house wren (*Troglodytes aedon*) in Ohio have been particularly instructive. In these studies one male house wren was found mated with three different birds in three successive years, and this same individual mated with two different mates for first and second broods during one season. Another wren mated with one companion for one brood, and in the following year took a new mate, with which it was found in the year succeeding. This shifting in the mating relation is not due to the death of one of the birds.

Though the majority of birds associate in pairs only during the nesting season there are some exceptions to this. The white-breasted nuthatch (*Sitta carolinensis*) of North America is found so invariably in pairs that when one appears alone the assumption is that something has killed its mate. Cardinal grosbeaks (*Cardinalis cardinalis*) also are usually found in pairs throughout the year. It is commonly stated that some birds, as eagles, mate for life, but this remains to be definitely proven.

Polygamy is practised by numbers of birds, particularly among the pheasant-like species. The males of the capercaillie (*Tetrao urogallus*), black grouse (*Lyrurus tetrix*) and wild turkey (*Meleagris gallopavo*) regularly take several mates, though the bobwhite (*Colinus virginianus*), a related species, is monogamous. Polyandry has been alleged for a number of species but needs verification as to regular occurrence since one of the forms concerned, the cowbird (*Molothrus ater*), where the female has been said to

mate with several males, has recently been found to pair as regularly as is normal in small birds.

Nests.—The nests of birds (see NESTS) exhibit a wide range in form and many have wonderful features.

The skimmer (*Rynchops nigra*) and the least tern (*Sterna antillarum*) excavate a slight hollow in sand or gravel to contain the eggs. The American avocet (*Recurvirostra americana*) may line a slight depression near the water's edge with a few bits of weed stem, and there deposit its four eggs. Subsequently, should the waters increase in freshet the avocet hustles about gathering grass, bits of wood, feathers, small bones and weeds to raise its treasures above the flood, so that where necessity arose, these birds have been known to erect piles of rubbish a foot in height. If the waters subsequently subside these elevated nests become conspicuous structures, but are not removed.

Some ground-nesting birds regularly conceal their eggs in holes. The Manx shearwater (*Puffinus puffinus*) digs burrows in loose soil, and makes its nest at the end of the tunnel. There may be variation in method in one species, however, as the wedge-tailed shearwater (*Puffinus pacificus*) of the Pacific islands ordinarily excavates a hole for nesting, but on rocky islands, where there is little soil, may deposit its egg on the ground, under bushes, or even in the open. The little auk or dovekie (*Alle alle*) searches out a crevice or shelter beneath boulders, often on talus slopes where rock fragments are piled in great confusion. The belted kingfisher (*Streptoceryle alcyon*) digs a tunnel on the face of a steep bank and lays its eggs at the end, gradually building up a mass of fish bones from regurgitated pellets for a nest.

Concealment is sought also by some tree-nesting birds. The scops owl (*Otus scops*) of Europe, and the screech owl (*Otus asio*) of North America, seek hollows in trees, where the eggs are placed without nest lining of any kind. Woodpeckers excavate special chambers in the trunks of trees, placing their eggs on an accumulation of chips at the bottom. Though dead trunks are usually chosen, the yellow-bellied woodpecker (*Sphyrapicus varius*) frequently drills its home in a living hardwood tree, and the Porto Rican woodpecker (*Melanerpes portoricensis*) may nest in a living palm trunk.

Nests of many herons, e.g., the night-heron (*Nycticorax nycticorax*), are placed in trees, and are flat structures of twigs and sticks that form a mere platform, so loosely built that the eggs may often be seen from below. Among larger nests there is every variation from this type to that of the osprey (*Pandion haliaetus*) to which material may be added year after year until the mass is 8 or 10 ft. in diameter and makes a cartload in bulk.

Among smaller birds, the tree nest is usually a simple cup that has a foundation of rough material on which the nest proper of finer material rests; the lining is made of soft substances, as rootlets or plant downs. The blackbird (*Turdus merula*) and the American robin (*Turdus migratorius*) line their nests with cups of mud, within which are placed soft grasses. Many birds place nests of grasses and rootlets under herbage or in thickets on the ground. For protection, many tree-nesting birds build homes with arched tops that wholly conceal the eggs. There is a great group of birds in South America, the so-called tracheophones, many of whose species have this habit. Conspicuous among them in the Argentine is the leñatero, or firewood-gatherer (*Anumbius anumbi*), that gathers a quantity of thorny twigs to form a spherical mass, within which is placed the nest proper, reached by a runway, the whole so firmly constructed that the eggs inside may be reached only with difficulty. These nests are durable and last for several years, until the materials composing them decay. The oven-birds (*Purnarius*) in this group construct rounded masses of mud, with an entrance at one side, the walls being an inch or more in thickness, and so built that they will withstand the beating of heavy rains without damage.

Many of the tropic family (*Icteridae*) make purse-like nests that are suspended in the tops of trees. The nest of the oropendola (*Gymnostinops montezuma*) of Central America may be 5 ft. in length, suspended by the upper end, below which is located the entrance which leads through a long, constricted neck to the expanded lower part, where the nest proper is placed. The oro-

pendola nests in colonies, but nests of the orioles, as the Baltimore oriole (*Icterus galbula*) which also constructs a purse-shaped nest from 8 to 10 in. in length, are found alone. The nests of the social weaver-finches of southern Africa are among the most remarkable structures known in the bird world. These birds are gregarious and, in company, accumulate masses of grass in trees to form a roof, under which each pair of birds has its separate cubicle, lined warmly with feathers. From 20 to 300 pairs may inhabit a single structure, which grows in size as it is inhabited year after year, until it may contain several wagon-loads of material.

Among other curious nests there may be mentioned those of the edible-nest swiftlets of the Indian, Australian, and South Pacific areas, that are cupped platforms, composed of a coagulated mucus secreted by the mouth-glands of the birds, placed on the walls of caves. These are gathered commercially and form the basis for a soup highly prized by the Chinese. The American chimney swift (*Chaetura pelagica*) makes a nest of twigs, cemented together by mucus from the mouth, to make a tiny basket. In early times these nests were placed on the inside of hollow tree-trunks, but with the advent of the Caucasian race and the building of houses, hollow trees have been forsaken for chimneys.

Nest-building with most birds seems to be usually the duty of the female. The male may assist by bringing material and may lay it on the nest, but it is mainly arranged by the female. In many species the entire work devolves upon the female.

EGGS

In birds, as in all other vertebrates, the gonads are paired organs on the dorsal wall of the body-cavity. In most birds the right ovary disappears early in life, leaving only the left to grow and mature. This rule, though usual, is not invariable, since in many hawks, particularly the harriers (*Circus*), and the small bird-eating forms (*Accipiter*) usually, but not invariably, we find both ovaries present and functional. The ovum, or yolk, in birds is a relatively enormous cell which passes from the ovary into the mouth of a convoluted tube, the oviduct. As the yolk moves down the oviduct it receives first a deposit of gelatinous albumen, the "white," next a membranous sheath, and then is enclosed in a hard, calcareous shell, and is deposited as an egg (q.v.).

Eggs are ordinarily oval in shape, though this is not invariable, as the eggs of swifts are usually elliptical, and those of owls are nearly round. Eggs of birds that breed on rock ledges without constructing nests are much pointed, which allows them to roll about in a relatively small circle and so lessens the danger of a fall over the edge. Eggs of many shore-birds, which are relatively large in relation to the size of the birds, are also strongly pointed, which permits them to pack closely with the pointed ends toward the centre, thus bringing the whole into a compass that permits the parent to cover them.

Eggs of owls, kingfishers and woodpeckers, which are laid usually in holes or cavities (though some owls occupy open nests) are white, and whitish eggs are found in grebes, albatrosses and petrels. Most eggs have, however, a coloured shell, or spots and blotches of colour spread over a lighter background. Where there is a pattern of markings present there is usually a wreath of heavy colour about the large end of the eggs. Herons' eggs are pale blue or bluish-green, and plain green or blue eggs are found in various perching birds. The tinamous of the New World, a primitive group, have very striking eggs, with smooth and highly polished shells, varying from green or pink to deep brown, their lustre suggesting porcelain.

The egg-shells are penetrated by pores which usually cannot be seen, except under a lens, but that in some eggs, as those of the ostrich, are easily visible to the unaided eye. Evaporation takes place through these openings, so that the egg loses steadily in weight during the incubation period.

The number of eggs produced annually varies widely in different groups, being adjusted to the requirements of each species, to enable maintenance of its normal numbers. The migratory species that covers a considerable range encounters more dangers than one that is sedentary and, therefore, must produce more of its kind

This statement, however, has many exceptions. Migratory wild ducks lay from five to 12 eggs, while the bobwhite, which is sedentary, may have as many as 21, though usually not more than a dozen. Among small birds, on the average more eggs are deposited annually by the migratory species of the temperate zones than by the sedentary forms of the Tropics. On the other hand, the non-migratory titmice and wrens lay many more eggs than the migratory warblers (*Sylviidae*). Most perching birds of temperate regions have from three to five eggs, rarely six, in a setting, but may nest two or three times each season. Most sandpipers deposit four eggs, though in some the number is reduced to three. Many gulls, hummingbirds, loons, and some species of pigeons have two eggs regularly. Other kinds of pigeons, with auks, petrels and albatrosses, lay but one egg. Boobies lay two eggs, but never seem to rear more than one young.

Adjustment of birds to their environment as regards the number of eggs deposited, to ensure continuance of each species, was made before the rise of man, who has been an active factor in the life of the earth for a relatively brief period compared to other animals. In some cases, where man has kept in check enemies of birds, these species have increased. In other instances, where man has been an active enemy, he has brought about reduction in numbers or actual extermination, because the birds concerned had become adjusted to a certain annual drain on their numbers from natural enemies and were unable to change to counteract added destruction by man. The great auk laid only one egg, and as it nested in colonies was quickly exterminated. The passenger pigeon of North America, which existed in colonial days in innumerable hosts, also produced but one young each season, which did not enable it to withstand the drain of hunting, so that it has become extinct. Usually, only those birds which rear a number of young each year can be maintained as game, and these must have protective regulation to enable them to hold their own.

Incubation.—After the egg is deposited it requires a certain definite temperature to develop to the point of hatching. This is normally accomplished by incubation on the part of one of the parents, usually the female, a period during which the bird remains closely on the nest, except for brief intervals required for a hasty search for food. The eggs are warmed by being brought into close contact with the breast and abdomen of the brooding bird, there being usually a sloughing of down and other feathers over a part of this area, to permit close contact between the skin and the eggs, and at the same time an increase in the blood supply to the skin, to bring a more even heat to bear. The actual degree of heat required to develop the embryo in the egg is known for only a few forms of birds. In the case of the domestic fowl the average incubation temperature is about 103° F. In charts published by Baldwin and Kendeigh, showing by use of a thermo-couple fluctuating temperature in the nest of a house-wren (*Troglodytes aedon*), the incubating temperature is shown to vary from 39° to 41° C, or 102° to 106° F, the average being about 104° F.

Though, ordinarily, care of the eggs involves their being heated from the body of the incubating bird, in species that nest in the open, in warm climates, where the sun is torrid, brooding may be required to shade the eggs from too powerful sun-rays. The body of the bird here acts as a shelter and an equalizer of heat.

Though incubation falls ordinarily to the lot of the female, there are many species in which both sexes alternate in this duty. This is true in the ostrich, various auklets, herons, grebes, petrels, etc. The male rose-breasted grosbeak (*Zamelodia ludoviciana*) broods devotedly, though in this case his action would seem disadvantageous, as his plumage is strikingly variegated with black and white, and the rose-red spot on his breast often shows above the rim of the nest, while his mate is inconspicuous in a brown, streaked dress. In the phalaropes, the bustard-quails (*Turnix*), the emu and the rhea the male alone incubates, the female taking no part in this duty. It is believed that this also obtains in other shore-birds.

The megapodes or mound-builders (*Megapodidae*), found from the Nicobars and Philippine islands to Australia, carry on no incubation whatever. For example, the scrub-fowl (*Megapodius querryi*), of Northern Territory and Queensland in Australia,

scrapes together a mound of sand and earth, to which a small amount of vegetation is added, during the wet season. The mound may be used for a number of consecutive seasons; and mounds 14 ft. in height and 35 ft. in diameter have been discovered. The eggs of one pair of birds are buried in the top of such a mound, and, through heat generated by decomposition of the included vegetation, are maintained at an even temperature of 95° F. The Mallee fowl (*Leipoa ocellata*) of Australia constructs a much smaller nest by scraping out a hole in the ground 2 ft. wide and 1 ft. deep, with the excavated earth piled up around the opening, so that the whole resembles the crater of a volcano in miniature. The cavity is filled with leaves, twigs and vegetable debris, scraped up by use of wings and feet for yards around. This is left uncovered for four or five months until it is soaked by rains, when decomposition changes it into a hot-bed. A central chamber is excavated in the top at the proper time, and the debris taken out, mixed with sand and returned. In a few days another excavation is made, and an egg placed within it, so that it stands with the small end down. On warm days when the sun shines the birds make a cavity in the top of the mound to catch the rays of warmth. In damp, rainy weather the conical peak of the mound is covered with sticks and rubbish that assist in turning water that might penetrate to the eggs. The temperature about the eggs is maintained from 90° to 97° F until they are hatched. During dry seasons, when there is no moisture to promote the necessary decomposition of vegetable material to produce heat, the birds are said not to breed. On the other hand recent researches show that in some species at least there is no generation of heat by decomposition within the nests, and the comparatively low temperature necessary for development is maintained by oxidations within the egg itself. The nesting activities of these curious birds are strongly reminiscent of the breeding-habits of the reptilian group, from which the class of birds as a whole is descended.

The period of incubation varies greatly in different groups, in general, being longer in large birds. The period may be shortened slightly by slight increase in incubation temperature or prolonged somewhat by irregular attention on the part of the parent. The incubation period of the emu is said to range from 56 to 63 days, that of the ostrich is reported as 42 days, the domestic mallard requires four weeks, and the domestic fowl three weeks. Most small perching birds require from 12 to 14 days, with magpies and jays running from 16 to 18 days. The shortest incubation period known is that of the American cowbird (*Molothrus ater*), whose eggs hatch after 10½ days' incubation.

In the gallinaceous birds, e.g., the domestic fowl, and many other species, the nest is used merely to house and incubate the eggs and the young, which are born covered with down, and follow the mother in search of food as soon as their plumage is dry. In some mound birds the young are hatched with developed wing-quills, so that they are able to fly within half-an-hour of hatching. In most tree-nesting species the young undergo a shorter period of development in the egg, and consequently must remain in the nest under close parental care for a period after hatching. The nest is thus a home during early juvenile development. Food is sought by the parents and brought to the young, and what guard may be possible is maintained against destructive enemies. In hole-nesting species like the hoopoes and woodpeckers there is indifference to nest sanitation, as immunity against dangerous bacteria that multiply actively when heat and moisture are available has apparently been developed. Such nests become extremely foul as the period of occupancy progresses. Hawks, herons and numerous others, even when very young, instinctively void their excrement beyond the nest, so that such unsanitary condition is obviated. In most of the smaller perching birds the excrement of the young is of such a consistency that it maintains a globular form and is removed from the nest by the parent. In a few finches, as the American goldfinch and crossbills, the excreta are voided by the young about the margin of the nest and are not removed.

In most birds the young remain with the parents for a time after leaving the nest, and gradually become self-reliant, so that they procure their own food. At this stage family parties usually

separate as the young drift away from their parents, or the adults tire of importunate begging for food on the part of progeny able to procure their own sustenance, and so either drive the young away or themselves leave. When the young learn early to search for food they may remain in bands with their parents.

Parasitism.—Breeding parasitism is found in several groups of birds in which no nest is built, the eggs being deposited with those of other birds and left entirely to the foster-parent for care. The European cuckoo (*Cuculus canorus*) has long been known to have such habits. The female places a single egg in the nest of some bird, usually a species of small size, ordinarily choosing a nest in which the eggs are fresh, and removing one of the rightful set when leaving her own (see Cuckoo.) Although about 100 species of birds have been recorded as parasitized, ordinarily each female cuckoo places her eggs in the nests of one particular species of bird. Each female cuckoo is supposed to lay from five to 16 eggs during the season. There is argument as to whether the cuckoo deposits her egg directly in the nest of the fosterer or whether she extrudes the egg elsewhere and carries it in her throat to the nest chosen. The former is certainly the more usual. An egg of the foster-parent is almost invariably removed and eaten by the cuckoo after she has deposited her own. The process of placing the egg requires only a few seconds, and then the bird leaves at once, which renders definite observation difficult. The young cuckoo's back is hypersensitive to touch, has a spasmodic reaction when it comes in contact with objects other than the nest; aided by a curious depression on the back, the parasite casts out the rightful young, or the eggs until finally it occupies the nest alone.

Similar parasitic habits are known for a number of other cuckoos in other parts of the world. Stuart Baker, in discussing parasitism in Indian cuckoos, shows that a number are parasitic on one species or group of species of birds, and that the cuckoo's egg is specialized to resemble the foster-parent's rather closely. In some cases one cuckoo may have widely different eggs in different parts of its range, as the hawk-cuckoo (*Hierococcyx sparveroides*), which, when it parasitizes the streaked spider-hunter (*Arachnothera magna*), lays a dark olive-brown egg like that of the bird parasitized, but that elsewhere foists on the laughing thrushes or allied species a bright blue egg like that of its dupes.

Some of the American cowbirds are also parasitic. The common North American cowbird (*Molothrus ater*) has developed no particular resemblance in egg colour to the egg of the fosterer, except that many of its dupes lay spotted eggs like its own. In South America the bay-winged cowbird (*Molothrus badius*) cares for its own eggs in a normal manner, but is parasitized by a related species, the screaming cowbird (*Molothrus rufo-axillaris*), which uses this species alone as foster parent. Parasitism is also known in the rice-grackles (*Cassidix orizivora*) which lay in the nests of related oriole-like birds. Certain species of weaver-birds (*Ploceidae*) and the honey-guides (*Indicatoridae*) of Africa also parasitize other birds. The origin of such habits is obscure.

POST-BREEDING LIFE

The period of reproduction is the most active part of the annual life-cycle of the bird, from a biological standpoint, as it brings in play instincts and activities different and more complex than those apparent during the remainder of the year. Reproductive activity reaches its climax with the maturity of the young. With these on the wing the individual pair have done their utmost in the perpetuation of their kind, and there ensue a number of months of more restful life, with search for food and escape from enemies as the principal activities. For many species there is immediately a period of moult to renew the feathers, a period during which birds are quiet and sluggish, often seeking haunts where they will be disturbed as little as possible. With the drain on vitality brought by feather-production at an end, there comes a time of greater activity, when old and young seem to attain greater vitality.

Moult.—The close of the breeding season finds adult birds with worn feathers, so that most species immediately undergo a moult, during which the old feathers are dropped and new ones are grown. The process is one that, in totality, requires more than a month to

complete and progresses in regular routine, varying in sequence over the body in the different orders. In most species the feathers of the wing are shed and renewed one or two at a time, so that the bird still retains the power of flight. Ducks, geese, flamingos, cranes, rails and grebes drop all the wing- and tail-feathers in a very short time, so that they become flightless for several weeks until new feathers are grown. Penguins shed their feathers in patches, almost as a lizard drops its old skin. The epidermis of the tarsus and feet is sloughed during the moult, and any ornamental coverings of the beak are dropped at the same time.

Young birds have a first plumage, grown during their period of development, that is replaced by a post-juvenile dress of feathers that comes when they are fully grown and able to care for themselves. In most, the flight-feathers remain until the following year, but in some, as the house sparrow (*Passer domesticus*), the wing- and tail-quills are also completely renewed at this first moult.

In most adult birds the moult comes immediately after the close of the breeding season, and in temperate regions occurs in late summer. The birds are thus again in full dress when the time for migration arrives, or, if resident, by the approach of cold weather. Swallows, many shorebirds, and hawks moult during the winter, the two former groups undergoing this process in the winter home after migration.

Most birds have one complete moult annually, which takes place as indicated, at the close of the breeding season. In many, particularly among the perching birds there is another moult, partial or complete, through which the bird acquires nuptial plumes. In the bobolink (*Dolichonyx orizivorus*) and the whinchat (*Saxicola rubetra*), for example, the body plumage is completely changed in late winter and early spring. Many of the sparrow family, as the ciril bunting (*Emberiza cirilus*) and the Harris's sparrow (*Zonotrichia querula*), have a partial moult of the feathers about the head that produces bright plumes for the breeding dress.

Change in colour is not necessarily accompanied by moult, as often the tip of a feather may be one colour and the middle portion another. In the throat of the male house sparrow, for example, in autumn and early winter the black throat is obscured by greyish feather tips. As spring arrives the grey tips wear away, so that the black is fully revealed. The most striking change of this type is found in the snow bunting (*Plectrophenax nivalis*), which is white or light brown above in autumn and winter, but through sloughing of the feather tips becomes entirely black on the back in spring.

MIGRATION

Aristotle (384–322 B.C.), the first to discourse connectedly on migration (*q.v.*), tells in his writings that the crane flies from the steppes of Scythia to the marshlands at the source of the Nile, south of Egypt. He noted migration also in the swan, land-rail, lesser goose, quail, rock-dove and turtle-dove, though he reports that of the last three a few may linger through the winter in protected localities. The cuckoo disappeared with the rising of the dog-star in July. Pliny, in his *Natural History*, repeats much that had been said by Aristotle, adding that the European blackbird, starlings and thrushes pass to neighbouring countries, while storks and cranes travel to a great distance. There are scattered references to migration in the writings of the middle ages, Olaus Magnus, in 1555, speaking of the migrations of swallows, and Francis Willughby, in 1768, mentioning various migratory birds. In the succeeding century Gilbert White, Thomas Pennant and George Edwards kept regular records of the arrival and departure of birds. Interest in the subject was considerable by the opening of the 19th century, and from that time forward the number of observers and the mass of published information on migration has increased yearly.

Superstitious Beliefs.—Though the migrations of larger birds were understood, as these travelled openly across the spring and autumn skies, the movement of smaller species, that appeared or disappeared under cover of night, so that they were present one day and gone the next, or vice versa, were present suddenly after an absence of several months, was the basis of considerable superstitious belief. It was thought that the smaller species were too weak to travel far, so that, in 1740, J. G. Gmelin was told by

the Tatars of Krasnojarsk that each crane carried a corn-crake on its back in its journeys. In southern Europe the peasantry believe to-day that small birds congregate on the shores of the Mediterranean, and as opportunity offers flutter on the backs of storks and cranes who carry them across to Africa.

Somewhat more unusual is a belief promulgated in an anonymous tract published in London in 1703 "By a person of Learning and Piety," entitled in part "An Essay Towards the Probable Solution of this Question. Whence come the Stork and the Turtle, the Crane, and the Swallow, when they Know and Observe the Appointed Time of their Coming." The author announces a belief that migratory birds travel to the moon, where they pass the winter, the journey in either direction requiring 60 days to compass, during which the author (who, according to Hugh Gladstone, was Charles Moreton, a minister who in late life removed to New England), informs us that they required no food, as they travelled in a rarefied ether.

Another superstition centring around migration has been the supposed hibernation on the part of some birds, a belief that dates back to early times and has been prevalent both in Europe and America. Aristotle attributed hibernation to the swallow and various other birds, saying that some individuals became torpid, and so passed the winter in the shelter of caves or hollow trees in a state of suspended animation. In later years hibernation was used mainly to explain the disappearance of swifts, swallows and the sora rail. Many and detailed have been the arguments over this matter, and over 200 papers have been written dealing with supposed cases of hibernation. It was related that the sora rail abounded in its favourite marshes, until, overnight, the birds turned into frogs, or sank in the mud, to remain until the following spring. Naturalists with great detail described how swallows gathered on reeds growing in water until their combined weights bent down these slender supports and the birds were submerged in the water. Those to whom this theory did not appeal stated that swallows and swifts hibernated in hollow trees and clefts in rocks, and the finding of birds in such situations in winter was described in great detail in a number of instances, all, however, under some misunderstanding of the circumstances. In short, though hibernation, or its correlate aestivation, is common among mammals, reptiles, amphibians, and even in fishes, it has never been proved among birds. The frequent coupling of this superstition with swallows may be explained, perhaps, by the fact that these birds in autumn regularly roost at night in marshes, and that during storms many perish to fall into the water and sink into the mud, never, however, to revive.

Among other superstitious beliefs mention may be made also of a transmutation theory prevalent among early writers, who supposed that at the approach of winter a bird might be transformed into another species, to remain thus until spring, when it resumed its proper form. Apparently this was first suggested by Aristotle, who held that the redbreast or robin (of Europe) changed to the redstart. The confusion resulted, apparently, from similarity of form and difference of plumage in two related species, where one disappeared in southward migration about the time that another arrived from northern regions, thus lending colour to a transmutation argument.

Theories of Origin.—An explanation of migrational movement has been that of seasonal change in food supply. According to this belief, with the approach of winter in areas remote from the Equator, there is failure of the food supply that causes birds to travel, and as the food supplies remain more constant toward the Tropics, birds move in that direction. When, with the approach of spring, the instinct for reproduction becomes paramount, as the food supplies of the broad equatorial area are not sufficient to support the great host of young birds that will appear, the adults move out again to their summer homes in temperate or boreal regions, where they rear their families. It may be argued against this that the tropical belt supports the migratory hosts when they have become grown, so that it would seem that these same individuals might obtain sustenance there while in younger stages.

An allied theory contends that migration is controlled by cold, from which birds retreat in autumn. Under this hypothesis some

have held that birds originated in the north, were driven south by the advance of ice in the Pleistocene, and have returned to the north with the coming of milder climate. Each year now they retreat before the breath of approaching winter, while each spring a love of birthplace calls them to their natal homes. It must be noted that many birds retreat south early in the season, long before there is climatic necessity for their movement. This, with similar facts, has given rise to the theory that all species of birds have had their origin in the south, and through a natural struggle among individuals have spread to the north, especially for the period when each pair must be bound to a restricted territory for its breeding ground.

A somewhat different theory is that of phototropism, which holds that birds move toward the region of greatest light, this bringing a natural ebb and flow of bird life with the changing seasons as the sun moves north and south across the Equator. It is true that the course of migration, in general, follows the advance and retreat of the sun, but it would seem that it is the changing season and not the change in intensity in light itself that affects our bird-life. Through phototropism we may not, for example, explain the migrations of nightjars, which are nocturnal, and which, therefore, find in darkness the period of their activity. Such birds should find their optimum conditions of life in the equatorial regions, where the hours of the day are divided between daylight and darkness. The nightjar and whippoorwill, to give two well known examples, travel north to breed, and in June in their northern ranges have their hours of activity greatly curtailed through the lengthened period of daylight. A recent theory, supported by some experimental evidence, asserts that the onset of migration is physiologically controlled by the relative length of day and night, as is known to be the case with the flowering of plants.

The main difficulty with these and a number of other theories that have been promulgated in connection with migration is that they attempt to explain this great and impelling semi-annual movement by some single factor. When we consider that the known history of the bird in its evolutionary development, from present knowledge goes back through an enormous stretch of time, so vast that it may be noted in figures but is beyond human comprehension, to the fossil species known as *Archaeopteryx* and *Archaeornis* of the Jurassic period, it must be recognized that our present day species have had their instincts and habits moulded by many factors, so that it seems reasonable to consider that such a widespread phenomenon as migration may be due to a complex association of a number of powerful causes, some of which may have affected one species and some another, but no one of which may serve to explain the entire phenomenon as it exists at present.

We may believe, therefore, that the underlying basis of migration is founded on a combination of a number of causes, and we may look upon the present migratory instinct as an outgrowth of all the complex circumstances that have affected birds during their entire evolution, though it seems evident that the actual routes followed by migratory birds, at least in the northern hemisphere, have been shaped during the climatic changes of the Pleistocene.

During breeding-period the bird is restricted closely to the region in which the nest is located, and though some young are free to move about when recently hatched, the parents are, as a rule, confined to one neighbourhood until their offspring may be old enough to require no further care. This close confinement is seen easily in the smaller perching birds that are held within a very limited range until the young are finally on the wing. When the young are grown the adults may linger to rear other broods, but the young, driven often by antagonism of erstwhile attentive parents, wander away, borne by their newly-developed wings, and though they may not go far, do not usually remain for long in the immediate vicinity of the nest. This is one type of wandering in its simplest form. Somewhat more complex is the condition found in some parts of Australia, where prolonged droughts occur during which water evaporates, vegetation is not developed and the majority of birds disappear. With the incidence of rains the country again becomes green and birds return. Though both kinds of movement that have been described may appear as vagrancy, yet such impulses need only to become synchronized with seasonal

climatic change to become true migration.

Tropical regions offer interesting data in this connection, as though hundreds of birds found in these areas are strictly sedentary, yet there are some that shift about with changing conditions. Climatic variation within the Tropics is confined mainly to a cycle, in which periods of relatively little precipitation alternate with those of heavy rains. There is thus a seasonal shift that is influenced by changes in the vegetation. Some species of tree or vine come into flower or fruit and immediately there appear tanagers, honey-eaters and other birds hitherto absent to live upon the newly-available food.

It is idle to suppose all birds have arisen within either tropical or temperate areas. Birds, as a group, have been in existence for many million years, and during all that period there has been constant unceasing competition between individuals. In virile species individuals have been produced in abundance, and many have necessarily been forced out into new range. Some have reacted to new conditions, or have become modified through some inherent quality, so that they have been changed so greatly that they have finally become species apart from the parent stock, and have thus set up their own *loci* for subsequent radiation. The complexity of overlapping ranges under such conditions is easily apparent.

HOW MIGRATION PROCEEDS

Some students have indicated that the spring and fall migrations correspond to advance to the breeding station and subsequent retreat therefrom, and indicate correctly that the stimulus for this may be a hormone arising from physiological change in the gonads. This, however, is merely an activating principle for migration as it exists at the moment, and may not be considered the cause through which migration itself has originated.

Briefly, migration may be defined as advance and retreat, with fluctuation in conditions favourable to each species separately, which, as each form has its own reaction to its environment, has originated from varying causes. The origin of the present day regular, seasonal movements is thus complex.

Methods of Migration.—Migration may take place by day or by night, according to the species. Geese, ducks, cranes and pelicans crossing the sky, flying abreast or in angular formation, are accepted as portents of changing season throughout the world. Though seen regularly by day, these birds may also migrate by night, as we frequently hear the calls of geese and swans coming from darkened skies during the height of their movements. The smaller birds travel mainly by night, and descend on us in hordes, so that frequently we go out in early morning to find fields and hedgerows crowded with songsters that were absent the previous evening. During the proper season, when a full moon rides the sky in evening, it is possible to detect the forms of these nocturnal travellers silhouetted against the illuminated disk of light as they pass far above the earth, and occasionally to recognize a feathered friend by some peculiarity of form or wing movement. Many such observations have been made through large telescopes, and birds may be seen occasionally against the moon through ordinary field-glasses. It is probable that timid wrens, warblers and sparrows, that live ordinarily under shelter, feel greater safety in prolonged flights under the protecting cover of darkness. King-birds, robins, bluebirds, bluejays and many others however regularly fly by day.

The matter of procurement of food is probably a greater factor than timidity in inducing nocturnal flight. Digestion in birds is rapid, so that food must be obtained at regular intervals to maintain the activity especially characteristic of smaller species, whose tiny bodies have necessarily smaller reserves of energy than their larger brethren. Stomachs of small birds killed at night by striking lights or other obstructions are nearly always entirely empty, which, though an entirely natural thing, in some cases has given rise to belief that the individuals in question were in the throes of starvation. If tiny migrants flew long distances by day they would arrive at some distant destination with empty stomachs and depleted energies, perhaps almost exhausted, and because of darkness would not be able to procure food until the following morning. Such circumstances would lead to delay in further flights through

need for recuperation or, if accompanied by cold or storm, might prove fatal because of the lowered vitality. By arrival at day-break it is possible for migrants to rest for a time and then search for food, and so to recuperate that they may continue the following evening if desired. At the same time there is often detected among these smaller species an indication of continuation of migratory flight by day, as in feeding they often tend to move in the general direction towards which the seasonal flight trends.

It was thought formerly that migrants flew at great altitudes above the earth, there being a somewhat hazy notion that rarefied atmosphere in some uncertain way facilitated flight. Modern observations from aeroplanes show, however, that this belief is unfounded, and that the bulk of migrant birds travel at less than 3,000 ft. above the earth. It is unusual to meet with birds above 5,000 ft., though exceptionally aviators have recorded shore-birds at 10,000 and 12,000 feet. In many instances birds pass at very moderate altitudes, particularly above the sea, where they may barely clear the waves. At night, the calls of migrants may be often heard, apparently only short distances above the trees.

There has been much discussion of the method by which birds direct their courses in flights to distant lands, without arrival at definite explanation. Memory of routes previously travelled, some magnetic sense, courses laid by the positions of the heavenly bodies, as a mariner directs his navigation, the direction of regular winds, telepathy, television and hereditary memory have all had their champions. It may be said that there appears great probability that young birds of the season, on occasion, migrate southward without the guidance of others that have previously made the journey, that sea-birds return across apparently trackless oceans to remote islands where they nest, and that birds have returned to their breeding stations when removed forcibly to waters that they do not ordinarily frequent. This may, perhaps, be explained in the somewhat general terms, by supposition, that the birds are directed by some special sense of direction, but must be regarded at present as something of which there is no definite explanation.

One of the most interesting facts connected with migration is the almost unfailing regularity that accompanies the movements of birds in the temperate regions. Through records kept over a long period of years, the average dates of arrival in spring of the common birds are now known, and it is found that they appear with almost uncanny regularity, often on the average day and always within a range of a few days earlier or later. Among small birds the seed-eaters generally migrate earlier in spring and later in autumn than insect-eaters, as they find their food with greater readiness. The first arrivals in spring or fall are usually few, and it may be days or weeks before the mass of individuals appear.

The length of the journeys made by individual birds varies greatly. Inhabitants of high mountains, in a flight of a mile or two, descend to some warm valley, where they may spend the winter in comfort, or the migration flight may entail a movement to a great distance, as from central Europe to southern Africa. The Arctic tern is supposed to have the longest migration route known, as it nests in the far north and spends the northern winter near the shores of the Antarctic continent, with 11,000 m. in an air-line separating its northern and southern homes. Incidentally, this tern probably enjoys longer hours of daylight than any other living creature, since it lives under the midnight sun in both northern and southern hemispheres, and only in its travels through the equatorial belt does it meet extended periods of darkness. There are numerous shore-birds, such as the American golden plover, that nest in the Arctic and spend the northern winter on the plains of Argentina. Many birds nest in Canada or in the northern United States and winter in the Gulf States, Mexico, Central America, the West Indies, or northern South America. Likewise, many pass from northern Europe to Africa, some going as far as Cape Colony.

There is almost infinite variety in the migration routes and travels of the many forms of birds, yet in each continent it is found that there is a tendency to converge in great lanes of migration that carry the bulk of individuals, though random birds may cross anywhere in the intervening area. The flight-lines often fol-

low river valleys or coast-lines, which seem to afford assistance in directing the flight. The observer interested in bird life who is located on one of these great air-roads is fortunate.

Through prolonged journeys birds encounter constant perils and dangers, so that many are destroyed. Storms, unfamiliar coverts, with consequent exposure to the attacks of enemies, and wandering from the direct course in crossing broad reaches of water annually exact a toll of unknown thousands of individuals, as has been indicated in a previous section. To enable maintenance of their proper number migratory species, therefore, are required to produce a sufficient number of young to permit this toll, and at the same time leave a pair to continue the species at the next breeding season. On the average, the migratory species of the north and south temperate zones produce from three to six eggs in each nesting, four or five being the rule, with from one to three families each season, while the more strictly resident form of the Tropics may produce only two or three eggs and have only one nesting annually. In spite of apparent prolificness the more northern species do not increase inordinately. The song sparrow family, in August, at the close of the breeding season, if there has been no mortality, may have ten or 14 individuals, depending upon whether two or three broods have been reared, yet by next spring does not show any appreciable increase in abundance; so that there has been a tremendous wastage in individual life during the migrations and the intervening winter.

In final consideration, it may be said that residents in Europe and North America are often prone to consider migration as something peculiar to birds breeding in the northern hemisphere. It must be noted, however, that in South America, southern Africa, and Australia there are native species that, at the approach of the southern winter, travel north toward the Equator, to return at the proper season to their breeding-grounds.

BIRD BANDING

Until the beginning of the present century the study of migration was carried on by mass-observation, under which records were kept of the first appearance for each species and of its subsequent fluctuations in abundance, the value of the records depending to a certain degree upon the skill and experience of the observer. Much valuable data has thus been assembled, and this method of study is still highly useful. In recent years there have been developed methods in marking individual birds with numbered bands that have added greatly to knowledge of migration, since by this means it is possible to single out the individual bird from the great army of his fellows, and to learn something of the separate flights that make up this mass movement.

Sporadic attempts to mark wild birds so that they might be identified began more than 125 years ago, and have ranged from little bells, bits of coloured yarn, marks made with indelible inks or paints on some of the feathers, plain rings of wire or other material, or strips of metal on which were marked scriptural quotations, to the modern scheme of bands of aluminium marked with a serial number and the name and address of the person or organization responsible for them.

The earliest definite record for a banded bird, according to F. C. Lincoln, is that of a heron (*Ardea cinerea*), captured in Germany in 1710, with metal rings on the leg, one of which had been placed on the bird in Turkey several years before. Sporadic efforts to mark birds have been made at irregular intervals, but nothing of real importance was attempted until 1899, when C. C. Mortensen, of Viborg, Denmark, began systematically to band storks, ducks, starlings and birds of prey. The results obtained were so valuable that soon others took up this study, with the result that at the beginning of the World War approximately 20 distinct banding projects had been initiated in Europe.

In America the first birds ringed seemed to have been some common phoebes (*Sayornis phoebe*), marked by Audubon, when in the nest, with silver wires around the leg, some of them returning the following year to breed in the locality where they had been born. After several persons in America had arranged schemes for the marking of birds the American Bird Banding Association was organized, in 1909, through the efforts of Dr. L. J. Cole, and con-

tinued until 1920, when its activities were taken over as part of the work of the Bureau of Biological Survey, U.S. Department of Agriculture. Under Government auspices the work has been expanded through a co-operative scheme until now more than 1,500 persons are engaged in banding birds in the United States and Canada, and to 1928 approximately 350,000 birds had been banded. Early work was concerned with the marking of young birds before they were able to fly, or the casual capture of adult individuals. In recent years this has changed to the banding, principally, of adults captured by a variety of ingenious traps, and then marked and released. Banding in the United States has progressed to a point where there have been organized four regional societies concerned with it. Though hundreds of birds that have been marked are not subsequently detected, enough are recovered to render the work profitable to a high degree. Among ordinary birds from one to four in every hundred banded are later retaken, while among ducks, which are hunted as game, the recovery runs from 12 to 20 in each hundred, a remarkable number. Through the trapping method it often happens that banded birds are retaken and released uninjured, sometimes on several occasions.

Through banding, it has been found that some birds have winter homes as definitely defined as those inhabited in summer. As a case in point, there may be mentioned the white-throated sparrow (*Zonotrichia albicollis*), which nests in the northern section of eastern North America, from Massachusetts and Wyoming north to Labrador and Great Bear lake, and winters in the central and southern States. A bird of this species banded by S. P. Baldwin, near Thomasville, Georgia, on March 5, 1916, was retaken within a few yards of the original spot on March 7 and 19, 1917, on several occasions between February 25 and March 22, 1920, and on March 27, 1921, indicating a remarkable regularity in return to one spot. Wild ducks banded by the writer at the northern end of Great Salt lake, in Utah, were killed subsequently in California, Mexico, Texas, Oklahoma, Missouri, Nebraska and Saskatchewan, revealing a tremendous spread in flight, and, with other similar data, giving information of great importance in game conservation. A black-headed gull (*Larus ridibundus*), banded at Rossitten, Germany, was taken subsequently at Bridgetown, Barbados, and another from the same point crossed to Vera Cruz, Mexico. A common tern, marked at Eastern Egg Rock, on the coast of Maine, was found dead four years later at the mouth of the Niger. A lapwing (*Vanellus vanellus*) banded in Cumberland, England, was taken in Newfoundland. Such examples of trans-oceanic migration will increase as the work progresses.

SONGS AND CALLS

The voice in mammals, including man, is produced in the voice-box, or larynx, in the upper part of the throat. The bird possesses a similar larynx; but its sounds and notes are formed in another voice-box, the syrinx, at the lower end of the windpipe, where it divides to send a bronchial tube to either lung. The syrinx is composed of firm walls derived from the rings of the trachea, or in part from the bronchi, and has within delicate membranes whose tension is controlled by slender muscles. Air expelled forcibly over these membranes produces sound which may be of many kinds, according to the species concerned. The adult turkey vulture (*Cathartes aura*), and the brown pelican (*Pelecanus occidentalis*), have as their only note a sighing aspiration made by expelling the air unmodulated, though their young utter harsh calls in some variety, either in begging for food or in attempting to repel possible enemies. The voiceless condition in the adult is unusual. The rhea sends forth a booming call, ventriloquial in effect, that carries for long distances, the wedge-tailed shearwater utters a series of indescribable groans and shrieks, which combine with those of thousands of its kind to produce a vast volume of sound, the gull or tern calls in constant iteration with a note of harshest sound. In the highest order of birds, among the oscines or song-birds, song has reached high development, and in many follows lines of human music sufficiently to give deep aesthetic pleasure. The male mockingbird (*Mimus polyglottos*) of America, is stirred by spring to a period of vocal utterance that includes a varied repertoire of utterances peculiar to his

own expression, as well as notes borrowed from tuneful neighbours. In the height of the breeding season his efforts continue day and night in apparently ceaseless expression of virile energy. The nightingale (*Luscinia megarhyncha*) of Europe, a dweller of tangled copses, would be overlooked by many were it not for his impassioned outburst of song (which, contrary to popular belief, may be heard at all hours of day and night). The two just mentioned, with the addition of the hermit thrush and the skylark, are the songsters of greatest renown among English-speaking peoples.

A number of bird-songs, even where they have variety of note, are frequently unpleasant to some human ears. Many complain of the doleful cadence of the cooing of mourning doves (*Zenaidura macroura*), or are unpleasantly affected by the harsh chatter of the house sparrow. The song of the plant-cutter (*Phytotoma rutila*) of Argentina exactly resembles the creaking of two tree-limbs rubbing against one another in the wind. The song of the Henslow's sparrow (*Passerherbulus henslowii*) is a low double note barely audible at a hundred yards.

The song impulse is so predominant at the height of its period that it is given expression on the slightest disturbance. Birds awakened at night frequently sing for an instant as clearly as during the day, and song also may be used to express emotions of fear and anger.

Though modulated speech for the expression of abstract ideas may be peculiar to man, there is no question but that birds possess a rudimentary language in the sense that they use their calls to communicate with one another. A low call on the part of a parrot or parakeet at detection of a sound or sight that may denote danger will instantly cause the entire group of its companions to become motionless, or send them in screaming confusion into the air. The mother pheasant warns her young, who immediately hide and cannot be found. The rooster, by rapid repetition of a certain note, calls the members of his harem to some supply of food. There are also cries of anger, and others that may be interpreted as conversational, that enable species of social habit to keep in touch with one another. Bird-calls are often intelligible to other creatures, as the alarm-call of a jay or plover will often startle deer or other game.

There are a number of birds that possess a strong imitative faculty which, in domesticated individuals, may be adapted to the mimicry of human sounds. Canaries and other finches may be taught to whistle a few notes of musical airs. The Amazon parrots are particularly adept at mimicry of the human voice, and similar ability is found in some macaws, paroquets and other parrots. Crows, jays and magpies also may learn to repeat a few words, as may starlings and mynahs. According to a widely current superstition the tongues of the latter birds must be split to enable them to articulate human speech, a belief for which there is no valid basis, whatever, and which, when practised, imposes a needless cruelty. This curious belief may be based on the fact that the tongue of crows and jays is naturally somewhat split.

FLIGHT

The wing-membranes of the ancient reptilian pterosaur (see PTERODACTYL) were supported by elongated finger-bones, as are the wings of bats (though differently), but birds have developed another mechanism for flying, as the fore-limb, including the hand, has long feathers projecting from its posterior margin that are extended to form a supporting surface, by which flight is accomplished (see also BIRD). The hand is stiffened, being flexible only at the wrist, the number of hand and finger-bones is reduced, and those that remain are partly fused together. The wing thus developed folds against the sides, so that it causes no embarrassment when the bird is at rest or is walking or climbing, but at the same time may be extended instantly should need or desire for flight arise. It appears thus perfectly adapted for its purpose and in utility (though not in speed) eclipses the aeroplanes of man.

Methods in Flight.—Avian flight is accomplished, except when soaring, by strokes of the wings, which may be slow or fast according to circumstances or the custom of the bird. A

certain momentum must be acquired before the bird actually moves through the air. From a level surface this is ordinarily accomplished by an initial spring, through which the flexed legs throw the body as though from a catapult. From an elevation, as from a cliff or the limb of a tree, a fall of a few inches or a few feet may occur before the bird is under way. Albatross take off from land facing the wind, running a few steps forward with beating wings and then spreading their pinions, to rise and sail gracefully away. Some aquatic birds with small wings and heavy bodies, as coots, diving ducks, grebes and loons rush across the water surface with beating wings and alternately striking feet until they acquire sufficient momentum to carry them into the air. Surface-feeding ducks, on the contrary, spring directly into the air with one tremendous impulse that gives such impetus that they fly without appreciable pause. Grebes rise with difficulty except from the water. From a smooth, hard surface they can sometimes take off in flight, but in herbage they are unable to rise, as the slightest obstructions break their momentum.

There is a considerable group of birds that in their active moments are so constantly in the air that they may almost be termed aerial creatures. The swallows are an excellent example of these as they secure their entire supply of food in the air, and for hours on end circle and swing with tirelessly moving wings, only perching when their appetite is satisfied, for the purpose of rest at night, or at their nests.

Aerial existence of a stronger, more placid type, is exemplified by the great vultures and the larger hawks that circle and turn on broadly extended wings above the earth, frequently at great heights. Such birds may soar for hours with only an occasional stroke of the wings, as they use the force of rising or laterally moving air-currents to maintain themselves, the only motion being a constant slight adjustment of the angle of the wings, particularly at the tips, and of the tail to secure the proper amount of upward thrust to enable them to maintain the desired altitude and at the same time move ahead. The turkey vulture (*Cathartes aura*), which uses a soaring flight constantly for its progress through the air, is seldom abroad on foggy days when the air is still, but on such occasions remains quietly in its roosts. Many other birds soar merely for the pleasure that this occasions. Pelicans, cormorants, storks, and screamers, to mention only a few, are seen wheeling for hours so high above the earth that they appear as mere specks in the sky, though these birds search for food near, or on the surface of, water or the ground. Soaring flight of a different kind is seen where gulls glide beside or over a vessel, holding steady position in one place for minutes at a time without movement of the wings. This again is occasioned by steady air-currents that are deflected from the surfaces of the boat at a constant angle.

Hawks and the other soaring birds that have been mentioned that perform their flights relatively high in the air have wings wide in proportion to their length. Albatrosses and other seabirds that travel habitually near the surface of the water have long, narrow wings that when fully extended are more or less of equal width throughout their length, and so are somewhat similar in shape to the wings of a monoplane. These birds progress by utilization of air-currents induced by wind, and are most common in pelagic regions where there are regular winds, and are rare in regions of calm. Their flight is quick and subject to sudden turns, so that the method of progression differs somewhat from the smooth, spiraling turns that mark the soaring of hawks and vultures. As the larger petrel-like birds follow in the wake of ships they bank and turn rapidly with stiffly-extended wings, frequently swinging so that the plane of the wings for a brief space is at right angles to the line of the horizon. It is common to see shearwaters caught in the trough of a wave fly rapidly to the crest and then scale with set wings down the succeeding moving slope of water.

Birds like magpies and ducks, that habitually fly long distances, travel with a steady beat of the wings that carries them in a smooth, direct line. Inhabitants of thickets and hedgerows, as sparrows and wrens, progress with a tilting flight in which the short, rounded wings move rapidly for a few quick strokes, and

then pause for a very brief instant, so that the flight is rapidly tilting, or irregular in a vertical plane. Another group of birds, as many woodpeckers, fly in long undulations with a regular rise, during which the wings are stroked rapidly, and a slow descent, during which they are closed and the bird progresses through a combination of its previous momentum and the pull of gravity.

Such ground-haunting birds as the grouse and quails regularly walk or run, and use their wings extensively only to carry them from danger. In these the wings move rapidly, so that flight is swift and is accompanied by a roaring sound. The rapid movement is maintained for a comparatively short distance when the bird drops to the ground to hide in cover. Flight at high speed is thus maintained for only a brief space. The tinamous (*Tinamidae*) of South America, birds of grouse-like appearance related to the rheas, like grouse, fly only when pressed. They rise violently and drive rapidly away for fair distances, but are reluctant to rise again, and when forced to fly a second or third time do so with some difficulty. They are so seldom in the air that in violent winds they cannot easily control their direction, and often alight so clumsily that they fall.

Ground-inhabiting birds that reside on islands where they have no regular persistent enemies, have little incentive to flight, with the result that wings become shortened and their movement weakened. In many instances, particularly among rails, this has resulted in species in which the power of flight is completely lost, and the wings, though they may beat rapidly as the bird runs, cannot raise it from the ground. In some species now living loss of power of flight is now taking place. The Laysan teal (*Anas laysanensis*) is now in this process, so that, though an initial flight of about 100 yd. may be made, the birds are then exhausted and may sometimes be caught by hand.

Speed of Flight.—The speed that birds attain in flight, until comparatively recent years, has been a matter of uncertainty, in many cases subject to gross exaggeration. Most of these may be traced to Gätke, who in his otherwise admirable studies of migration on the island of Heligoland became seized with the hypothesis that birds perform most of their migration-flight during the course of a single night. On this theory, he placed the migratory speed of the northern blue-throat at 180 to 240 m. per hour, the hooded crow at 108 m., and plovers and related species at 240 m. per hour, or 4 m. per minute. He believed that these tremendous speeds were possible through flight at great altitudes, even to 40,000 ft. above the earth, where he supposed that the thin air offered little resistance. These statements, which have been widely quoted, are wholly erroneous.

Reliable data on the rate of flight have accumulated slowly during the past 15 years. The writer has secured some information on the subject by timing birds flying parallel to roads by means of the speedometer of an automobile, and in such diverse forms as herons, hawks, horned larks, ravens and shrikes has found the usual flight to vary from 22 to 28 m. per hour. Another observer has found the Arkansas kingbird and scissor-tailed flycatcher flying at only 10 to 17 m. per hour. Gladstone gives similar records for the willow warbler as 23½ m. per hour, the pied wagtail as 25, the European blackbird as over 22, the missel thrush as 23, and the cuckoo as 23 m. per hour.

Meinertzhagen has recently given very definite data on the speed of flight in birds from observations made by theodolites designed to estimate the speed of aeroplanes at anti-aircraft stations, by stop watches along measured courses, and by observations from travelling aeroplanes. From his records it appears that members of the crow family may travel from 31 to 45 m. per hour, the smaller perching birds, as larks, pipits and buntings from 20 to 37 m. per hour, starlings from 38 to 49 m., geese from 42 to 55 m., ducks 44 to 59 m., falcons 40 to 48 m. and sand grouse 43 to 47. The fastest flying birds known are found in the family of swifts (*Micropodidae*). One species (apparently the common swift of Eurasia), observed from an aeroplane in Mesopotamia, circled easily about a plane when this was flying at 68 m. per hour. From this and other observations it appears that ordinary swifts fly regularly at 70 m., and may accelerate this to 100 m. per hour for necessity or pleasure.

FOOD

During their long period of evolution, birds have become adapted to all foods available to their methods of feeding. Geese graze on tender herbage as readily as cattle, rheas and ostriches select a miscellaneous vegetable diet, the plant-cutter (*Phytotoma*) eats buds, berries and other vegetable matter, the palm-chat of Haiti (*Dulus dominicus*) frequently consumes blossoms, the sagehen (*Centrocercus urophasianus*) delights in the bitter twigs and leaves of sage (*Artemisia*), ducks are fond of succulent roots, tubers and leaves of aquatic plants, and many other birds have similar propensities for plant-stems or leaves. Fruits are taken by many birds, while the number of birds that depend upon starchy seeds for the major part of their diet is myriad, and includes a great variety of species. The finches with their strong bills crack off the investing hulls of large seeds and consume only the starchy interior. Small hard seeds, as those of lambs-quarter (*Chenopodium*), are swallowed entire and are ground up by sand and bits of gravel swallowed for the purpose. Grackles (*Quiscalus*) by means of a keeled process on the palate, cut around the shells of acorns until they crack in two and the meat is exposed. Jays hold nuts between the toes and break them open by strong blows of the beak. Some woodpeckers force acorns into crevices in trees, where they are held until they may be broken open. The mallard and wood-duck swallow acorns and even entire nuts of the hickory, which have a shell so thick that it requires a strong blow of a hammer to break them, and grind them up in their gizzards. Seeds form a standard autumn and winter food when other sustenance is lacking, and are produced in tremendous quantity. From the stomach and gullet of one mallard duck there have been taken 102,400 seeds of the water primrose (*Jussiaea leptocarpa*).

Birds that feed on insect-life abound, and include a large proportion of the smaller species. Vireos, warblers and kinglets search actively for insects among leaves and twigs, picking off their prey at rest or flying out a few inches after some escaping titbit. Flycatchers (*Tyrannidae*) watch from commanding perches and fly out to snap up passing insects on the wing, or occasionally to pick them from the ground. Nuthatches and creepers search over the bark of trees for insects, spiders or eggs hidden in the crevices, and woodpeckers chisel out coleopterous grubs from their hidden tunnels in wood. Usually these are found in decaying trunks, but occasionally some of the stronger woodpeckers will cut in through 1 in. of hard wood to secure a grub. The flicker (*Colaptes*) feeds much on the ground on ants, which it secures by its long tongue as the insects run about their hills. More than 6,000 ants have been taken from the stomach of one flicker. Swifts, swallows and nightjars feed exclusively on the wing, securing flying insects in their capacious mouths. In the stomach of one nighthawk there have been found 50 species of flying insects comprising several thousand individuals. Cuckoos consume large numbers of hairy caterpillars, from which the stomach becomes so filled with hairs stuck in the lining that its inner surface appears covered with short, stiff fur. Hummingbirds live on the nectar of flowers and tiny flies, Hymenoptera, beetles and spiders that find a home in blossoms or in the bark of trees.

Grebes, divers, herons, mergansers, cormorants and pelicans feed on fish of various kinds, most often on species not especially desirable from a human standpoint. Albatrosses and shearwaters take quantities of squid, and the smaller petrels seem to secure the miscellaneous array of smaller marine creatures known collectively as plankton (*q.v.*). Hawks and owls feed extensively on small mammals and other birds. Some eat frogs, snakes and large insects, as well as crayfish. Larger owls may capture and consume smaller ones, and partly-grown brown pelicans, when ravenous with hunger, may seize and swallow a small member of the colony, that has just been fed. The flesh of dead animals, even in the form of putrid carrion, is sought by vultures that eat with impunity where death from poison from bacillary action would be the fate of another creature.

Though most birds seek their food day by day and so live an existence that involves continual search for sustenance, a few species form food-stores against a time of scarcity. Most

remarkable among these is a group of North American woodpeckers (*Balanophya formicivora*), that drill holes in the trunks of trees, in which they fit acorns, and so preserve a part of the acorn harvest for subsequent consumption. The birds work assiduously, as 13,200 acorns have been estimated as the store on one large tree-trunk, with an average density of 60 to the square foot. That the instinct for storage sometimes goes astray is shown when the carefully-drilled holes are filled with pebbles instead of nuts. The red-headed woodpecker (*Melanerpes erythrocephalus*) fills cavities with quantities of acorns or other small nuts, over which it piles bits of bark to conceal them. Many shrikes (*Lanius*), when food is abundant, frequently impale the bodies of grasshoppers, birds, mice or other prey on thorns, to return to them later if needed.

Hawks and owls swallow their prey entire or in large fragments, digest out all nutritive matter and form the bones, fur, scales, feathers or chitin into pellets, which are subsequently regurgitated, leaving the stomach empty to receive another meal. Albatrosses eject pellets composed of the beaks of squids, flycatchers masses of insect chitin, and even hummingbirds may throw up tiny pellets made up of the indigestible portions of their insect food. Birds with strong, muscular gizzards, that feed on seeds, swallow sand or gravel that serves as millstones to triturate into digestible starch meal the seeds they have eaten.

The Brahmins maintain towers where food for birds is placed, and where birds may nest. In Japanese temples shelves are built where swallows may erect their homes. Indians in the eastern United States placed hollow gourds on bare stubs of trees to provide nesting cavities for the purple martin (*Progne subis*), a species of swallow, a practice that was adopted by early colonists from Europe, and that is followed to-day in country districts in the southern States. From these somewhat rude foundations there have developed complicated procedures for the attraction of birds about human homes. The martin-gourd has been transformed into ornate martin-houses containing many compartments, each of a size to house a pair of birds, and boxes or houses have been designed for many other hole-nesting birds. Though in use in many places, particularly in Germany, at an earlier date, it is since the beginning of the present century that methods for the attraction of birds have received widespread attention. In the United States and Europe single-compartment houses (nesting-boxes) are set up for wrens, bluebirds, tits, woodpeckers and similar birds, and where favourably located are occupied without the slightest hesitation. These bird-houses are of many types, and so many are used that commercial companies have been formed for their manufacture.

Large pieces of suet tied to the trunks or limbs of trees, where birds may feed without fear of capture from cats, draw woodpeckers, nuthatches and titmice. A shelf built on an outside window ledge will draw many birds where they may be seen to the best advantage. Sunflower and canary seed, wheat, chick-feed, moderately fine-ground corn, nut meats and crumbs of bread are all relished by feathered neighbours. A mixture of suet and nut meats, preferably peanuts, ground medium fine in a food grinder, is especially relished by titmice and jays. Birds come to such feeding stands throughout the year.

ORIGIN AND EVOLUTION

Bizarre as the idea may seem at first, birds are more closely allied to reptiles (*q.v.*) than to any other living group of vertebrates. The bird, while similar to the reptile in much of its structure, in its superior mental capacity, and concomitant adaptations that this has permitted, has far outstripped its lowly cousins, and so has flourished and multiplied while its cold-blooded relatives with decreasing numbers have fallen behind in the race of life. From one viewpoint we may look upon the bird as the attempt of the reptilian groups to retain the dominance of the earth that was theirs during the Mesozoic era, a design that was frustrated by the development of mammals.

The earliest birds known were contemporaneous with dinosaurs (*q.v.*), to which, structurally, they seem to have close affinity, particularly to the hollow-boned, agile, bird-like groups. As these

creatures existed at a time when primitive birds were also known search must be carried farther into the ages for a generalized reptilian group from which both birds and dinosaurs may have sprung. This, apparently, is found in the fossil reptiles known as the Pseudosuchians, of early Triassic times; though according to some the original ancestor of the bird-like creatures should be sought in still older ages in the Permian.

Fossil Birds.—The bones of birds are so poorly preserved in the fossil state that there is record now of only about 750 fossil forms, including some of questionable identity. The earliest fossils known are *Archaeopteryx* (*q.v.*) and *Archaeornis* of the Jurassic beds of Bavaria, creatures with toothed jaws, very long, bony tails with feathers projecting along the sides, and free fingers, that in spite of their reptilian form, were birds, as they were covered with feathers and were able to fly. In the Cretaceous period two types of birds, both possessing teeth, are known from nearly complete skeletons, *Hesperornis* and its allies, diver-like species that lived in water and seemed to have had no wings, and *Ichthyornis* which was aerial and may have had the habits of a gull (see ODONTORNITHES). These four are the most peculiar fossil birds known at present, since others, while often strange, are allied more or less closely to modern families.

At the beginning of the Tertiary period the types of birds found were suggestive, in form, of existing birds, though in the Eocene some were highly peculiar, and most seem to pertain to extinct families. In the Miocene there occur a number of birds very closely similar to those existing to-day, and in the Pleistocene are found bones of numerous birds still in existence, in addition to many that differed from modern forms.

The progress of the avian group since the coming of the Pleistocene ice seems to have been one of extermination rather than of consistent evolutionary progress, as peculiar types seem to have been exterminated in numbers during the Pleistocene, and there is no indication that others have developed to take their places except for the minor characters that distinguish sub-species or poorly-marked species. The story of fossil birds is far from complete, and much work remains to be done on many of those at present discovered, to establish their relationship.

SYSTEMATIC CLASSIFICATION

It is difficult to arrive at an exact figure for the number of kinds of birds now known, but at a conservative estimate it is believed this may reach 25,000 distinct forms.

The primary group or class, Aves, is one of the great divisions of the vertebrates and is equal in rank to the fishes, amphibians, reptiles and mammals. This class is divided into two sub-classes, the first, the Archaeornithes, containing the most primitive birds which are very close to reptiles, and the second, the Neornithes, all other known birds. The Neornithes are divided again into three major divisions or super-orders, the Odontognathae, containing forms with teeth, the Palaeognathae, for the ostrich-like birds and their allies, which have a primitive arrangement of the bones of the palate, and the Neognathae, including the remaining species with a more specialized modern type of palatal structure. These super-orders are divided again into orders, sub-orders, super-families and families. An arrangement embodying modern ideas of classification follows:

Class Aves.

Sub-class ARCHAORNITHES

Order Archaeopterygiformes

Family Archaeopterygidae, *Archaeopteryx*, *Archaeornis* (fossil)

Sub-class NEORNITHES

Super-order Odontognathae, toothed bird

Order Hesperornithiformes

Family Hesperornithidae, *Hesperornis*, *Hargeria* (fossil)

" Enaliornithidae, *Enaliornis* (fossil) [position provisional]

Order Ichthyornithiformes

Family Ichthyornithidae, *Ichthyornis* (fossil)

Super-order Palaeognathae

Order Struthioniformes

Family Struthionidae, *Ostriches* (Old World)

Order Rheiformes

Family Rheidae, *Rheas* (South America)

- Order **Casuariiformes**
 Family **Casuariidae**, Cassowaries (Australian region)
 " **Dromicidae**, Emus (Australian region)
 " **Dromornithidae**, *Dromornis* (fossil)
- Order **Dinornithiformes**
 Family **Dinornithidae**, Moas (extinct, New Zealand)
- Order **Aepyornithiformes**
 Family **Aepyornithidae**, *Aepyornis* (extinct, Madagascar)
- Order **Apterygiformes**
 Family **Apterygidae**, Kiwis (New Zealand)
- Order **Tinamiformes**
 Family **Tinamidae**, Tinamous (S. Central America)
- Super-order **Neognathae**
- Order **Sphenisciformes**
 Family **Spheniscidae**, Penguins (Southern hemisphere)
 " **Cladornithidae**, *Cladornis* (fossil)
- Order **Gaviiformes**
 Family **Gaviidae**, Loons and divers (Arctic & North temperate)
- Order **Colymbiformes**
 Family **Colymbidae**, Grebes (Cosmopolitan)
- Order **Procellariiformes**
 Family **Diomedidae**, Albatrosses (Tropics, sub-Tropics & Antarctic)
 Family **Procellariidae**, Shearwaters, Fulmars (Cosmopolitan)
 Family **Hydrobatidae**, Small Petrels (Cosmopolitan)
 " **Pelecanoididae**, Diving Petrels (Cosmopolitan)
- Order **Pelecaniformes**
 Sub-order **Phaethontes**
 Family **Phaethontidae**, Tropic-birds (tropical)
- Sub-order **Pelecani**
 Super-family **Pelecanides**
 Family **Pelecanidae**, Pelicans (Tropics, sub-Tropics and warm temperate)
 Family **Cyphornithidae**, *Cyphornis*, *Palaeochenoides* (fossil)
- Super-family **Sulides**
 Family **Pelagornithidae**, *Pelagornis* (fossil)
 " **Sulidae**, Boobies, Gannets (Cosmopolitan)
 " **Phalacrocoracidae**, Cormorants (Cosmopolitan)
 " **Anhinga**, Snake-Birds or darters (Tropics and sub-Tropics)
- Sub-order **Fregates**
 Family **Fregatidae**, Man-o'-war Birds (Tropics and sub-Tropics)
- Sub-order **Odontopteryges**
 Family **Odontopterygidae**, *Odontopteryx* (fossil)
- Order **Ciconiiformes**
 Sub-order **Ardeae**
 Family **Ardeidae**, Herons, Bitterns (Cosmopolitan)
 " **Cochleariidae**, Boat-billed Herons (S. America)
- Sub-order **Balaenicipites**
 Family **Balaenicipitidae**, Shoe-bills (Africa)
- Sub-order **Ciconiae**
 Super-family **Scopides**
 Family **Scopidae**, Hammerheads (Africa)
- Super-family **Ciconiides**
 Family **Ciconiidae**, Storks, Jabirus (Cosmopolitan)
- Super-family **Threskiornithides**
 Family **Threskiornithidae**, Ibises, Spoonbills (Cosmopolitan)
- Sub-order **Phoenicopter**
 Family **Phoenicopteridae**, Flamingos (temperate & tropical regions)
- Order **Anseriformes**
 Sub-order **Anhimae**
 Family **Anhimidae**, Screamers (South America)
- Sub-order **Anseres**
 Family **Anatidae**, Ducks, Geese, Swans (Cosmopolitan)
- Order **Falconiformes**
 Sub-order **Cathartae**
 Family **Cathartidae**, New World Vultures (America)
 " **Teratornithidae**, *Teratornis* (fossil)
- Sub-order **Falcones**
 Family **Sagittariidae**, Secretary-birds (Africa)
 " **Accipitridae**, Hawks, Old World Vultures, Harriers, Ospreys (Cosmopolitan)
 Family **Falconidae**, Falcons, Caracaras (Cosmopolitan)
- Order **Galliformes**
 Sub-order **Galli**
 Super-family **Cracides**
 Family **Megapodidae**, Megapodes (Australian region)
 " **Cracidae**, Curassows, Guans, Chachalacas (Central & South America)
- Super-family **Phasianides**
 Family **Tetraonidae**, Grouse (Cosmopolitan)
- Family **Perdidae**, Quails (Old World)
 " **Phasianidae**, Pheasants, Peacocks, Common Fowl (Old World)
 Family **Numididae**, Guinea-fowl (Africa)
 " **Meleagridae**, Turkeys (America)
- Sub-order **Opisthocomi**
 Family **Opisthocomidae**, Hoatzins (South America)
- Order **Gruiformes**
 Sub-order **Mesoenatides**
 Family **Mesoenatidae**, Roatelos, Monias (Madagascar)
- Sub-order **Turnices**
 Family **Turnicidae**, Bustard-Quails (Old World)
 " **Pedionomidae**, Collared Hemipodes (Old World)
- Sub-order **Grues**
 Super-family **Gruides**
 Family **Gruidae**, Cranes (Cosmopolitan except South America)
 Family **Aramidae**, Limpkins (America)
 " **Psophiidae**, Trumpeters (South America)
- Super-family **Rallides**
 Family **Rallidae**, Rails, Coots, Gallinules (Cosmopolitan)
- Sub-order **Heliornithes**
 Family **Heliornithidae**, Sun-Grebes or tin-foots (Old World and South America)
- Sub-order **Rhynocheti**
 Family **Rhynochetidae**, *Kagus* (New Caledonia)
- Sub-order **Eurypygae**
 Family **Eurypygidae**, Sun-Bitterns (Central and South America)
- Sub-order **Phororhaci**
 Family **Phororhacidae**, *Phororhacos* (fossil)
- Sub-order **Cariamae**
 Family **Hermosiornidae**, *Hermosiornis* (fossil)
 " **Cariamidae**, Cariamas (South America)
- Sub-order **Otides**
 Family **Otididae**, Bustards (Old World)
- Order **Diatrymiformes**
 Family **Diatrymidae**, *Diatryma* (fossil)
- Order **Charadriiformes**
 Sub-order **Charadrii**
 Super-family **Jacaniides**
 Family **Jacaniidae**, Jacanas (Tropics)
- Super-family **Charadriides**
 Family **Haematopodidae**, Oyster-catchers (Cosmopolitan)
 Family **Charadriidae**, Plovers, Lapwings, Turnstones, Surf-birds (Cosmopolitan)
 Family **Scolopacidae**, Snipe, Woodcock, Sandpipers (Cosmopolitan)
 Family **Recurvirostridae**, Avocets, Stilts (Cosmopolitan)
- Family **Presbyornithidae**, *Presbyornis* (fossil)
 " **Phalaropodidae**, Phalaropes (Northern hemisphere)
- Super-family **Dromades**
 Family **Dromadidae**, Crab-plovers (India, Arabia and East Africa)
- Super-family **Oedinenides**
 Family **Oedinenidae**, Thick-knees (Cosmopolitan)
- Super-family **Glaucolides**
 Family **Glaucolidae**, Pratincoles, Coursers (Old World)
- Super-family **Thinocorides**
 Family **Thinocoridae**, Seed-snipe (Tropics)
- Super-family **Chionides**
 Family **Chionidae**, Sheath-bills (Southern hemisphere)
- Sub-order **Lari**
 Family **Stercorariidae**, Skuas, Jaegers (Cosmopolitan)
 " **Laridae**, Gulls, Terns (Cosmopolitan)
 " **Rynchopidae**, Skimmers (America, Africa and South Asia)
- Sub-order **Alcae**
 Family **Alcidae**, Auks, Auklets, Murres, Guillemots (North temperate and Arctic)
- Order **Columbiformes**
 Sub-order **Pterocletes**
 Family **Pteroclididae**, Sand-Grouse (Old World)
- Sub-order **Columbae**
 Family **Raphidae**, Dodo, Solitaire (Mauritius, Réunion, Rodriguez)
 Family **Columbidae**, Pigeons, Doves (Cosmopolitan)
- Order **Cuculiformes**
 Sub-order **Musophagi**
 Family **Musophagidae**, Plantain-eaters (Africa)
- Sub-order **Cuculi**
 Family **Cuculidae**, Cuckoos, Road-runners, Anis (Cosmopolitan)

Order Psittaciformes
 Family Loriidae, Lories (Australian region)
 " Psittacidae, Parrots, Macaws (Tropics & sub-Tropics)
 Order Strigiformes
 Family Tytonidae, Barn-owls (Cosmopolitan)
 " Strigidae, Owls (Cosmopolitan)
 Order Caprimulgiformes
 Sub-order Steatornithes
 Family Steatornithidae, Oil-birds (South America)
 Sub-order Caprimulgi
 Family Podargidae, Frogmouths (India and Australia)
 " Nyctibiidae, Potoos (Old World Tropics)
 " Aegothelidae, Owlet-Frogmouths (Old World Tropics)
 Family Caprimulgidae, Nightjars, Night-hawks, Whip-poorwills (Cosmopolitan, except east Pacific)
 Order Micropodiformes
 Sub-order Micropodii
 Family Micropodidae, Swifts (Cosmopolitan)
 " Macropterygidae, Crested Swifts (Asia)
 Sub-order Trochili
 Family Trochilidae, Hummingbirds (America)
 Order Coliiformes
 Family Coliidae, Colies (Africa)
 Order Trogoniformes
 Family Trogonidae, Trogons (Tropics)
 Order Coraciiformes
 Sub-order Alcedines
 Super-family Alcedinides
 Family Alcedinidae, Kingfishers (Cosmopolitan)
 Super-family Todides
 Family Todidae, Todies (West Indies)
 Super-family Momotides
 Family Momotidae, Motmots (Central and South America)
 Sub-order Meropes
 Family Meropidae, Bee-eaters (Old World)
 Sub-order Coracii
 Family Coraciidae, Rollers (Old World)
 " Leptosomatidae, Ground-rollers (Madagascar)
 " Upupidae, Hoopoes (Old World)
 " Phoeniculidae, Wood-hoopoes (Africa)
 Sub-order Bucerotes
 Family Bucerotidae, Hornbills (Old World Tropics)
 Order Piciformes
 Sub-order Galbulae
 Super-family Galbulides
 Family Galbulidae, Jacamars (Central and South America)
 Family Bucconidae, Puff-birds (Central & South America)
 Super-family Capitonides
 Family Capitonidae, Barbets (Tropics)
 " Indicatoridae, Honey-guides (Old World)
 Super-family Rhamphastides
 Family Rhamphastidae, Toucans (Central and South America)
 Sub-order Pici
 Family Picidae, Woodpeckers, Piculets (Cosmopolitan, except Madagascar and Australia)
 Order Passeriformes
 Sub-order Eurylaimi
 Family Eurylaimidae, Broadbills (Indo-Malaya)
 Sub-order Tyranni
 Super-family Furnariides
 Family Dendrocolaptidae, Wood-hewers (South America)
 Family Furnariidae, Ovenbirds (America)
 " Formicariidae, Ant-thrushes (Central and South America)
 Family Conopophagidae, Ant-pipits (South America)
 " Rhinocryptidae, Tapaculos (Central and South America)
 Super-family Tyrannides
 Family Cotingidae, Cotingas (America)
 " Pipridae, Manakins (Central and South America)
 Family Tyrannidae, New World Flycatchers (America)
 " Oxyruncidae, Sharp-bills (Central and South America)
 Family Phytotomidae, Plant-cutters (South America)
 " Pittidae, Pittas (Old World Tropics)
 " Xenicidae, New Zealand Wrens (New Zealand)
 " Philpittidae, Asities or Wattled Ant-thrushes (Madagascar)
 Sub-order Menurae
 Family Menuridae, Lyre-birds (Australia)
 " Atrichornithidae, Scrub-birds (Australia)

Sub-order Oscines
 Family Alaudidae, Larks (Cosmopolitan, one genus in America)
 Family Palaeospizidae, *Palaeospiza* (fossil)
 " Hirundinidae, Swallows, Martins (Cosmopolitan)
 Family Campephagidae, Cuckoo-shrikes (Old World)
 " Dicruridae, Drongos (Old World Tropics)
 " Oriolidae, Old World Orioles (Old World)
 " Corvidae, Crows, Magpies, Jays (Cosmopolitan)
 Family Ptilinorhynchidae, Bower-birds (Australian region)
 Family Paradisidae, Birds of Paradise (Australian region)
 Family Paridae, Titmice (Europe, Asia, Africa, North America)
 Family Sittidae, Nuthatches (Northern hemisphere, Australia, Madagascar)
 Family Hyposittidae, Coral-billed Nuthatches (Madagascar)
 Family Certhiidae, Creepers (Europe, Asia, North America, Australia)
 Family Chamacidae, Wren-tits (Oregon and California)
 " Timeliidae, Babbling Thrushes (Old World)
 " Pycnonotidae, Bulbuls (Old World)
 " Cincidae, Dippers (Northern hemisphere)
 " Troglodytidae, Wrens (Cosmopolitan, except Africa and Australia)
 Family Mimidae, Thrashers, Mockingbirds (America)
 " Turdidae, Thrushes (Cosmopolitan)
 " Zeledoniidae, Wren-thrushes (Central America)
 " Paramythiidae, *Paramythia* (New Guinea)
 " Sylviidae, Old World Warblers (Old World)
 " Regulidae, Kinglets, Gold-crests (Northern hemisphere)
 Family Muscipapidae, Old World Flycatchers (Old World)
 Family Motacillidae, Wagtails, Pipits (Cosmopolitan)
 " Enicuridae, Fork-tails (Indo-Malaya)
 " Bombycillidae, Waxwings (mainly northern hemisphere)
 Family Ptilogonatidae, Silky Flycatchers (Tropical America)
 Family Dulidae, Palm-chats (West Indies)
 " Artamidae, Wood-swallows (Africa, India, Australia)
 Family Vangidae, Vanga Shrikes (Madagascar)
 " Lanidae, Shrikes (Cosmopolitan except South America)
 Family Prionopidae, Wood-shrikes (Old World Tropics)
 Family Aërocharidae, Helmet-birds (Madagascar)
 " Cycularhidae, Pepper-shrikes (Central and South America)
 Family Vireolaniidae, Shrike-vireos (Central and Northern South America)
 Family Sturnidae, Starlings (Old World)
 " Graculidae, Glossy Starlings (Old World)
 " Meliphagidae, Honey-eaters (Australian region)
 " Nectariniidae, Sun-birds (Africa, Asia, Australia)
 Family Dicaeidae, Flower-peckers (West Africa, Indo-Malaya, Australia)
 Family Zosteropidae, White-eyes (Africa, Asia, Australasia)
 Family Vireonidae, Vireos (America)
 " Coerebidae, Honey-creepers (Tropical America)
 Family Drepanididae, Hawaiian Honey-creepers (Hawaiian Islands)
 Family Mniotiltidae, Wood Warblers (America)
 " Ploceidae, Weaver-finches (Africa, South Asia, Australia)
 Family Icteridae, New World Blackbirds, Troupials (America)
 Family Procnidae, Swallow-Tanagers (America)
 " Thraupidae, Tanagers (America)
 Family Catamblyrhynchidae, Plush-capped Finches (Northern Andes)
 Family Fringillidae, Grosbeaks, Finches, Buntings (Cosmopolitan)
 [Fossil Families of uncertain Systematic position]
 Enaliornithidae, *Enaliornis*
 Gastornithidae, *Gastornis*
 Opisthodactylidae, *Opisthodactylus*

BIBLIOGRAPHY.—The literature of ornithology is extensive and important, and works on birds appear in increasing numbers annually. The following list of books is intended merely to indicate a few useful works for consultation from which general information may be obtained, and which will assist the student by references to other works. The titles are grouped for convenience under several headings.

General: G. M. Allen, *Birds and their Attributes* (Boston, Mass., 1925), a readable and accurate general account of birds as a group; G. Heilmann, *The Origin of Birds* (London, 1926), a discussion of fossil birds and their relations to reptiles; F. H. Knowlton, *Birds of the World* (New York, 1909), a popular and authentic account of the principal species; A. Newton, *A Dictionary of Birds* (London, 1893-96), a vast amount of information arranged in encyclopaedic form; W. P. Pycraft, *A History of Birds* (London, 1910), a general account of the biology and evolution of birds; J. A. Thomson, *The Biology of Birds* (London and New York, 1923), a modern account that considers broadly the entire subject.

Migration: A. L. Thomson, *Problems of Bird Migration* (London, 1926), a detailed discussion of migration; A. Wetmore, *The Migrations of Birds* (Cambridge, Mass., 1926), a summary of modern knowledge of migration in its broader aspects.

Manuals and Check Lists: Florence M. Bailey, *Handbook of Birds of the Western United States* (Boston, 1921), a manual for the identification and study of the birds of its region; E. C. Stuart Baker, *The Fauna of British India—Birds* (London, 1922, 4 vols. at present issued), a systematic account; F. M. Chapman, *Birds of Eastern North America* (New York, 1912), a manual for the identification and study of the birds of its region; E. Hartert, *Die Vögel der palaarktischen Fauna* (Berlin, 1903), an authoritative manual of the birds of Europe and North Asia; F. W. Hutton and J. Drummond, *The Animals of New Zealand* (Christchurch, N.Z., 1905), includes an account of the bird life of the Dominion; K. Lambrecht, *Fossilium Catalogus, I., Animalia, Aves* (Berlin, 1921), a list of known fossil birds; G. M. Mathews, *Systema Avium Australasianum* (London, 1927, one part issued, another in preparation), a list of names, with ranges of the birds of the South Pacific islands, including Australia; C. A. Reed, *Land Birds East of the Rockies; Water Birds East of the Rockies; Land Birds West of the Rockies* (Nat. Assoc. of Audubon Soc., New York), three booklets for easy identification of birds in the field by coloured illustrations; W. L. Slater, *Systema Avium Ethiopicarum* (London, 1924, one part issued, another in preparation), a list of names, with ranges of the birds of Africa; H. F. Witherby (editor), *A Practical Handbook of British Birds* (London, 1920-24), a complete manual for its region; American Ornithologists Union, *Check-list of North American Birds* (Philadelphia, 19—) the official list for America north of Mexico; British Ornithological Union, *List of British Birds* (London, 1915), the official list for the British Isles; Royal Australasian Ornithologists' Union, *Official Check-list of the Birds of Australia* (Melbourne, 1912, and thence quarterly), a list of names with ranges of Australian birds.

Economic Papers: W. Collinge, *The Food of some British Birds* (London, 1913), detailed studies of the food of certain British birds; J. Henderson, *The Practical Value of Birds* (New York, 1927), general review of economic status, with extended bibliography; Biological Survey, U.S. Dept. of Agriculture, many *Bulletins* by Judd, Beal, McAtee, Fisher, Kalmbach, Wetmore and others, beginning in 1892 and forming the most comprehensive series of reports on this subject.

Periodicals: American Ornithologists' Union, *The Auk* (Washington, D.C.), published quarterly, with articles of current, general and scientific interest, particularly relating to the New World, and with a *résumé* of current literature; British Ornithologists' Union, *The Ibis* (London), quarterly, articles of general and scientific interest, particularly of the Old World, review of current literature; Avicultural Society, *The Avicultural Magazine* (London), monthly, deals with problems of aviculture; American Museum of Natural History, *Bird Lore* (New York), bi-monthly, devoted to popular ornithology and bird protection; H. F. and G. Witherby, *British Birds* (London), monthly, a popular magazine on current ornithology in the British Isles; Cooper Ornithological Club, *The Condor* (Berkeley, Calif.), bi-monthly, devoted particularly to birds of western North America; Royal Australasian Ornithologists' Union, *The Emu* (Melbourne), to promote the interest of ornithology in Australia and adjacent regions; Sociedad Ornithologica del Plata, *El Hornera* (Buenos Aires), deals with current ornithological studies in the Argentine and adjacent countries; Deutsche Ornithologische Gesellschaft, *Journal für Ornithologie* (Berlin), for general and technical ornithological articles. (A. Wr.)

ECONOMIC ORNITHOLOGY

The method of analysing the food of birds has been described. An instance may be added. The skylark requires about 6 lb. of food per year; in other words 10,000 larks would require about 27 tons of food in a year. Knowing the percentages of food eaten by this species, it is possible to analyse this figure. Of the total bulk of food consumed in a year 35.5% consists of injurious insects, 3.5% of neutral insects, 2.5% of beneficial insects, 9.5% of grain, 1% of leaves, 2% of earthworms,

1% of slugs, 1.5% of miscellaneous animal matter, and 43.5% of weed seeds. In other words, the lark benefits the farmer in regard to 36.5% of its food eaten, is neutral in respect of 50.5%, and injurious only in respect of 13%. If the debit and credit account is further examined it shows on the former side a loss of 2½ tons of cereals, and on the latter something like 30,000,000 injurious insects and 30,000 slugs. Such a plague of insects left to themselves would have destroyed many more tons of cereals, root crops, etc. Thus the farmer is undoubtedly the gainer from the activities of this bird by an enormous tonnage of produce.

Some species of wild birds are injurious because they are too numerous, and as a result there are too many birds feeding upon the same kind of food in a given area, in consequence of which certain species supplement their diet by feeding upon cultivated crops. No better instance of this can be found than the European house sparrow. It has been estimated that in Great Britain alone the losses due to this species reach the incredible figure of £8,000,000 a year. Wherever it has been introduced it has increased and spread with startling rapidity, and proved an enemy to the cultivator.

The contention that insectivorous birds do more harm than good by attacking beneficial insects and parasitized caterpillars does not appear to be well founded. Similarly those species which feed largely upon the seeds of weeds have been regarded as beneficial, but it is now known that many of these species act as distributors of the seeds.

The Feeding of Nestlings.—During the first few days of life nestlings consume daily considerably more than their own weight of food and add 20 to 50% to their weight. From sunrise to sunset feeding continues, 200 to 300 visits being paid to the nest by the parent birds. With the exception of doves and pigeons, and aquatic and raptorial species, the food brought to the young consists of caterpillars, soft-bodied insects, spiders, worms and slugs. Moreover, during the whole of the nesting period the parent birds are feeding upon food similar to that fed to the young. "Few people," states H. C. Bryant, "have any realization of the great quantities consumed by birds. For instance, if we consider that there is an average of one meadow lark to every two acres of available land for cultivation (11,000,000 ac.) in the Sacramento and San Joaquin valleys, and that each pair of birds raises an average of four young, each one of which averages one ounce in weight while in the nest, and consumes half of its own weight of food each day, it takes over 343½ tons of insect food each day to feed the young birds in the great valleys alone."

It is difficult to bring home to the mind by an expression of figures the millions of caterpillars, grubs, flies, beetles, etc., that birds consume. Careful investigations have shown that the British song thrush during the breeding season, April to June, consumes on an average 10,080 caterpillars, flies, grubs, etc., per month; assuming that there are 100,000 of these birds in the British Isles, they would account for 3,024,000,000 insects, etc., weighing upwards of 520 tons. Such a number are capable of destroying in three months upwards of 65,000 tons of produce, and assuming that this was worth £5 per ton, the activities of the thrushes would result in a saving of £325,000. Other species are equally beneficial, so that these figures might be multiplied by 20 or 30, thus showing a saving of produce every spring approaching ten millions sterling.

COMMERCIAL USES

Game.—Commercially, birds are utilized in various ways. Some are used as food, others are valued for their plumage and others for their guano.

Most game-birds are beneficial to agriculture. While accurate statistics are difficult to obtain, there is a larger consumption of such birds to-day than ever, and most nations have enacted special laws for their preservation. When and where such laws do not exist the danger of extermination is very great. In practically all cases the preservation of game-birds has, economically, proved of great value.

Eggs.—The eggs of various species of wild birds are highly esteemed as food, and large quantities are annually gathered, but

here again there is the same tendency toward extermination unless the gatherings are limited, or close seasons instituted.

Feathers.—The feathers of birds are commercially of considerable value apart altogether from the demand of the millinery trade. There is a large trade carried on for upholstery purposes in which the feathers of gulls, guillemots, puffins, ducks and the domestic fowl are utilized. The soft feathers or down of the eider-duck are preferred to all others owing to their superior warmth, lightness and elasticity. Large quantities are imported from Iceland, Greenland and the Faeroe islands. The great mercantile value of the plumes of the ostrich has led to the establishment of ostrich farms, which yield considerable profits.

What is known as the plumage trade, *i.e.*, the trade in birds' feathers for millinery purposes, has, quite apart from many very repulsive aspects, led to more wanton destruction of certain species of birds than all other causes combined. The almost complete extinction of the egrets in the United States and the appalling destruction of birds of paradise, gulls, terns, grebes, tanagers, orioles, bluebirds and numerous other small birds is a blot on present-day civilization. Restrictive measures have been, or are being, taken in many countries.

Guano.—Prior to the introduction of artificial manures, guano from the various islands of the Pacific ocean was greatly sought after. Although utilized by the Peruvians over three centuries ago, it was not until the middle of the 19th century that it assumed any importance as an article of commerce. So great was the demand that the better qualities were soon exhausted, and the poorer ones proved unprofitable when compared with the better artificial fertilizers. Small quantities are still collected. Schemes for protection and conservation of the birds and their product have, however, now been introduced.

Legislation.—In the absence, until recent years, of really comprehensive and reliable statistics with reference to the precise economic status of the different species of wild birds, it is not surprising that the various acts and orders relating to the preservation or destruction of wild birds have proved largely abortive. Many of these have been ill-considered and often hastily prepared, others have been largely selfish in nature, while the advocates of uniform protection have indirectly contributed to the wanton destruction of many useful birds. What would be the probable ultimate effect of such legislation was never seriously considered at the time.

In some countries the principles on which legislation has been based are, that all wild birds are the property of the State, hence that without permission no one has a right to destroy them; the State has the right to impose restrictions and birds may be captured, killed, possessed, etc., only under such conditions as the State enacts; in a like manner landowners can only kill or capture as a privilege and according as the law specifically grants.

International co-operation in Europe as regards the protection of wild birds has proved difficult, so many and diverse are the interests of the different countries. Valuable work has, however, been done by the International Ornithological Congresses and other organizations. An international committee was founded in London in 1922, and the International Treaty of 1916 between Great Britain and the United States of America for the protection of migratory birds constitutes one of the most important and far-reaching measures in the history of wild bird protection.

The immediate need of the present is for (1) wide and comprehensive measures that will ensure protection to all non-injurious and beneficial wild birds, and provide adequate repressive measures for those species which have, or do, become too numerous and destructive; (2) the establishment of an ornithological bureau, which would have full control of all matters relating to wild birds, including game-birds. Such an organization should be the sole authority for framing new laws or making special local orders, and for granting licences to persons to collect birds or their eggs for scientific or other purposes, or to destroy birds which the bureau considers to be injurious. Such a bureau would of course be in close touch with other similar bodies, so that international action could be taken where desirable. (See EGG; FEATHER.)

ORNITHOPTER, a flying machine with flapping wings operated either mechanically or manually. The type is of historic interest only, and represents man's attempt to imitate the flight of birds. Its failure may be ascribed mainly to two causes. With all that high speed photography can tell us, with all our knowledge of aerodynamics, and despite our achievement of flight in aeroplanes, we know little in detail of the mechanism of bird flight. Earlier generations, with none of these advantages, could discover little by watching the flight of live birds and examining their dead bodies. The inadequacy of human muscular power was not realized, nor yet the fact that the muscles which operate a bird's wings comprise about one sixth of its total weight.

The ornithopter presents mechanical problems of great difficulty, and even if these could be solved satisfactorily it could be only at the expense of a large increase of weight. With most birds, flapping is a means of propulsion rather than of generation of a lifting force, except at the moments of arising and alighting. The loss in the propulsive mechanism of an aeroplane (the air-screw), which amounts to some 25% of the power of the engine, might conceivably be appreciably reduced by some means of combining the functions of lifting and propelling in one surface—the wings. But from general experience rotational motion is much more easily and efficiently obtained from a mechanism than is an oscillating motion. (See HELICOPTER; GYROPLANE; FLIGHT; FLYING.) (W. S. F.)

ORODES (also called HYRÔDES, Pers. *Hurauda*), the name of two Parthian kings.

1. **ORODES I.**, son of Phraates III., whom he murdered in 57 B.C., assisted by his brother Mithradates III. This Mithradates was made king of Media, but soon afterwards was expelled by Orodes and fled into Syria. Thence he invaded the Parthian kingdom, but having reigned for a short time (55) was besieged by Surenas, general of Orodes, in Seleucia, and after a prolonged resistance was captured and slain. Meanwhile Crassus had begun his attempt to conquer the east, but he was defeated and killed in 53 at Carrhae by Surenas, while Orodes himself invaded Armenia and forced King Artavasdes, the son of Tigranes, to abandon the Romans. By the victory of Carrhae the countries east of the Euphrates were secured to the Parthians. In the next year they invaded Syria, but with little success, for Surenas, whose achievements had made him too dangerous, was killed by Orodes (Plut. *Crass.* 33), and Pacorus, the young son of the king, was defeated by C. Cassius in 51. During the civil war the Parthians sided first with Pompey and then with Brutus and Cassius, but took no action until 40 B.C., when Pacorus, assisted by the Roman deserter Labienus, conquered a great part of Syria and Asia Minor, but was defeated and killed by Ventidius in 38. (See PACORUS.) The old king, Orodes, who was deeply afflicted by the death of his gallant son, appointed his son Phraates IV. successor, but was soon afterwards killed by him (37 B.C.; Dio. Cass. 49.23; Justin 42.4; Plut. *Crassus*, 33). Plutarch relates that Orodes understood Greek very well; after the death of Crassus the *Bacchae* of Euripides were represented at his court (Plut. *Crass.* 33).

2. **ORODES II.**, raised to the throne by the magnates after the death of Phraates V. about A.D. 5, was killed after a short reign on account of his cruelty (Joseph. *Ant.* xviii. 2, 4). (Ed. M.)

ORONTES, the ancient name of the chief river of Syria, also called Draco, Typhon, Axios, the last name being probably the name whence has sprung the modern name El-'Asi (rebel). Taking its rise on the east side of the Bekaa, it flows northwards expanding into the lake of Homs, and in the plain of Antioch, it is joined by two tributaries, the Afrin and Kara-su. It reaches the

sea near the small port of Suedia (Seleucia Pieriae). In its 170m. course it is mainly unnavigable and of small value for irrigation. Its valley, however, has served as a highway for armies and trade between Egypt and Palestine, and Asia Minor.

OROPUS, a Greek seaport, on the Euripus, in the district *Peraikê*, opposite Eretria. A border city between Boeotia and Attica, it was a continual cause of dispute; but falling finally to Athens, it was always an Attic town under the Roman empire. The harbour, called Delphinium, was about a mile N. of the city at the mouth of the Asopus. Oropo village occupies the ancient site. The oracle of Amphiaraus, in the territory of Oropus, 12 stadia from the city, has been excavated by the Greek Archaeological Society; it contained a temple, a sacred spring, into which coins were thrown by worshippers, altars, porticoes, and a small theatre, of which the proscenium is well preserved. The oracle was consulted by sleeping on the skin of a slaughtered ram within the sanctuary.

OROSIUS, PAULUS (fl. 415), historian and theologian, was born in Spain (possibly at Braga in Galicia) towards the close of the 4th century. Having entered the Christian priesthood, he naturally took an interest in the Priscillianist controversy then going on in his native country, and it may have been in connection with this that he went to consult Augustine at Hippo in 413 or 414. After staying for some time in Africa as the disciple of Augustine, he was sent by him in 415 to Palestine with a letter of introduction to Jerome, then at Bethlehem. The ostensible purpose of his mission (apart, of course, from those of pilgrimage and perhaps relic-hunting) was that he might gain further instruction from Jerome on the points raised by the Priscillianists and Origenists; but in reality, it would seem, his business was to stir up and assist Jerome and others against Pelagius, who, since the synod of Carthage in 411, had been living in Palestine, and finding some acceptance there. The result of his arrival was that John, bishop of Jerusalem, was induced to summon at his capital in June 415 a synod at which Orosius communicated the decisions of Carthage and read such of Augustine's writings against Pelagius as had at that time appeared.

Success, however, was scarcely to be hoped for amongst Orientals who did not understand Latin, and whose sense of reverence was unshocked by the question of Pelagius, *et quis est mihi Augustinus?* All that Orosius succeeded in obtaining was John's consent to send letters and deputies to Innocent of Rome; and, after having waited long enough to learn the unfavourable decision of the synod of Diospolis or Lydda in December of the same year, he returned to north Africa, where he is believed to have died.

The earliest work of Orosius, *Consultatio sive commonitorium ad Augustinum de errore Priscillianistarum et Origenistarum*, explains its object by its title; it was written soon after his arrival in Africa, and is usually printed in the works of Augustine along with the reply of the latter, *Contra Priscillianistas et Origenistas liber ad Orosium*. His next treatise, *Liber apologeticus de arbitrii libertate*, was written during his stay in Palestine, and in connection with the controversy which engaged him there. It is a keen but not always fair criticism of the Pelagian position from that of Augustine. The *Historiae adversum Paganos* was undertaken at the suggestion of Augustine, to whom it is dedicated. The *Hormesta*, *Ormesta*, or *Ormista*, as it was called, speedily attained a wide popularity.

Nearly two hundred mss. of the *Historiae* have survived. A free abridged translation by King Alfred is still extant (Old English text, with original in Latin, edited by H. Sweet, 1883). The *editio princeps* of the original appeared at Augsburg (1471); that of Haverkamp (Leiden, 1738 and 1767) has now been superseded by C. Zangemeister, who has edited the *Hist.* and also the *Lib. apol.* in vol. v. of the *Corp. scr. eccl. Lat.* (Vienna, 1882), as well as an edit. min. (Leipzig, Teubner, 1889). The "sources" made use of by Orosius have been investigated by T. de Möriér (*De Orosii vita eiusque hist. libr. vii. adversum Paganos*, 1844); besides the Old and New Testaments, he appears to have consulted Caesar, Livy, Justin, Tacitus, Suetonius, Florus and a cosmography, attaching also great value to Jerome's translation of the *Chronicles* of Eusebius.

ORPEN, SIR WILLIAM NEWENHAM MONTAGUE (1878–), British painter, was born at Stillorgan, co. Dublin, on Nov. 27. 1878. and studied at the Dublin Metropolitan school

of Art and at the Slade school, London. He was elected A.R.A. in 1910 and R.A. in 1919. He first exhibited at the New English Art club, of which he became a member in 1900, his early work being marked by preoccupation with spacing and silhouette and the use of quiet harmonies of grey and brown, with a note of vivid red or blue. He soon turned to the use of bright colour and the study of light, seen in a series of brilliant portrait interiors such as the "Hon. Percy Wyndham" (1907), "Myself and Venus" (1910, now in Pittsburgh gallery, U.S.A.). About this time he became well known for his vigorously characterised portraits. During the World War Orpen received an appointment as official artist and in 1918 an exhibition of his war pictures was held in London. Many of these are now in the Imperial War museum. He was created K.B.E. in 1918. He wrote *An Onlooker in France* (1921) and *Stories of Old Ireland and Myself* (1924).

ORPHAN, the term used of one who has lost both parents by death, sometimes of one who has lost father or mother only. In Law an orphan is such a person who is under age. By the custom of the city of London, the lord mayor and aldermen, in the Court of Orphans, have the guardianship of the children still under age of deceased freemen.

In the United States the guardianship of orphans and the administration of their estates is administered by probate, surrogate, county or orphans' courts, the name varying in the different states. The courts appoint a guardian, "next friend," curator or tutor, according to circumstances, to care for the orphan and manage his property. A guardian's powers and privileges are usually limited by statute and by the rulings of the court to which he must report at required intervals.

ORPHEUS. The legendary founder of the cult known as Orphism, ὁ Ὀρφεὺς βίος. The derivation of the name is uncertain, possibly from the same root as ὀφφύρη, signifying darkness. What original figure, human or divine, lies behind the legend, is unknown; it seems possible, however, that Orpheus is the name or title of Thracian priest-kings, who may have been regarded as incarnating the god Dionysus (*q.v.*) or some similar deity, and were perhaps killed by the worshippers of the god after a period of years, or when they grew old (see Frazer, *Golden Bough*, 3rd ed. vi. 90).

Legend.—Orpheus was the son, in most accounts, of the Thracian king Oeagrus (sometimes of Apollo), and a Muse, generally Calliope, sometimes Polyhymnia. He took part in the Argonautic expedition (see ARGONAUTS), and there was an Orphic version of that exploit, preserved in a late form in the *Orphic Argonautica*. The best-known episode of his career is that of his marriage. His wife Eurydice was bitten by a serpent (while fleeing from Aristaeus, according to Virgil, *Georg.*, iv., 457; this detail is not found earlier, but the story itself is old and widespread; see Rose in *Aberystwyth Studies*, iv. p. 21). Orpheus, inconsolable at her death, went down to Hades to get her back. The infernal deities, softened by his music, allowed her to return, on condition that she should walk behind Orpheus and he should not look back. He broke this condition, and she became a ghost once more (Plato, *Sympos.*, 179 D., seems to allude to a slightly different account). He now refused to have anything more to do with women, and consequently the Thracian women, during a Dionysiac orgy, set upon him and tore him to pieces. His head floated down the Hebrus and finally came ashore on Lesbos, where there was apparently an oracular shrine of Orpheus. The legend may be founded on the practice of the *omphagia* (see DIONYSUS).

Orpheus is represented as a musician so marvellous that the wild beasts, and even trees and rivers, came to listen to him. He is also represented as a seer, a founder of mystic rites, particularly Dionysiac, a magician, and later as an astrologer, also. Sometimes his adventures tend to be assimilated to the stock incidents in the career of a philosopher, for he is represented as travelling in search of knowledge (as Plato, for example, is said to have visited Egypt). Several writers speak of him as a sort of missionary of civilization (*e.g.*, Aristophanes, *Frogs*, 1032, Horace *A.P.*, 391). He is also the reputed author of a number of books, some dating from the time of Peisistratus of Athens (*cf.* ONOMACRITUS).

The Orphic Doctrines and "Life".—There was no Orphic Church but there existed a number of *thiasoi* (conventicles) of initiates into the Orphic mysteries, all having a similar doctrine and rules of life, but lacking any sort of central organization and probably having no common standard of orthodoxy. Orphic initiators (*ὀρφεύς τελεσταί*) were numerous, and are spoken of with the utmost contempt by Plato and others. We hear of Orphism from about the 6th century on, and the doctrine, which seems to have grown out of a combination of the Thracian-Phrygian worship of Dionysus with certain religious speculations characteristic of that age, and probably resulting from the contact of Greece with the East, was in outline as follows. When Zagreus was devoured by the Titans (*see* DIONYSUS) and they were consumed by the thunderbolt, man sprung from their ashes. Hence man is partly divine (Zagreus), partly desperately wicked (the Titans). It is his chief end to get rid of the latter element, which is accomplished by a life of ritual and moral purity during the soul's incarnation in a series of bodies. When completely purified, it will be freed from the "circle of birth or becoming" (*κύκλος τῆς γενέσεως*) and be made fully divine. The rules of purity included abstinence from animal food of all kinds, avoidance of polluting actions, such as contact with death or birth, wearing of white garments and other ascetic practices. There were mysteries of some kind, at which we may conjecture that the death of Zagreus was enacted (*see* MYSTERY), also various Dionysiac practices, such as the *omophagia*. In some cases, at least, the Orphic dead were provided with extracts from the sacred writings of their sect, inscribed on gold tablets, containing directions for their conduct in the underworld. Several of these have been recovered (*see* next paragraph). The influence of Orphism on Pythagoreanism was very great, so much so that it is often impossible to separate the two, although one was primarily a religion, the other a system of philosophy.

Orphic Literature.—A great number of books existing in antiquity were ascribed to Orpheus, or his son Musaeus. This literature was well known to Pindar and Euripides, and exercised great influence, directly or through Pythagoreanism, on Plato, and probably on Socrates also (*see* A. E. Taylor, *Varia Socratica*). It is now lost save for (1) the gold tablets already mentioned, which clearly contain extracts from a poem dealing with the underworld, (2) a collection of hymns of late date, (3) *Lithica* (on the virtues of minerals) and the *Argonautica*, also late. There are, however, numerous quotations in writers of various dates, which together make up a large collection of fragments, some early and undoubtedly genuine Orphic, others much later, including palpable forgeries, showing Jewish and other foreign influence. A principal source for these is the controversialists, Christian and pagan, of the 3rd and 4th centuries A.D. Among editions may be mentioned E. Abel, *Orphica* (1885); O. Kern, *Orphicorum fragmenta* (1922). The former contains the hymns, *Lithica* and *Argonautica*.

Gomperz, *Greek Thinkers* (Eng. trans. 1901), vol. i.; A. Dieterich, *Nekyia* (1913) (since reprinted with some additional notes). *See* also the larger works on mythology, as O. Gruppe, *Griechische Mythologie*, ii. (1906), and the relevant articles in Roscher's *Lexikon der Mythologie* and Daremberg-Saglio's *Dictionnaire des antiquités*.

On the representations of Orpheus in heathen and Christian art (in which he is finally transformed into the Good Shepherd with his sheep), *see* A. Baumeister, *Denkmäler des klassischen Altertums*, ii. p. 1,120; P. Knapp, *Über Orpheusdarstellungen* (Tübingen, 1895); F. X. Kraus, *Realencyklopädie des christlichen Altertums*, ii. (1886); J. A. Martigny, *Dictionnaire des antiquités chrétiennes* (1889); A. Heussner, *Die altchristlichen Orpheusdarstellungen* (Leipzig, 1893); R. Eisler, *Vorträge der Bibliothek Warburg 1922-23, ii. Teil*, (1925); and the articles in Roscher's and Daremberg and Saglio's *Lexicons*.

The story of Orpheus, as was to be expected of a legend told both by Ovid and Boethius, retained its popularity throughout the middle ages and was transformed into the likeness of a northern fairy tale. In English mediaeval literature it appears in three somewhat different versions: *Sir Orpheo*, a "lay of Brittany" printed from the Harleian ms. in J. Ritson's *Ancient English Metrical Romances*, vol. ii. (1802); *Orpheo and Heurodis* from the Auchinleck ms. in David Laing's *Select Remains of the*

Ancient Popular Poetry of Scotland (new ed. 1885); and *Kyng Orfew* from the Ashmolean ms. in J. O. Halliwell's *Illustrations of Fairy Mythology* (Shakespeare Soc., 1842). The poems show traces of French influence.

ORPIMENT, a native arsenic trisulphide, As₂S₃. The pigment is artificially prepared under the name "king's yellow" and varies in colour from yellow to red according to the particle size. Owing to its poisonous nature and lack of permanence, it is no longer used as an artist's colour but is employed to some extent in pigmenting rubber. *See* PAINTS, CHEMISTRY OF; REALGAR.

ORPINGTON, a residential town of Kent, England, 13½ m. S.E. of London, and 2½ m. S. by E. of Chislehurst, on the S.R. Pop. (1921) 7,047. The church is Early English. An old mansion called the Priory dates in part from 1393. In 1873 John Ruskin set up at Orpington a private publishing house for his works, in the hands of his friend George Allen. Fruit and hops are extensively grown in the neighbourhood. A line of populous villages extends between Orpington and Bexley—St. Mary Cray, St. Paul's Cray, Foots Cray (an urban district), and North Cray.

ORRERY, CHARLES BOYLE, 4th EARL OF (1676-1731), British author, soldier and statesman, the second son of Roger, 2nd earl, born at Chelsea, was educated at Christ Church, Oxford. He translated Plutarch's life of Lysander, and published an edition of the epistles of Phalaris, which engaged him in the famous controversy with Bentley. Orrery was imprisoned for a short time in 1721 on suspicion of being concerned in Lyster's Jacobite plot. He died on Aug. 28, 1731. Among the works of Roger, earl of Orrery, will be found a comedy, entitled *As you find it*, written by Charles Boyle.

ORRERY, ROGER BOYLE, 1st EARL OF (1621-79), British soldier, statesman and dramatist, 3rd surviving son of Richard Boyle, 1st earl of Cork, was born on April 25, 1621, created baron of Broghill on Feb. 28, 1627, and educated at Trinity college, Dublin, and, according to Wood, also at Oxford. He travelled in France and Italy, and coming home took part in the expedition against the Scots. He returned to Ireland on the outbreak of the rebellion in 1641 and fought with his brothers at the battle of Liscarrol in September 1642. On the resignation of the marquis of Ormonde, Lord Broghill consented to serve under the parliamentary commissioners till the execution of the king, when he retired from public life. He was engaged in royalist schemes, however, when Cromwell visited him, and, explaining that he knew all about his activities, offered him a chance of clearing himself by serving the Commonwealth in Ireland. He accepted, and served Cromwell faithfully throughout the Irish campaign.

Orrery was returned to Cromwell's parliaments of 1654 and 1656 as member for the county of Cork, and also in the latter assembly for Edinburgh, for which he elected to sit. He served that year as lord president of the council in Scotland; and when he returned to England he was included in the inner cabinet of Cromwell's council, and was nominated in 1657 a member of the new House of Lords. On Cromwell's death he gave his support to Richard; but as he saw no possibility of maintaining the government he left for Ireland, where by resuming his command in Munster he secured the island for Charles and anticipated Monk's overtures by inviting him to land at Cork. He sat for Arundel in the Convention and in the parliament of 1661, and at the Restoration was taken into great favour. On Sept. 5, 1660, he was created earl of Orrery. The same year he was appointed a lord justice of Ireland and drew up the act of Settlement. He continued to exercise his office as lord-president of Munster till 1668, when he resigned it on account of disputes with the duke of Ormonde, the lord-lieutenant. On Nov. 25 he was impeached by the House of Commons for "raising of money by his own authority upon his majesty's subjects," but the proceedings were interrupted by the prorogation of parliament and were not afterwards renewed. He died on Oct. 26, 1679.

In addition to Lord Orrery's achievements as a statesman and admin-

¹The orrery, an astronomical instrument—consisting of an apparatus which illustrates the motions of the solar system by means of the revolution of balls moved by wheelwork—invented, or at least constructed, by Graham, was named after the earl.

istrator, he gained some reputation as a writer and a dramatist. He was the author of *An Answer to a Scandalous Letter . . . A Full Discovery of the Treachery of the Irish Rebels* (1662), printed with the letter itself in his *State Letters* (1742), another answer to the same letter entitled *Irish Colours Displayed . . .* being also ascribed to him; *Parthenissa*, a novel (1654); *English Adventures by a Person of Honour* (1676), whence Otway drew his tragedy of the *Orphan*; *Treatise of the Art of War* (1677), a work of considerable historical value; poems, of little interest, including verses *On His Majesty's Happy Restoration* (unprinted), *On the Death of Abraham Cowley* (1677), *The Dream* (unprinted), *Poems on most of the Festivals of the Church* (1681); plays in verse, of some literary but no dramatic merit, of which *Henry V.* (1664), *Mustapha* (1665), *Tryphon* (acted 1668), *The Black Prince* (1669), *Herod the Great* (published 1694), and *Altemira* (1702) were tragedies, and *Guzman* (1669) and *Mr. Anthony* comedies. A collected edition was published in 1737, to which was added the comedy *As you find it*. *The General* is also attributed to him.

AUTHORITIES.—*State Letters of Roger Boyle, 1st Earl of Orrery*, ed. with his life by Th. Morrice (1742); *Add. mss.* (Brit. Mus.) 25,287 (letter-book when governor of Munster), and 32,095 sqq. 109–188 (letters); article in the *Dict. of Nat. Biog.* and authorities there collected; Wood's *Athenae Oxonienses*, iii. 1200; *Biographia Britannica* (Kippis); *Orrery Papers*, ed. by Lady Cork and Orrery (1903) (Preface); *Contemporary Hist. of Affairs in Ireland*, ed. by John T. Gilbert (1879–80); *Cal. of State Pap., Irish and Domestic*.

ORRIS-ROOT (apparently a corruption of "iris root"), the rhizomes or underground stems of three species of *Iris*, *I. germanica*, *I. florentina* and *I. pallida*, closely allied plants growing in subtropical and temperate latitudes, but principally identified with north Italy. The three plants are indiscriminately cultivated in the neighbourhood of Florence as an agricultural product under the name of "ghiaggiuolo." The rhizomes are in August dug up and freed of the rootlets and brown outer bark; they are then dried and packed in casks for sale. In drying they acquire a delicate but distinct odour of violets. It is principally powdered for use in dentifrices and other scented dry preparations.

ORSHA (Polish, Orsza), a town of the White Russian S.S.R., in 54° 34' N., 30° 20' E., on the Dnieper river, and at a junction on the Moscow-Warsaw railway. Pop. (1926) 21,311. It is an entrepôt for grain and timber and has iron works and a brewery. An electric plant was under construction in 1928. It is mentioned in the annals in 1067 as Rsha and was captured by the Lithuanians in the 13th century. A Polish Jesuit college was founded here in 1604. During the 16th and 17th centuries it was several times besieged by the Russians, and finally annexed 1772. Near it is the Jewish town of Dubrovno, which joined in the 1905 revolution and from which a band of Jewish youths set out for Orsha to defend the Jews against a pogrom, but perished in the attempt.

ORSINI, the name of a Roman princely family of great antiquity. According to tradition the popes Paul I. (757) and Eugenius II. (824) were of the Orsini family, but the probable founder of the house was a certain Ursus (the Bear), about whom very little is known, and the first authentic Orsini pope was Giacinto Orsini, son of Petrus Bobo, who assumed the name of Celestin III. (1191). The latter endowed his nephews with church lands and founded the fortunes of the family, which alone of the Guelph houses was able to confront the Ghibelline Colonna. "Orsini for the church" was their war-cry in opposition to "Colonna for the people." In the 13th century the "Sons of the Bear" were already powerful and rich, and under Innocent III. they waged incessant war against other families, including that of the pope himself (Conti). In 1241 Matteo Orsini was elected senator of Rome, and sided with Pope Gregory IX. against the Colonna and the Emperor Frederick II., saving Rome for the Guelphic cause. In 1266 the family acquired Marino, and in 1277 Giovanni Orsini was elected pope as Nicholas III.

When Boniface VIII. proclaimed a crusade against the Colonna in 1297, the Orsini played a conspicuous part in the expedition and captured Nepi, which the pope granted them as a fief. On the death of Benedict XI. (1304) fierce civil warfare broke out in Rome and the Campagna for the election of his successor, and Cardinal Napoleone Orsini appears as the leader of the French faction at the conclave. The Campagna was laid waste by the feuds of the Orsini, the Colonna and the Caetani. At this time the Orsini held the castle of S. Angelo, and a number of palaces on the Monte Giordano, which formed a fortified and walled quar-

ter. In 1332, during the absence of the popes at Avignon, the feuds between Orsini and Colonna, in which even Giovanni Orsini, although cardinal legate, took part, reduced Rome to a state of complete anarchy. The Orsini were again at war with the Colonna at the time of Rienzi. In 1435 Francesco Orsini was appointed prefect of Rome, and created duke of Gravina by Pope Eugenius IV. In 1484 war between the Orsini and the Colonna broke out once more, the former supporting the pope (Sixtus IV.). Virginio Orsini led his faction against the rival house's strongholds, which were stormed, the Colonna being defeated.

The Orsini fortunes waxed and waned many times, and their property was often confiscated, but they always remained a powerful family and gave many soldiers, statesmen and prelates to the church. The title of prince of Solofra was conferred on them in 1620, and that of prince of the Holy Roman empire in 1629. In 1724 Vincenzo Maria Orsini was elected pope (Benedict XIII.) and gave his family the title of Roman princes.

See F. Sansovino, *Storia di casa Orsina* (Venice, 1565); F. Gregorovius, *Geschichte der Stadt Rom* (Stuttgart, 1872); A. von Reumont, *Geschichte der Stadt Rom* (1868); *Almanach de Gotha*.

ORSINI, FELICE (1819–1858), Italian revolutionist, was born at Meldola in Romagna. He joined the Giovane Italia, a society founded by Giuseppe Mazzini. Implicated together with his father in revolutionary plots, he was arrested in 1844 and condemned to imprisonment for life. The new pope, Pius IX., released him, and he led a company of young Romagnols in the first war of Italian independence (1848). He was elected member of the Roman constituent assembly in 1849, and after the fall of the republic he conspired against the papal autocracy once more in the interest of the Mazzinian party. Mazzini sent him on a secret mission to Hungary, but he was arrested in 1854 and imprisoned at Mantua, escaping a few months later. His account of his prison experiences, *Austrian Dungeons in Italy* (1857), led to a rupture between him and Mazzini.

He then formed a plot to assassinate Napoleon III., whom he regarded as the principal obstacle to Italian independence. On the evening of Jan. 14, 1858, while the emperor and empress were on their way to the theatre, Orsini and his accomplices threw three bombs at the imperial carriage. The intended victims were unhurt, but several other persons were killed or wounded. Orsini was arrested; on Feb. 11, he wrote a letter to Napoleon, exhorting him to take up the cause of Italian freedom. He addressed another letter to the youth of Italy, stigmatizing political assassination. He was executed on March 13, 1858. Of his accomplices Pieri also was executed, Rudio was condemned to death but obtained a commutation of sentence, and Gomez was condemned to hard labour for life. Orsini's attempt terrified Napoleon, who may have been so induced to take up Italy's cause.

O.* (Milan, 1861); Enrico Montazio, *I contemporanei Italiani-Felice Orsini* (Turin, 1862); *La verità sur Orsini, par un ancien proscrit* (1879); Angelo Arboit, *Tofin e la fuga di Felice Orsini* (Cagliari, 1893).

ORTA, LAKE OF, in north Italy, west of Lago Maggiore. Its southern end is about 22 m. by rail N.W. of Novara on the main Turin-Milan line, while its north end is about 4 m. by rail S. of the Gravelona-Toce railway station. It has an area of about 6½ sq.m., it is about 8 m. in length, its greatest depth is 469 ft., and the surface is 951 ft. above sea-level, while its width varies from ½ to 1½ m. The island of San Giulio (just west of the village of Orta) has a picturesque church. The chief place is Orta, on a peninsula projecting from the east shore of the lake, while Omegna is at its northern extremity. The lake is the remnant of a larger sheet of water by which the waters of the Toce flowed south towards Novara. As the glaciers retreated the waters flowing from them sank, and were gradually diverted into Lago Maggiore. This explains why no considerable stream feeds the Lake of Orta, while at its north end the Nigoggia torrent flows out of it, ultimately joining Lago Maggiore.

ORTELIUS (WORTELS), ABRAHAM (1527–1598), next to Mercator the greatest geographer of his age, was born at Antwerp on April 14, 1527, and died in the same city on July 4, 1598. He

was of German origin, his family coming from Augsburg. He travelled extensively in western Europe. Beginning as a map-engraver, he became a merchant, and most of his journeys before 1560 were for commercial purposes. In 1560, however, when travelling with Gerhard Kremer (see MERCATOR, GERHARDUS), he became interested in scientific geography and began to prepare that atlas or *Theatre of the World* by which he became famous. In 1564 he completed a *mappemonde*, which afterwards appeared in the *Theatrum*. In 1570 (May 20) was issued, by Gilles Coppens de Diest at Antwerp, Ortelius' *Theatrum Orbis Terrarum*, the "first modern atlas" (of 53 maps). Many editions, Flemish, Latin and German, appeared in his lifetime. Most of the maps were admittedly reproductions (a list of 87 authors is given by Ortelius himself), and many discrepancies of delineation or nomenclature occur; but, taken as a whole, this atlas with its accompanying text was a monument of rare erudition and industry. In 1573 Ortelius published 17 supplementary maps under the title of *Additamentum Theatri Orbis Terrarum*.

In 1575 Ortelius was appointed geographer to the king of Spain, Philip II., on the recommendation of Arius Montanus, who vouched for his orthodoxy (his family, as early as 1535, had fallen under suspicion of Protestantism). Other important works are: *Synonymia geographica* (1578); *Nomenclator Ptolemaicus* (1584); his *Parergon* (a series of maps illustrating ancient history, sacred and secular), and his *Itinerarium per nonnullas Galliae Belgicae partes*, a record of a journey in Belgium and the Rhineland made in 1575; an edition of Caesar (*C. I. Caesaris omnia quae extant*, Leyden, Rapheligen, 1593), and the *Aurei saeculi imago, sive Germanorum veterum vita* (Philippe Galle, Antwerp, 1596). He also aided Welser in his edition of the Peutinger Table in 1598. His death and burial (in St. Michael's Abbey church) in 1598 were marked by public mourning.

(Brussels, 1901); J. H. Hessels, *Abrahami Ortelii epistolae* (Cambridge, England, 1887); Max Rooses, *Ortelius et Plantin* (1880); Génard, "Généalogie d'Ortelius," in the *Bulletin de la Soc. roy. de Géog. d'Anvers* (1880 and 1881).

ORTHEZ, a town of S.W. France, department of Basses-Pyrénées, 25 mi. N.W. of Pau on the Southern railway. Pop. (1926) 4,097.

At the end of the 12th century Orthez passed from the viscounts of Dax to the viscounts of Béarn, who resided there in the 13th century. Jeanne d'Albret founded a Calvinist university in the town and Theodore Beza taught there for some time. An envoy sent in 1569 by Charles IX. to revive the Catholic faith was besieged in Orthez which was taken by the Protestant captain, Gabriel, count of Montgomery. In 1684 Nicholas Foucault, intendant under Louis XIV., was more successful, as the inhabitants, ostensibly at least, renounced Protestantism, which however is still strong there. It stands on the right bank of the Gave de Pau here crossed by a 14th century bridge with four arches and surmounted by a central tower. The Tour de Moncade, a pentagonal tower of the 13th century, was once the keep of a castle of the viscounts of Béarn, and is now used as a meteorological observatory. The work of spinning and weaving cotton, especially of the fabric called *toile de Béarn*, the manufacture of paper and of leather, and the preparation of hams known as *jambons de Bayonne* and of other delicacies are carried on.

ORTHOCLASE, an important rock-forming mineral belonging to the feldspar group (see FELSPAR). (Gr. *ὀρθός*, "right," and *κλάω*, "to break.") The mineral, so named by A. Breithaupt in 1823 in allusion to the right-angled intercleavage angle, has the composition $KAlSi_3O_8$ but commonly contains significant proportions of the corresponding $NaAlSi_3O_8$ compound in solid solution.

Included under orthoclase are the varieties known as adularia and sanidine, the former occurring in druses in granites and crystalline schists, the latter as glassy crystals enclosed in lavas and dike rocks. The apparent symmetry of orthoclase is that of a monoclinic crystal with the two prominent cleavages 001 and 010 at right angles. The crystals show considerable variety of habit, prismatic, as in adularia, elongated along the edge 001: 010 as in

crystals from the Baveno granite quarries, and tabular on the clinopinacoid as in sanidine. The simple Carlsbad type of twinning is exceedingly common.

Orthoclase melts incongruently at $1,170^\circ$ C with formation of leucite (q.v.). As a primary mineral it is an essential constituent of many acidic igneous rocks, in granites, porphyries, syenites and trachytes, while the variety sanidine is practically wholly limited to surface lavas and associated dike rocks. It is common as a constituent of thermally altered argillaceous sediments but its place in the crystalline schists is usually taken by microcline (q.v.). (C. E. T.)

ORTHODONTIA, a special department of dentistry concerned with the prevention and correction of irregular and of malposed teeth. Orthodontic treatment is usually effected by means of the spring force of delicate wires attached to the teeth. The earliest attempt in the literature at systematic treatment of orthodontia was by Fauchard in 1728. In 1836 Kniessel published a special work on the subject. Between these two it was variously treated by several writers in the field of mechanical dentistry (Bunon 1742; Burdot 1757; Fox 1803; Delebarre 1806). At the beginning of the 20th century in America orthodontia emerged from the general field of mechanical dentistry as a recognized specialty. Its advent was heralded by the appearance of many "systems of regulating." These "systems" were marketable combinations of mechanical appliances designed to effect various movements of the teeth, and were identified by the names of their inventors (Angle, Case, Jackson *et al.*). While this period of the exploitation of apparatus undoubtedly was a great stimulus to the development of technique, the literature which it evoked took the form of personal opinion rather than the presentation of scientific evidence. Expert technicians soon demonstrated the limitations of the mechanical conception of the subject whereupon interest centred in its biological aspect. Since then the results of treatment have been more satisfactory. Great advances have been made in America where specialization is more common while the conservative influence of the dental profession in Great Britain and European countries has acted as a stabilizing force in its growth. The condition of irregular and malposed teeth, *i.e.*, malocclusion, may be caused by bad diet in both its chemical and physical aspects (Howe, McCollum, Mellanby). Habits of infancy and childhood as thumb-sucking, tongue-biting and mouth-breathing, and mutilations from trauma and disease are also important causes. In fact any abnormal function in or about the mouth when persisted in may result in irregular and malposed teeth. (A. L. J.)

ORTHODOX EASTERN CHURCH (frequently spoken of as "the Greek Church," and described officially as "The Holy Orthodox Catholic Apostolic Eastern Church"), the historical representative of the churches of the ancient East. It consists of (a) those churches which accepted all the decrees of the first seven general councils, and have remained in full communion with one another, (b) such churches as derived their origin from these by missionary activity, or by abscission without loss of communion.

Origins of the Greek or Eastern Church.—Christianity arose in the East, and Greek was the language of the Scriptures and early services of the church, but when Latin Christianity established itself in Europe and Africa, and when the old Roman empire fell in two, and the eastern half became separate in government, interests and ideas from the western, the term Greek or Eastern Church acquired gradually a fixed meaning. It denoted the church which included the patriarchates of Antioch, Alexandria, Jerusalem and Constantinople, and their dependencies. The ecclesiastical division of the early church, at least within the empire, was based upon the civil. Constantine introduced a new partition of the empire into dioceses, and the church adopted a similar division. The bishop of the chief city in each diocese naturally rose to a pre-eminence, and was commonly called *exarch*—a title borrowed from the civil jurisdiction. In process of time the common title *patriarch* was restricted to the most eminent of these exarchs, and councils decided who were worthy of the dignity. The council of Nicaea recognized three patriarchs—the bishops of Rome, Alexandria and Antioch. To these were after-

wards added the bishops of Constantinople and Jerusalem.

When the empire was divided, there was one patriarch in the West, the bishop of Rome, while in the East there were at first two, then four and latterly five. This geographical fact has had a great deal to do in determining the character of the Eastern Church. It is not a despotic monarchy governed from one centre and by a monarch in whom plenitude of power resides. It is an oligarchy of patriarchs. It is based, of course, on the great body of bishops; but episcopal rule, through the various grades of metropolitan, primate, exarch, attains to sovereignty only in the five patriarchal thrones. Each patriarch is, within his diocese, what the Gallican theory makes the pope in the universal church. He is supreme, and not amenable to any of his brother patriarchs, but is within the jurisdiction of an oecumenical synod. The schismatic churches of the East have always reproduced the ecclesiastical polity of the church from which they seceded.

The Greek Church, like the Roman, soon spread far beyond the imperial dioceses which at first fixed its boundaries, but it was far less successful than the Roman in preserving its conquests for Christianity. This was due in the main to the differing quality of the forces by which the area covered by the two churches was respectively invaded. Greek Christianity became the religion of the Slavs as Latin Christianity became that of the Germans; but the Orthodox Church never conquered her conquerors.

The great dogmatic work of the Eastern Church was the definition of that portion of the creed of Christendom which concerns *theology proper*—the doctrines of the essential nature of the Godhead, and the doctrine of the Godhead in relation with manhood in the incarnation, while it fell to the Western Church to define *anthropology*, or the doctrine of man's nature and needs.

All the churches of the East, schismatic as well as orthodox, accept unreservedly the decrees of the first two councils. The schismatic churches protest against the additions made to the creeds of Nicaea and Constantinople by succeeding councils. The Nicaeo-Constantinopolitan creed declared that Christ was *consubstantial* (*ὁμοούσιος*) with the Father, and that He *had become man* (*ἐνανθρωπήσας*). Disputes arose when theologians tried to explain the latter phrase. These differences took two separate and extreme types, the one of which forcibly separated the two natures so as to deny anything like a real union, while the other insisted upon a mixture of the two, or an absorption of the human in the divine. The former was the creed of Chaldaea and the latter the creed of Egypt; Chaldaea was the home of Nestorianism, Egypt the land of Monophysitism. The Nestorians accept the decisions of the first two councils, and reject the decrees of all the rest as unwarranted alterations of the creed of Nicaea. The Monophysites accept the first three councils, but reject the decree of Chalcedon and all that come after it. They gave rise to numerous sects and to at least three separate national churches,—the Jacobites of Syria, the Copts of Egypt, and the Abyssinian church, which are treated under separate headings. (See also NICAEA [COUNCIL OF]; CHALCEDON [COUNCIL OF]; NESTORIUS; NESTORIANS; MONOPHYSITES.)

CONFLICT WITH ROME

The relation of the Byzantine Church to the Roman may be described as one of growing estrangement from the 5th to the 11th century, and a series of abortive attempts at reconciliation since the latter date. The estrangement and final rupture may be traced to the increasing claims of the Roman bishops and to Western innovations in practice and in the doctrine of the Holy Spirit, accompanied by an alteration of creed. In the early church three bishops stood forth prominently, principally from the political eminence of the cities in which they ruled—the bishops of Rome, Alexandria and Antioch. The transfer of the seat of empire from Rome to Constantinople gave the bishops of Rome a possible rival in the patriarch of Constantinople, but the absence of an overawing court and of meddling statesmen did more than recoup the loss to the head of the Roman Church. The theological calmness of the West, amid the violent theological disputes which troubled the Eastern patriarchates, and the statesmanlike wisdom of Rome's greater bishops, combined to give a unique position to the pope, which councils

in vain strove to shake, and which in time of difficulty the Eastern patriarchs were fain to acknowledge and make use of, however they might protest against it and the conclusions deduced from it.

But this pre-eminence, or rather the Roman idea of what was involved in it, was never acknowledged in the East; to press it upon the Eastern patriarchs was to prepare the way for separation, to insist upon it in times of irritation was to cause a schism. The theological genius of the East was different from that of the West. The Eastern theology had its roots in Greek philosophy, while a great deal of Western theology was based on Roman law. (See Stanley's *Eastern Church*, ch. i.) This gave rise to misunderstandings, and at last led to two widely separate ways of regarding and defining one important doctrine—the procession of the Holy Spirit from the Father or from the Father and the Son. Political jealousies and interests intensified the disputes, and at last, after many premonitory symptoms, the final break came in 1054, when Pope Leo IX. smote Michael Cerularius and the whole of the Eastern Church with an excommunication. There had been mutual excommunications before, but they had not resulted in permanent schisms. Now, however, the separation was final, and the ostensible cause of its finality was the introduction by the Latins of two words *Filioque* into the creed. (After the words "and in the Holy Ghost" of the Apostles' Creed the Constantinopolitan creed added "who proceedeth from the Father." The Roman Church, without the sanction of an oecumenical council and without consulting the Easterns, added "and the Son." The addition was first made at Toledo [589] in opposition to Arianism. The Easterns also resented the Roman enforcement of clerical celibacy, the limitation of the right of confirmation to the bishop and the use of unleavened bread in the Eucharist.) It is this addition which was and which still remains the permanent cause of separation.

Doctrines and Creeds.—The Eastern Church has no creeds in the modern Western use of the word, no *normative* summaries of what must be believed. It has preserved the older idea that a creed is an adoring confession of the church engaged in worship; and, when occasion called for more, the belief of the church was expressed more by way of public testimony than in symbolical books. Still the doctrines of the church can be gathered from these confessions of faith. The Eastern creeds may thus be roughly placed in two classes—the oecumenical creeds of the early undivided church, and later testimonies defining the position of the Orthodox Church of the East with regard to the belief of the Roman Catholic and of Protestant Churches. These testimonies were called forth mainly by the protest of Greek theologians against Jesuitism on the one hand, and against the reforming tendencies of the patriarch Cyril Lucaris (*q.v.*) on the other. The Orthodox Greek Church adopts the doctrinal decisions of the seven oecumenical councils, together with the canons of the Concilium Quinisextum or second Trullan council (692); and they further hold that all these definitions and canons are simply explanations and enforcements of the Nicaeo-Constantinopolitan creed and the decrees of the first council of Nicaea. The first four councils settled the orthodox faith on the doctrines of the Trinity and of the Incarnation; the fifth supplemented the decisions of the first four. The sixth declared against Monothelitism; the seventh sanctioned the worship (*δουλεία*, not *ἀληθινή λατρεία*) of images; the council held in the Trullus (a saloon in the palace at Constantinople) supplemented by canons of discipline the doctrinal decrees of the fifth and sixth councils.

The most important doctrinal testimonies of the Eastern church are (1) the Orthodox confession of catechism of Peter Mogilas, confirmed by the Eastern patriarchs and by the synod of Jerusalem (1643), and (2) the decree of the synod of Jerusalem or the confession of Dositheus (1672). Besides these, the catechisms of the Russian Church should be consulted, especially the catechism of Philaret, which since 1839 has been used in all the churches and schools in Russia.

The Church of Christ is the fellowship of ALL THOSE WHO ACCEPT AND PROFESS ALL THE ARTICLES TRANSMITTED BY THE APOSTLES AND APPROVED BY GENERAL SYNODS. *Without this visible Church there is no salvation.* It is under the abiding influence of

the Holy Ghost, and therefore cannot err in matters of faith. Specially appointed persons are necessary in the service of the Church, and they form a threefold order, distinct *jure divino* from other Christians, of Bishops, Priests and Deacons. THE FOUR PATRIARCHS, OF EQUAL DIGNITY, HAVE THE HIGHEST RANK AMONG THE BISHOPS, AND THE BISHOPS united in a General Council represent the Church and infallibly decide, under the guidance of the Holy Ghost, all matters of faith and ecclesiastical life. All ministers of Christ must be regularly called and appointed to their office, and are consecrated by the sacrament of orders. Bishops must be unmarried, and PRIESTS AND DEACONS MUST NOT CONTRACT A SECOND MARRIAGE. To all priests in common belongs, besides the preaching of the word, the administration of the six SACRAMENTS—BAPTISM, CONFIRMATION, PENANCE, EUCHARIST, MATRIMONY, UNCTION OF THE SICK. The bishops alone can administer the sacrament of orders.

Ecclesiastical ceremonies are part of the divine service; most of them have apostolic origin; and those connected with the sacrament must not be omitted by priests under pain of mortal sin. (This summary has been taken with Corrections from G. B. Winer, *Comparative Darstellung des Lehrbegriffs der verschiedenen Kirchenparteien*, Eng. trans. 1873. Small capitals denote differences from Roman Catholic, italics differences from Protestant doctrine.)

Liturgy and Worship.—The ancient liturgies of the Eastern Church were very numerous but a strong desire for uniformity led to the almost exclusive use of the liturgy of Jerusalem or of St. James in the East. It is used in two forms, a shorter revised by Chrysostom, and a longer called the liturgy of St. Basil. This liturgy and the service generally are either in Old Greek or in Old Slavonic, and frequent disputes have arisen in particular districts about the language to be employed. Both sacred languages differ from the language of the people, but it cannot be said that in the Eastern Church worship is conducted in an unknown tongue—"the actual difference," says Neale, "may be about that between Chaucer's English and our own." There are eleven chief service books, and no such compendium as the Roman breviary. Fasting is frequent and severe. Besides Wednesdays and Fridays, there are four fasting seasons, Lent, Pentecost to SS. Peter and Paul, August 1-15 preceding the Feast of the Sleep of the Theotokos, and the six weeks before Christmas. Indulgences are not recognized; an intermediate and purificatory state of the dead is held but not systematized into a doctrine of purgatory. The Virgin receives homage, but the dogma of her Immaculate Conception is not admitted. While ikons are found in the churches, there is no "graven image" apart from the crucifix.

Monasticism is, as it has always been, an important feature in the Eastern Church. An Orthodox monastery is perhaps the most perfect extant relic of the 4th century. The simple idea that possesses the monks is that of fleeing the world; they have no distinctions of orders, and though they follow the rule of St. Basil object to being called Basilians. A few monasteries (Mt. Sinai and some on Lebanon) follow the rule of St. Anthony. K. Lake in *Early Days of Monasticism on Mount Athos* (1909) traces the development through three well-defined stages in the 9th and 10th centuries—(a) the hermit period, (b) the loose organization of hermits in *lauras*, (c) the stricter rule of the monastery, with definite buildings and fixed rules under an *ηγούμενος* or abbot. (See ABBEY, MONASTICISM, and related articles.)

The Branches of the Church.—In addition to the ancient churches which have separated themselves from the Orthodox faith, many have ceased to have an independent existence, owing either to the conquests of Islam or to their absorption by other churches. In the early years of the present century the Orthodox Eastern Church consisted of 12 mutually independent churches (or 13 if we reckon the Bulgarian Church), using their own language in divine service (or some ancient form of it, as in Russia) and varying not a little in points of detail, but standing in full communion with one another, and united as equals in what has been described as one great ecclesiastical federation. However, in using such language it must be remembered that we are not dealing with bodies which were originally separated from one

another and have now entered into fellowship, but with bodies which have grown naturally from a single origin and have not become estranged. The most ancient of these divisions depend on the jurisdiction of the four patriarchates. (1) The ancient *Patriarchate of Constantinople* included the imperial dioceses of Pontus, Asia, Thrace and Eastern Illyricum—i.e., speaking roughly, the greater part of Asia Minor, European Turkey, and Greece, with a small portion of Austria. The Oecumenical Patriarch, as he has been called since early in the 6th century, is the most exalted ecclesiastic of the Eastern churches, and his influence reaches far outside the lands of the patriarchate. His jurisdiction extends over the dominions of the Sultan in Turkey, together with Asia Minor and the Turkish islands of the Aegean; there are 82 metropolitans under him, and the "monastic republic" of Mount Athos. He has great privileges and responsibilities as the recognized head of the Greek community in Turkey, and enjoys also many personal honours which have survived from the days of the Eastern emperors. In ecclesiastical affairs the patriarch acts with two governing bodies—(a) a permanent Holy Synod (*Ἱερά Σύνοδος τῆς Ἐκκλησίας Κωνσταντινουπόλεως*) consisting of 12 metropolitans, six of whom are re-elected every year from the whole number of metropolitans, arranged in three classes according to a fixed cycle; (b) the Permanent National Mixed Council (*Διαρκὲς Ἐθνικὸν Μικτὸν Συμβούλιον*), a remarkable assembly, which is at once the source of great power by introducing a strong lay element into the administration, and of a certain amount of weakness by its liability to sudden changes of popular feeling. Its members are chosen by an electoral body appointed for the purpose. The election of the patriarch himself is to a considerable extent popular. (2) The *Patriarchate of Alexandria*, consisting of Egypt and its dependencies, was at one time the most powerful, as it was the most centralized, of all; but the secession of the greater part of his church to Monophysitism (COPTIC CHURCH), and the Mohammedan conquest of Egypt, have left him but the shadow of his former greatness. (3) The *Patriarchate of Antioch* has undergone most changes in extent of jurisdiction, arising from the transfer of sees to Jerusalem, from the progress of the schismatic churches of the East and from the conquests of the Mohammedans. The patriarch retains little of his old importance. His jurisdiction includes Cilicia, Syria (except Palestine) and Mesopotamia. (4) The *Patriarchate of Jerusalem* was constituted at the council of Chalcedon in 451, with jurisdiction over Palestine. The inroads of the Saracens reduced its importance, which afterwards depended chiefly on the position and associations of Jerusalem.

In addition to the four patriarchates, the Orthodox Eastern Church, until 1914, consisted of nine national branches or divisions: the ancient Church of Cyprus (see CYPRUS, CHURCH OF); the Church of Mount Sinai, consisting of little more than the famous monastery of St. Catherine; the Eastern Orthodox Church in Austria-Hungary, which consisted of the Serbs of Hungary and Croatia, the Rumanians of Transylvania, the Ruthenians of Bukovina, and the Serbs of Bosnia-Herzegovina; and the respective national churches of Russia, Greece, Bulgaria, Rumania, Serbia, and Montenegro.

POSITION AT THE OUTBREAK OF WORLD WAR

Russia, with Georgia, is reckoned to have had nearly 100,000,000 Slavonic Orthodox. Georgia, an exarchate once independent, was gradually being Russianized; the exarch was a Russian and an *ex officio* member of the Russian Holy Synod since 1801, while his suffragan bishops were Georgians. The effects of Tsarism on the Russian Church have been described by a learned observer as not good (Agéyev, *The Christian East*, 1920). "Under the guise of protecting the Church, the state in reality had enslaved it." The Church was in a state of paralysis, and the Russian educated classes were estranged from it.

The Orthodox Church in Turkey (Greek), under the Ecumenical Patriarch, Archbishop of Constantinople—often erroneously in the West called the Patriarch of Constantinople—is believed to have numbered 2,500,000 in Europe—counting in those transferred to the kingdom of Hellas in 1912—and 2,000,000

in Asia Minor and the islands. In Greece proper, where the autocephalous position of the Church was recognised by the Ecumenical Patriarch in 1850, there were about 2,000,000 orthodox (*ib.*).

In the Austro-Hungarian Empire there were several orthodox Churches, chiefly Slavonic, with some 3,000,000 souls: the Karlowitz Serbian Church; those of Dalmatia and Cattaro, joined to the Ruthenian Bukowina, though far distant from it; of Bosnia and Hercegovina; of Transylvania; and a certain number of orthodox scattered in various districts. The Bulgarian Church was made autocephalous by the Sultan in 1876, when the Bulgarian exarch resided in Constantinople; but the Ecumenical Patriarch did not recognise its independence. It numbered about 4,000,000.

In Rumania the old Church of Okhrida was suppressed in 1767 and the Orthodox then became subject to the Ecumenical Patriarch till recent times. They numbered about 4,500,000. The same state of things obtained in Serbia (1,500,000), where the old Church of Ipek was suppressed in 1766.

The little Church of Montenegro (about 200,000 souls) was made independent in 1766 and governed by a metropolitan who had one suffragan bishop. (Note that in some of the separated Churches of the East the metropolitans have no suffragans.) In addition there were the Orthodox in the patriarchate of Antioch, that of Jerusalem, that of Alexandria, Cyprus, autocephalous since 431, and the monastery of Mount Sinai, autocephalous since 1575, the archbishop of which usually resides in Egypt.

POSITION AFTER THE WAR

The alterations in the boundaries of the various states have necessarily had a great effect on the Church. But a much greater effect has been produced by the internal convulsions in Russia and Turkey.

Russia has lost Poland and the Baltic provinces; but this has not affected the Orthodox Church to a very great extent, as the bulk of the population was of other faiths. Poland has still 3 million Orthodox; Lithuania has 23,000 Orthodox and 35,000 "Old Believers"; Czechoslovakia has very few Orthodox, most of the population being Roman Catholics or Uniats.

In Russia proper and in Georgia the effect has been most disastrous. At first the revolution promised well for the Orthodox. A Holy Synod of 12 bishops and a council of bishops, priests and laymen were established in 1917; the office of Chief Procurator—a layman who had represented the Tsar, and who wielded very great powers—was abolished; the patriarchate, discontinued by Peter the Great since 1700, was revived (Nov. 1, 1917) in the person of Tikhon, Patriarch of Moscow and all Russia, who was enthroned on Dec. 4, 1917. But the Bolshevik régime dashed all the hopes of the Church. The new rulers set themselves to oppose Christianity in all its forms.

All teaching of religion in public schools was forbidden; parents were not allowed to teach their children religion; only candidates for the priesthood, if over 18 years of age, might learn theology. No minister of religion could enjoy full civil rights. No religious association could hold property, and all property of existing religious associations was confiscated to the State, which might at its pleasure lend buildings for religious worship. Monasteries were to be converted to useful purposes. Most of the bishops who have not escaped from Russia and have not been put to death have been interned in or about Moscow, or in monasteries in the far north. And the only organization that has been found possible is a synod of 15 Russian bishops which holds its sessions outside Russia, at Belgrade. The patriarch Tikhon died in 1925, and a makeshift for the patriarchate has been devised in the shape of a *locum tenens*. The passive resistance of the Russian peasantry has been the great obstacle to the Government's endeavour to suppress Christianity, and the so-called reformed Russian Church, a body encouraged by the Soviet power, has so far been a failure for the same reason. In Georgia, the Church is in as great confusion as in Russia; since the first revolution the tendency has been towards independence in ecclesiastical matters. (The translation of an official summary of Soviet legislation against religion is

given in the *Church Times*, Oct. 30, 1925; see also Nov. 20, 1925.)

Post-War Turkey, with its curtailed frontiers, has as its aim the creation of an entirely Muslim State; and among other things the Turkish Government desires the abolition of the Ecumenical Patriarchate. But the European Powers, while restoring Constantinople to Turkey, prevented this, and at Lausanne the Turkish delegates made a formal declaration of their Government that the Patriarchate would be allowed to continue. Yet, as far as Turkey is concerned, the Patriarchate is little more than "the shadow of a shade." By the Treaty of Lausanne all Greek Orthodox residents in Constantinople before Oct. 30, 1918, are exempt from expulsion. All other Greeks in Turkey, however, are liable to expulsion, and those in Asia Minor have been settled in the new Greece and elsewhere, in many cases in change for Muslims. Only Turkish subjects can be metropolitans in Turkey, and therefore the episcopate has to be recruited from the comparatively few Greek residents in Constantinople. Outside modern Turkey the Ecumenical Patriarch, not the Metropolitan of Athens, has jurisdiction in Macedonia, Western Thrace, Epirus, Crete and the Aegean Islands, and this is an exception to the rule about ecclesiastical independence mentioned above. (See an informative series of four articles on *The Orthodox Churches*, by Dr. Greig, Bishop of Gibraltar in *Theology*, 10-11, March, April, July, Aug., 1925.)

Yugoslavia, called in the Treaties the Serb-Croat-Slovene State, is now re-organizing its Church, which includes the former Serbian Church, the Karlowitz Serbian Church, that of Dalmatia and Cattaro, that of Bosnia and Hercegovina (these three formerly in Austro-Hungary) and Montenegro. During the World War many Serbians were in England; over 600 refugees, young ordinands, were there instructed and prepared for the Orthodox priesthood under Serbian priests. (*The Christian East*, 48 f, 51 f, 54.) Many others were in France, engaged in secular pursuits, and in other countries. This will be a convenient place to remark on the changed ecclesiastical conditions in both Yugoslavia and Rumania. Before the War Rumania and Serbia were inhabited practically by Orthodox alone. But the enlarged boundaries have brought in many Roman Catholics and Lutherans, and this has complicated the problem of national religions. The former idea of one country, one church, has to be given up, and religion and politics cannot have the same close connection that they had before. Moreover, the greatest hindrance to the reorganization of the Orthodox Church in the Balkans and in Rumania is the exaggerated national feeling and jealousy of each country against the others. This jealousy is much more felt between the different branches of Orthodoxy than between them and the Roman Catholics or Lutherans. (Greig in *Theology*, ii., 8, 66.)

To the former Rumanian Church, with its two metropolitans, is now added the Transylvanian Church (formerly in Hungary), with its metropolitan at Hermannstadt, and suffragan bishops at Arad and Kazansebes; and also the Churches of Bukowina and Bessarabia.

The old metropolitanate of Athens has not been greatly affected. For Macedonia, etc., see above; but it is hard to see how the Ecumenical Patriarch in Constantinople can under the changed conditions exercise an effective supervision over these districts. Salonika has now become once more a Christian city, and the mosques which had originally been Christian churches have now been restored to Orthodox worship.

Bulgaria has lost the Aegean coast to Greece, and part of the Dobruja to Rumania. Otherwise the Church has not been much affected. It has, by the official census of 1920, about 4,000,000 members, almost all of Bulgarian nationality, out of a total population of nearly 5,000,000, of whom about 700,000 are Muslims, chiefly Turks.

Among the smaller communities in Asia and Africa which were once under Turkish rule, the Orthodox patriarchate of Jerusalem, now under British mandate, consists of about 30,000 Arab and Greek Christians and a few Russians: the chief obstacles to progress are the jealousies between Arabs and Greeks, and the financial difficulties of the monasteries. The Orthodox patriarchate of Antioch, now under French mandate, suffers from the same difficulties as that of Jerusalem. It has some 300,000 members. The

Orthodox ("Melkite") Patriarch of Alexandria has only a small following of about 100,000, as has been the case since the Monophysite schism in the 5th century. Under him is the Archbishop of Nubia. The autocephalous Churches of Cyprus (with about 200,000 Orthodox) and Mount Sinai have not been greatly affected by the War.

BIBLIOGRAPHY.—For the origins of the Eastern Church and the early controversies see the authorities cited in the article CHURCH HISTORY. The following are devoted specially to the history and condition of the Eastern Church: M. le Quien, *Oriens Christianus* (1740); J. S. Assemani, *Bibliotheca Orientalis* (1719-28); A. P. Stanley's *Eastern Church* (1861); J. M. Neale, *The Holy Eastern Church (General Introduction, 2 vols.; Patriarchate of Alexandria, 2 vols.; and, published posthumously in 1873, Patriarchate of Antioch)*; W. F. Adeney, *The Greek and Eastern Churches* (1908); A. Fortescue, *The Orthodox Eastern Church* (1907, with valuable bibliography); also references in Hastings' *Encyclopaedia of Religion and Ethics*, articles "Greek Orthodox Church" and "Russian Church" by S. V. Troitsky. For liturgy, see H. A. Daniel, *Codex Liturgicus Eccl. Univ. in epitomen reductus* (4 vols., 1847-55); F. E. Brightman, *Eastern Liturgies* (Oxford, 1896). On the question of Reunion, see Fortescue, as above; and art. REUNION (CHURCH).

ORTHOGENESIS, a zoological term introduced by Eimer to express the view that the variations from the normal form of an animal species, on the occurrence of which evolution depends, do not arise at hazard but have a definite direction in all closely allied species; and that these variations may be repeated over a long series of generations, always in the same direction. The cause of these definite variations is left uncertain but is supposed to lie within the animal and not in its environment. Thus evolution would follow a direct course, which need have no positive adaptive significance. This view was founded on a study of the patterns of butterfly wings.

The phylogenies built up by palaeontologists, as E. D. Cope was the first to observe, do show that evolution has generally proceeded in definite directions, each member of a series differing from its predecessor in the same ways as its successor differs from it. In most cases the changes take place in such a way that greater mechanical efficiency is secured, and they can thus, theoretically, be accounted for by natural selection, exercised by a constant or auto-orthogenetic environment. In some cases however the changes may proceed in a definite direction despite very great changes in habits and habitat amongst the animals.

The essential point, that variation is not indefinite in direction, has been established for those heritable variations known as mutations by the observation that definite mutants appear time after time at a definite rate amongst the members of a species bred under controlled conditions; and that identical mutants occur in allied species and genera. The implication of these facts is that the mechanism which determines the course of development of the fertilized egg, and is hence responsible for heredity, is capable of modification only in certain definite ways, and that this mechanism is of essentially the same structure in allied animals. This view is in harmony with the fact, observed by palaeontologists, that closely allied stocks (phyla or lineages) exposed to similar conditions pursue parallel evolutionary courses. It is not inconsistent with the view that the evolution, at least of certain structures, may follow a definite trend independently of its environment. See EVOLUTION. (D. M. S. W.)

ORTHOPAEDIC SURGERY. In this branch of surgery, which deals with the rectification of congenital and acquired deformities, particularly those of the limbs, great advances have been achieved during recent years as a consequence of the exceptional opportunities of study and practice afforded during the Great War. Thus the treatment of fractures during the early part of the War was attended not only by unnecessary deformity, but also by a high mortality, and remained unsatisfactory until special hospitals were started, manned by teams of expert surgeons. In compound fractures of the femur an initial mortality of 80% was ultimately reduced to 25%. This dramatic change was accomplished by immediate reduction and fixation of the fracture, by segregation and by continuity of treatment. Knowledge thus gained has formed the basis of the efforts to place the

organisation and teaching of fractures upon a different basis with a view to minimising the disabilities of industrial accidents. Reform lies in the simplification of apparatus, and in an intensive education in their application, in segregation of fractures in special wards and in appointing surgeons with special qualifications to teach the student.

Improved Technique.—Among certain reconstructive operations in the case of which a greatly improved technique has resulted may be mentioned repair of injuries to the peripheral nerves, tendon transplantations, bone grafting and bone infections. The enormous number of complete nerve lacerations enabled a finished operative technique to be built up, which was largely wanting previously. Many misconceptions were also corrected, such as the worthlessness of complete transplants of nervous or other tissue to bridge gaps in peripheral nerves, and the doubtful value of lateral nerve anastomosis. In cases of irreparable destruction to nerves, healthy muscles were transposed to take the place of paralysed ones. These operations proved singularly successful where large tracts of the musculo-spiral nerve were irreparably damaged.

Certain flexor muscles of the forearm were attached in such a way that extension of the wrist and fingers became assured. Bone graft surgery likewise received a great impetus and has since been extended. This has led to considerable research on the viability of transplanted tissue, and in the case of the bone it is held that the transplant is a scaffold along which the fresh bone-laying cells creep from the embracing bone and deposit new bone, the scaffolding itself being ultimately removed by absorption. The treatment of virulent infections has been similarly developed. The Carrel-Dakin method has permanently established itself as well as the procedure of laying open infected bone cavities so that the soft tissues fall in easily to obliterate the gap when the infection is at an end.

Care of Cripples.—The most notable recent advance in orthopaedic surgery in Great Britain has been in the organization for the care and cure of cripples. This has consisted in the establishment of well-equipped open-air hospitals in various parts of the country, known as hospital schools, fully staffed by surgeons specially trained to deal with deformities of every kind. These schools provide treatment and education for the cripple, and are associated with what are known as after-care clinics situated in small towns covering an area of from 40 to 50 m. distant from the hospital in every direction. These after-care clinics are visited by the hospital staff at stated times, and are attended by out-patients who have been inmates of the hospital school, and by cases from the district, who are often seen at a sufficiently early date to prevent deformities from arising. These hospitals and clinics are run in close association and agreement with the local practitioners, the education authorities and the Ministry of Health. This scheme, in association with preventive measures, promises practically to eliminate the cripple. Its aims are to secure the potential cripple at the earliest moment, to give him expert institutional treatment in fresh air and sunlight and to secure continuity of treatment until recovery is complete. (See CRIPPLES, CARE OF.)

Artificial Light.—Of other recent advances in knowledge, the evolution of the artificial light treatment as an auxiliary form of therapeutics for tuberculosis of bones and joints and of rickets may be instanced. The work of Rollier, Leonard Hill and others has given prominence to the therapeutic value of sunlight (see HELIOTHERAPY), and in the absence of sun extended observation favours the conclusion that we have in various forms of artificial light a promising substitute. This treatment, as in the case of heliotherapy, must be looked upon merely as an accessory measure in surgical tuberculosis. It is most effective when used in combination with other surgical procedures. It should be pointed out that there is grave danger in spreading a belief that other forms of treatment are unnecessary and subsidiary.

Infantile Paralysis.—The further study of infantile paralysis has resulted in a more widespread knowledge of the early symptomatology and important work has been done; especially by the late Prof. Lovett of Harvard from 1916 onwards. It has

now been proved that complete rest and immobilisation and the elimination of meddlesome therapeutics during the acute and convalescent stages have resulted in lessening the severity of symptoms by limiting the paralysis. The mass of material rendered available during late years by epidemics has thrown new light on the actual treatment of deformity. Tendon transplantations for various deformities of the feet have given place to operative stabilisation of the flail foot, and transplantations when practised are now associated with reconstructive operations upon bone. This combination has resulted in more satisfactory function.

Rickets.—Rickets and allied nutritional diseases have likewise received within recent years close investigation by many observers abroad and at home with valuable results. Considerable work on the aetiology, particularly with reference to diet, exercise and sunlight, has been carried out at Johns Hopkins Hospital, the Lister Institute and by Findlay of Glasgow, Mellanby and Chick. Much has been discovered regarding "vitamines" or "accessory food factors" (see VITAMINES). The report of the Research Committee provisionally dealt with only two varieties; one known as vitamin A, or fat soluble A, and the other as anti-rachitic vitamin. Both are essential to the diet of growing animals. Defect in the one leads to arrest of growth and loss of weight; in the other a deficiency in the deposit of lime salts. The committee conclude that an anti-rachitic vitamin is a central factor in the prevention of rickets; and that a deficiency of calcium and phosphorus, in conjunction with a deficiency of anti-rachitic vitamin, hastens rickets. The greater the discrepancy in the calcium phosphorus intake the greater need for an appropriate anti-rachitic intake. It has now been proved that sunlight and ultra-violet rays act as an antidote to a deficiency diet, and can ward off the on-coming of rickets. This work has added considerably to the knowledge of orthopaedic surgeons, and has rendered unnecessary a good deal of the operative treatment for rachitic deformities.

Spinal Treatment and Other Operations.—The writings of Albee, Hibbs, Calvé, Girdlestone and Waldenstrom have enabled us to place in accurate perspective the bony fixation of the vertebral column in tubercular disease of the spine. Forcible correction and fixation of the spine in lateral curvature is being abandoned in favour of less drastic measures, and bony fixation of the flail spine in paralytic cases is being performed with promising results.

Operative treatment in osteoarthritis, especially in the non-articular type, is being more widely practised. This consists in stabilising the joint by exercising the joint surfaces and in the complete removal of diseased synovial membrane in the knee joints. The so-called operations of arthroplasty, or mobilisation in ankylosis of joints is becoming more common, and the results more encouraging. They mainly consist of the loosening and reconstruction of the bone ends, and the introduction of transplanted or living tissue between the bone ends to secure movement.

The treatment of fractures of the neck of the femur by wide abduction of the limb with internal rotation have been still further perfected by Royal Whitman of New York, and a large percentage of recoveries in this obstinate type of fracture occurring in old age is reported. The pathology of the rarer bone diseases such as "cysts of bone," "myeloid sarcoma," "Paget's disease" have been closely studied by many observers, resulting in valuable information in relation to operative procedure.

Jones (ed.), *Orthopaedic Surgery of Injuries* (by various authors), 2 vol. (Oxford University Press 1921); Sir R. Jones and R. W. Lovett, *Orthopaedic Surgery* (Oxford University Press 1923) (bibl.); R. Whitman, *Treatise on Orthopaedic Surgery*, 8th ed. London 1927 (bibl.); W. A. Cochrane, *Orthopaedic Surgery*, Edinburgh 1926; G. Potel, *Traité pratique d'orthopédie*, Paris 1925; F. Calot, *L'orthopédie indispensable aux praticiens*, 8th ed. Paris 1923; F. H. Albee, *Orthopaedic and Reconstruction Surgery*, Philadelphia 1919 (bibl.). (R. J.)

Developments in the United States.—The World War taught the *rehabilitation* of human beings, the first step of which is reconstruction surgery. Instead of accepting a functional handicap

as inevitable, and fitting out the patient with braces, canes, or crutches, reconstruction operations are performed which in many instances accomplish normal, or nearly normal return of function. Plastic operative work, tendon transplantation, skin and bone grafting have finally been placed in their proper correlation with the old methods of braces, straps and buckles, plaster of Paris casts, etc., so that the specialty now has rounded out into one in which operative work and the mechanical means of treatment as well as heliotherapy and physiotherapy have been co-ordinated.

At least 65 per cent of all the injuries sustained in the late war and coming to definitive treatment involved bones, joints, ligaments, muscles, tendons or nerves, thus throwing orthopaedic surgery into sharp relief. The technique of reconstruction operations to meet the unusual demands was rapidly developed and perfected, and the scope of this branch of surgery widened appreciably as the best orthopaedic surgeons combined their skill at the front.

The war over, the demand for rehabilitation surgery has increased rather than decreased. The high-powered machines of industry, the speeding automobile, the aeroplane, and our great railway systems and construction projects take a terrific annual toll in bones, joints, muscles, tendons, etc., which, without reconstruction surgery, would mean a tremendous number of cripples, unhappy themselves, and a great economic burden upon society.

The introduction of automatic machine tools into orthopaedic surgery was an important event in the technical world as it has made possible the cutting and moulding of bone with as much variety as the machinist shapes metal, and these power-driven instruments have been an important factor in the development of reconstruction surgery. In 1909 Dr. Fred H. Albee of New York city conceived the technique of bone graft of the spine to arrest tuberculous destruction and prevent hunchback; but found it impossible of accurate execution with the hand tools then comprising the surgeon's armamentarium. Realizing further the great possibilities of repair and reconstruction in cases of extensive loss of bone and damage to joints which adequate machine tools (such as circular twin saw, dowel and screw cutter) would make possible in transplanting bone from one portion of the body to another, he designed a set of miniature automatic machine tools, carefully adapted from those used by a cabinet maker and mechanic, to the various surgical problems encountered in cutting and shaping bone. This has become known as the Albee bone mill. As other grafting plastic bone operations were devised, notably for hip, knee and jaw, new instruments have been added to the "mill," which by their great accuracy and rapidity tremendously reduce the shock attendant upon cutting bone with the old hand instruments, shorten the time of anaesthesia, and permit intricate bone operations.

As a result of the benefits of the X-ray in determining diagnosis and showing the exact condition of bone, and the use of the automatic machine tools and orthopaedic appliances introduced within the last 25 years, the human bony system can to-day be made over in a truly remarkable way.

The increased understanding of shock, as a result of the researches of Crile and Cannon, and the increased means of combating or eliminating it by employing electrically driven tools, as well as outstanding advances in technique, have made complicated and exacting operative problems that were formerly hopeless now possible.

The Carrel-Dakin treatment of lacerated or infected wounds before operation is attempted has greatly lessened the chances of sepsis. By this method, which was devised during the war by Carrel of the Rockefeller Foundation and Dakin, the English chemist, the wound is kept constantly bathed in a solution containing free chlorine gas with elements which dissolve away the discharges of the wound.

In fractures of the hip, conditions are such that union does not occur in a large percentage of cases, even when conservative treatment is applied in the most ideal way. Cases of persistent non-union have been salvaged by means of automatic machinery and the bone graft, dowel or peg union being secured in from 75% to 90% of cases according to the degree of erosion between the fragments.

The conception that arthritis is a metastatic infection from some focus, often remote from the joint or joints affected, has led to the prevention of many cases and relief of others by elimination of sources of toxic absorption.

One of the most striking developments has been the technique which enables the surgeon to manufacture or make joints when they have been destroyed, that will function in a nearly normal manner without pain.

If a case is not controlled wisely from the psychologic standpoint while the patient is receiving treatment physically, the compensation law may react to his detriment rather than his benefit. The best sympathy that can be given a crippled man is to see that he is receiving adequate treatment and to encourage him to return to work as soon as it is safe. Follow-up work is most important; this lies with the surgeon and social worker co-operating with the surgeon.

Rehabilitation, of which the orthopaedic treatment is an important part, to-day represents three distinct yet overlapping problems: (1) the problem of treatment, preventive or corrective; (2) the sociological problem—relationship of the injured labourer to the rest of society; and (3) the medico-legal problem of properly applying the Workmen's Compensation Act. The first concerns chiefly the patient, his relatives and immediate friends, but the second and third affect all society. The rehabilitation movement in the United States has gone forward with the same strides since the war as have the hospital schools for cripples in Great Britain, the difference being that in the United States through wise legislation, state and national, it has been possible to a large extent to correlate the efforts of various agencies and to avoid duplication of effort.

The first compensation law, passed by the State of New Jersey in 1911, grew out of the sympathy of society for those crippled or physically handicapped in our great industrial plants. Since then thirty-six States have passed compensation or rehabilitation laws. (F. H. A.)

ORTHOPTERA, the term used in zoological classification for that order of insects which includes the cockroaches, mantids, grasshoppers, locusts, crickets and their allies. The earwigs are included here by some authorities but they are now more often relegated to a separate order of their own—the *Dermaptera* (see *EARWIG*). The Orthoptera are essentially terrestrial insects and many possess greatly developed powers of running or leaping. Excepting in the *Acridiidae*, flight is not one of their striking characteristics and wings are often reduced or entirely lost. They are mostly insects of comparatively large size, some being among the giants of their class; many possess well-developed sound-producing organs and are notorious stridulators. The wings, when present, are net-veined, the anterior pair being more or less hardened to form tegmina which are narrower than the membranous hind wings; the latter have a well developed posterior lobe capable of being folded up fanwise. The antennae are most often long and threadlike, the mouth parts are of the biting type and have a 4-lobed ligula. The prothorax is generally large and the abdomen is terminated by a pair of cerci. Metamorphosis is incomplete and in the wingless forms it is very little evident. Over 13,000 species of Orthoptera are known and of these about 500 inhabit Europe. In Britain there are 31 indigenous forms, while some others are naturalized alien species; there are also a number of casual immigrants which have not become established.

Orthoptera may be conveniently divided into forms which run or walk (*Cursoria*) and into those which leap (*Saltatoria*) as given below.

DIVISION I.—CURSORIA

Legs of approximately equal size, hind pair not adapted for leaping. Tarsi 5-jointed, stridulatory organs absent, ovipositor almost always concealed.

Included in this division are four families. The *Grylloblattidae* are confined to western North America and Japan; they are wingless insects with long ovipositor and cerci and exhibit close affinities with the *Saltatoria* also. The *Blattidae* or cockroaches (*q.v.*), have a large shieldlike prothorax, very broad coxae and short,

jointed cerci (fig. 1). The *Mantidae* (see *MANTIS*) have the fore legs adapted for seizing prey; the eyes are large and the cerci are several-jointed. The *Phasmodae* comprise the Stick Insects (*q.v.*)

BY COURTESY OF THE UNITED STATES DEPARTMENT OF AGRICULTURE

FIG. 1.—THE COMMON COCKROACH (*BLATTA ORIENTALIS*), NATURAL SIZE

and the Leaf Insects (*q.v.*); the fore legs are normal, the eyes are small and the cerci are single-jointed (fig. 3).

DIVISION II.—SALTATORIA

Legs of unequal size, the hind pair with enlarged femora and adapted for leaping. Tarsi with fewer than five joints, stridulatory organs usually present, ovipositor well developed and evident.

Three families belong here and included in the *Acridiidae* are the short-horned grasshoppers (see *GRASSHOPPER*) and the true locusts (*q.v.*). The antennae are shorter than the body, the tarsi are 3-jointed and the ovipositor short. Stridulation takes place by the insect rubbing the inner side of its hind femur, which bears a row of minute pegs, against a hardened area of the tegmen of the same side. Auditory organs are represented by a pair of drums at the base of the abdomen. The *Tettigoniidae* (*Locustidae*) include the long-horned grasshoppers (see *GRASSHOPPER*) which have the antennae usually longer than the body, 4-jointed tarsi and a long broad ovipositor. Stridulation is effected by the insect rubbing its

BY COURTESY OF THE U.S. DEPT. OF AGRICULTURE

FIG. 2.—EGG CAPSULE OF AMERICAN COCKROACH (*PERIPLANETA AMERICANA*)

right tegmen against a filelike area of the left tegmen and auditory organs are present on the fore tibiae. The *Gryllidae* include the crickets (*q.v.*) and their allies. The antennae are generally long and threadlike, the tarsi are usually 3-jointed and the ovipositor is commonly long and slender (fig. 4). Stridulation takes place by rubbing the tegmina together and the auditory organs are on the fore tibiae, but unlike the *Tettigoniidae* the outer organ is larger

than the inner one of the same side. The tegmina differ from those of other Saltatoria in that they are bent downwards along the sides of the body when in repose.

The eggs of Orthoptera are more or less cylindrical and in cockroaches (fig. 2) and mantids they are laid in protective capsules or oothecae, each containing 16 or more eggs. On hatching the young

FIG. 3.—STICK INSECT (CARAUSIUS MOROSUS)

nymphs bear a close miniature resemblance to the adults except for the absence of wings. After a period of gradual growth, accompanied by a very variable number of moults, the adult condition is assumed. As previously mentioned, the saltatory forms are capable of stridulation, a feature that is almost confined to the males; auditory organs, on the other hand, are present in both sexes. Some of the most notorious stridulators are the katydids (see GRASSHOPPER) and the crickets, and in some cases the strident notes can be heard nearly a mile away. Many Orthoptera are wingless (fig. 3), while among the stridulating forms the wings are sometimes reduced to the sound-producing portions of the tegmina only. The majority of the Orthoptera are herbivorous, and many of the grasshoppers and all the locusts are highly injurious insects—voracious devourers of all kinds of vegetation. Some of the cockroaches are omnivorous, the domestic species injuring or fouling a great variety of materials, while the mantids are predators devouring various insects and other creatures. Although Orthoptera are predominantly terrestrial in habit, a few species are aquatic, the curious cricket *Hydropedeticus*, for example, skates actively over streams in Fiji. Many of the *Tettigoniidae* frequent trees and bushes, while some of the *Gryllidae*, notably the mole crickets and their allies, are subterranean. The curious small wingless crickets of the genus *Myrmecophila* live in close association with ants.

Geographically the largest families are world-wide in range. The leaf insects, however, are restricted to the oriental region and the *Grylloblattidae* are confined to North America and Japan. The *Mantidae* and *Phasmodae* are common in the warmer regions of the world, but are absent from more northern latitudes. Among individual species the oriental cockroach (*Blatta orientalis*) and some of its allies have become practically cosmopolitan. In the fossil condition cockroaches are abundant, and form the greater part of the insect remains in certain of the Upper Carboniferous rocks of western Europe. They persisted until Permian times, after which their pre-eminence gradually declined until at the present day they form an insignificant part of the world's insects.

BIBLIOGRAPHY.—For the British Orthoptera see W. J. Lucas, *British Orthoptera* (1920), while for the European species see R. Tümpel, *Die Geradflügler Mitteleuropas* (1907-08), M. Burr, *Synopsis of the Orthoptera of Western Europe* (1910) and the handy work of C. Houlbert which forms two volumes in the *Encyclopédie Scientifique* (Paris, 1924-1927). For the North American species consult W. S. Blatchley, *Orthoptera of North-Eastern America* (1920). (A. D. I.)

ORTIGUEIRA, a seaport of north-western Spain, in the province of Corunna; on the northern slope of the Sierra de la Faladoira, on the river Nera and on the eastern shore of the Ría de Santa Marta—a winding, rock-bound and much indented inlet of

the Bay of Biscay, between Capes Ortegal and Vares. Pop. (1920) 19,422. The population is very scattered. The industries are fishing and farming. There is an important coasting trade, despite the dangerous character of the coast-line and the fogs and gales.

ORTLER, the highest point (12,802 ft.) in Tirol, and in the whole of the Eastern Alps. It is a great snow-clad mass, which rises east of the Stelvio Pass, and a little south of the upper valley

ORTLER ALP FARM, ON THE SLOPES OF THE HIGHEST PEAK (12,802 FT.) IN THE EASTERN ALPS, BETWEEN THE VALLEYS OF TRAFÖI AND SULDEN

of the Adige between the valleys of Trafoi (north-west) and of Suldén (north-east). It was long considered inaccessible, but was conquered in 1804 by three Tirolese peasants. The first traveller to make the climb was Herr Gebhard in 1805 (sixth ascent). Many routes to the summit are now known.

ORTNIT or **OTNIT**, German hero of romance, was originally Hertnit or Hartnit, the elder of two brothers known as the Hartungs, who correspond in German mythology to the Dioscuri. His seat was at Holmgard (Novgorod), according to the *Thidrekssaga* (chapter 45), and he was related to the Russian saga heroes. Later on his city of Holmgard became Garda, and in ordinary German legend he ruled in Lombardy. Hartnit won his bride, a Valkyrie, by hard fighting against the giant Isungs, but was killed in a later fight by a dragon. His younger brother, Hardheri (replaced in later German legend by Wolddietrich), avenged Ortnit by killing the dragon, and then married his brother's widow. Ortnit's wooing was corrupted by the popular interest in the crusades to an Oriental *Brautfahrtsaga*, bearing a resemblance to the French romance of Huon of Bordeaux (*q.v.*).

See editions of the *Heldenbuch* and one of *Ortnit und Wolddietrich* by Dr. J. L. Edlen von Lindhausen (Tübingen, 1906).

ORTOLAN, *Emberiza hortulana*, a bunting (*q.v.*) celebrated for the delicate flavour of its flesh. A native of most European countries—the British islands excepted—as well as of western Asia, it migrates southwards in autumn and returns about the end of April. Its distribution throughout its breeding range seems to

BY COURTESY OF THE U.S. DEPT. OF AGRICULTURE

FIG. 4.—HOUSE CRICKET (GRYLLUS DOMESTICUS)

be very local. In habits it much resembles the yellow-hammer, but it wants the bright colouring of that species. The monotonous song of the cock is also much of the same kind. The nest is placed on or near the ground, but the eggs seldom show the hair-like markings which characterize those of most buntings. Its natural food consists of beetles, other insects and seeds. Ortolans are netted in great numbers, kept alive in a darkened room, and fed with oats and millet. In a very short time they become enormously fat and are then killed for the table.

ORTONA, small seaport and episcopal see, Abruzzi, Italy, province of Chieti, 12 m. directly E. of that town, 105 m. by rail S.S.E. of Ancona. Pop. (1921) 9,417 (town); 16,802 (commune). It is situated on a promontory 230 ft. above sea-level, and connected with the port below by a funicular railway. The ruined castle has magnificent views. The cathedral (1127) has a fine portal by a local artist, Nicolo Mancini (1311). The town occupies the site of the ancient Ortona, a seaport of the Frentani.

ORURO, a department and town of Bolivia. The department is bounded north by La Paz, east by Cochabamba and Potosí, south by Potosí and west by Chile; it occupies part of an ancient lacustrine basin lying between the eastern and western ranges of the Andes, and has an area of 20,657 sq.m., the greater part of which is semi-arid and covered with extensive saline deposits. The Desaguadero river, the outlet of Lake Titicaca, flows southward into Lake Pampa-Aullagas, or Poopó, on the eastern side of the department near the Cordillera de los Frailes. Lake Poopó is 12,106 ft. above sea-level, or 400 ft. lower than Titicaca, and its waters discharge through a small outlet, called the Lacahahuira, into the lagoon and saline morasses of Coipasa (12,073 ft. elevation) in the south-west corner of the department. Oruro is almost exclusively a mining department, the country being too arid and too cold for agriculture. With the exception of a narrow strip along the foot-hills of the Cordillera de los Frailes, where a few cattle, mules, llamas and sheep are reared, little of the area is suitable even for grazing. In the vicinity of the capital, in the north-east part of the department, there are large deposits of tin, silver, tungsten and copper; Oruro is the second largest producer of tin in the republic.

The capital of the department is Oruro, 125 m. south-south-east (direct) of La Paz; it is an old mining town dating from the 17th century, when it is said to have had a population of 70,000. The estimate of 1924 gave it a population of 32,908, the greater part of whom are Indians and mestizos. A considerable number of foreigners are interested in the neighbouring mines. The elevation of Oruro is 12,158 ft. above sea-level, and its climate is characterized by a cool summer with light rainfall and a cooler but sunny winter, with nightly frosts and an occasional snow-storm. The mean temperature of the warmest month, December, is 51° F and that of the coolest month, June, is 31° F. There is a much greater difference than this between day and night temperatures, both in summer and winter. Oruro is connected by rail with La Paz and Cochabamba, with Antofagasta, 578 m. away, and with Arica (via Viacha) 380 m. distant. (G. M. McB.)

ORVIETO (anc. *Volsinii* [q.v.], later *Urbs Vetus*, whence the modern name), town and episcopal see, province of Perugia, Italy, on the Paglia, a tributary of the Tiber, 78 m. by rail N. by W. of Rome. Pop. (1921) 7,598 (town); 19,409 (commune). It crowns an isolated rock, 1,033 ft. above sea-level, 640 ft. above the plain, commanding splendid views, and is approached by a funicular railway. The town has a large number of fine 13th-century houses and palaces. The splendid cathedral dedicated to the Virgin was begun at least as soon as 1288 on the site of two older churches erected to commemorate the miracle of Bolsena (q.v.), and was decorated by many mediaeval painters and sculptors. The exterior is black and white marble; the interior is grey limestone with bands of dark basaltic stone. There is a large rectangular nave, with semicircular recesses for altars, opening out of the aisles, north and south, two transeptal chapels and a short choir. The finest polychrome monument in existence is the west façade, of richly-sculptured marble from the designs of Lorenzo Maitani of Siena, divided into three gables with intervening pinnacles; it is a reproduction of the façade of Siena cathedral. The mosaics are

modern. The four wall-surfaces that flank the three western doorways are decorated with beautiful sculpture in relief, executed under Maitani's direction until his death in 1330. In the interior, the Cappella del Corporale possesses a large silver shrine, resembling the cathedral façade, enriched with countless figures in relief and subjects in translucent coloured enamels—one of the most important specimens of early silversmith's work. It was begun by Ugolino Vieri of Siena in 1337, and was made to contain the Holy Corporal from Bolsena (q.v.). On the south side is the chapel of S. Brizio, separated from the nave by a fine 14th-century wrought-iron screen. The walls and vault are covered with fine and well preserved frescoes—among the noblest works of Fra Angelico and Luca Signorelli, painted 1499 to 1504—the latter being of especial importance in the history of art owing to their great influence on Michelangelo in his early days. The choir stalls are fine and elaborate specimens of *tarsia* and rich wood-carving—the work of Pietro del Minella (1430–41). In 16th-century sculpture the cathedral is especially rich, containing many statues, groups and altar-reliefs by Simone Mosca and Ippolito Scalza. Close by are two Gothic buildings, the bishop's palace (1264) and the Palazzo dei Papi (1264–1302), the latter with a huge hall now containing the Museo Civico, with various mediaeval works of art, and also objects from the Etruscan necropolis of the ancient Volsinii (q.v.). The Palazzo Faina has another interesting Etruscan collection. The Palazzo del Comune is Romanesque (12th cent.). S. Andrea and S. Giovenale are also Romanesque churches of the 11th century; both contain later frescoes. To the 11th–12th century belongs the ruined abbey of SS. Severo and Martirio, 1 m. south of the town. The church of S. Domenico contains one of the finest works in sculpture by Arnolfo del Cambio, the tomb with recumbent effigy of the Cardinal de Braye (1282), with much beautiful sculpture and mosaic. There are a few buildings by Sammicheli of Verona, architect of the cathedral from 1509–28. The fortress built in 1364 by Cardinal Albornoz has been converted into a public garden. The well, now disused, called Il pozzo di S. Patrizio, is one of the chief curiosities of Orvieto. It is 200 ft. deep to the water-level and 42 ft. in diameter, cut in the rock, with a double winding inclined plane, so that asses could ascend and descend to carry the water from the bottom. It was begun by the architect Antonio da San Gallo the younger in 1527 for Clement VII. and was finished by Simone Mosca under Paul III. (See UMBRIA.)

See L. Fumi, *Il Duomo d'Orvieto e i suoi restauri* (1891); *Orvieto, note storiche e biografiche* (1891), and other works; P. Perali, *Orvieto* (ibid. 1919). (T. A.)

ORYX, the scientific name of a group of African antelopes of large size with long horns, which are present in both sexes, and long tufted tails. They are desert animals. The true oryx is the East and North-east African beisa oryx (*Oryx beisa*), which is replaced in South Africa by the gemsbok (q.v.). In northern Africa the group is represented by *O. leucoryx*, and in Arabia by *O. beatrix*. See ANTELOPE.

ORZESZKO or ORSZESZKO, **ELIZA** (1842–1910), Polish novelist, was born near Grodno, of the noble family of Pawlowski. In her 16th year she married Piotr Orzeszko, a Polish nobleman, who was exiled to Siberia after the insurrection of 1863. She wrote a series of powerful novels and sketches, dealing with the social conditions of her country. *Eli Makower* (1875) describes the relations between the Jews and the Polish nobility, and *Meir Ezołowicz* (1878) the conflict between Jewish orthodoxy and modern liberalism. *On the Niemen* (1888), perhaps her best work, deals with the Polish aristocracy, and *Lost Souls* (1886) and *Cham* (1888) are on rural life in White Russia. She died at Grodno on May 18, 1910.

OSAGE, a tribe of American Indians formerly on Osage and Arkansas rivers in Missouri and Arkansas. Their speech is Siouan; their culture that of the plains. The original population is estimated at 5,000; in 1921 there were 2,200 in Oklahoma. Oil royalties, land leases and interest on trust funds held for them by the Government, make them one of the richest populations in the world.

See F. La Flesche, *Bur. Am. Ethn. Rep.* xxxvi, 1921; xxxix, 1925.

OSAGE ORANGE (*Maclura aurantiaca*), a thorny tree with large, yellow, somewhat orange-like fruit. The tree, which is the only species of its genus, belongs to the mulberry family (Moraceae). It is native to rich soils in the south central United States from Missouri and Kansas to Texas, but has been planted extensively for hedges throughout the prairie region of the Mississippi valley and occasionally in the eastern States, being hardy in New England. The very hard, strong, flexible, yellow wood, formerly used for bows and war-clubs by the Osage and other Indians west of the Mississippi, is utilized in wheel-work and for railway ties and fence posts. Osage orange is also known as bow-wood.

OSAKA, a city of Japan in the province of Settsu. Pop. (1925) 2,114,804. It lies in a plain bounded, except westward, where it opens on Osaka Bay, by hills of considerable height, on both sides of the Yodogawa, or rather its headwater the Aji (the outlet of Lake Biwa), and is so intersected by river-branches and canals as to suggest a comparison with a Dutch town. Steamers ply between Osaka and Kobe-Hiogo or Kobe, and Osaka is an important railway centre. The opening of the railway (1873) drew foreign trade to Kobe, but a harbour for ocean-steamers has been constructed at Osaka. Shin-sai Bashi Suji, the principal thoroughfare, leads from Kitahama, the district lying on the south side of the Tosabori, to the iron suspension bridge (Shin-sai Bashi) over the Dotombori. The foreign settlement is at Kawaguchi at the junction of the Shirinashi and the Aji. It is the seat of a number of European mission stations. Buddhist and Shinto temples are numerous. The principal secular buildings are the castle, the mint and the arsenal. The castle was founded in 1583 by Hideyoshi; the enclosed palace, probably the finest building in Japan, survived the capture of the castle by Iyeyasu (1615), and in 1867 and 1868 witnessed the reception of the foreign legations by the Tokugawa shoguns; but in the latter year it was fired by the Tokugawa party. It now provides military headquarters, containing a garrison and an arsenal. The whole castle is protected by high and massive walls and broad moats. The mint, erected and organized by Europeans, was opened in 1871. Osaka possesses iron-works, sugar refineries, cotton spinning mills, shipyards and a great variety of other manufactures.

Osaka owes its origin to Rennio Shonin, the eighth head of the Shin-Shu sect, who in 1495-1496 built, on the site now occupied by the castle, a temple which afterwards became the principal residence of his successors. In 1580, after ten years' successful defence of his position, Kenryo, the eleventh "abbot," was obliged to surrender; and in 1583 the victorious Hideyoshi made Osaka his capital. The city brought several suburban districts within its boundaries in 1925 and thereby became the most populous city in Japan. In 1909 one-third of the city was destroyed by fire and though it was rebuilt with wider streets and better buildings, there are still many wooden houses and bridges, dangerous in case of fire, and its factories and warehouses compare less favourably with European and American standards than those of Tokyo. Work on a drainage system was started in 1909, but is still incomplete. Electric railways connect the city with Kobe.

Trade has grown very largely, but most goods are loaded and discharged at Kobe, as the river is only navigable for small vessels. A fourth shipbuilding yard was opened in 1911. A pharmaceutical school was opened in 1917 and in 1919 the university of medicine was made into a general university. The spread of pulmonary tuberculosis has caused alarm and a tuberculosis laboratory has been opened. In 1919 a municipal home for workpeople, including a children's clinic, was inaugurated. (See JAPAN.)

OSAWATOMIE, a city of Miami county, Kansas, U.S.A., 45 m. S. by W. of Kansas City, on the Missouri Pacific railroad. Pop. 4,722 in 1920 (89% native white). It is near oil and gas fields, in a farming and grazing region, and has railroad shops, an oil refinery and other manufacturing plants. A State hospital for the insane is 1 m. N.E. Osawatome was settled about 1854 by colonists sent out by the Emigrant Aid company. The name was derived from Osage and Pottawattomie. It was the scene of many clashes between the pro-slavery and the free-soil factions of Kansas and Missouri, notably on Aug. 30, 1856, when Capt. John Brown (who had come to Osawatome in 1855) and 40 fol-

lowers attempted to repulse an attack by Gen. John W. Reid, at the head of 400 Missourians. They were quickly overpowered and the town was looted and practically destroyed.

OSBORN, HENRY FAIRFIELD (1857-), palaeontologist, was born at Fairfield (Conn.), Aug. 8, 1857. He graduated from Princeton university (1877) and continued his studies under Balfour and Huxley. His professorships have included natural history and anatomy at Princeton (1881-91); biology and zoology until 1910, and the deanship of the faculty of pure science (1892-1895) at Columbia university. Since 1910 he has held the research professorship in zoology at Columbia university. His connection with the American Museum of Natural History began as curator of the department of vertebrate palaeontology (1891-1910), and was followed by a number of offices till 1908, when he became president, which he still is (1929). Since 1900 he has been connected with the U.S. Geological Survey, first as vertebrate palaeontologist and since 1924 as senior geologist. Among offices too numerous to mention, he has had important connections with the Canadian Geological Survey, the New York Zoological Society, and the Carnegie Institute. He declined the proffered secretaryship of the Smithsonian Institution.

The American Museum of Natural History extension school service, its unique exhibition halls, and the organization of a complete survey of the geological succession of the higher vertebrates of North America are due to President Osborn's efforts. His extensive researches chiefly have concerned the palaeontology of the vertebrates. His publications have dealt with almost all groups of animals and reptiles, but have made especially important contributions to the knowledge of the rhinoceroses, horses, titanotheres, and dinosaurs. He has founded a flourishing school of vertebrate palaeontology which already includes the names of numerous brilliant younger men of science. He has done much towards the determination of relative ages of extinct mammals in North America, and has done important services in working out a correlation between the Tertiary and mammal horizons of Europe and America. He has also studied and written on the philosophical bearings of his work. He was called, by the Royal Society of London at the time of his election to membership, "one of the most distinguished palaeontologists of our time."

His scientific writings (1877-1928) in geology, palaeontology, anthropology and biology comprise 755 titles, including memoirs on extinct reptiles and mammals.

His books combine literary art and scientific information. Among the most important are: *From the Greeks to Darwin* (1894); *Evolution of Mammalian Molar Teeth* (1907); *The Age of Mammals* (1910); *Huxley and Education* (1910); *Men of the Old Stone Age* (1915); *Origin and Evolution of Life* (1917); *The Earth Speaks to Bryan* (1925); *Evolution and Religion in Education* (1926); *Creative Education and Man Rises to Par-nassus* (1927).

See "Eminent Living Geologists," *Geological Magazine*, London (1917), vol. 4, pp. 193-196, new Series, Decade 6.

OSBORNE, a former royal residence in the Isle of Wight, England, south-east of East Cowes. The name of the manor in early times is quoted as Austerborne or Oysterborne. In 1845, it was purchased by Queen Victoria, who died there in 1901. King Edward VII. presented the property to the nation. A part of the house was transformed into a convalescent home for officers of the navy and army, opened in 1904. In 1903 there was opened on the Osborne estate a Royal Naval college, which in 1921 was closed down, and the cadets thenceforward joined Dartmouth college.

OSCAN was the name given by the Romans to that dialect (*lingua Oscan*) which they found spoken by the *Osci* of Campania. But inscriptional and other records, i.e., local and personal names and glosses in ancient authors, manifestly of the same dialect, have been found not only in Campania, where the dialect was, according to the most probable interpretation of the evidence, not original, but seems to have been imposed upon the Oscans by Samnite invaders in the 5th century B.C., but also further south, namely in northern Apulia, Lucania, in the country of the Brutii (the "toe" of Italy), and even in the north-east angle of Sicily at Messana (the modern Messina), which was captured by the

Campanian Mamertines c. 289 B.C.; in Samnium proper, including the territory of the Frentani and Hirpini; and finally, further north, in the country of the Paeligni, Marrucini and Vestini. Thus there are distinguished, geographically, and dialectally, three main groups of Oscan: (1) Central Oscan of Campania and the Samnite tribes, (2) Southern Oscan, and (3) Northern Oscan. These are all closely related to one another as compared with the dialect of the Volsci and of the Umbrian townships (Iguvium, the modern Gubbio; Tuder, modern Todi; and one or two others); while Oscan, Volscian and Umbrian, taken together, make one of the two great divisions—the other being Latin (*q.v.*) with Faliscan—into which the Italic branch of the Indo-European family of languages falls. Since the Samnite tribes, whose expansion by successive migrations—"sacred springs" as they were called—diffused the Oscan speakers from their home in central Italy, knew their land (in Latin, Samnium) by the name *Safnīm*, it has been proposed to describe their dialects as "Safine," a title at once more comprehensive and historically truer than "Oscan." The stock to which the Samnites belonged used commonly a suffix *-no-* (e.g., in *Sabi-ni*) to form their tribal names, as distinguished from the suffixes *-co-* and *-(a)ti-* of an earlier stratum of population (e.g., in *Vol-sci*, *Teu-te*). In names like *Marru-ci-ni*, *Ardea-ti-ni*, the superimposed *-no-* suffix bears witness to a conquest or overlordship of the earlier by the later stock.

Until the Roman advance gradually replaced it by Latin—important stages of this advance are marked not so much by the three Samnite wars as by the destruction of Capua in 211 B.C. and the Social War of 91–89 B.C.—Oscan held its place as a language in recognized official and educated usage side by side with, or instead of, Latin or Greek. The poet Ennius is said to have spoken all three tongues (Gellius 17.17.1), and if Strabo (5, p. 233 C) may be trusted, the rude farces or puppet-shows introduced from the Oscan town Atella (*fabulae Atellanæ*, *ludi Osci*) were actually performed at Rome in Oscan. The latest Oscan inscriptions, scratched on the walls of houses at Pompeii, were written shortly before the eruption of Vesuvius which overwhelmed that city in A.D. 79, and it is probable that the dialect, which has left its mark on modern south Italian dialects, survived in remote country districts as a local patois for some time longer. None of the Oscan inscriptions, on the other hand, is older than the 5th century B.C.

Many of the inscriptions are carefully, indeed almost with phonetic accuracy, written in a native alphabet which was itself derived, with certain necessary modifications, from the Etruscan alphabet; but a few belonging to the southern group, and including all those from Sicily, are in the Greek, and some from Lucania and elsewhere in the rustic or Colonial Latin alphabets. Over 250 in number, the majority are quite short; nevertheless, they furnish materials adequate to give us a fairly complete conspectus of the dialect. About two-thirds of the whole come from Campania, and most of those from Capua and Pompeii.

In character they fall mostly into the following classes: (1) official documents—municipal regulations (Bantia, a treaty (Nola and Abella), inscriptions relating to public works (Pompeii and elsewhere); (2) religious—an inventory of statues and altars in a sacred grove at Agnone (Samnium), the interesting group of heraldic *ivvillæ* (*q.v.*) from Capua, recording or prescribing special ceremonies connected with family cults, numerous simple votive and dedicatory inscriptions; (3) military and election announcements (from Pompeii); (4) private documents—epitaphs, bricks inscribed with names, and (from Campania) a few belonging to the interesting group of curses, inscribed on lead and deposited in tombs; (5) coin legends, including those of the Social War reading *vittellii*, i.e., "Italia."

Oscan has many peculiarities which distinguish it from Latin in sound changes, word forms and vocabulary; in syntax the differences are much less marked. But it also possesses certain features which distinguish it amongst the Italic dialects themselves. Their nature and extent may be indicated roughly by a specimen text (on a sundial found at Pompeii):

mr atiniis mr kvaisstur eitiuvad
múltasikad kumbennieis tangi(nud)
aamanaffed

This in Latin would be:

M(a)r(a) Atinius M(a)r(ae) (filius) quaestor pecunia
multatitia conventus scitu
feri iussit

(Mara Atinius, son of Mara, quaestor, in accordance with a decree of the assembly, had this set up from fine-money.)

Buck, *Grammar of Oscan and Umbrian* (1904), all three with bibl. New inscriptions are reported in the official *Notizie degli Scavi* (Hoepli), but often more promptly in F. Ribezzo's *Rivista Indo-greco-italica* (since 1917); those discovered between 1897 and 1925 will be found collected by W. Schwering and M. Bacherler in *Bursian's Jahresbericht*, vol. 176 (1916–18), pp. 69 *sqq.*, Bacherler, *ibid.* vol. 184 (1920), pp. 140 *sqq.*, vol. 205 (1925), pp. 51 *sqq.*; see also Ribezzo, *l.c.*, vol. 8 (1924), pp. 83 *sqq.*; *résumés* of discoveries and new studies in the field appear regularly also in *Glotta* (since 1907) and in the *Indogermanisches Jahrbuch* (since 1912). G. Herbig, in M. Ebert's *Reallexikon der Vorgeschichte*, s.v. *Italiker* (1925; bibl.), and R. S. Conway in *Cambridge Ancient History*, vol. iv. (1926) pp. 444 *sqq.*, give summary accounts of the Italic peoples and dialects. (J. WH.)

OSCAR I. (1799–1859), king of Sweden and Norway, was the son of General Bernadotte, afterwards King Charles XIV. In 1838 the king began to suspect his heir of plotting with the Liberal party to effect a change of ministry, or even his own abdication. Oscar, however, avoided an actual rupture. After his accession (March 8th, 1844) it appeared that his liberalism was very restricted. He refused any radical reform of the cumbrous and obsolete constitution. But one of his earliest measures was to establish freedom of the press. Most of the legislation during his reign aimed at improving Sweden's economic position.

In foreign affairs Oscar I. was a friend of the principle of nationality. In 1848 he supported Denmark against Germany; placed Swedish and Norwegian troops in cantonments in Fünen and North Schleswig (1849–1850); and mediated the truce of Malmö (August 26, 1848). He was also one of the guarantors of the integrity of Denmark (London protocol, May 8, 1852). Oscar I. left four sons, of whom two, Carl (Charles XV.) and Oskar Fredrik (Oscar II.), succeeded to his throne.

See T. Almén, *Ätten Bernadotte* (Stockholm, 1896); and C. E. Akrell, *Minnen från Carls XIV., Oscars I. och Carls XV. Lagar* (Stockholm, 1884, 1885). Also NORWAY: *History*, and SWEDEN: *History*.

OSCAR II. (1829–1907), king of Sweden and Norway, son of Oscar I., was born at Stockholm on Jan. 21, 1829. In 1857 he married Princess Sophia Wilhelmina, youngest daughter of Duke William of Nassau. He succeeded his brother Charles XV. on Sept. 18, 1872, and was crowned in the Norwegian cathedral of Drontheim on July 18, 1873. At his accession he adopted as his motto *Brödras folkens Vål*, "the welfare of the brother folk," and from the first he realized the essential difficulties in the maintenance of the union between Sweden and Norway. The political events which led up to the final crisis in 1905, by which the thrones were separated, are dealt with in the historical articles under NORWAY and SWEDEN. But it may be said that the peaceful solution eventually adopted could hardly have been attained but for the tact and patience of the king himself. He declined, indeed, to permit any prince of his house to become king of Norway, but better relations between the two countries were restored before his death, which took place at Stockholm on Dec. 8, 1907. His acute intelligence and his aloofness from the dynastic considerations affecting most European sovereigns gave the king considerable weight as an arbitrator in international questions. At the request of Great Britain, Germany and the United States in 1889 he appointed the chief justice of Samoa, and he was again called in to arbitrate in Samoan affairs in 1899. In 1897 he was empowered to appoint a fifth arbitrator if necessary in the Venezuelan dispute, and he was called in to act as umpire in the Anglo-American arbitration treaty that was quashed by the senate.

Himself a distinguished writer and musical amateur, King Oscar was a generous friend of learning and of education. His works, which included his speeches, translations of Herder's *Cid* and Goethe's *Torquato Tasso*, a play, *Castle Cronberg*, poems and historical works, were collected in 1875–76 (new and enl. ed.,

1885-88). His *Memoirs of Charles XII.* were translated into English in 1879.

See A. Hasselgren, *Oskar II., en lefnadsteckning* (1908).

OSCEOLA (c. 1804-1838), a Seminole American Indian, leader in the second Seminole War, was born in Georgia, near the Chattahoochee river. His father was an Englishman named William Powell; his mother a Creek of the Red Stick or Mikasuki division. In 1808 he removed with his mother into northern Florida. When the U.S. commissioners negotiated with the Seminole chiefs the treaties of 1832-33 for the removal of the Seminoles to Arkansas, Osceola seized the opportunity to lead the opposition of the young warriors, and declared to the U.S. agent, Gen. Wiley Thompson, that any chief who prepared to remove would be killed. Late in 1835 he murdered Charley Emathla (or Emar-tla), a chief who was preparing to emigrate with his people, and with a few companions shot and killed Gen. Thompson.

In 1836 Generals Edmund P. Gaines (1777-1849), Winfield Scott (1786-1866) and Richard K. Call (1791-1862) waged war against them with little effect, and the year closed with General Thomas Sidney Jesup (1788-1860) in command with 8,000 troops at his disposal. General Jesup drove the enemy from the Withlacoochee country and was pursuing them southward toward the Everglades when several chiefs expressed a readiness to treat for peace. On March 6, 1837, they agreed to cease hostilities, to prepare for emigration to Arkansas, and gave hostages to bind them to their agreement. But on June 2 Osceola came to the camp at the head of about 200 Mikasuki (Miccosukees) and effected the flight of all the Indians there, about 700 including the hostages, to the Everglades. Hostilities were then resumed, but in September, after the capture of several chiefs, Osceola requested an interview. This was granted, and by command of General Jesup he was taken captive and carried to Fort Moultrie, at Charleston, S.C., where he died in January, 1838. The war continued until 1842, but after Osceola's death the Indians did little but attack the unarmed inhabitants.

See J. T. Sprague, *The Origin, Progress and Conclusion of the Florida War* (1848).

OSCHERSLEBEN, a town in the Prussian province of Saxony, on the Bode, 24 m. by rail W.S.W. of Magdeburg, and at the junction of lines to Halberstadt and Jerxheim. Pop. (1925) 13,507. Oschersleben is first mentioned in 803. Among its industrial establishments are sugar-refineries, iron-foundries, breweries, machine-shops and brick works.

OSCILLATOR. A non-rotating device used in radio apparatus for producing alternating current. The output frequency of the oscillation is determined by the characteristics of the device.

OSCILLATORY CIRCUIT, as applied to radio apparatus, is a relatively low resistance circuit containing both inductance and capacity, such that the voltage impulse will produce a current which periodically reverses in direction.

OSCILLOGRAPH, an instrument for the delineation of alternating current wave forms. In the type devised by Duddell (*Electrician* xxxix., Sept. 1897, 636) two phosphor bronze strips under tension pass, side by side, between the poles of an electromagnet. The current is led up one strip and down the other so that they move in opposite directions at right angles to their length. A small mirror bridged across the strips is thus tilted to an extent dependent on the strength of the current. The mirror reflects a spot of light on to a photographic film whose movement at right angles to that of the light spot provides the time scale. The natural period of vibration of the strips is arranged to be very small ($\frac{1}{5,000}$ - $\frac{1}{10,000}$ sec.) to enable them to move in accordance with the fluctuations of the current. Other types of oscillograph have been designed by Blondel, Irwin (the *hot-wire* oscillograph) and others. The Cathode Ray Oscillograph is available for high-frequency observations. For further information see INSTRUMENTS, ELECTRICAL; BALLISTICS; OSISA.

OSH, a town of Asiatic Russia, in the Kirghiz A.S.S.R. in 40° 35' N., 72° 55' E., 31 m. S.E. of Andijan railway terminus, at an altitude of 4,030 ft. Pop. (1926) 29,088. It is on the Ak-bara river, a tributary of the Kara-Su, in a fertile cotton, grain and fruit growing valley leading to the Alai and Pamir. The famous Takht-

i-Suleiman (Solomon's Throne) rock, the theme of so many Eastern legends, is near the town and is frequented by pilgrims.

O'SHAUGHNESSY, ARTHUR WILLIAM EDGAR (1844-1880), English poet, was born in London on March 14, 1844, and at seventeen became a copyist in the library of the British Museum. Later, he specialised in ichthyology. He published his *Epic of Women* in 1870, *Lays of France*, a free version of the *Lais* of Marie de France, in 1872, and *Music and Moonlight* in 1874. He died on Jan. 30, 1880, his *Songs of a Worker* appearing immediately afterwards. In Palgrave's words, he had "a haunting music all his own."

OSHAWA, a manufacturing city and port of entry of Ontario county, Ontario, Canada, on Lake Ontario and the Canadian National and Canadian Pacific railways, 30 m. E.N.E. of Toronto. Pop. (1921) 11,940. It contains large motor works, flour, woollen and grist-mills, piano, farm implement and carriage factories, foundries, tanneries, canning factories, etc.

OSHIMA, a group of three small islands belonging to Japan, lying southwards of Kiushiu, in 30° 50' N. and 130° E. Their names, from west to east, are Kuro-shima, Iwo-shima and Taka-shima. Kuro-shima rises to a height of 2,475 ft., and Iwo-shima has an active volcano 2,480 ft. high. These islands are not to be confounded with Oshima, the most northerly island of the Izu-noshichito, or with the northern group of the Luchu Islands.

OSHKOSH, a city of Wisconsin, U.S.A., 75 m. N.N.W. of Milwaukee, on the west shore of Lake Winnebago, where the Fox river flows into it; the county seat of Winnebago county. It is on Federal highways 41 and 110, and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, the Soo Line, and electric railways, motor-coaches and 8 motor-truck lines. Pop. (1920) 33,162 (82% native white); 1928 local estimate, 43,000. Oshkosh is the seat of a State Teachers' college with an enrolment of 1,100. Lumber used to be the main industry but products are now highly diversified. The output in 1925 was \$32,681,683. Bank clearings for 1927 were \$51,943,192, and the valuation for 1927 was \$56,988,802. The city has a commission government.

The Fox river and Lake Winnebago early became an important line of communication, under French control, on the route between the Great Lakes and the Mississippi. Trading posts were established on the site of Oshkosh in the 18th century, and a flotilla of 50-100 fur-laden barges and bateaux was not an uncommon sight on the river. Permanent settlement here began about 1827. The north side of the river was at first called Saukeer and the south side Algoma, but in 1840 the name Oshkosh was adopted, to honour a friendly Menominee chief. In 1874 and in 1875 the city suffered serious loss from fire. It was chartered as a city in 1853.

OSIANDER, ANDREAS (1498-1552), German reformer, was born at Gunzenhausen, near Nuremberg, on Dec. 19, 1498. His German name was Heiligmann, or, according to others, Hosemann. After studying at Leipzig, Altenburg and Ingolstadt, he was ordained priest in 1520 and appointed Hebrew tutor in the Augustinian convent at Nuremberg. Two years afterwards he was appointed preacher in the St. Lorenz Kirche, and about the same time he publicly joined the Lutheran party, taking a prominent part in the discussion which ultimately led to the adoption of the Reformation by the city. He married in 1525. He was present at the Marburg conference in 1529, at the Augsburg diet in 1530 and at the signing of the Schmalkald articles in 1537. His vehemence, coarseness and arrogance in controversy brought him many personal enemies. The introduction of the Augsburg Interim in 1548 necessitated his departure from Nuremberg; he went first to Breslau, and afterwards settled at Königsberg as professor in its new university at the call of Duke Albert of Prussia. Here in 1550 he published two disputations, the one *De lege et evangelio* and the other *De justificatione*, which aroused a controversy still unclosed at his death on Oct. 17, 1552. While he was fundamentally at one with Luther in opposing both Romanism and Calvinism, his mysticism led him to interpret justification by faith as not an imputation but an infusion of the essential righteousness or divine nature of Christ. His party was afterwards led by his son-in-law Johann Funck, but disappeared after the latter's

execution for high treason in 1566. Osiander's son Lukas (1534-1604), and grandsons Andreas (1562-1617) and Lukas (1571-1638) were well-known theologians.

Osiander, besides a number of controversial writings, published a corrected edition of the Vulgate, with notes, in 1522, and a *Harmony of the Gospels*—the first work of its kind—in 1537. The best-known work of his son Lukas was an *Epitome of the Magdeburg Centuries*. See the *Life* by W. Möller (Elberfeld, 1870).

OSIER, the common term under which are included the various species, varieties and hybrids of the genus *Salix*, used in the manufacture of baskets. The chief species in cultivation are: *Salix viminalis* (the common osier) and *S. triandra*, *S. amygdalina*, *S. purpurea* and *S. fragilis*, which botanically are willows and not osiers. The first named with some 40 of its varieties, formed until recent times the staple basket-making material in England. It is an abundant cropper, sometimes attaining on low-lying soils 13 ft. in height. Full-topped and smooth, it is by reason of its pithy nature mainly cultivated for coarse work and is generally used as brown stuff. Some harder varieties, known as stone osiers and raised on drier upland soils, are peeled and used for fine work. *S. fragilis*, with some half-score varieties, is almost exclusively used by market gardeners for bunching greens, turnips and other produce. Owing to the increased demand for finer work much attention has been given (see **BASKET**) in recent years to the cultivation of the more ligneous and tougher species, *S. triandra*, *S. purpurea* and *S. amygdalina* with their many varieties and hybrids.

It is commonly supposed that osiers or willows will prove remunerative and flourish with little attention on any poor, wet, marshy soil. This is, however, not the case. No crop responds more readily to careful husbandry and skilful cultivation. For the successful raising of the finer sorts of willows good, well-drained, loamy upland soil is desirable, which before planting should be deeply trenched and cleared of weeds.

At any time, from late winter to early spring, the ground may be planted with "sets," i.e., cuttings of about 9 to 16 in. in length, taken from clean, well-ripened rods. These are firmly set to within 3 to 6 in. of the top in rows, 16 to 20 in. apart and spaced at intervals of 8 to 12 in. Yearling sets are largely planted, but the practice of the best Midland and west of England growers proves the superior productiveness of sets cut from two yearling rods. Great care should be exercised in planting lest the bark be fractured, loosened or removed from the wood and if not subject to periodical alluvial floods the ground should be manured yearly. The coarser *S. viminalis* may be raised on lowland soil if not water-logged or marshy. The more valuable kinds are known as: New kind, Black mauls, Spaniards, Glibskins, Long-bud, Long-skin, Lancashire red-bud, French, Italians, Pomeranians and Councillors and scores of other local names. A hybrid of *S. viminalis* and *S. triandra*, known as Black-top has been found to produce the heaviest crops on the best Leicestershire grounds.

Cutting and binding take place in early winter after the fall of the leaf, the crop being known as green whole stuff. The coarser kinds are sorted, cured (dried in the sun and wind) and stacked ready for market. These are known as brown rods. The finer kinds, after the more shrubby or ill-grown rods, termed Ragged, have been rejected, are peeled or buffed. Two methods of stripping are chiefly practised: from the heads (sets) and from the pit. By the former method the rods are left on the ground until spring advances, when a rapid growth of the cork cambium begins. They are then cut direct from the head and the bark is easily removed by drawing the rods through a bifurcated hand-brake of smooth, well-rounded steel, framed in wood. Improved brakes worked by a treadle strip two rods at a time. For the smaller sizes, rubber brakes are sometimes used and, for the very smallest, the fingers either bare or protected by linen bands. This method ensures a clean-butted unfractured rod, but unless great judgment is exercised in selecting the proper time for cutting the rods will remain double-skinned and the head may bleed. By the "pit" process the green rods are stood upright in shallow pits of water at a depth of about 6 to 9 in. until the sap rises and growth begins, when they are ready for the brake. The defects of this method are that the tops are liable to split in the brake and the

butts to remain foul. A third, known as the "pie" system, enables the grower to bridge over the interval, and to keep his hands employed, between the end of the "head" and the beginning of the "pit" strippings.

The willows are cut at the first indication of the sap rising and "couched" in rotten peelings and soil at a slight angle, the butts being on the ground, which should be strewn with damp straw from a manure heap. The tops are covered lightly with rotted peelings and by periodical application of water, fermentation is induced at the bottom, heat is engendered, the leaves force their way through the covering and peeling may begin. Peeling is chiefly done by women and lasts from early May to the middle of July, but a motor peeler has recently been introduced in some osier grounds. After stripping, the rods are bleached in the sun and stored for sale as White. If the rods are to be buffed they are immersed in large tanks of boiling water from 4 to 6 hours. They are then allowed to cool and mellow, are stripped and carefully dried in sun and air and remain dyed a rich tawny brown or buff colour. Brown rods may also be buffed by sinking them in cold water which is heated to boiling point, and maintained at that temperature for the requisite period.

In its natural habitat the osier or willow is a dioecious plant reproduced by cross fertilization but for at least 2,000 years has been cultivated from cuttings. The stocks have therefore become enfeebled; their cultivation is attended with many disturbing causes—ground vermin, fungoid and insect pests as well as winter floods and spring frosts. A suggestion made to the British Ministry of Agriculture and Fisheries by the present writer that under suitable conditions improved stocks of basket willows could be raised by cross fertilization and their disease-resisting power strengthened has been actualized and experiments in this direction are being carried out at the Long Ashton Research Institution, Bristol.

See W. P. Ellmore, *The Cultivation of Osiers and Willows*, 2nd ed.; also a leaflet (No. 36) on the same subject published gratis by the British Ministry of Agriculture. (T. O.)

OSIJEK (Germ. *Esseg*, Magyar, *Eszek*), town of Slavonia, Yugoslavia. Pop. (1921) 34,412, chiefly Magyars and Croats. It is situated on the Drave, which is here crossed by two bridges, below which the river is navigable by small steamers. The upper, or old town, contains the fortress, while the lower or new town is the commercial centre. It has several Orthodox and Roman Catholic churches, Franciscan and Capuchin monasteries, a synagogue, gymnasium, school, hospital, chamber of commerce and law courts. Osijek has a thriving trade in grain, fruit, livestock, plum brandy and timber. There are cotton mills, tanneries and a sugar beet factory, while silk weaving, glass blowing and the making of hats and caps are also carried on.

Osijek owes its origin to its fortress, which existed in Roman times under the name of *Mursia*; though the present structure dates only from 1720.

OSIMO, a town and episcopal see (anc. *Auximum*, *q.v.*), the Marches, Italy, province of Ancona, 10 m. S. of that town by rail. Pop. (1921) 8,860 (town); 19,811 (commune). It is on the top of a hill 870 ft. above sea-level and it retains a portion of its ancient town wall (2nd century B.C.). The cathedral has a portal with sculptures of the 13th century, an old crypt and a fine bronze font of the 16th century; the town hall contains a number of statues found on the site of the ancient forum and also a few pictures. Silk spinning and the raising of cocoons are carried on.

OSIRIS, one of the principal gods of the ancient Egyptians. See **EGYPT: Religion**.

OSISO, an instrument for recording the exact character of vibrations. It has been used for the investigation of electrical phenomena, recording sounds, enabling the totally deaf to understand speech and to speak, studying and eliminating vibration in machinery, determining the recoil action of guns, locating heavy artillery, aeroplanes and vessels, studying heart-beats, respiration and other bodily functions, locating oil, ore bodies, etc. The osiso consists of a tiny mirror mounted on two wires and suspended between the poles of a magnet. If a current flows through the wires in a strong magnetic field, they will tend to move, the direction and

extent of the motion depending upon the direction and strength of the current flow. A beam of light, reflected from the mirror, provides a means for making visible the movements of the mirror and for recording them on a photographic film. Every sound produces its own individual wave form, and the meaning of these waves can be read. (See INSTRUMENTS, ELECTRICAL: *Oscillograph*.)

OSKALOOSA, a city of south-eastern Iowa, U.S.A., on Federal highway 63 and near the Des Moines river; the county seat of Mahaska county. It is served by the Burlington Route, the Minneapolis and St. Louis, and the Rock Island railways. Pop. (1925 State census) 10,331. It is in a farming and coal-mining region, and has a number of important factories. Penn college, founded in 1873 under the auspices of the Iowa Yearly Meeting of Friends, occupies a beautiful campus of 30 ac. on the northern edge of the city. In the suburb of University park, adjoining it on the east, is John Fletcher college. Oskaloosa was settled in 1843, chosen for the county seat in 1844, and chartered as a city in 1853. It was named after a Seminole princess.

OSLER (ôz-lur), **SIR WILLIAM** (1849–1919), British physician, born at Bond Head, Canada, July 12, 1849, was educated at Trinity college school, Port Hope, Trinity College, Toronto, and McGill university, Montreal, where he took the M.D. degree in 1872. He studied medicine in London, Leipzig and Vienna and in 1874 was appointed professor of medicine at McGill university. From 1884 to 1889 he was professor of clinical medicine in the University of Pennsylvania, and from 1889 to 1904 professor of medicine at Johns Hopkins university. In 1905 he was appointed regius professor of medicine at Oxford, where he also served as a curator of the Bodleian library, as a delegate of the University Press and as one of the Radcliffe trustees. In 1911 he was created a baronet. Sir William Osler carried out original and valuable researches on the diseases of the spleen and blood and also made eminent contributions to the study of infections of the heart, of angina pectoris, of malaria and of many minor maladies. Sir William died at Oxford Dec. 29, 1919.

His most important work was *The Principle and Practice of Medicine* (1892, latest edition 1920). He also wrote monographs on *Cerebral Palsies in Children* (1889); and *Chorea and Choreiform Affections* (1894); a volume of essays *Aequanimitas* (1901); and *A Way of Life* (1913).

OSLO (formerly Kristiania), the capital of Norway, forming a separate county (*amt*), and the seat of a bishopric (*stift*). Pop. (1927) 250,620. It lies on the south-eastern coast, on the Aker river, at the head of Oslo fjord, about 80 m. from the Skagerrack. Pine-wooded hills rise behind the city, while several islands stud the fjord. The town is mainly modern. It is the seat of government, of the supreme courts, of the parliament (*Storting*), and of a university. In the principal street, Karl-Johans-gade, are some of the most important buildings, the *Storthing*-Bygning or parliament house (1866), the National Theatre (1899), in front of which are great statues of the dramatists Ibsen and Bjørnson, and the Fredericiana university, founded in 1811. At the western end of the Karl-Johans-gade is the Slotspark, crowned with the royal palace (*slot*). North of the university is the museum of art. The historical museum contains three viking ships, excavated since 1867. The Margaret church was built in memory of the late crown princess of Sweden.

Oslo is a well-planned city and its suburbs are attractive and are growing rapidly. Garden suburbs have been laid out at Ullevaal, where there is the largest municipal hospital in the country, and at Tören, with a science museum dating from 1908. On the east side of the Aker lies the old city of Oslo, with the existing episcopal palace, and an old bishop's palace, in which James VI. of Scotland (I. of England) was betrothed to Princess Anne of Denmark (1589). In the environs are the royal pleasure castle of Oscarsholm (1847–52), and the Norwegian national museum (1881), containing industrial and domestic exhibits from the various provinces. On Hovedö (Head island) are the ruins of a Cistercian monastery, founded in 1147 by monks from Kirkstead in Lincolnshire, England, and burnt in 1532. At Holmenkollen, the famous *ski* (snow-shoe) races are held in February.

Oslo has two railway stations, the Hovedbanegaard by the

Björvik, recently enlarged, and the Vestbanegaard by the Pipervik. Regular passenger steamers serve the port from Hull, Newcastle, Grangemouth and London, from Trondhjem, Bergen and the Norwegian coast towns, from Hamburg, Amsterdam, Antwerp, etc. Except for two large shipbuilding yards, most of the manufacturing factories are concentrated in Sagene. They include cotton, woolen, linen and sailcloth factories, sawmills, paper and pulp mills, foundries and engineering shops, brick and tile works, flour mills, biscuits, condensed milk, margarine, oil, soap and tobacco factories, hardware and nail works, glass, gunpowder and chemical works, breweries and distilleries, granite pavement and ice.

A great hydro-electric scheme for supplying Oslo and its suburbs with electricity by utilizing Solbergfos on the river Glommen has recently been completed, and seven units totalling 77,000 kw. had been installed by the end of 1925. Since about 1912 there have been, at great expense, extensive improvements made on the existing harbour works and port facilities. The port can be used by the largest vessels. There are also two dry-docks and four floating docks and a grain elevator. Imports are of about three times the value of exports. The harbour is icebound for three or four months in the winter.

The original city was founded by Harald Sigurdsson in 1048. By the close of the 14th century it was established as the chief city of Norway. Trade was long dominated by the powerful Hanseatic League, at least until the beginning of the 16th century. The town, built mainly of wood, was no less subject to fires than all Norwegian towns have always been, and after one of these King Christian IV. refounded the capital on the site it now occupies, and gave his name to it in 1624. By the close of the century it was fortified, but this did not prevent Charles XII. from gaining possession of it in 1716. The name of the city was changed again to Oslo in 1925.

See L. Daac, *Det gamle Christiania, 1624–1824* (Christiania, 1890); Y. Nielsen, *Christiania und Umgegend* (Christiania, 1894); G. Amnæs, *La Ville de Christiania . . . Résumé historique*, etc. (Christiania, 1900).

OSMAN ('Uṣmān), the usual form of the Arabic name 'OTHMAN, as representing the Turkish and Persian pronunciation of the name. It is used, therefore, for (1) the founder of the Osmanli or Ottoman dynasty, Osman I., who took the title of sultan, ruled in Asia Minor, and died in 1326, and (2) the sixteenth sultan Osman II., who reigned 1616–1621. (See **TURKEY**: *History*; **OTHMAN** and **CALIPHATE**.)

OSMAN (1832–1900), Turkish pasha and mushir (field marshal), was born at Tokat, in Asia Minor, in 1832. Educated at the military academy at Constantinople, he entered the cavalry in 1853, and served under Omar Pasha in the Russian War of 1853–56, in Wallachia and the Crimea. Appointed a captain, in the Imperial Guard, he distinguished himself in the campaigns of the Lebanon in 1860 and of Crete in 1867 to 1869, and was promoted lieutenant-colonel. He served under Redif Pasha in suppressing an insurrection in Yemen in 1871, was promoted major-general in 1874, and general of division in 1875. Appointed to command the army corps at Widin in 1876 on the declaration of war by Serbia, he defeated Tchnernaieff at Saitzchar and again at Yavor in July, invaded Serbia and captured Alexinat and Deligrad in October, when the war ended. Osman was promoted to be mushir, and continued his command at Widin.

When the Russians crossed the Danube in July 1877, Osman moved his force to Plevna, and, with the assistance of his engineer, Tewfik Pasha, entrenched himself on the right flank of the Russian line of communication, and gradually made the position a most formidable one. He repulsed the three assaults of the Russians and after being closely invested, held the position until Dec. 9, when, compelled to cut his way out, he was severely wounded and forced to capitulate. This famous improvised defence delayed the Russians for five months, and entailed their crossing the Balkan range in the depth of winter after the third battle of Plevna. The sultan conferred on Osman the Grand Cross of the Osmanie and the title of "Ghazi" (victorious), and, when he returned from imprisonment in Russia, made him commandant of the Imperial Guard, grand-master of the artillery and marshal

of the palace. In December 1878 he became war minister, and held the post, with a small break, until 1885. He died at Constantinople on April 14, 1900.

OSMANLI, the tribal name of the Turks of the Ottoman empire. The Osmanli include a heterogeneous group of peoples, the original conquering Osmanli having mixed very considerably with the conquered peoples, until physically they have ceased to have a definite separate existence. (See ASIA: *Ethnology* and *TURKS*.)

OSMIUM, a chemical element found in small quantities in platinum ores but obtained chiefly from the mineral osmiridium by the method of Deville and Debray (see *RUTHENIUM*); together with iridium it was first isolated by Smithson Tennant in 1803 (symbols Os, atomic number 76, atomic weight 190.8). Osmiridium is fused with metallic zinc, the excess of zinc is dissolved in hydrochloric acid and the residue ignited with a mixture of barium nitrate and barium peroxide. When cold, the mass is finely powdered and treated with cold dilute hydrochloric acid in a stoppered bottle; this is necessary as osmium is present in the form of volatile tetroxide. After all action has ceased, nitric and sulphuric acids are added, the mixture is well shaken and the barium sulphate allowed to deposit. The liquid is then distilled, when the volatile osmium tetroxide passes over in an almost pure state. The residue from the distillation is concentrated, ammonium chloride is added, and ammonium iridium chloride $(\text{NH}_4)_2\text{IrCl}_6$ (together with a little ruthenium) is precipitated. Another method of obtaining osmium from osmiridium is to heat the alloy mixed with common salt in a slow stream of chlorine. The sodium osmichloride, Na_2OsCl_6 , produced is extracted with water; sal ammoniac is added to precipitate sparingly soluble ammonium osmichloride, $(\text{NH}_4)_2\text{OsCl}_6$, which on gentle ignition leaves a residue of spongy osmium.

Osmium in the massive state is a metal of a bluish-white colour. It can be obtained crystalline by alloying any of its forms with metallic tin and subsequently removing the tin by means of hydrochloric acid. It has a specific gravity of 22.5, and melts at about $2,700^\circ\text{C}$, although it begins to volatilize at a lower temperature. It is a very hard metal, especially when combined with iridium, and the alloy was at one time used extensively for tipping gold pens, but for this purpose cheaper alloys are now employed free from platinum metals and generally having tungsten for their basis. It is not suitable in alloys with other platinum metals for high-temperature work, for, owing to the ease with which it oxidizes, it causes the alloy to disintegrate.

Osmium forms several oxides of which four are known with certainty, namely, OsO , Os_2O_3 , OsO_2 and OsO_4 , while OsO is present in the metallic osmates. The lower oxides are unimportant. *Osmium tetroxide*, OsO_4 , known in commerce under the name of osmic acid, can readily be obtained in a state of purity, and is the source from which other osmium compounds are generally prepared. If metallic osmium in any form is heated in a tube in a current of air, or preferably oxygen, to a bright red heat, combination takes place and a yellowish liquid, OsO_4 , condenses in the cold part of the tube, afterwards crystallizing in yellowish needles which melt at 40°C ; the liquid boils at 100°C giving a colourless vapour. Traces of the vapour of osmium tetroxide have a very strong odour somewhat resembling that of chlorine. The vapour is poisonous and exceedingly corrosive and attacks animal membranes vigorously, becoming reduced and leaving a deposit of metallic osmium. In small quantities the physiological effect is transitory but larger quantities entail serious consequences. It is largely used for preparing microscopic slides as it acts preferentially on certain portions of tissue, staining them black. If alcohol is added to OsO_4 dissolved in caustic potash, the solution becomes red and on concentration potassium osmate, $\text{K}_2\text{OsO}_4 \cdot 2\text{H}_2\text{O}$, crystallizes out. This salt is stable in neutral solutions but decomposes on acidification, forming OsO_4 and lower oxides. Osmium has several chlorides such as OsCl_2 , OsCl_3 and OsCl_4 ; these, and especially the last two, have a great tendency to combine with alkaline chlorides producing double chlorides of the form M_2OsCl_6 and M_2OsCl_4 . They are readily formed from the tetroxide by the use of suitable reducing agents. Two

sulphides of osmium are known, OsS_2 and OsS_4 ; the latter is formed by the action of sulphuretted hydrogen upon acid solutions of the tetroxide. Qualitatively, osmium is detected by the odour of OsO_4 , produced when the metal is ignited in air. A delicate test for OsO_4 is to warm an aqueous solution with thiocarbamide and dilute hydrochloric acid, when a red coloration shows the presence of osmium. (F. E. M.)

OSNABRÜCK, a town and episcopal see in the Prussian province of Hanover, situated on the Hase, 70 m. W. of the city of Hanover, 31 m. by rail N.E. of Münster, and at the junction of the lines Hamburg-Cologne and Berlin-Amsterdam. Pop. (1925) 88,941. In 888 Osnabrück received the right to establish a mint, a market and a toll-house. Surrounded with walls towards the close of the 11th century, it maintained an independent attitude towards its nominal ruler, the bishop, and joined the Hanseatic League, reaching the height of its prosperity in the 15th century. The older streets contain examples of Gothic and Renaissance domestic architecture. The Roman Catholic cathedral, with its three towers, is a building of the 13th century, partly in the Romanesque and partly in the Transitional style; but it is inferior in architectural interest to the Marienkirche, a Gothic structure of the 14th and 15th centuries. The town hall, a 15th century Gothic building, contains portraits of some of the plenipotentiaries engaged in concluding the peace of Westphalia. Other important buildings are the museum, containing scientific and historical collections; the episcopal palace and the law courts. The lunatic asylum on the Gertrudenberg occupies the site of an ancient nunnery. Linen was formerly the staple product, but it no longer retains that position. The manufactures include machinery, paper, celluloid, chemicals, tobacco and cigars, pianos and beer. Other industries are spinning and weaving. The town has large iron and steel works and there are coal mines in the neighbourhood. Trade is carried on in grain, wood and wine.

OSPREY or **OSPRAY**, a bird of prey of conspicuously marked plumage, the white of its lower parts and head contrasting sharply with the dark brown of the back when it is on the wing. It is the representative of the family *Pandionidae*, closely related to the *Falconidae*. Its special characters are the presence of a reversible outer toe and spicules on the soles of the feet.

The osprey (*Pandion haliaetus*) is one of the most cosmopolitan birds of prey. Where, through abundance of food, it is numerous, the nests of the fish-hawk (to use its American name) may be placed on trees to the number of 300 close together. Where food is scarcer and the species accordingly less plentiful, a single pair will occupy an isolated rock, as formerly in Scotland. Few birds

BY COURTESY OF THE NATIONAL ASSOCIATION OF AUDUBON SOCIETIES

THE OSPREY (PANDION HALIAETUS)
A bird of prey, known in America as the fish-hawk

lay eggs so rich in colouring: their white or pale ground is spotted, blotched or marbled with almost every shade of purple, orange and red, from the most delicate lilac and buff, through violet, chestnut and crimson, to black. The fierceness with which ospreys defend their eggs and young, in addition to the dangerous situation chosen for the aerie, makes the task of robbing the nests difficult. It no longer breeds in Great Britain. The term "osprey," applied to the nuptial plumes of the egrets in the feather trade, is derived from the

French *esprit*; it has nothing to do with the osprey bird.

OSROENE or **OSRHOENE**, a district of northwestern Mesopotamia, in the hill country on the upper Bilechas (Belichus; mod. *Nahr Belik*, Bilkh), the tributary of the Euphrates, with its capital at Edessa (q.v.), founded by Seleucus I. About 130 B.C. Edessa was occupied by a nomadic Arabic tribe, the Orrhoei (Plin. v. 85; vi. 25, 117, 129), who founded a small state ruled by their chieftains with the title of kings. After them the district was called Orrhoene (thus in the inscriptions, in Pliny and Dio Cassius), which occasionally has been changed

into Osroene, in assimilation to the Parthian name Osroes or Chosroes (Khosrau). The founder of the dynasty is therefore called Osroes by Procop. (*Bell Pers.* i. 17) but Orhâi or Urhâi, son of Hewyâ (i.e. "the snake"), in the chronicle of Dionysius of Tellmahre; he is no historical personality, but the eponym of the tribe. The kings soon became dependants of the Parthians; their names are mostly Arabic (Bekr, Abgar, Ma'nu), but among them occur some Iranian (Parthian) names, as Pacorus and Phratamaspatas. Under Tigranes of Armenia they became his vassals, and after the victories of Lucullus and Pompey, vassals of the Romans. Their names occur in all wars between Romans and Parthians, when they generally inclined to the Parthian side; e.g., in the wars of Crassus and Trajan. Trajan deposed the dynasty, but Hadrian restored it. The kings generally used Greek inscriptions on their coins, but when they sided with the Parthians, as in the war of Marcus Aurelius and Verus (A.D. 161-165), an Aramaic legend appears instead. Hellenism soon disappeared and the Arabs adopted the language and civilization of the Aramaeans. This development was hastened by the introduction of Christianity, which is said to have been brought here by the apostle Judas, the brother of James, whose tomb was shown in Edessa. In 190 and 201 we hear of Christian churches in Edessa. King Abgar IX. (or VIII.) (179-214) himself became a Christian and abolished the pagan cults, especially the rite of castration in the service of Atargatis, which was now punished by the loss of the hands.

Caracalla in 216 abolished the kingdom of Osroene (Dio Cass. 77. 12, 14) and Edessa became a Roman colony. The list of the kings of Osroene is preserved in the Syrian chronicle of Dionysius of Tellmahre, which is checked by the coins and the data of the Greek and Roman authors; it has been reconstructed by A. v. Gutschmid, "Untersuchungen über die Geschichte des Königreichs Osroene," in *Mémoires de l'Acad. de St. Pétersbourg*, t. xxxv. (1887). Edessa remained Roman till it was taken by Chosroes II. in 608; but in 625 Heraclius conquered it again. In 638 it was taken by the Arabs. (Ed. M.)

OSSA (mod. *Kissoto*, *Kissavo*), a mountain (el. c. 6,400 ft.) in Larissa, S.E. part of Thessaly, Greece; S. of Olympus, from which it is separated by the valley of Tempe, and N. of Pelion which the Giants are said to have piled on it to scale Olympus.

OSSENDOWSKI, FERDINAND ANTHONY (1876-), Polish traveller and writer, was born on May 27, 1876, in the government of Witebsk. He studied at St. Petersburg (Leningrad) and at Paris, where he received the degree of docteur des sciences and officier d'Académie for his work entitled *The Allotropy of Silver*. He was appointed lecturer in physics and physical chemistry at the Tomsk Polytechnic, and he then became successively a lecturer in chemistry, physics, geography; a manufacturer, a commercial manager, a journalist, a novelist, a physician, a draughtsman, a teacher of languages, and a mineralogist. At the university Ossendowski was sentenced to five months' imprisonment for taking part in a manifestation against capital punishment, and, at the time of the Russo-Japanese War, he was brought before a Russian law court for leading a patriotic organization in the Far East with the object of preventing civil war after the defeat of the Russian army. He was sentenced to death but the sentence was later commuted to 20 months' imprisonment. During this period Ossendowski's books on prisons appeared, which led to a revision of the Russian prison system.

After the outbreak of the October Revolution, Ossendowski held office as financial adviser to the Government of General Kolchak in Siberia. After Kolchak's Government fell, he made his way through the forests to Mongolia disguised as a peasant. In 1926-27 he travelled in Central Africa. His journey through Central Asia is recounted in *Beasts, Men and Gods* (1923), and his other works on Asia include *Man and Mystery in Asia* (1924), and *The Shadow of the Gloomy East* (1925). His play *The Living Buddha* had a successful run at the National theatre in Warsaw. See Sven Hedin, *Ossendowski und die Wahrheit* (1925).

OSSETE. This member of the northern group forms of Iranian speech was spoken in the area north of the Caucasus. It is the survival of a number of Scythian languages formerly

current in S. Russia before the Slav onset. It is divided into two divisions, eastern and western. A number of words in Hungarian indicate an ancient association between the languages.

See Miller, *Grundriss der Iranische Philologie* Vol. I.

OSSETIAN AUTONOMOUS AREAS, two administrative units of Russia. (1) The South Ossetian Area created in 1922 is linked administratively with the Georgian S.S.R. Area 3,337 sq.km. Pop. (1926) 87,342. (2) The North Ossetian Area created in 1924 is linked administratively with the North Caucasian Area. Area 6,027 sq.km. Pop. (1926) 152,000.

The Ossetes are descended from the Alans, the strongest and most numerous of the Sarmatian tribes, and their language belongs to the Iranic group of the Aryan tongues. The earliest reference to the Alans is A.D. 35 when, according to Josephus, they occupied the Kuban valley; later they occupied the Don and Dnieper regions, where they joined forces with Germanic tribes in attacks on the Romans. Legend gives the Emperor Maximin a Gothic father and an Alan mother. The Mongol invasion swept them from the steppe, but they took refuge in the Caucasus and were probably settled in their present territory in the 5th and 6th centuries. They have been described by some writers as long headed, blue eyed and fair haired, but recent Russian investigators describe them as rather broad headed, with swarthy complexions, dark eyes and hair, and straight noses, their stature being above the average. In the Caucasus they held the grassy passes leading from the sources of the Terek and the Ardon to those of the Rion and the Kura, by which alone horsemen and troops can cross the range in summer, and in the height of their prosperity their flocks whitened the steppe and their vineyards were famous. The rude walls and towers of their fortified farms and villages still remain on high and defensible ridges in the mountain fastnesses. Later they formed villages with two storeyed stone houses, the lower for the cattle and the upper for human habitation, with flat wooden roofs and balconies.

Queen Tamara introduced Christianity among them in the 12th century, but later the Kabardians drove them from many of their pastures and Turkish tribes supplanted them in the lower valleys and introduced the Islamic faith within their borders. The Ossetes, however, even in their decline, still held the upper passes, the keys of the Caucasus. The Russian hold on the region began when a small fortress was established at Vladikavkaz in 1784 and the Ossetes were conquered in 1802. Later the famous Georgian military road through the Dariel gorge of the Terek, constructed 1811 to 1864, brought the Ossetes more definitely under Russian rule. For a description of the rich treasures found in the tombs of the Alans, see Rostovtseff, M., *Iranians and Greeks in South Russia*, 1922.

Most of the territory of the Ossetes consists of the mountain region of the Caucasus, with snow clad peaks, e.g., the Adai Khokh (15,242 ft.). Numerous streams ultimately join the Terek; in their upper courses they have carved deep valleys. They are of no use for floating timber or for navigation, owing to their rapidity and the numerous falls, but are of great potential value as a source of hydro-electric energy, and a hydro-electric station has recently been built on the Gizeldon. The chief pass is the Mamison, over which goes the Ossetian military road, constructed in 1889. No other good road exists in the whole Ossetian area. A loop from the Black Sea-Caspian Railway passes through the north of the territory, with a branch to Alagir and Vladikavkaz. The latter town is the administrative centre for the North Ossetes, but forms a separate administrative division of the North Caucasian Area. Tskinali, a settlement of 5,809 inhabitants, is the administrative centre of the South Ossetes. The chief range apart from the Central Caucasus, is the Bokovoi Ridge, exceeding a height of 10,000 feet. The average altitude of South Ossetia is 10,000 feet. (See CAUCASUS.)

Forest and shrub are general in the region, oak and hardbeam being the prevailing varieties in the north, where timber is exported through Alagir. The forests extend to the upper limit of the limestone gorges, but the crystalline schists are bare of vegetation. Coniferous forests extend above the oak, hardbeam, ash, maple and lime and alpine meadows with a rich variety of

blossoms are found above the tree limit. On the plateau in the north maize gives good harvests and occupies 76% of the sown area; winter-wheat, potatoes, fruit, sunflower seed, tobacco and vegetables are also cultivated; the latter find a market in Vladikavkaz, and in the tomato canning factory recently established at Alagir. Milk, meat and cheese, from sheep and goats especially, and from cows in some regions, form the staple food of the herdsmen and shepherds. The numbers of sheep and pigs are greater than in 1913, but horses, asses, mules and horned cattle are still below that level. Small patches of summer wheat, barley, oats and potatoes are grown in sheltered spots among the hills, but frost or early snow often spoils the harvest. Unworked coal, naphtha, iron, manganese, graphite, asbestos, wolfram and arsenic exist; the only mineral at present exploited is lead.

South Ossetia is essentially a grazing region, with sheep and goats in the east and cattle in the west. It is thinly peopled in comparison with the north, and its population was further diminished by the disastrous war conditions following the 1917 revolution, when many natives left their homes and went northwards. Conditions in this region are recovering very slowly. Peasant industries include the making of daggers and metal goods, fur caps, leather goods, and small metal wares.

There are two main Ossetian dialects, the Iron and the Digor; the South Ossetians call themselves Tualte and speak a dialect related to the Iron group. Ossetes form about 85% of the population and Russians and Ukrainians about 12%. The literacy rate among this scattered population in a region of poor communications is low and decreases from north to south. Since the Ossetes received cultural autonomy, the Latin script has been adopted and some newspapers and books are now printed in Ossete. School provision is made for less than half the children, mainly for those in the plateau region. The problem of providing education and medical help for the herdsmen and shepherds of the mountain regions is at present unsolved. (R. M. F.)

OSSETIAN LANGUAGE; see OSSETE.

OSSETT, a municipal borough in the West Riding of Yorkshire, England, 2½ m. W. of Wakefield on the L.M.S. railway. Pop. (1921) 14,796. It lies along a spur of upland about 300 ft. high, which forms part of the Aire-Calder divide. The town is mentioned in Domesday book and it suffered devastation under the Conqueror. In the 17th century, Ossett was visited by plague, but the discovery of medicinal springs on the north-eastern side gave to the town a temporary attraction. It is one of the main centres of "shoddy" manufacture, an industry severely depressed since the Armistice. Ossett was incorporated as a municipal borough in 1890.

OSSINING, a village of Westchester county, New York, U.S.A., on the east bank of the Hudson river, 30 m. above New York city; served by the New York Central railroad and river steamers. Pop. (1920) 10,739 (77% native white); 1928 local estimate, 13,500. Ossining has a fine site, looking over the Tappan Zee and beyond Croton point to Haverstraw bay (expansions of the Hudson), and is surrounded by wooded rolling country. Two beautiful residential villages (Scarborough and Briarcliff Manor) adjoin it on the south and south-east. It is the seat of several private schools and Sing Sing (State) prison is just outside the village limits. The manufactures are varied, including porous plasters, pills, brass, wire, marine engines and maps, and were valued in 1925 at \$2,030,420. The site of Ossining (originally part of the Phillipse Manor) was settled about 1700 and the name Sing Sing was taken from the Sin Sinck Indians. The village was incorporated in 1813 and adopted its present name in 1901.

OSSORY (*Osráighe*), an ancient kingdom of Ireland, in the south-west of Leinster. Its name is preserved by dioceses of the Church of Ireland and the Roman Catholic Church and its kings maintained their position until 1110.

OSTADE, the name of two Dutch painters whose ancestors were settled at Eyndhoven, near the village of Ostade. Early in the 17th century Jan Hendrix, a weaver, moved from Eyndhoven to Haarlem, where he married and founded a large family. The eldest and youngest of his sons became celebrated artists.

I. ADRIAEN VAN OSTADE (1610–1685), the eldest of Jan Hendrix's sons, was born and died at Haarlem. According to Houbraken he was taught by Frans Hals, at that time master of Adrian Brouwer. He was president of the painters' guild at Haarlem, in 1662. A striking picture in the Louvre represents the father of a large family sitting in state with his wife at his side in a handsomely furnished room, surrounded by his son and five daughters, and a young married couple. The number of Ostade's pictures is given by Smith at three hundred and eighty-five, but by Hofstede de Groot (1910) at over 900. At his death the stock of his unsold pieces was over two hundred. His engraved plates were put up to auction, with the pictures, and fifty etched plates—most of them dated 1647–1648—were disposed of in 1686. Two hundred and twenty of his pictures are in public and private collections, of which one hundred and four are signed and dated, while seventeen, though signed, are undated.

Adrian Ostade was the contemporary of David Teniers and Adrian Brouwer. Like them he spent his life in the delineation of the homeliest subjects—tavern scenes, village fairs and country quarters. Between Teniers and Ostade the contrast lies in the different condition of the agricultural classes of Brabant and Holland, and the atmosphere and dwellings that were peculiar to each region. Brabant has more sun, more comfort and a higher type of humanity; Teniers, in consequence, is silvery and sparkling; the people he paints are fair specimens of a well-built race. Holland seems to have suffered much from war; the air is moist and hazy, and the people, as depicted by Ostade, are short, ill-favoured and marked with the stamp of adversity on their features and dress. The key of his harmonies remains for a time in the scale of greys. But his treatment is dry and careful, and he shuns no difficulties of detail, representing cottages inside and out, with the vine leaves covering the poorness of the outer walls, and nothing inside to deck the patchwork of rafters and thatch, or tumble-down chimneys and ladder staircases, that made up the sordid interior of the Dutch rustic of those days.

Before the dispersion of the Gsell collection at Vienna in 1872, it was easy to study the steel-grey harmonies and exaggerated caricature of his early works in the period intervening between 1632 and 1638. There is a picture of a "Countryman having his Tooth Drawn," in the Vienna Gallery, unsigned, and painted about 1632; a "Bagpiper" of 1635 in the Liechtenstein Gallery at Vienna; cottage scenes of 1635 and 1636, in the museums of Karlsruhe, Darmstadt and Dresden; and "Card Players" of 1637 in the Liechtenstein palace at Vienna, which make up for the loss of the Gsell collection. The same style marks most of those pieces. About 1638 or 1640 the influence of Rembrandt changed his style. "The Angels appearing to the Shepherds" in the Brunswick gallery is very much in the style of Rembrandt. In 1642, he painted the beautiful interior at the Louvre, in which a mother tends her child in a cradle at the side of an immense chimney. In 1667, he produced an admirable "Nativity" (collection of Otto Beit, London) which is only surpassed as regards arrangement and colour by Rembrandt's "Carpenter's Family" at the Louvre. He devoted himself to familiar themes, from small single figures, representing smokers or drinkers, to vulgarized allegories of the five senses (Hermitage and Brunswick galleries), half-lengths of fishmongers and bakers and cottage brawls, or scenes of gambling, or itinerant players and quacks, and nine-pin players in the open air. His art is seen in the large series of dated pieces which adorn every European capital, from St. Petersburg to London. Buckingham Palace has a large number. At Amsterdam we have the likeness of a painter, sitting with his back to the spectator, at his easel. The colour-grinder is at work in a corner, a pupil prepares a palette and a black dog sleeps on the ground. A replica of this picture, with the date of 1663, is in the Dresden gallery. The same subject is represented on a picture in the Johnson collection at Philadelphia. In his etching (*Bartsch*, 32) the painter shows himself in profile, at work on a canvas. In the signatures of Ostade, the first two letters are generally interlaced. Up to 1635 Ostade writes himself *Ostaden*, e.g., in the "Bagpiper" of 1635 in the Liechtenstein collection at Vienna. Later on he uses the long *s* (*f*), and occasionally he signs in capital letters. His pupils are

his own brother Isaac, Cornelis Bega and Cornelis Dusart.

2. ISACK VAN OSTADE (1621-1649) was born in Haarlem, and began his studies under Adriaen. At an early period he felt the influence of Rembrandt, and this is apparent in a "Slaughtered Pig" of 1639, in the gallery of Augsburg. A specimen of Isaac's work when under the influence of his brother may be seen in the "Laughing Boor with a Pot of Beer" (1643), in the museum of Amsterdam. The low price he received for such subjects—in which he could only hope to remain a satellite of Adriaen—led him to prefer landscapes in the fashion of Esaias Van de Velde and Salomon Ruisdael. He died young and was buried at Haarlem on Oct. 16, 1649, having painted about 340 pictures. (See H. de Groot, 1910.)

The first manifestation of Isack's surrender of Adriaen's style is apparent in 1644 when the skating and sledging scenes were executed which are in the Lacaze collection and the galleries of the Hermitage, Antwerp and Lille. Three of these examples bear the artist's name, spelt Isack van Ostade, and the dates of 1644 and 1645. The roadside inns, with halts of travellers, form a compact series from 1646 to 1649. In this, the last form of his art, Isaac has very distinct peculiarities. The air which pervades his composition is warm and sunny, yet mellow and hazy, as if the sky were veiled with a vapour coloured by moor smoke. The trees are rubbings of umber, in which the prominent foliage is tipped with touches hardened in a liquid state by amber varnish mediums. It is in winter scenes that Isack displays the best qualities. The absence of foliage and crisp atmosphere, preclude the use of the brown tinge, and leave the painter no choice but to ring the changes on opal tints of great variety, upon which the figures emerge with masterly effect on the light background upon which they are thrown. Amongst the roadside inns which will best repay attention may be noted those of Buckingham Palace, the National Gallery, the Wallace collections in England, and those of the Louvre, Berlin, Hermitage and Rotterdam museums and the Rothschild collection at Vienna on the Continent. The finest of the ice scenes is the famous one at the Louvre.

For paintings and etchings see *Les Frères Ostade*, by Marguerite van de Wiele (Paris, 1893). For his etchings see *L'Oeuvre d'Ostade, ou description des eaux-fortes de ce maître*, etc., by Auguste d'Orange (1860); and *Catalogue raisonné de toutes les estampes qui forment l'oeuvre gravé d'Adrian van Ostade*, by L. E. Faucheux (Paris, 1862); Hoistede de Groot, *Catalogue of Dutch Painters* (1910).

(J. A. C.; X.)

OSTASHKOV, a town of Russia in the province of Tver, in 57° 10' N., 33° 5' E., on the south shore of Lake Seliger, near the outlet of its waters into a stream that joins the Upper Volga and was at one time thought to be the source of that river. It is in a damp and marshy situation, but became a centre for pilgrims visiting the Smolenskiy Zhitnyi monastery on an island in the lake. Later the railway passed through the town, and it became the terminus of a telegraph line. Its population (12,892 in 1926) is mainly occupied in tanning and the making of leather goods, in iron founding and brick making and in fishing on the lake.

OSTEND, town, province of West Flanders, Belgium. Pop. (1925) 44,002. It is the most fashionable seaside resort and the third port of the kingdom. In the middle ages it was strongly fortified and underwent several sieges; notably in 1601-04, when it only surrendered by order of the states to Spinola. The creation in 1722 of the *Compagnie de Commerce des Indes* seemed to assure a hopeful future to the port of Ostend. But the success obtained caused the envy of neighboring nations, who forced Emperor Charles VI. to revoke the grant made. Under Joseph II. Ostend enjoyed another period of commercial prosperity. In the last 30 years a new town has been created. The digue or parade, constructed of solid granite, extends for over 3 m. along the shore in a southerly direction from the long jetty which protects the entrance to the port. A casino and the royal châlet are prominent on the sea front. In the rear of the town is a fine park to which a race-course has been added. The modern docks accommodate ships of large tonnage. Apart from these docks Ostend has a very considerable passenger and provision traffic with England, and is the headquarters of the Belgian fishing fleet, estimated to employ 400 boats and 1,600 men

and boys. Ostend supplies sea-fish and is renowned for its oyster and lobster beds. It has a school of navigation and a fishery training school. There is a daily service from Ostend to Tilbury carrying food produce for England. Ostend is in direct railway communication with Brussels, Cologne and Berlin. It is also the starting point of several light railways along the coast and to the southern towns of Flanders.

The War of 1914-18.—Ostend was occupied by the Germans for four years during the War, and was at first, until it was rendered untenable by aerial bombardments, a base for destroyers and submarines. In May 1918 the entrance channel to the harbour and the canal to Ghent and Bruges were blocked to all craft except the smallest submarines by the sinking of the "Vindictive." After the War she was raised and broken up. Parts of the "Vindictive," "Intrepid" and "Thetis" have been made into a memorial on the Digue. A new lighthouse, in place of the large one destroyed in 1916, was finished in 1924.

OSTEND COMPANY. The success of the Dutch, English and French East India Companies led the merchants and ship-owners of Ostend to desire to establish direct commercial relations with the Indies. A private company was accordingly formed in 1717 and some ships sent to the East. The Emperor Charles VI. encouraged his subjects to raise subscriptions for the new enterprise, but did not grant a charter or letters patent. Some success attended these early efforts, but the jealousy of the neighbouring nations was shown by the seizure of an Ostend merchantman with its rich cargo by the Dutch in 1719 off the coast of Africa, and of another by the English near Madagascar.

The Ostenders, however, despite these losses, persevered in their project. The opposition of the Dutch made Charles VI. hesitate for some time to grant their requests, but on Dec. 19, 1722, letters patent were granted by which the Company of Ostend received for the period of 30 years the privilege of trading in the East and West Indies and along the coasts of Africa on this side and on that of the Cape of Good Hope. Six directors were nominated by the emperor, and subscriptions to the company flowed in so rapidly that the shares were at the end of Aug., 1723 at 12 to 15% premium. Two factories were established, one at Coblom on the coast of Coromandel near Madras, the other at Bankibazar on the Ganges. At the outset the prospects of the company appeared to be most encouraging, but its promoters had not reckoned with the jealousy and hostility of the Dutch and English. The Dutch appealed to the treaty of Westphalia (1648) by which the king of Spain had prohibited the inhabitants of the southern Netherlands from trading with the Spanish colonies. The transference of the southern Netherlands to Austria by the peace of Utrecht (1713) did not, said the Dutch, remove this disability. The Spanish government, however, after some hesitation concluded a treaty of commerce with Austria and recognized the Company of Ostend. The reply to this was a defensive league concluded at Herrenhausen in 1725 by England, the United Provinces and Prussia. Confronted with such formidable opposition the court of Vienna judged it best to yield. By the terms of a treaty signed at Paris on May 31, 1727 the emperor suspended the charter of the company for seven years, and the powers in return guaranteed the Pragmatic Sanction. The company, after nominally existing for a short time in this state of suspended animation, became extinct.

(G. E.)

OSTEND MANIFESTO, a document issued (Oct. 18, 1854) by James Buchanan, J. V. Mason and Pierre Soulé, U.S. ministers respectively to Great Britain, France and Spain, who had met by President Pierce's orders at Ostend, Belgium, to discuss and adopt measures for concerted diplomatic action at Madrid on the subject of alleged injuries by Spain to American commerce with Cuba. The manifesto recommended that "the United States ought, if practicable, to purchase Cuba as soon as possible," and, if Spain should refuse to sell, then "by every law, human and divine, we shall be justified in wresting it from Spain if we have the power." William L. Marcy, secretary of State, promptly disavowed the document.

OSTEOLOGY, that part of the science of anatomy which has for its subject the bony framework of the body (see BONE,

SKELETON, ANATOMY, etc.).

OSTEOPATHY. According to its advocates, osteopathy is a system of health and healing founded on the theory that the living body is a vital machine which will make the remedies necessary to protect itself against disease so long as it is in correct mechanical adjustment. In addition, osteopathy insists upon a wholesome physical and mental environment, good food, proper exercise and rest, and pure air and water.

Structural derangement is considered as the most important underlying disease cause. What is called a "lesion" may be in bony, muscular, ligamentous, fascial or other tissue. For example in the bony "lesion," a joint usually lacks free movement. This stiffness may come from injury, strain, inflammation, infection, reflexes or other causes. The resultant lack of normal movement in surrounding tissues allows blood and lymph to stagnate, causing acidosis, irritating nerves which pass that way, and through them affecting the functions of various organs including blood vessels. The oedema and swelling and the contraction of muscles may also affect, by pressure or otherwise, the nerves, arteries and veins. Not only is there said to be a resultant interference with the body's ability to make its own serums and antitoxins to fight infectious disease processes, but "lesions" also produce positive suffering and disease in the form of neuritis and neuralgia, lumbago and sciatica, foot troubles, and disturbances of the special senses and of the functions of the various organs including endocrine and other glands.

Osteopathic diagnosis comprises physical examination of the entire body, including heart, lungs and other internal organs, but particularly, the condition of spinal and other joints. There is physical, chemical, and microscopic study of secretions and excretions, and if necessary of tissues, and the use of the x-ray, basal metabolism apparatus and other scientifically accepted appliances.

Osteopathic therapy is based on the specific manipulative removal of the "lesion" already discussed. It includes also correction of hygienic, dietetic, environmental and psychic conditions; surgery for fractures and lacerations, and the removal of abnormal growths or organs so diseased as to be dangerous to life; obstetrics and the administration of antidotes for poisons.

The American School of Osteopathy was organized at Kirksville, Mo., in 1892. In 1929 there were other recognized colleges at Los Angeles, Kansas City, Des Moines, Chicago and Philadelphia. At the beginning, when the standards of medical education were low, the length of the course was two years. By about 1916, all the colleges required a high school education followed by four standard college years in osteopathy.

Osteopathy was promulgated by Dr. A. T. Still (*q.v.*). There are (1929) about 7,000 practitioners. What is now the American Osteopathic association was organized in 1897. Its headquarters are in Chicago. It publishes a *Journal* and four other monthly periodicals. There are State, provincial and local societies, British, Canadian, New England, Eastern, Middle-Atlantic and Western associations, the Osteopathic Women's National association, and several societies of specialists. Osteopathy is regulated by law throughout the United States and most of Canada. In a majority of States examination for license to practice is in the hands of examining boards composed of osteopathic physicians. In several States, there is no legal distinction between "doctor of osteopathy" and "doctor of medicine," while in others osteopathic practice is somewhat restricted. Many osteopathic physicians have served on State and local health boards.

In Great Britain, though osteopathy is not recognized or regulated by law, the British Osteopathic Association admits to membership graduates of recognised osteopathic colleges.

OSTERMAN, ANDREI IVANOVICH, COUNT (1686–1747), Russian statesman, born at Bochum, Westphalia, became secretary to vice-admiral Cornelis Kruse, who had a standing

commission from Peter the Great to pick up promising young men, and in 1767 entered the tsar's service. He assisted the vice-chancellor Shafirov during the negotiations which terminated in the peace of the Pruth (1711). Osterman, together with General Bruce, represented Russia at the Aland peace congress of 1718. Shrewdly guessing that Sweden was at exhaustion point, and that Görtz, the Swedish plenipotentiary, was acting *ultra vires*, he advised Peter to put additional pressure on Sweden to force a peace. In 1721 Osterman concluded the peace of Nystad with Sweden, and was created a baron for his services. In 1723 he was made vice-president of the ministry of foreign affairs. Peter consulted him in domestic affairs, and he introduced many administrative novelties, e.g., "the table of degrees" and the reconstruction of the college of foreign affairs on more modern lines. During the reign of Catherine I. (1725–1727) the conduct of foreign affairs was left entirely in Osterman's hands, and he held also the posts of minister of commerce and postmaster-general. On the accession of Peter II. Osterman was appointed governor to the young emperor, and on his death (1730) he refused to participate in the attempt of Golitsuin and the Dolgorukis to convert Russia into a limited constitutional monarchy. He held aloof till Anne was established on the throne as autocrat.

His unique knowledge of home and foreign affairs made him indispensable to the empress. It was at his suggestion that the cabinet system was introduced into Russia. All the useful reforms introduced between 1730 and 1740 are to be attributed to his initiative. He improved the state of trade and materially raised the credit of Russia. The successful conclusions of the War of the Polish Succession (1733–1735) and of the war with Turkey (1736–1739) were entirely due to his diplomacy. During the brief regency of Anna Leopoldovna (October 1740–December 1741) Osterman stood at the height of his power, and the French ambassador, La Chetardie, reported to his court that "it is not too much to say that he is tsar of all Russia." Osterman's foreign policy was based upon the Austrian alliance. He had, therefore, guaranteed the Pragmatic Sanction with the deliberate intention of defending it. Hence the determination of France to remove him at any cost. Indeed it was only the Russian alliance which, in 1741, seemed to stand between Maria Theresa and ruin.

The most obvious method of rendering the Russian alliance unserviceable to the queen of Hungary was by implicating Russia in hostilities with Sweden. A rupture was brought about in 1741 by French influence and French money, but the Swedes were defeated. It now became evident to La Chetardie that only a revolution would overthrow Osterman, and this he proposed to promote by elevating to the throne the tsarevna Elizabeth, who hated the vice-chancellor because, though he owed everything to her father, he had systematically neglected her. Osterman was therefore the first and the most illustrious victim of the *coup d'état* of Dec. 6, 1741. He was condemned but, reprieved on the scaffold, was banished to Siberia, where he died.

See S. Shubinsky, "Count A. I. Osterman" (Rus.) in *Syevernoye Siyanie*, vol. ii. (St. Petersburg, 1863); D. Korsakov, *From the Lives of Russian Statesmen of the XVIIIth Century* (Rus.) Finch, *Diplomatic Despatches from Russia, 1740–1742* (St. Petersburg, 1893–94) in the collections of the Russ. Hist. Soc., vols. 85 and 91; R. Nisbet Bain, *The Pupils of Peter the Great* (London, 1897); and *The Daughter of Peter the Great* (London, 1899), chapters 1–3. (R. N. B.; X.)

OSTERODE, a town in East Prussia, 75 m. by rail N.E. of Thorn, on Lake Drewenz, and at the junction of lines to Memel, Elbing and Neidenburg. Pop. (1925) 16,299. It has a castle built by the Teutonic knights in 1270, to whom the town owes its birth. Its chief manufactures are machinery, beer, furniture and bricks; it has several saw-mills. Osterode trades in grain and timber.

OSTERODE, a town in the Prussian province of Hanover, at the south foot of the Harz mountains, 34 m. N.W. of Nordhausen by rail. Pop. (1925) 7,826. The church of St. Aegidius was founded in 724 and rebuilt after a fire in 1578. The dukes of Brunswick-Grubenhagen, made Osterode their residence from

1361 to 1452. There are manufactures of woollen goods, cigars, casks and leather, and iron foundries, tanneries, dyeworks and gypsum quarries. In recent years Osterode has become celebrated as a health resort.

OSTIA, an ancient town and harbour of Latium, Italy, at the mouth of the river Tiber, on its left bank. It lies 14 m. S.W. from Rome by the Via Ostiensis, a road of very ancient origin followed by the modern road which preserves some traces of the old pavement and remains of several ancient bridges, until the construction of a new motor road to Ostia Mare. It was said to be the first colony ever founded by Rome—according to the Romans themselves, by Ancus Martius—and took its name from its position at the mouth (*ostium*) of the river. Excavations have, however, brought to light nothing earlier than the 4th century B.C., the date of a small rectangular fort, measuring 200 by 125 yd., built of hewn blocks of volcanic stone, which may have been in Virgil's mind when he wrote his description of the fortified camp which Aeneas founded at the Tiber mouth. It was out of this fort that the city developed the establishment of the salt-marshes (*salinae*—see SALARIA, VIA) which only ceased to exist in 1875. We learn much as to its cults, magistrates and trade guilds (for the last see J. P. Waltzing, *Les Corporations professionnelles* [Brussels and Liège]) from the large number of inscriptions found. The city was divided into five regions. Vulcan was the most important deity worshipped at Ostia, and the priesthood of Vulcan was held sometimes by Roman senators. The Dioscuri, too, as patrons of mariners, were held in honour. Later we find the worship of Isis and of Cybele, the latter being especially flourishing, with large corporations of *dendrophori* (priests who carried branches of trees in procession) and *cane-phori* (basket-carriers); the worship of Mithras, too, had a large number of followers. There was a temple of Serapis at Portus. At Portus a considerable number of Jewish inscriptions in Greek have come to light. In the 4th century Ostia began to be abandoned while the importance of Portus increased.

Until Trajan formed the port of Centumcellae (Civitavecchia) Ostia was the best harbour along the low sandy coast of central Italy between Monte Argentario and Monte Circeo. It is mentioned in the history of the year 354 B.C. as a trading port, and became important as a naval harbour during the Punic Wars. Its commerce increased with the growth of Rome, and this, and the decay of agriculture in Italy, which obliged the capital to rely almost entirely on imported corn (which was, from 267 B.C. onwards, under the charge of a special quaestor stationed at Ostia), rendered the possession of Ostia the key to the situation on more than one occasion (87 B.C., A.D. 409 and 537). Ostia, however, was by no means an ideal harbour; the mouth of the Tiber is exposed to the south-west wind, which often did damage in the harbour itself; in A.D. 62 no less than 200 ships with their cargoes were sunk, and there was an important guild of divers (*urinatores*) at Ostia. The difficulties of the harbour were increased by the continued silting up, produced by the enormous amount of solid material brought down by the river. Even in Strabo's time the harbour of Ostia had become dangerous.

Caesar had projected remedial measures, but it was only under Claudius that the problem was approached. He constructed a large new harbour on the right bank, 2½ m. N. of Ostia, with an area of 170 ac. enclosed by two curving moles, with an artificial island, supporting a lofty lighthouse, in the centre of the space between them. This was connected with the Tiber by an artificial channel, and by this work Claudius, according to his inscriptions of A.D. 46, freed the city of Rome from the danger of inundation. The harbour was named by Nero Portus Augusti.

Trajan found himself obliged in A.D. 103, owing to the silting up of the Claudian harbour and the increase of trade, to construct another port further inland—a hexagonal basin enclosing an area of 97 ac., with enormous warehouses and docks attached, communicating with the harbour of Claudius and with the Tiber by means of the channel already constructed by Claudius, which was prolonged so as also to give direct access to the sea. This became blocked in the middle ages, but was reopened by Paul V. in 1612, forming the right arm of the Tiber, by which

navigation is carried on at the present day, and is known as the Fossa Trajana. The island between the two arms Procopius calls *Insula Sacra* (it is still named *Isola Sacra*).

Ostia thus lost a considerable amount of its trade, but its importance still continued to be great. The 2nd and 3rd centuries, indeed, are the high-water mark of its prosperity; and it still possessed a mint in the 4th century A.D. The first bishop of Ostia of whom we have knowledge dates from A.D. 313, and the first bishop of Portus from about the same time. Both sees exist; the former is held by the dean of the College of Cardinals.

During the Gothic wars, trade was confined to Portus and the ravages of pirates led to the gradual abandonment of Ostia. Gregory IV. constructed in 830 a fortified enceinte, called Gregoriopolis, in the eastern portion of the ancient city, and the Saracens were signally defeated here under Leo IV. (847–856). The battle is represented in Giulio Romano's fresco from Raphael's design in the Stanza dell' Incendio in the Vatican.

In the middle ages Ostia became a quarry for the cathedral of Orvieto, etc., some of its marbles being conveyed by the Pisans as far as Sardinia. Later it regained something of its importance owing to the silting up of the right arm of the Tiber. In 1483–1486 Giuliano della Rovere (nephew of Pope Sixtus IV., and afterwards himself Pope Julius II.) caused the castle to be erected by Baccio Pintelli, a little to the east of the ancient city. It is built of brick and is one of the finest specimens of Renaissance fortification, and exemplifies especially the transition from the old girdle wall to the system of bastions: it still has round corner towers, not polygonal bastions. An agricultural colony, founded after 1875, and consisting mainly of cultivators from the neighbourhood of Ravenna, has produced a great change for the better in the condition of the place. The modern village is part of the commune of Rome. The marshes have been drained, and a pumping station erected near Castel Fusano. An electric railway has been constructed from Rome to Ostia and thence to the sea-bathing resort of Ostia Mare.

Excavations on the site of Ostia were only begun towards the close of the 18th century, and no systematic work was done until 1854, when under Pius IX. a considerable amount was

done (the objects are now in the Lateran museum). The Italian Government laid bare many of the more important buildings in 1880–89; and resumed work in 1907. Owing to the fact that the site is largely covered with sand and to the absence of any later alterations, the preservation of the buildings excavated is very good, and Ostia is, with the exception of Pompeii, the best example in Italy of a town of the Roman period, while its houses, the massive concrete walls of which were faced with brick and reticulate work (both as a rule left unplastered on the outside) rose to a height of three or four storeys and had balconies and

numerous windows. They were frequently planned like modern apartment houses, and show us what the ancient Roman *insula* or block was. On the east the site is approached by the ancient road from Rome, flanked by tombs. It entered the enceinte of the 1st century B.C. (see plan) by a gate still preserved. This wall enclosed an irregular area far larger than that of the 4th century fort, extending down to the ancient coast line and the continuation of the road forms the main street of the town. A considerable part of it had porticoes on each side. On the right (N.) are some small well-preserved *thermae*, and the barracks of the firemen (*vigiles*), a special cohort of whom was stationed here. On one side of the central courtyard of the latter building is a chapel with inscribed pedestals for imperial statues (2nd and 3rd century A.D.) and a well-preserved black and white mosaic representing a sacrifice.

To the south-west is the theatre, an area 265 ft. square surrounded by colonnades, in which were placed the offices of the various *collegia* or guilds of boatmen, raftmen and others, which had a special importance at Ostia; the names of the guilds may still be read in inscriptions in the mosaic pavements of the chambers. In the centre of the area are the substructions of a temple, and on the south-east side are the remains of the theatre, built in the early imperial period, restored by Septimius Severus in 196-197 and again in the 4th or 5th century. To the south-west of the theatre are the remains of four small temples, one dedicated to Venus, and a well-preserved Mithraeum, with mosaics representing the seven planets, etc. To the south-west again is the conspicuous brick cella of a lofty temple, on arched substructures, hitherto supposed to be that of Vulcan, but more probably the Capitolium or temple of Jupiter, Juno and Minerva, with a threshold block of *africano* (Euboean) marble over 15 ft. long; from it a street over 20 ft. wide leads north-west to the river. It is flanked on each side by well-preserved warehouses, another group of which, surrounding a large court, lies to the south-west. Farther still are the well-preserved Horrea Epaphroditiana et Epagathiana, a large private warehouse. Hence an ancient road, leading between warehouses (into which the Tiber is encroaching), in one room of which a number of well-preserved large jars may be seen embedded in the floor, runs close to the river to a large private house with *thermae*, in which fine mosaics were found: it (groundlessly) bears the name of "imperial palace." Farther to the south-west are remains of other warehouses, and (possibly) of the docks—long narrow chambers, which may have served to contain ships. The mediaeval Torre Bocacciana marked approximately the mouth of the river in Roman times.

The south-eastern portion of the city has been excavated only partially. Opposite the Capitolium is the Forum, with remains of a temple of Rome and Augustus, a basilica (much destroyed by mediaeval plunderers), the curia, etc. To the south-west of this are the remains of the temple of Cybele, with a portico. This lay close to the commencement of the Via Severiana (see SEVERIANA, VIA), and the line of tombs which flanked it soon begins. Farther south-east, a line of sand dunes, covering the ruins of ancient villas, marks the coast line of the Roman period.

(T. A.)

OSTIAKS or **OSTYAKS**, a tribe who inhabit the basin of the Ob in western Siberia. The so-called Ostyaks of the Yenisei speak an entirely different language. The trans-Uralian Ostiaks and Samoyedes are probably identical with the Yugra of the Russian annals. During the Russian conquest their abodes extended much farther south than now, 41 of their fortified places having been destroyed by the Cossacks in 1501, in the region of Obdorsk alone. Remains of these "towns" are still to be seen at the Kunovat river, on the Ob 20 m. below Obdorsk and elsewhere. Those on the Irtysh are mostly settled, and have adopted the manner of life of Russians and Tatars. Those on the Ob are mostly nomads, and own large herds of reindeer. The Ob Ostiaks are russified to a great extent. They live almost exclusively by fishing, buying from Russian merchants corn for bread.

The Ostiaks call themselves As-yakh (people of the Ob), and it is supposed that their present designation is a corruption of this

name. By language they belong with the Voguls to the East Ugrian branch of the Ugrian division of the Ugro-Finnish section of the Ural-Altaic languages. Three or four leading dialects can be distinguished.

The Ostiaks are middle-sized, or short. The skull is roundish, mostly of moderate size and height. The hair is dark and soft for the most part, fair and reddish individuals being rare; the eyes are dark, generally narrow; the nose is flat and broad; the mouth is large and with thick lips; the beard is scanty. Mongoloid traits are more strongly pronounced in the women than in the men. The purest type is found among the fishers on the Ob, the reindeer-breeders of the tundra being largely intermixed with Samoyedes. They are very skilful in carving wood and bone, tanning (with egg-yolk and brains), preparation of implements from birch-bark, etc. Some of their carved or decorated bark implements show considerable artistic skill. Christianity has made some progress among them, but their ancient pagan observances are still retained.

For customs, religion, etc., see *Journal de la Société Finno-Ougrienne*, particularly papers by Sirelius and Karjalainen, and the papers by Munkácsi, Gennep, Fuchs and others in the *Revue orientale pour les études Ouralo-Altaïques*; Patkanov, *Die Irtysh-Ostiaken und ihre Volkspoesie* (1900); Patkanov, *Irtysh-Ostjaken und ihre Volkspoesie* (1897-1900); Papay, *Sammlung ostjakischer Volksdichtungen* (1906); M. Czaplicka, *Aboriginal Siberia* (1914).

OSTRACISM, a political device instituted as a constitutional safeguard for the Athenian democracy. Its effect was to remove from Athens for a period of ten years any person who threatened the harmony and tranquillity of the body politic. In the sixth prytany (see PRYTANEUM) of each year the representatives of the Boule asked the Ecclesia whether it was for the welfare of the state that ostracism should take place. If the answer was in the affirmative, a day was fixed for the voting in the eighth prytany. No names were mentioned, but it is clear that two or three names at the most could have been under consideration. The people met, not as usual in the Pnyx, but in the Agora, in the presence of the archons, and recorded their votes by placing in urns small fragments of pottery (*ostraka*) on which they wrote the name of the person whom they wished to banish. Ostracism did not take effect unless ten thousand votes in all were recorded. The ostracised person was compelled to leave Athens for ten years, but he was not regarded as a traitor or criminal. When he returned, he resumed possession of his property and his civic status was unimpaired. The adverse vote simply implied that his power was so great as to be injurious to the state. Ostracism must therefore be carefully distinguished from *exile* in the Roman sense, which involved loss of property and status, and was for an indefinite period (i.e., generally for life). At the same time it was strictly unjust to the victim, and a heavy punishment to a cultured citizen for whom Athens contained all that made life worth living. Its political importance really was that it transferred the protection of the constitution from the Areopagus to the Ecclesia. It was later replaced by the *Graphê Paranomôn*.

The object was primarily to get rid of the Peisistratid faction without perpetual recourse to armed resistance. Aristotle's *Constitution of Athens* (22) gives a list of ostracized persons, the first of whom was a certain Hipparchus of the Peisistratid family (488 B.C.). This, however, may conceivably be simply the list of those recalled from ostracism at the time of Xerxes' invasion, all of whom must have been ostracized less than ten years before 481 (i.e., since Marathon). With the end of the Persian Wars, the original object of ostracism was removed, but it continued in use for forty years and was revived in 417 B.C. It then became a mere party weapon, and the farcical result of its use in 417 in the case of Hyperbolus led to its abolition. Such a device inevitably lent itself to abuse (see Aristotle, *Pol.* 38, 1284 b. 22).

BIBLIOGRAPHY.—G. Gilbert, *Constitutional Antiquities* (Eng. trans., 1895); A. H. J. Greenidge, *Greek Constitutional Antiquities* (1896); L. Whibley, *Companion to Greek Studies* (1923); histories of Greece in general, Grote.

OSTRACODA, a sub-class of the Crustacea (*q.v.*) comprising minute forms found in fresh water and in the sea and distinguished by having the body and limbs completely enclosed in a bivalve shell. They are remarkable for having a smaller num-

ber of appendages than any other Crustacea, there being not more than four pairs and sometimes only two pairs of limbs behind the mandibles. The antennules and antennae are used for swimming or creeping. The mandibles have a large palp, often biramous and sometimes leg-like. The remaining limbs are very varied in form but some of them are usually leg-like and used in locomotion.

FROM (A) SARR, "CRUSTACEA OF NORWAY," AND FROM (B) THE "ZOOLOGICAL JOURNAL"

FIG. 1.—FRESH-WATER OSTRACOD (PIONOCYPRIS VIDUA) ENLARGED

A. External appearance. B. Appendages after removal of left valve shell; left, Antennule and antenna; center, mouth-parts, and behind them to the right, two leg-like appendages

The breeding habits of the ostracods present several features of interest. Parthenogenesis is common, at least among the fresh-water species, in many of which males are rarely seen; while in some species they have not yet been discovered. A colony of a species of *Cypris* has been kept in an aquarium for more than 30 years and during the whole of that time no males made their appearance, the colony reproducing exclusively by parthenogenesis. In some *Ostracoda* the thread-like spermatozoa are not only relatively but absolutely larger than those of any other animals. In one species which, when adult, is no more than .6 millimetres in length the spermatozoa are from 5 to 7 millimetres long.

Most species live on or near the bottom, creeping among weeds or burrowing in mud, but some marine species are planktonic. One of the latter, *Gigantocypris*, is the largest member of the group, reaching a length of 23 millimetres, but most species are much smaller and some do not exceed half a millimetre in length.

Numerous fossil *Ostracoda* have been described from all geological formations from the oldest to the most recent, but the affinities of many of them are obscure.

The recent *Ostracoda* are generally grouped in two orders. The *Myodocopa* are exclusively marine and can usually be recognized by the presence of a notch in the margin of the shell near the anterior end. They generally have paired compound eyes and a heart. The *Podocopa* include both marine and freshwater species. There is no notch in the shell, no paired eyes and no heart.

FROM SARR, "CRUSTACEA OF NORWAY"

FIG. 2.—MARINE OSTRACOD (CYTHEREIS MUCRONATA) MUCH ENLARGED, SHOWING STRONGLY SCULPTURED SHELL

OSTRACODERMS, a name given collectively to a number of fish-like vertebrate animals found fossil in the Silurian and Devonian formations of Europe and North America, in most of which the body was protected by a bony armour. The recent researches of Kiaer and Stensio have established that the Pteraspida and Cephalaspida are related to the Cyclostomata (*q.v.*), but that the Asterolepida (*Pterichthys*) are akin to the Anthrodira, which have been shown to be armoured Selachians (*q.v.*). They are small animals, some only a few centimetres long.

OSTRAU: see MORAVSKÁ OSTRAVA and SLEZSKÁ OSTRAVA.

OSTRICH, the largest living bird; the male may be nearly 8 ft. high, and weigh 300 lb. The ostrich forms the type of the subclass *Ratitae*, (*q.v.*) characterized by the absence of a keel on the breast-bone (see ORNITHOLOGY). The genus *Struthio* is unique in possessing only two toes, thus distinguishing it from *Rhea* (*q.v.*), the South American ostrich, which has three toes.

The ostrich, in a wild state, is much less abundant now than formerly. It inhabits sandy plains and open country in Arabia

and Africa, the latter more abundantly. It occurs in small troops of five or six, of which one is a cock and the rest hens. At other times it will form mixed herds with zebras and various antelopes. Extremely fleet of foot, when brought to bay the ostrich uses its strong legs as weapons with great effect. Several hens combine to lay their eggs in one nest, and on these the cock sits by night while the females relieve one another by day, though this is more to guard the eggs from beasts of prey

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

THE OSTRICH (*STRUTHIO CAMELUS*)

(U.S.), THE LARGEST OF ALL BIRDS

than to incubate them, the heat of the sun sufficing for that. The parents display great solicitude for their young. The great value of ostrich feathers, combined with the growing scarcity of the birds themselves, has led to the establishment of ostrich farms, where the birds are kept and deprived of their plumes at regular intervals. Ostrich farming is carried on in Cape Colony, Egypt, Algeria, the French Riviera, southern U.S. and elsewhere. There appear to be four existing species: *S. camelus* of North Africa and Arabia, and *S. australis* of South Africa being the best known.

OSTROG, a town of Poland, in the province of Volhynia, 95 m. W. of Zhitomir, at the confluence of the Vilya with the Goryn. It is an episcopal see of the Orthodox Greek Church, and in the 16th century had a classical academy, converted later into a Jesuit college. Here was made and printed in 1581 the first translation of the Bible into old Slav. In the town is a brotherhood of Cyril and Methodius, which maintains schools of its own. The tanning of light leather is an active domestic trade; other industries are potteries, oil-works, soap, candle and tobacco factories. After being plundered by the Cossack chieftain Gmelnicki in 1648, and later conquered by the Russians, the town fell into decay.

OSTROGOTHS or **EAST GOTHS**, one of the two main branches into which the Goths were divided, the other being the Visigoths, or West Goths. See **GOTHS**.

OSTROVSKY, ALEXANDER NIKOLAEVICH (1823–1886), Russian dramatic author, was born on April 12, 1823 in Moscow, where his father was an official of the senate. He studied law in the university of that city, which he quitted without having submitted to the final examination. He was then employed as a clerk in the office of the "Court of Conscience," and subsequently in that of the Commercial Court at Moscow. Among his early comedies are *Byednaya Nivesta* ("The Poor Bride"), *Byednost ne Porok* ("Poverty not a Vice"), and *Ne v'svoi sani ne sadis* (literally "Don't put yourself in another's sledge"). Of this last Nicholas I. said, "it was not a play, but a lesson." The Moscow merchants are strikingly portrayed in *Grozá* (1860, Eng. trans. *The Storm*, by C. Garnett, 1898) the most famous of all his plays, and *Svoei lyudi sochtlyomsya* ("Between near relatives no accounts are needed") (1850) which was originally called "The Bankrupt." *The Bankrupt* was prohibited for ten years, until the accession of Alexander II., and Ostrovsky was dismissed from the government service and placed under the supervision of the police. The Liberal tendencies of the new reign, however, soon brought relief; Ostrovsky was one of several well-known literary men who were sent into the provinces to report on the condition of the people. Ostrovsky's field of inquiry lay along the upper Volga. This mission inspired several historical dramas, such as *Kuzma Zakharich Minin Soukhorouk*, *Vassilisa Malenteva* and others. Four of his Plays have been translated into English by G. R. Noyes (1917). Ostrovsky enjoyed the patronage of Alexander III., and received a pension of 3,000 roubles a year. With the help of Moscow capitalists he established in that city a model theatre and school of dramatic art, of which he became the first director. He also founded the Society of Russian Dramatic Art and Opera

Composers. He died on June 24, 1886.

OSTUNI, a picturesque walled city of Apulia, Italy, province of Lecce, 23 m. N.W. of Brindisi by rail. Pop. (1921) 19,298 (town); 24,914 (commune). It has a 15th century cathedral.

OSTWALD, WILHELM (1853-), German chemist, was born in Riga Sept. 2, 1853, and educated at the University of Dorpat. In 1882 he became a professor in Riga, and five years later was appointed professor of physical chemistry in the University of Leipzig, where he was later director of the Physico-chemical Institute. In 1906 he resigned his university appointments and subsequently lived in retirement in Saxony. Ostwald may be regarded as one of the pioneers of modern physical chemistry and with van't Hoff (*q.v.*) he founded the important *Zeitschrift für physikalische Chemie*. His own contributions to the science have been mainly in the fields of electrochemistry and solutions. He applied the law of mass action to the equilibrium resulting from electrolytic dissociation and obtained in this way the affinity constants of acids and bases. By means of these constants, and by the use of other methods which he developed, he was able to compare the strengths of these reagents. Ostwald made some experiments on the viscosity of solutions and devised the viscometer known by his name. On the technical side he will be chiefly remembered for his discovery in 1900 of a method of oxidizing ammonia to form oxides of nitrogen; a mixture of air and ammonia being passed over a platinum catalyst. By means of this process and by later developments in connection with it, Germany was enabled to continue the manufacture of explosives during the World War after the Allied blockade had been enforced; the method is being used in various countries, under the name of the Ostwald-Brauer process, for the manufacture of nitric acid from ammonia. In 1909 Ostwald was awarded the Nobel Prize for chemistry. His published works include *Lehrbuch der allgemeinen Chemie* (2nd ed. 1884-87), *Grundlinien der anorganischen Chemie* (5th ed. 1922) and *Die wissenschaftlichen Grundlagen der analytischen Chemie* (1894) which have been translated into English.

OSUNA, a town of southern Spain, in the province of Seville; 57 m. by rail E.S.E. of Seville. Pop. (1920) 16,374. Osuna is built on a hill, overlooking the fertile plain watered by the Salado, a sub-tributary of the Guadalquivir. Osuna, the Urso of Hirtius, famous in the 1st century B.C. for its long resistance to the troops of Caesar, and its fidelity to the Pompeians, was subsequently called by the Romans Orsona and Gemina Urbanorum, the last name being due, it is said, to the presence of two urban legions here. Osuna was taken from the Moors in 1239, and given by Alphonso X. to the knights of Calatrava in 1264. Don Pedro Giron appropriated it to himself in 1445. One of his descendants, Don Pedro Tellez, was the first holder of the title duke of Osuna, conferred on him by Philip II. in 1562. The University of Osuna, founded in 1549, was suppressed in 1820. The industries are agriculture and the making of esparto mats, pottery, bricks, oil, soap, cloth, linen and hats.

OSWALD (d. 992), archbishop of York, was a nephew of Oda, archbishop of Canterbury, and at an early age became, by purchase, head of the Old Minster at Winchester. Desiring to become a monk, he went with Oda's approval to the monastery of Fleury on the Loire—at that time the great centre of reviving Benedictinism. Here he soon distinguished himself by the monastic austerity of his life. In 959 he returned to England at the request of Oda, who, however, died before his arrival. He now went to York to his kinsman the Archbishop Oskytel, who took him with him on a pilgrimage to Rome. Soon after his return he was appointed bishop of Worcester at the recommendation of Dunstan, his predecessor in the see (961). As bishop he took a prominent part in that revival of monastic discipline on Benedictine lines of which Aethelwold, bishop of Winchester, was the most ardent leader. Among other religious houses he founded that of Ramsey in conjunction with Aethelwine, Ealdorman of East Anglia. In 972 he was translated (again at Dunstan's recommendation) to the archbishopric of York, with which he continued to hold the see of Worcester. He died on Feb. 29, 992.

See *Memorials of St. Dunstan*, ed. by W. Stubbs, Rolls series (1874);

and T. Raine, *Historians of the Church of York* (1879-86).

OSWALD (c. 605-642), king of Northumbria, was one of the sons of Aethelfrith and was expelled from Northumbria on the accession of Edwin, though he himself was a son of Edwin's sister Acha. He appears to have spent some of his exile in Iona, where he was instructed in the principles of Christianity. In 634 he defeated and slew the British king Ceadwalla at a place called by Bede Denisesburn, near Hefenfelth, which has been identified with St. Oswald's Cocklaw, near Chollerford, Northumberland. By this he avenged his brother Eanfrith, who had succeeded Edwin in Bernicia, and became king of Northumbria. Oswald reunited Deira and Bernicia, and soon raised his kingdom to a position equal to that which it had occupied in the time of Edwin, with whom he is classed by Bede as one of the seven great Anglo-Saxon kings. His close alliance with the Celtic church is the characteristic feature of his reign. In 635 he sent to the elders of the Scots for a bishop. On the arrival of Aidan in answer to this request he assigned to him the island of Lindisfarne as his see, near the royal city of Bamborough. He also completed the minster of St. Peter at York which had been begun by Paulinus under Edwin. Bede declares that Oswald ruled over "all the peoples and provinces of Britain, which includes four languages, those of the Britons, Picts, Scots and Angles." His relationship to Edwin may have helped him to consolidate Deira and Bernicia. Early in his reign he was sponsor to the West Saxon king Cyneigils, whose daughter he married. In 642 he was defeated and slain at a place called Maserfeld, probably Oswestry in Shropshire, by Penda of Mercia.

See Bede, *Historia Ecclesiastica* (ed. C. Plummer, 1896), ii. 5, 14, 20; iii. 2, 3, 5, 6, 7, 9-14; *Anglo-Saxon Chronicle* (ed. J. Earle and C. Plummer, 1899), s.a., 617, 634, 635, 642, 654.

OSWALD TWISTLE, urban district, Accrington parliamentary borough, Lancashire, England, on Leeds and Liverpool canal, and the L.M.S. railway (Church and Oswaldtwistle station). Pop. (1921) 15,125. It possesses cotton-mills, printworks, bleach-works and chemical works, and in the neighbourhood are collieries, stone quarries and potteries.

OSWEGO, a city of New York, U.S.A., the county seat of Oswego county; on Lake Ontario, 35 m. N.N.W. of Syracuse at the mouth of the Oswego river and the Oswego canal, which connects with the State Barge canal at Three River Point, 25 m. S.E. It is served by the Lackawanna, the New York Central and the New York, Ontario and Western railways, lake steamers and canal barges. Pop. (1920) 23,626 (84% native white); 1928 local estimate, 26,000. The city has a fine harbour, abundant water-power and large hydro-electric developments. Water-borne commerce (largely coal, petroleum products, sand and gravel, raw sugar and wheat) amounted in 1925 to 235,483 tons by lake vessels and 95,356 tons by canal. The manufactures (notably matches, rayon, cotton and woollen goods, candy, peanut butter, cocoa and oil-well supplies) were valued in 1925 at \$15,214,745. Oswego is the seat of a State normal school (established by the city in 1861 and taken over by the State in 1867), a State armory and a U.S. life-saving station. Ft. Ontario (within the city limits) is the oldest fort in North America which is still garrisoned. The site of Oswego was visited by Champlain in 1616. Later it became a station for the Jesuit missionaries and the *coureurs des bois*. An English trading post was established in 1722, and in 1727 Governor William Burnet of New York built the first fort. It was an important base of operations during King George's War and the French and Indian War. In 1755-56 the British erected two new forts (Oswego and Ontario) on either side of the mouth of the river, both of which were taken by Montcalm (Aug. 14-15, 1756) and dismantled. The British restored Ft. Ontario in 1759 and kept it garrisoned until they turned it over to the United States in 1796. It was here that Pontiac in 1766 made his acknowledgment to Sir William Johnson of Great Britain's authority. On May 6, 1814, the fort was captured by the British and Canadians, and was held by them for a short time. It was rebuilt and garrisoned by the United States in 1839, abandoned in 1899, and again reconstructed and garrisoned in 1905. Oswego became the county seat in 1816, was incorporated as a village in 1828 (when the canal was completed) and as a city in 1848.

OSWEGO CANAL: see NEW YORK STATE BARGE CANAL SYSTEM.

OSWEGO-TEA (*Monarda didyma*), a North American plant of the mint family (Labiatae), called also American bee-balm, native to moist soil from Quebec to Michigan and southward to North Carolina and Georgia. It is a stout perennial, 2 to 3 ft. high, with opposite, lance-shaped, sharply toothed leaves, and showy scarlet flowers, about 2 in. long, borne in dense bracted heads terminating the branches. The Oswego-tea, so named because of former medicinal use, is one of the most handsome flowering plants native to eastern North America; several choice varieties are cultivated.

OSWESTRY, municipal borough, Shropshire, England, situated near the Welsh border in the north-west corner of the county. Pop. (1921) 9,785. The town is placed where valleys open from the Berwyn mountains, and is a market town between hill and plain as well as a route centre. There are various accounts of the early history of the settlement (*Trer Cadeirau*). The present name comes from Oswald's Tree (alternative Oswald's Cross, Welsh *Croes Oswallt*) and is said to refer to the death of Oswald, king of Northumbria, in a battle fought here against Penda, the ruler of Mercia. The heavily fortified encampment of "Old Oswestry," about a mile from the town, suggests early border warfare. The town was twice burnt by Welsh invaders in the middle ages. In the Domesday Survey it is included in the manor of Maesbury. Richard II., by a charter dated 1308, granted all the privileges which belonged to Shrewsbury. In 1582 Elizabeth incorporated the town and her charter was confirmed by James I. in 1616.

In the 15th and 16th centuries a weekly market was held at Oswestry for the sale of woollen goods manufactured in the adjoining parts of Wales, but the drapers of Shrewsbury, a rival centre, ruined the trade by refusing to buy cloth there. In 1642 it was garrisoned for Charles I., but two years later surrendered to the parliamentary forces. The church of St. Oswald, originally conventual, is Early English and Decorated, but has been much restored. The grammar school, founded in the reign of Henry IV., occupies modern buildings. During the World War Oswestry benefited greatly by the presence of thousands of troops at Park Hall camp. The Cambrian railway had its headquarters in the town but the engine and carriage works were in part removed by the G.W.R. after 1922. Oswestry is governed by a mayor, six aldermen and 18 councillors. Area, 1,887 ac.

OTHMAN (c. 574-656), in full OTHMĀN IBN 'AFFĀN, the third of the Mohammedan caliphs, a kinsman and son-in-law of Mohammed and cousin of Abu Sofīān, whose son Moawiya became the first of the Omayyad dynasty. He was elected caliph in succession to Omar in 644, but owing to his weakness and cruelty and his preference of the Koreish for all responsible positions irrespective of their capacity, he produced strife throughout the empire which led to his assassination by Mohammed, son of Abu Bekr. He was succeeded by Ali. See CALIPHATE.

OTHO, MARCUS SALVIUS (A.D. 32-69), Roman emperor, was born on April 28, A.D. 32. He appears first as one of the wildest of Nero's court. In 58 he refused to divorce his wife Poppaea Sabina at Nero's bidding, and was thereupon sent to be governor of Lusitania, where he remained ten years. In 68 Galba, governor of the neighbouring province of Tarraconensis, rebelled against Nero, and Otho accompanied him to Rome, hoping to succeed him. In Jan. 69 Galba adopted Piso as his successor, and Otho at once organized a revolt of the praetorian guard, and on Jan. 15 had himself proclaimed emperor, murdered Galba and Piso, and was accepted by the Senate. He owed his success partly to Galba's disciplinary measures being unpopular with the guards, partly to the power of the memory of Nero, which he further enlisted by restoring his statues and the officials of his household, and proposing to complete his palace, the Golden House. News soon arrived, however, that the army in Germany had declared for Vitellius. On March 14 he started northwards to prevent the Vitellians entering Italy. In this he failed, but his advance guard successfully defended Placentia against Alienus Caecina, compelling him to retire to Cremona, and he held the line of

the Po. Opinions were divided in Otho's camp, he himself wishing to force a decisive battle, others advising him to wait for the arrival of the troops from Dalmatia. Otho prevailed, and the main army crossed the Po to Bedriacum, Otho staying behind with the reserve at Brixellum, on the southern bank. The Othonian forces were defeated outside Cremona, and deserted to the enemy. Otho refused to renew the struggle and committed suicide in his tent on the morning of April 15, 69, and was buried at Brixellum.

See Tacitus, *Histories*, i. 12-50, 71-90, ii. 11-51; *Lives* by Suetonius and Plutarch; Dio Cassius lxiiv.; L. Paul, "Kaiser M. Salvius Otho" in *Rhein. Mus.* lvii. (1902); W. A. Spooner's Intro. to his edition (1891) of the *Histories* of Tacitus; B. W. Henderson, *Civil War and Rebellion in the Roman Empire*, A.D. 69-70 (1908).

OTIDIDAE: see BUSTARD.

OTIS, HARRISON GRAY (1837-1917), American journalist, was born near Marietta, O., on Feb. 10, 1837. He became a printer's apprentice, working in various offices in Illinois, Iowa, Ohio and Kentucky. He served throughout the Civil War, and rose to be lieutenant-colonel. He was in the Government printing office at Washington, D.C., 1867-70, and in 1870 moved to California, where he managed the *Santa Barbara Press*. In July 1882 he became connected with the *Los Angeles Daily Times*, obtaining control of that paper in 1886. He served in the war with Spain as brigadier-general in the Philippines 1898-99. In 1910 the *Times* building was dynamited, 21 employees being killed. He died at Los Angeles on July 30, 1917.

OTIS, JAMES (1725-1783), American patriot, was born at West Barnstable, Mass., on Feb. 5, 1725. He was the eldest son of James Otis (1702-1778), fourth in descent from John Otis (1581-1657), a native of Barnstable, Devon, and one of the first settlers (in 1635) of Hingham, Mass. The elder James Otis was elected to the provincial general court in 1758, was its speaker in 1760-1762, and was chief justice of the court of common pleas from 1764 until 1776; he was a prominent patriot in the colony of Massachusetts. The son graduated at Harvard in 1743; and after studying law in the office of Jeremiah Gridley (1702-1767), a well-known lawyer with Whig sympathies, rose to great distinction at the bar, practising first at Plymouth and after 1750 at Boston. In 1760 he published *Rudiments of Latin Prosody*, a book of authority in its time. Soon after the accession of George III. to the throne of England in 1760, the British Government decided upon a rigid enforcement of the navigation acts, which had long been disregarded by the colonists and had been almost wholly evaded during the French and Indian War. The writs of assistance issued in 1755 were about to expire, and it was decided to issue new ones, which would empower custom house officers to search any house for smuggled goods, though neither the house nor the goods had to be specifically mentioned in the writs. Much opposition was aroused in Massachusetts, the legality of the writs was questioned, and the superior court consented to hear argument. Otis held the office of advocate-general at the time, and it was his duty to appear on behalf of the Government. He refused, resigned his office, and appeared for the people against the issue of the writs. The case was argued in the old town house of Boston in Feb. 1761, and the chief speech was made by Otis. His plea was fervid in its eloquence and fearless in its assertion of the rights of the colonists. Going beyond the question at issue, he dealt with the more fundamental question of the relation between the English in America and the home Government, and argued that even if authorized by act of parliament such writs were null and void. The young orator was elected in May of the same year a representative from Boston to the Massachusetts general court. To that position he was re-elected nearly every year of the remaining active years of his life, serving there with his father. In 1766 he was chosen speaker of the house of representatives, but the choice was negatived.

In Sept. 1762 the younger Otis published *A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay*, in defence of the action of that body in sending to the governor a message (drafted by Otis) rebuking him for asking the assembly to pay for ships he had (with authorization of the council and not of the representatives) sent to protect New England fisheries against French privateers; according to this

message "it would be of little consequence to the people whether they were subject to George or Louis, the king of Great Britain or the French king, if both were as arbitrary as both would be if both could levy taxes without parliament." He also wrote various State papers addressed to the colonies to enlist them in the common cause, or sent to the Government in England to uphold the rights or set forth the grievances of the colonists. His influence at home in controlling and directing the movement of events which led to the War of Independence was universally felt and acknowledged; and abroad no American was so frequently quoted, denounced or applauded in parliament and the English press before 1769 as the recognized head and chief of the rebellious spirit of the New England colonists. In 1765 Massachusetts sent him as one of her representatives to the Stamp Act congress at New York, and here he was a conspicuous figure, serving on the committee which prepared the address sent to the British House of Commons. From 1769 almost continually until his death, Otis was harmlessly insane, though he had occasional lucid intervals, serving as a volunteer in the battle of Bunker Hill in 1775 and arguing a case in 1778. He was killed by lightning (it is said that he had often expressed a wish that he might die in this way) at Andover, Mass., on May 23, 1783.

Otis's political writings exercised an enormous influence, his pamphlets being among the most effective presentations of the arguments of the colonists against the arbitrary measures of the British ministry. His more important pamphlets were *A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay* (1762); *The Rights of the British Colonies Asserted and Proved* (1764); *A Vindication of the British Colonies against the Aspersions of the Halifax Gentleman in his Letter to a Rhode Island Friend—a letter known at the time as the "Halifax Libel" (1765); and Considerations on Behalf of the Colonists in a Letter to a Noble Lord* (1765).

The best biography is that by William Tudor (Boston, 1823); there is a shorter one by Francis Bowen (Boston, 1847). The best account of Otis's characteristics and influence as a writer may be found in M. C. Tyler's *Literary History of the American Revolution* (1897). Consult the notes on the Writs of Assistance by Horace Gray, Jr., in Quincy's *Massachusetts Reports, 1761-1772* (Boston, 1865). See also Francis Wilson Sprague, *Birthplace of the Patriot James Otis* (1917).

OTLEY, an urban district and town in the West Riding of Yorkshire, England, 10 m. N. of Bradford on the L.M.S. and L.N.E. railways. Pop. (1921) 9,531. It stands on the Wharfe at the foot of the precipitous Chevin. To the south-west the Guiseley gap affords a route, only 4 m. long, between the Aire and the Wharfe. It is traversed by both roads and railways and brings much of the Aire valley within range of Otley markets.

In 937 King Aethelstan granted to the archbishop of York the manor of Otley. The town and the church were laid waste in 1069. Otley became an important local centre of the woollen cloth industry, which was introduced late in the 11th century. An annual fair was granted in 1222 and a weekly market in 1248.

The growth of cereals, which was important until the 18th century, was abandoned in favour of pastoral industries for the supply of meat to the dense population on the Yorkshire coal-field. To-day the prosperity of Otley depends, not on its importance as an agricultural centre, which has been decreasing for a century, but on its industries. Worsteds spinning and weaving, tanning and leather-dressing, paper-making and the manufacture of printing machines are the chief amongst these industries. Excellent building stone is quarried.

OTOLITH: see EQUILIBRIUM, ANIMAL.

OTOMACAN, an independent linguistic stock of South American Indians, named from the Otomacas, its best known tribe. The Otomacas lived in south-western Venezuela, along the Orinoco between the Meta and Arauca rivers. In recent times they have spread westward. Described by early writers as one of the most barbarous tribes of the whole Orinoco region, they appear to have been sedentary agriculturalists, cultivating their fields of manioc and maize communally, the produce, with that from hunting and fishing, being divided among all by the chief. They were noted as clay-eaters, even their bread being mixed with it, and made great use of narcotic snuff. They were monogamous, and it is said that they married all young girls to old widowers, and all

young men to elderly widows.

See J. Gumilla, *Histoire naturelle, civile et géographique de l'Orénoque* (Avignon, 1758).

OTOMI, an important group of Indians on the central mesa of Mexico. The ancient territory of the Otomi proper comprised the states of Guanajuato and Querétaro, south-western Hidalgo and northern Mexico, extending to the hills overlooking Mexico valley and city. With them are reckoned, on the basis of related speech, the Pame of eastern San Luis Potosí and the Mazahua and Pirinda of western Mexico (state). The Otomian languages are tonal and built up from monosyllabic elements. This analogy to Chinese has led to theories of relationship, generally fantastic. Remote kinship with the Zapotecan group is, however, possible. The Otomi passed as dull bores among the Aztec; they were provincially backward as compared with centres of native culture like Mexico, Tezcoco, Cholula, and possessed no large towns. The nearer ones were all subject to the Aztec. To-day they are peaceful and number about a quarter of a million.

OTRANTO, seaport and archiepiscopal see, Apulia, Italy, in the province of Lecce, 29½ m. S.E. from it by rail, 49 ft. above sea-level. Pop. (1921) 3,152. It is on the east coast of the peninsula of the ancient Calabria (q.v.). The castle was erected by Alfonso of Aragon; the cathedral, consecrated in 1088, has a rose window and side portal of 1481. The interior, a basilica with nave and two aisles, contains a fine mosaic pavement of 1165. It has a crypt supported by 42 marble columns. The church of S. Pietro has Byzantine frescoes. The harbour is small.

Otranto occupies the site of the ancient Hydrus or Hydruntum, a town of Greek origin. In Roman times it was less important than Brundisium as a point of embarkation for the East. It was taken by Robert Guiscard in 1068. In 1480 it was utterly destroyed by the Turkish fleet, and has never since recovered its importance. About 30 m. S.E. lies the promontory of S. Maria di Leuca (so called since ancient times from its white cliffs), the south-east extremity of Italy, the ancient Promontorium Iapygium or Sallentinum. The district between this promontory and Otranto is thickly populated, and very fertile. It was an important supply-base in the war and is now an air force base. The Straits are about 40 m. wide; cables leave here for Valona and Corfu.

OTTAKAR I. (d. 1230), king of Bohemia, was a younger son of King Vladislav II. (d. 1174) and a member of the Premyslide family, hence he is often referred to as Premysl Ottakar I. Recognized as ruler of Bohemia by the emperor Henry VI. in 1192, he was, however, soon overthrown, but in 1196 forced his brother, King Vladislav III., to abandon Bohemia to him and to content himself with Moravia. Ottakar first sought the support of the German king Philip, duke of Swabia, but then went over to his rival Otto of Brunswick. Philip thereupon invaded Bohemia, and Ottakar changed sides once more. Later still, he supported the young king, Frederick II. He united Moravia with Bohemia in 1222, and when he died in 1230 he left to his son, Wenceslaus I., a kingdom united and comparatively peaceable.

OTTAKAR II., or PREMYSL OTTAKAR II. (c. 1230-1278), king of Bohemia, was son of King Wenceslaus I.; his maternal grandfather was the German king, Philip, duke of Swabia. In his father's lifetime he ruled Moravia, and in 1251 secured his election as duke of Austria, where he strengthened his position by marrying (Feb. 11, 1252) Margaret (d. 1267), sister of Duke Frederick II., the last of the Babenbergs and widow of the German king, Henry VII. In Sept. 1253 he succeeded his father in Bohemia, and in 1254 concluded peace with Bela IV. of Hungary, who had claimed Styria, advancing the Austrian frontier to the present line. In 1259 he expelled the Hungarians from the rest of Styria, then divorced his wife, married a granddaughter of Bela IV. and secured his investiture (by letter) with Austria and Styria from the German king, Richard Cornwallis.

In 1269 Ottakar II. inherited Carinthia and part of Carniola; and having made good his claim, contested by the Hungarians, in battle, he was the most powerful prince in Germany when an election for the German throne took place in 1273. The electors, however, fearing his power, chose Rudolph of Habsburg, who in 1276 placed Ottakar under the ban, besieged Vienna, and com-

pelled Ottakar to renounce all his possessions except Bohemia and Moravia. (See AUSTRIA.) Ottakar was killed at Dürnkrut on the March, Aug. 26, 1278, in an attempt to recover his lands. Clever, strong and handsome, he is a famous figure both in history and in legend, and is the subject of a tragedy by F. Grillparzer, *König Ottokars Glück und Ende*.

See O. Lorenz, *Geschichte König Ottokars*, ii. (Vienna, 1866); and F. Palacky, *Geschichte von Böhmen*, vol. i. (Prague, 1844).

OTTAVA RIMA, a stanza of eight iambic lines, containing three rhymes, invariably arranged as follows:—*a b a b a b c c*. It is an Italian invention of the 14th century. Boccaccio employed it for the *Teseide* (1340) and for the *Filostrato* (some seven years later). These epics gave to *ottava rima* its classic character. In the succeeding century it was employed by Politian, and by Boiardo for his famous *Orlando Innamorato* (1486). It was Pulci, however, in the *Morgante Maggiore* (1487), who invented the peculiar mock-heroic, or rather half-serious, half-burlesque, style with which *ottava rima* has been most commonly identified. The most striking monument in *ottava rima* in English is *Don Juan* (1819–24). Byron also employed this measure in *The Vision of Judgment* (1822). Meanwhile Shelley also became attracted by it, and in 1820 translated the *Hymns* of Homer into *ottava rima*. In the Peninsula the form was largely used, e.g., by Boscán (1490–1542), by Ercilla y Zúñiga (1533–95) in the *Araucana*, by Camoens in the *Lusiads* (1572) and by Lope de Vega.

OTTAWA, a city of Carleton county, province of Ontario, and the capital of the dominion of Canada, on the right bank of the Ottawa river, 101 m. W. of Montreal and 217 m. N.E. of Toronto. The main tower of the Parliament Building is in 45° 25' 29.499" N., and 75° 42' 00.246" W.

The city stands for the most part on a cluster of hills, 60 to 155 feet above the river. It is on the transcontinental lines of both the Canadian National and Canadian Pacific railways, and has direct communication by both systems to Montreal, Toronto and other points in Canada, as well as by the Ottawa and New York and other railroads to New York and elsewhere in the United States. Electric railways afford communication with all parts of the city and the suburbs, as well as through the neighbouring city of Hull to Aylmer. Several bridges connect Ottawa with Hull and others cross Rideau river and the Rideau canal.

The site of the city is very picturesque. For three miles it follows the high southern bank of the Ottawa from the Chaudière falls, whose mist-crowned cauldron is clearly visible from the summit of Parliament Hill, to and beyond the Rideau falls, so named by early French explorers because of their curtain-like appearance. The Rideau, a southern tributary of the Ottawa, once formed the eastern boundary of the city, which, however, is now absorbing a string of suburbs that lie along its eastern banks. The Rideau canal cuts the city in two, the western portion being known as Upper Town and the eastern as Lower Town. Roughly speaking, the canal divides the two sections of the population, the English occupying Upper Town and the French Lower Town.

Opposite and a little below the mouth of the Rideau river, the Gatineau flows into the Ottawa from the north. The river is now the scene of very large hydro-electric developments. Above the Chaudière falls the river is broken by the Deschenes rapids, and beyond these again it expands into Lake Deschenes, a favourite summer resort. To the north the Laurentian Hills, broken by the picturesque Gatineau valley, offer skiing in winter.

Buildings.—The crowning architectural feature of the city is the splendid group of Gothic buildings on the summit of Parliament Hill. The three blocks form sides of a great quadrangle, the fourth side remaining open. The corner stone of the main building was laid by the then prince of Wales in 1860. With the exception of the library, it was destroyed by fire in 1916, and has since been rebuilt. In the tower is a remarkably beautiful war memorial chamber, and above it is hung a carillon of 53 bells. The Langevin block on the south side of Parliament Hill is used for departmental purposes, and to meet the increasing needs of the Government, a group of buildings is to be erected on the banks of the Ottawa, west of Parliament Hill. Other national

institutions are the Public Archives, Royal Mint, Department of National Revenue, National Museum and the National Art Gallery, and Dominion Observatory. Other buildings are the City hall, public library, university of Ottawa, the collegiate institutes, Normal and Model schools, and the Roman Catholic and Church of England cathedrals. City charities include a large general hospital and nurses' home, a general hospital supported by the Roman Catholics and three special hospitals devoted to contagious diseases.

A system of public parks and driveways, partly within and partly without the city, add very largely to its attractions. A number of these have been built and are maintained by the federal district commission. Statues of Queen Victoria, as well as of Sir John Macdonald, Sir Wilfrid Laurier and other Canadian statesmen, stand on Parliament Hill. A very beautiful war memorial was in preparation in 1928. Rideau Hall, the official residence of the governor general, lies on the eastern boundary of the city at the entrance to Rockcliffe park.

Ottawa is governed by a mayor, and board of control of four members, elected by the city at large, and a board of 18 aldermen, two elected by each of the nine wards. The city returns two members to the Dominion House of Commons, and three to the Ontario legislature. The population in 1921 was 107,843; a later estimate gives it as 126,000.

History.—The earliest description of the site of Ottawa is that of Samuel de Champlain, in his *Voyages*. In June 1613, on his way up the river, he came to a tributary on the south side, "at the mouth of which is a marvellous fall. For it descends a height of twenty or twenty-five fathoms with such impetuosity that it makes an arch nearly four hundred paces broad. The savages take pleasure in passing under it, not wetting themselves, except from the spray that is thrown off." This was the Rideau falls, but a good deal of allowance must be made for exaggeration in Champlain's account. Continuing up the river, "we passed," he says, "a fall, a league from there, which is half a league broad and has a descent of six or seven fathoms. There are many little islands. The water falls in one place with such force upon a rock that it has hollowed out in course of time a large and deep basin, in which the water has a circular motion and forms large eddies in the middle, so that the savages call it *Asticon*, which signifies boiler. This cataract produces such a noise in this basin that it is heard for more than two leagues." The present name, Chaudière, is the French equivalent of the old Indian name.

For two hundred years and more after Champlain's first visit the Chaudière portage was the main thoroughfare from Montreal

BY COURTESY OF THE CANADIAN NATIONAL RAILWAYS

BARRACK HILL, IN OTTAWA, WITH A PART OF THE PARLIAMENTARY BUILDINGS IN THEIR ORIGINAL STATE. FROM AN OLD PRINT

to the great western fur country; but it was not until 1800 that any permanent settlement was made in the vicinity. In that year Philemon Wright, of Woburn, Massachusetts, built a home for himself at the foot of the portage, on the Quebec side of the river, where the city of Hull now stands; but for some time the precipitous cliffs on the south side seem to have discouraged settlement there. Finally about 1820 one Nicholas Sparks moved over the river and cleared a farm in what is now the heart of Ottawa. Seven years later Colonel John By, R.E., was sent out

to build a canal from a point below the Chaudière falls to Kingston on Lake Ontario. The canal, completed at a cost of \$2,500,000 has never been of any great commercial importance; it has never been called upon to fulfil its primary object, as a military work to enable gun-boats and military supplies to reach the lakes from Montreal without being exposed to attack along the St. Lawrence frontier. The building of the canal created a fair-sized settlement at its Ottawa end, which came to be known as Bytown. As the lumber trade developed Bytown rapidly increased in wealth and importance. In 1854 it was incorporated as a city, the name being changed to Ottawa; and four years later Queen Victoria selected Ottawa as the capital of Canada. Ottawa was admirably situated for a capital from a political and military point of view; but there is reason to believe that the deciding factor was the pressure exerted by the four other rival claimants, Montreal, Quebec, Toronto and Kingston, any three of which would have fiercely resented the selection of the fourth. The first session of parliament in Ottawa was opened in 1865.

(L. J. B.)

OTTAWA, a city of Illinois, U.S.A., 84 m. S.W. of Chicago, at the confluence of the Illinois and the Fox rivers; the county seat of Lasalle county. It is on the Illinois and Michigan canal and the Illinois Waterway, and is served by the Burlington Route, the Illinois Traction (electric), and the Rock Island railways. Pop., 10,816 in 1920 (87% native white); estimated locally at 18,000 in 1928. It is surrounded by a rich agricultural country, and there are medicinal springs and large deposits of clay and silica in the vicinity. The city's manufactures (including plate glass, building tile, fire-brick and agricultural implements) had a value of \$5,071,391 in 1925. The mouth of the Fox was visited early by the French explorers, and Father Hennepin discovered coal here in 1680. On Starved Rock (8 m. W., on the south bank of the Illinois, in a State park of 900 ac.) La Salle in 1683 built Fort St. Louis, which was used by fur traders as late as 1718, and in 1770 was the last refuge of a band of Illini, pursued by the Pottawatomies and besieged here until they died of starvation. Ottawa was laid out in 1831, incorporated in 1837 and chartered as a city in 1853. On Aug. 21, 1858 it was the scene of the first of the Lincoln-Douglas debates.

OTTAWA, a city of Kansas, U.S.A., 58 m. S.W. of Kansas City, on the Marais des Cygnes (or Osage) river, at an altitude of 926 ft.; the county seat of Franklin county. It is on Federal highways 50S and 73W, and is served by the Missouri Pacific and the Santa Fe railways. Pop. 9,018 in 1920 (92% native white); estimated locally at 10,500 in 1928. Ottawa has a large trade in poultry and dairy products, fruit and other farm produce. Its manufacturing establishments include large repair shops of the Santa Fe Company, creameries, flour-mills, poultry-packing plants and factories making steel products, brooms and chicken-coops. It is the seat of Ottawa university (Baptist) established in 1865. The city owns its electric light and power and water plants, and natural gas is supplied from the Kansas fields. Ottawa was in the reservation of the Ottawa Indians until they were moved (1865) to the Indian Territory. A mission was established here in 1839. The city was chartered in 1866.

OTTAWA, the largest tributary of the river St. Lawrence; ranking ninth in length among the rivers of Canada, being 685 m. long. It flows first westward to Lake Timiscaming; thence south-east and east. The principal tributaries on the left bank are the Rouge (115 m.), North Nation (60), Lièvre (205), Gatineau (240), Coulonge (135), Dumoine (80); and on the right bank,

the South Nation (90), Mississippi (105), Madawaska (130) and Petawawa (95). Canals at Ste. Anne, Carillon and Grenville permit the passage of vessels drawing 9 ft., from Montreal up to the city of Ottawa. At Ottawa the river is connected with Lake Ontario by the Rideau Canal.

The Ottawa was first explored by Samuel de Champlain in 1613. Champlain describes many of its tributaries, the Chaudière and Rideau Falls, the Long Sault, Chats and other rapids, as well as the character of the river and its banks, with minuteness and reasonable accuracy. The Long Sault Rapids on the Ottawa, about midway between Montreal and the capital, were the scene of one of the noblest exploits in Canadian history, when in 1661 the young Sieur des Ormeaux with sixteen comrades and a handful of Indian allies deliberately gave their lives to save New France from an invasion of the Iroquois. They intercepted the war party at the Long Sault, and for nearly a week held them at bay. When finally the last Frenchman fell under a shower of arrows, the Iroquois were thoroughly disheartened and returned crestfallen to their own country. For a hundred and fifty years thereafter the Ottawa was the great highway from Montreal to the west for explorers and fur-traders. Throughout the 19th century the Ottawa was the thoroughfare of lumbermen, whose immense rafts went from its upper waters to Montreal and Quebec.

OTTER, the name of an aquatic carnivore inhabiting Europe and Asia. The otter (*Lutra vulgaris*) has an elongated body, short limbs terminating in broad webbed feet, the toes of which are armed with claws, a broad, flat head and a tail about half the length of the body. The muzzle is broad, the whiskers thick, the eyes small and the ears short and rounded. The fur consists of a short, soft, grey underfur, interspersed with longer, stiffer hairs, the points of which are bright brown. The average length is about 3½ ft., the weight of a male 18 to 24 lb., the female being about 4 lb. less. The otter lives on fish and inhabits streams, rivers, lakes and, in some localities, the sea. The female produces 3 to 5 young in March or April, bringing them up in a nest of grass in a hollow in a river-bank or under the roots of an overhanging tree. Otter hunting, with packs of special hounds, is a pastime in parts of England.

In North America, *L. vulgaris* is replaced by the larger *L. canadensis* and other species with similar habits occur in North and South America, South Africa and southern Asia.

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

OTTERS (*LUTRA VULGARIS*). WIDELY DISTRIBUTED THROUGH EUROPE AND ASIA

are very wary animals. Sea-otters feed on shellfish. See Elliott Coues, *Monograph of North American Fur-bearing Animals*.

Otters form a section of the family Mustelidae (see CARNIVORA).

OTTERY ST. MARY, a market town of Devonshire, England, 12 m. N.E. of Exeter on the S.R. Pop. of urban district (1921) 3,538. The parish church is Early English, with Decorated and Perpendicular additions, is cruciform, and has transeptal towers, imitated from Exeter cathedral. The manor of Ottery belonged to the abbey of Rouen in the time of Edward the Confessor. The church was dedicated in 1260 by Walter Brouncombe, bishop of Exeter; and enlarged by Bishop John Grandisson, c. 1335. The town has a large agricultural trade, and Honiton lace is a home industry. It was the birthplace of S. T. Coleridge.

OTTO I. (912–973), the Great, Roman emperor, eldest son of King Henry I. the Fowler by his second wife Matilda, was born on Nov. 23, 912. Little is known of his early years, but he probably shared in some of his father's campaigns. In 929 he married Edith, daughter of Edward the Elder, king of the English, and sister of the reigning King Aethelstan. In 936 Otto was chosen German king and crowned by Hildebert, archbishop of Mainz. Otto soon showed his intention of breaking with the policy of his father, who

had been content with a nominal superiority over the duchies; in 937 he punished Eberhard, duke of Franconia, for an alleged infringement of the royal authority; and in 938 deposed Eberhard, duke of Bavaria. Trouble soon arose in Saxony, probably from his refusal to give certain lands to his half-brother, Thankmar, who, although the king's senior, had been passed over in the succession as illegitimate. Thankmar, aided by an influential Saxon noble named Wichmann, and by Eberhard of Franconia, seized the fortress of Eresburg and took Otto's brother Henry prisoner; but soon afterwards he was defeated by the king and killed whilst taking sanctuary. The other conspirators were pardoned, but in 939 a fresh revolt broke out under the leadership of Henry, and Gisibert, duke of Lorraine. Otto gained a victory near Xanten, which was followed by the surrender of the fortresses held by his brother's adherents in Saxony, but the rebels, joined by Eberhard of Franconia and Archbishop Frederick of Mainz, continued the struggle, and Gisibert of Lorraine transferred his allegiance to Louis IV., king of France. Otto's precarious position was saved by a victory near Andernach when Eberhard was killed, and Gisibert drowned in the subsequent flight. Henry took refuge with Louis of France, but was soon restored to favour and entrusted with the duchy of Lorraine, where, however, he was unable to restore order. Otto therefore crossed the Rhine and deprived his brother of authority. Henry then became involved in a plot to murder the king, which was discovered in time, and the good offices of his mother secured him a pardon at Christmas 941.

The deaths of Gisibert of Lorraine and of Eberhard of Franconia, quickly followed by those of two other dukes, enabled Otto to unite the stem-duchies more closely with the royal house. In 944 Lorraine was given to Conrad, surnamed the Red, who in 947 married the king's daughter Liutgard; Franconia was retained by Otto in his own hands; Henry married a daughter of Arnulf, duke of Bavaria, and received that duchy in 947; and Swabia came in 949 to the king's son Ludolf, who had married Ida, a daughter of the late duke, Hermann. During these years the tribes living between the Elbe and the Oder were made tributary, bishoprics were founded in this district, and in 950 the king himself marched against the Bohemians and reduced them to dependence. Strife between Otto and Louis IV. of France had arisen when the French king sought to obtain authority over Lorraine and aided the German rebels in 939; but after the German king had undertaken an expedition into France, peace was made in 942. Afterwards, when Louis became a prisoner in the hands of his powerful vassal Hugh the Great, duke of France, Otto attacked the duke, who, like the king, was his brother-in-law, captured Reims, and negotiated a peace between the two princes; and in subsequent struggles between them his authority was several times invoked.

In 945 Berengar I., margrave of Ivrea, left the court of Otto and returned to Italy, where he soon obtained a mastery over the country. After the death in 950 of Lothair, king of Italy, Berengar sought the hand of his widow Adelaide for his son Adalbert; and Henry of Bavaria and Ludolf of Swabia had already been meddling independently of each other in the affairs of northern Italy. In response to an appeal from Adelaide, Otto crossed the Alps in 951. He assumed the title of king of the Lombards, and having been a widower since 946, married Adelaide and negotiated with Pope Agapetus II. about his reception in Rome. The influence of Alberic, prince and senator of the Romans, prevented the pope returning a favourable answer to the king's request. But when Otto returned to Germany in 952 he was followed by Berengar, who did homage for Italy at Augsburg. The chief advisers of Otto at this time were his wife and his brother Henry. Henry's influence seems to have been resented by Ludolf, who in 946 had been formally designated as his father's successor. When Adelaide bore a son, and a report gained currency that Otto intended to make this child his heir, Ludolf rose in revolt and was joined by Conrad of Lorraine and Frederick of Mainz. Otto fell into the power of the rebels at Mainz and was compelled to agree to demands made by them, which, however, he promptly revoked on his return to Saxony. Ludolf and Conrad were declared deposed, and in 953 war broke out in Lorraine and Swabia, and afterwards in Saxony and Bavaria. Otto was finally victorious and with the capture of

Regensburg in 955 the rising ended. Conrad and Ludolf retained their estates, but their duchies were not restored to them. Meanwhile the Magyars had renewed their ravages and were attacking Augsburg. Otto marched against them, and in a battle fought on the Lechfeld Aug. 10, 955, the king's troops gained a victory which freed Germany from these invaders; while in the same year Otto defeated the Slavs ravaging the Saxon frontier.

About this time the king seems to have perceived the necessity of ruling in closer union with the church. Lands and privileges were granted to prelates, additional bishoprics were founded, and some years later Magdeburg was made the seat of an archbishop. In 960 Otto was invited to come to Italy by Pope John XII., who was hard pressed by Berengar, and he began to make preparations for the journey. As Ludolf had died in 957 and Otto, his only son by Adelaide, had been chosen king at Worms, the government was entrusted to Bruno of Cologne, and Archbishop William of Mainz, a natural son of the king. Reaching Pavia at Christmas 961, the king promised to defend and respect the church. He then proceeded to Rome, where he was crowned emperor on Feb. 2, 962. After the ceremony he confirmed the rights and privileges which had been conferred on the papacy, while the Romans promised obedience, and Pope John took an oath of fidelity to the emperor. But as he did not long observe his oath he was deposed at a synod held in St. Peter's, after Otto had compelled the Romans to swear they would elect no pope without the imperial consent; and a nominee of the emperor, who took the name of Leo VIII., was chosen in his stead. A pestilence drove Otto to Germany in 965, and finding the Romans again in arms on his return in 966, he allowed his soldiers to sack the city, and severely punished the leaders of the rebellion. His next move was against the Greeks and Saracens of southern Italy, but seeking to attain his objects by negotiation, sent Liudprand, bishop of Cremona, to the eastern emperor Nicephorus II. to arrange for a marriage treaty between the two empires. Nicephorus refused to admit the validity of Otto's title, and the bishop was roughly repulsed; but the succeeding emperor, John Zimisces, was more reasonable, and Theophano, daughter of the emperor Romanus II., was married to the younger Otto in 972. The same year witnessed the restoration of peace in Italy and the return of the emperor to Germany, where he received the homage of the rulers of Poland, Bohemia and Denmark; but he died suddenly at Memleben on May 7, 973.

The empire was less universal under Otto, its restorer, than Charlemagne, but what it lacked in splendour it gained in stability. His object was not to make the state religious but the church political, and the clergy must first be officials of the king, and secondly members of an ecclesiastical order. He shared the piety and superstition of the age, and did much for the spread of Christianity. Although himself a stranger to letters he welcomed scholars to his court and eagerly seconded the efforts of his brother Bruno to encourage learning; and while he neither feared nor shirked battle, he was always ready to secure his ends by peace.

OTTO II. (955-983), Roman emperor, was the son of the emperor Otto the Great, by his second wife Adelaide. He was chosen German king at Worms in 961 and on Dec. 25, 967, was crowned joint emperor at Rome by Pope John XIII. On

April 14, 972, he married Theophano, daughter of the eastern emperor Romanus II., and after sharing in various campaigns in Italy, returned to Germany and became sole emperor on the death of his father in May 973. After suppressing a rising in Lorraine, difficulties arose in southern Germany, probably owing to Otto's refusal to grant the duchy of Swabia to Henry II., the Quarrelsome, duke of Bavaria. The first conspiracy was easily suppressed, and in 974 an attempt on the part of Harold III., king of the Danes, to throw off the German yoke was also successfully resisted; but an expedition against the Bohemians led by the king in person in 975 was a partial failure owing to the outbreak of further trouble in Bavaria. In 976 Otto deposed Duke Henry, restored order for the second time in Lorraine, and made another expedition into Bohemia in 977, when King Boleslaus II. promised to return to his earlier allegiance. Having crushed an attempt made by Henry to regain Bavaria, Otto was suddenly attacked by Lothair, king of France, who held Aix in his possession for a few days; but when the emperor retaliated by invading France he met with little resistance. He was, however, compelled by sickness among his troops to raise the siege of Paris, and on the return journey the rearward of his army was destroyed and the baggage seized by the French. An expedition against the Poles was followed by peace with France, when Lothair renounced Lorraine.

The emperor then prepared for a journey to Italy. In Rome, where he restored Pope Benedict VII., he held a splendid court, attended by princes and nobles from all parts of western Europe. He was next required to punish inroads of the Saracens on the Italian mainland, and in September 981 he marched into Apulia, where he met at first with considerable success; but an alliance between the Arabs and the Eastern Empire, whose hostility had been provoked by the invasion of Apulia, resulted in a severe defeat for Otto's troops near Stilo in July 982. Without revealing his identity, the emperor escaped on a Greek vessel to Rossano. At a diet held at Verona, largely attended by German and Italian princes, a fresh campaign was arranged against the Saracens. Proceeding to Rome, Otto secured the election of Peter of Pavia as Pope John XIV. Just as the news reached him of a general rising of the tribes on the eastern frontier of Germany, he died in his palace in Rome on Dec. 7, 983.

OTTO III. (983-1002), Roman emperor, son of the emperor Otto II. and Theophano, daughter of the eastern emperor Romanus II., was born in July 980, chosen as his father's successor at Verona in June 983 and crowned German king at Aix-la-Chapelle on Dec. 25. Otto II. had died a few days before this ceremony, but the news did not reach Germany until after the coronation. Early in 984 the king was seized by Henry II., the Quarrelsome, the deposed duke of Bavaria, who claimed the regency as a member of the reigning house, and probably entertained the idea of obtaining the kingly dignity himself. A strong opposition was quickly aroused, and when Theophano and Adelaide, widow of the emperor Otto the Great, appeared in Germany, Henry was compelled to hand over the young king to his mother. Otto's abilities were carefully cultivated by Bernward, afterwards bishop of Hildesheim, and by Gerbert of Aurillac, archbishop of Reims, and he was called "the wonder of the world." The government of Germany during his minority was in the hands of Theophano, and after her death in June 991 passed to a council in which the chief influence was exercised by Adelaide and Willigis, archbishop of Mainz.

Having accompanied his troops in expeditions against the Bohemians and the Wends, Otto was declared of age in 995. In 996 he crossed the Alps and was recognized as king of the Lombards at Pavia. Before he reached Rome, Pope John XV., who had invited him to Italy, had died, whereupon he raised his own cousin Bruno, son of Otto duke of Carinthia, to the papal chair

as Pope Gregory V., and by this pontiff Otto was crowned emperor on May 21, 996. On his return to Germany, the emperor learned that Gregory had been driven from Rome, which was again in the power of John Crescentius, patrician of the Romans, and that a new pope, John XVI., had been elected. Leaving his aunt, Matilda, abbess of Quedlinburg, as regent of Germany, Otto, in Feb. 998, led Gregory back to Rome, took the castle of St. Angelo by storm and put Crescentius to death. A visit to southern Italy, where many of the princes did homage to the emperor, was cut short by the death of the pope, to whose chair Otto then appointed his former tutor Gerbert, who took the name of Sylvester II.

In the palace which he built on the Aventine, Otto sought to surround himself with the splendour and ceremonial of the older emperors of Rome, and dreamed of making Rome once more the centre of a universal empire. Many names and customs were introduced into his court from that of Constantinople; he proposed to restore the Roman senate and consulate, revived the office of patrician, called himself "consul of the Roman senate and people" and issued a seal with the inscription, "restoration of the Roman empire." Passing from pride to humility he added "servant of the apostle," and "servant of Jesus Christ" to the imperial title, spent a fortnight in prayer in the grotto of St. Clement and did penance in various Italian monasteries.

Leaving Italy in the summer preceding the year 1000, when it was popularly believed that the end of the world was to come, Otto made a pilgrimage to the tomb of his old friend Adalbert, bishop of Prague, at Gnesen, and raised the city to the dignity of an archbishopric. He then went to Aix, and opened the tomb of Charlemagne, where, according to a legendary tale, he found the body of the great emperor sitting upright upon a throne, wearing the crown and holding the sceptre.

On his return to Rome, trouble arose between Otto and the citizens, and for three days the emperor was besieged in his palace. After a temporary peace, he fled to the monastery of Classe near Ravenna. Troops were collected, but whilst conducting a campaign against the Romans, Otto died at Paterno near Viterbo on Jan. 23, 1002, and was buried at Aix-la-Chapelle.

OTTO IV. (c. 1182-1218), Roman emperor, second son of Henry the Lion, duke of Saxony, and Matilda, daughter of Henry II., king of England, was most probably born at Argenton in central France. His father died when he was still young, and he was educated at the court of his uncle Richard I., king of England, under whose leadership he gained valuable experience in war, being appointed duke of Aquitaine, count of Poitou and earl of Yorkshire. When the emperor Henry VI. died in September 1197, some of the princes under the leadership of Adolph, archbishop of Cologne, were anxious to find a rival to Philip, duke of Swabia, who had been elected German king. After some delay their choice fell upon Otto, who was chosen king at Cologne on June 9, 1198. Hostilities broke out at once, and Otto, after a series of defeats, was driven to Brunswick. Preparations were made to drive him from here, when he was saved by the murder of Philip in June 1208. Many of the supporters of Philip now made overtures to Otto, and an attempt to set up Henry I., duke of Brabant, having failed, Otto submitted to a fresh election and was chosen German king at Frankfurt on Nov. 11, 1208, in the presence of a large gathering of princes. A general reconciliation followed, which was assisted by the betrothal of Otto to Philip's eldest daughter Beatrix, but as she was only ten years old, the marriage was deferred until July 22, 1212. The pope, who had previously recognized the victorious Philip, hastened to return to the side of Otto; large concessions were made to the church.

In August 1209 the king set out for Italy. Meeting with no opposition, he was received at Viterbo by Innocent, but refused the papal demand that he should concede to the church all the territories which, previous to 1197, had been in dispute between

the Empire and the Papacy, consenting, however, not to claim supremacy over Sicily. He was crowned emperor at Rome on Oct. 4, 1209, a ceremony which was followed by fighting between the Romans and the German soldiers. The pope then requested the emperor to leave Roman territory; but he remained near Rome for some days, demanding satisfaction for the losses suffered by his troops. The breach with Innocent soon widened, and in violation of the treaty made with the pope Otto attempted to recover for the Empire all the property which Innocent had annexed to the Church, and rewarded his supporters with large estates in the disputed territories.

Having occupied Tuscany he marched into Apulia, part of the kingdom of Frederick of Hohenstaufen, afterwards the emperor Frederick II., and on Nov. 18, 1210, was excommunicated by the pope. Regardless of this sentence Otto completed the conquest of southern Italy, but the efforts of Innocent had succeeded in arousing considerable opposition in Germany, where the rebels were also supported by Philip Augustus, king of France. A number of princes assembled at Nuremberg declared Otto deposed, and invited Frederick to fill the vacant throne. Returning to Germany in March 1212, Otto made some headway against his enemies until the arrival of Frederick towards the close of the year. The death of his wife in August 1212 had weakened his hold on the southern duchies, and he was soon confined to the district of the lower Rhine, although supported by money from his uncle King John of England. The final blow to his fortunes came when he was decisively defeated by the French at Douvines in July 1214. He escaped with difficulty from the fight and took refuge in Cologne. His former supporters hastened to recognize Frederick; and in 1216 he left Cologne for Brunswick, which he had received in 1202 by arrangement with his elder brother Henry. The conquest of Hamburg by the Danes, and the death of John of England, were further blows to his cause. On May 19, 1218, he died at the Harzburg after being loosed from the ban by a Cistercian monk, and was buried in the church of St. Blasius at Brunswick. He left no children.

OTTO, king of Greece (1815-1867), second son of Louis I., king of Bavaria, and his wife Teresa of Saxe-Altenburg, was born at Salzburg on June 1, 1815, and was educated at Munich. In 1832 he was chosen by the conference of London to occupy the newly-erected throne of Greece, and on Feb. 6, 1833, he landed at Nauplia, then the capital of independent Greece. Otto, who was not yet eighteen, was accompanied by a council of regency composed of Bavarians under the presidency of Count Josef Ludwig von Armansperg (1787-1853). In 1835 Otto came of age, but, on the advice of his father and under pressure of Great Britain and of the house of Rothschild, who all believed that a capable finance minister was the supreme need of Greece, he retained Armansperg as chancellor of state. The Greeks were more heavily taxed than under Turkish rule; they had exchanged government by the sword, which they understood, for government by official regulations, which they hated; they had escaped from the sovereignty of the Mussulman to fall under that of a devout Catholic, to them a heretic. Otto was well intentioned, honest and inspired with a genuine affection for his adopted country; but it needed more than mere amiable qualities to reconcile the Greeks to his rule.

In 1837 Otto married Princess Amalie of Oldenburg, who made herself unpopular by interfering in the government. Meanwhile Armansperg had been dismissed by the king, but a Greek minister was not put in his place, and the granting of a constitution was postponed. The attempts of Otto to conciliate Greek sentiment by efforts to enlarge the frontiers of his kingdom, e.g., by the suggested acquisition of Crete in 1841, only succeeded in em-

broiling him with the powers. His power rested wholly on Bavarian bayonets; and when, in 1843, the last of the German troops were withdrawn, he was forced by the outbreak of a revolutionary movement in Athens to grant a constitution and to appoint a ministry of native Greeks.

For the British blockade of the Peiræus and Greek intervention in the Crimean War see GREECE: History. Otto's position in Greece became untenable. In 1861 a student named Drusios attempted to murder the queen, and was hailed by the populace as a modern Harmodius. In October 1862 the troops in Acarnania under General Theodore Srivas declared for the king's deposition; those in Athens followed suit; a provisional government was set up and summoned a national convention. The king and queen, who were at sea, took refuge on a British warship, and returned to Bavaria, where, on July 26, 1867, Otto died.

OTTO OF FREISING (1114?-1158), German bishop and chronicler, was the fifth son of Leopold III., margrave of Austria, by his wife Agnes, daughter of the emperor Henry IV. By her first husband, Frederick I. of Hohenstaufen, duke of Swabia, Agnes was the mother of the German king Conrad III., and grandmother of the emperor Frederick I.; and Otto was thus related to the most powerful families in Germany. He studied in Paris, and became abbot of the Cistercian monastery of Morimond in Burgundy about 1136, soon afterwards being elected bishop of Freising. In 1147 he took part in the disastrous crusade of Conrad III., returning to Bavaria in 1148 or 1149. He enjoyed the favour of Conrad's successor, Frederick I.; was probably instrumental in settling the dispute over the duchy of Bavaria in 1156; was present at the famous diet at Besançon in 1157, and died at Morimond on Sept. 22, 1158.

Otto wrote a *Chronicon*, sometimes called *De duabus civitatibus*, an historical and philosophical work in eight books, which follows to some extent Augustine and Orosius. It goes down to 1146, and from this date until 1209 has been continued by Otto, abbot of St. Blasius (d. 1223). Of the *Gesta Friderici imperatoris* the first two books were written by Otto, and the remaining two probably by his pupil Ragewin, or Rahewin. First printed by John Cuspinian at Strasbourg in 1515, Otto's writings are now issued in the *Monumenta Germaniae historica*, Band xx. (Hanover, 1868); German trans. by H. Kohl (Leipzig, 1881-86). The *Gesta Friderici* has been published separately with introduction by G. Waitz.

Schmidlin, *Die geschichtsphilosophische und kirchenpolitische Weltanschauung Otto von Freising* (Freiburg i./B., 1906); A. Hofmeister, "Studien über O. v. Freising" in *Gesellschaft für ältere deutsche Geschichtskunde* (Hanover, 1911); A. Potthast, *Bibliotheca historica* (1896).

OTTO OF NORDHEIM (d. 1083), duke of Bavaria, belonged to the rich and influential Saxon family of the counts of Nordheim, and received the duchy of Bavaria from Agnes, widow of the emperor Henry III., in 1061. In 1062 he assisted Anno, archbishop of Cologne, to seize the German king, Henry IV.; led a successful expedition into Hungary in 1063; and took a prominent part in the government during the king's minority. In 1064 he went to Italy to settle a papal schism, secured the banishment from court of Adalbert, archbishop of Bremen, and crossed the Alps in the royal interests on two other occasions. In 1070 Otto was accused of being privy to a plot to murder the king, and was required to submit to the ordeal of battle with his accuser. The duke asked for a safe-conduct to and from the place of meeting, and when this was refused he declined to appear, and was consequently deprived of Bavaria, while his Saxon estates were plundered. He obtained no support in Bavaria, but raised an army among the Saxons and carried on a campaign of plunder against Henry until 1071, when he submitted; in the following year he received back

his private estates. When the Saxon revolt broke out in 1073 Otto is represented by Bruno, the author of *De bello Saxonico*, as delivering an inspiring speech to the assembled Saxons at Wormsleben, after which he took command of the insurgents. By the peace of Gerstungen in 1074 Bavaria was restored to him; he shared in the Saxon rising of 1075, after which he was again pardoned and made administrator of Saxony. After the excommunication of Henry IV. in 1076 Otto attempted to mediate between Henry and the Saxons; but when these efforts failed he again placed himself at their head. He assented to the election of Rudolph, count of Rheinfelden, as German king, when his restoration to Bavaria was assured, and by his skill and bravery inflicted defeats on Henry's forces at Mellrichstadt, Flarchheim and Hohenmölsen. He remained in arms against the king until his death on Jan. 11, 1083. By his wife Richenza, widow of Hermann, count of Werla, he left six children.

OTTOMAN BANK. The establishment of the "Imperial Ottoman Bank" was authorized by *Firman* in 1863 and effected by a Convention between the Turkish Government and a banking consortium of the English and French founders. Its function was to act as the State Bank of the Turkish Empire. It was granted the exclusive right of note issue, and was the sole accredited financial agent of the Sublime Porte.

In 1925 the concession under which the bank works was extended, with certain modifications, for ten years. At the same time the title "Imperial" was dropped, and the institution is now known as the "Ottoman Bank." Its legal domicile is Constantinople; the directing committees reside and meet in London and Paris, in which cities the bank has important offices. It has also a branch at Manchester and a branch at Marseilles; in addition the bank has agencies in the following countries: Turkey (45), Egypt (7), Cyprus (6), Iraq (4), Palestine (4), Greece (2), Persia (3), Arabia (1), Transjordan (1) and Tunis (1).

A subsidiary institution, the Banque de Syrie et du Grand Liban, has some ten branches throughout Syria. The Ottoman Bank is actively interested in the Banque Franco-Serbe, the Bank of Roumania Ltd., and the British-French Discount Bank Ltd.

The capital of the bank is £10,000,000, of which half is paid up, the reserve £1,250,000, while notes in circulation amount approximately to £600,000. The Ottoman Bank still maintains its original character as an Anglo-French institution.

OTTOMAN EMPIRE, the empire founded by Osman (1288-1320), which lasted six centuries and a half, and fell before the democratic movement inaugurated at Angora in 1919 by Mustafa Kemal Pasha (*q.v.*). (See CALIPHATE; TURKEY.)

OTTRELITE (from Otter, Belgium, the original locality), in mineralogy, a member of a group of closely related minerals with the general composition $H_2O \cdot RO \cdot Al_2O_3 \cdot SiO_2$, in which RO is dominantly FeO, but is often in part represented by a content of MgO or MnO. On account of its petrographic importance the term ottrelite is often used as the group name for this series of minerals, though the name clintonite is also in use. The chief members are chloritoid ($H_2FeAl_2SiO_7$), sismondine ($H_2[Fe, Mg]Al_2SiO_7$) in which the magnesia rises to 7%, and ottrelite the manganiferous variety ($H_2[FeMn]Al_2SiO_7$) in which the MnO content may rise to 8%. They are grey, green or black micaceous minerals, but in distinction from the "elastic" micas and "flexible" chlorites they are often referred to as the "brittle micas" on account of the brittleness of their laminae. Like the micas and chlorites they possess monoclinic symmetry and a perfect cleavage parallel to the flat surface (001) of the plates. Their superior hardness ($H=6.5$) readily distinguishes them from both these groups of minerals. Multiple twinning on the mica law is exceedingly common, and a zonal structure (often of hour-glass type) is often apparent. The ottrelite group of minerals is confined to metamorphic rocks—particularly those developed in regional metamorphism—in slates, phyllites and schists. Noteworthy occurrences of this mineral are the slates of the Ardennes, of Tintagel (Cornwall) and in the Mesozoic and Permian schists

of the Swiss and Italian Alps.

The minerals margarite, xanthophyllite and kossmatite show some relations with the ottrelite group of minerals. They are distinguished by an inferior hardness and contain calcium as an essential constituent. Margarite ($H_2CaAl_2Si_2O_{12}$) occurs in white pearly scales associated with corundum and is a common mineral of emery deposits. Xanthophyllite occurs in talc-chlorite schists at Slatoust in the Urals and in altered limestone at Riverside, California, while kossmatite is a recently described lime-rich mineral ($H=2.5$) occurring in the dolomite marbles of West Macedonia. (C. E. T.)

OTTUMWA, a city of south-eastern Iowa, U.S.A., on the Des Moines river, at an altitude of 650 ft.; the county seat of Wapello county. It is on Federal highways 34 and 63, and is served by the Burlington Route, the Chicago, Milwaukee, St. Paul and Pacific, the Rock Island and the Wabash railways. Pop. (1925 State census) 26,375. The city is built on a series of terraces rising from the river. It is in the bituminous coalfields of Iowa, at the heart of the corn and meat producing area of the Middle West. Pork products, serum, agricultural implements, boilers, car loaders, hoisting engines, chicken coops, lawn mowers, mine equipment and supplies, carpenters' squares and ice-cream cabinets are among the leading manufactures. The aggregate factory product in 1925 was valued at \$45,169,330. Ottumwa was founded in 1843, incorporated as a town in 1851, and chartered as a city in 1857. The name is a modification of an Indian word meaning "rippling water."

OTUQUIAN, a tribe or small group of tribes of South American Indians, constituting an independent linguistic stock, so called from the Otuquis, the most important tribe. The group, which was nearly extinct in the early part of the 19th century, lived in north-eastern Bolivia in the eastern portion of the province of Chiquitos, on the Otuquis river and between it and the Paraguay, between 17° and 18° S. lat. At that time the remnant of the people were located at the mission of Santa Corazon de Chiquitos, and had already lost their original culture.

See G. L. Krieger, *Das Land Otuquis in Bolivia* (Frankfurt, 1838); G. de Crequi-Montfort and P. Rivet, "Le groupe Otuque" (*J. Soc. Americanistes de Paris* [n.s.] vol. ix., pp. 317-337); *ibid.*, "Les affinités des dialectes Otuque" (*ibid.* vol. x., pp. 369-377).

OTWAY, THOMAS (1652-1685), English dramatist, was born at Trotten, near Midhurst, Sussex, on March 3, 1652. His father, Humphrey Otway, was at that time curate of Trotton, but Otway's childhood was spent at Woolbeding, a parish 3 m. distant, of which his father had become rector. He was educated at Winchester College, and in 1669 entered Christ Church, Oxford, as a commoner, but left the university without a degree in the autumn of 1672. In 1675 Thomas Betterton produced at Dorset Garden theatre Otway's first drama, *Alcibiades*, which was printed in the same year. It is a poor tragedy saved from absolute failure by the actors. He made a great advance on this first work in *Don Carlos, Prince of Spain* (licensed June 15, 1676; an undated edition probably belongs to the same year). In it the two characters familiar throughout his plays make their appearance. Don Carlos is the impetuous, unstable youth, who seems to be drawn from Otway himself, while the queen's part is the gentle pathetic character repeated in his more celebrated heroines, Monimia and Belvidera. In 1677 Betterton produced two adaptations from the French by Otway, *Titus and Berenice* (from Racine's *Bérénice*), and the *Cheats of Scapin* (from Molière's *Fourberies de Scapin*). These were printed together, with a dedication to Lord Rochester. In 1678 he produced an original comedy, *Friendship in Fashion*, popular at the moment, though it was hissed off the stage for its gross indecency when it was revived at Drury Lane in 1749.

Meanwhile he had conceived an overwhelming passion for Mrs. Barry, who filled many of the leading parts in his plays. Six of his letters to her survive, the last of them referring to a broken appointment in the Mall. In 1678, driven to despair by her, Otway obtained a commission through Charles, earl of Plymouth, a natural son of Charles II., in a regiment serving in the Netherlands. The English troops were disbanded in 1679, but

were left to find their way home as best they could. They were also paid with depreciated paper, and Otway arrived in London late in the year, ragged and dirty, a circumstance utilized by Rochester in his "Sessions of the Poets," which contains a scurrilous attack on his former protégé.

Early in the next year (February 1680) was produced at Dorset Garden the first of Otway's two tragic masterpieces, *The Orphan, or The Unhappy Marriage*, Mrs. Barry playing the part of Monimia. Written in blank verse, which shows a study of Shakespeare, its success was due to the tragic pathos, of which Otway was a master, in the characters of Castalio and Monimia. *The History and Fall of Caius Marius*, produced in the same year, and printed in 1692, is a curious grafting of Shakespeare's *Romeo and Juliet* on the story of Marius as related in Plutarch's *Lives*. In 1680 Otway also published *The Poet's Complaint of his Muse, or A Satyr against Libells*, in which he retaliated on his literary enemies. An indifferent comedy, *The Soldier's Fortune* (1681), was followed in February 1682 by *Venice Preserved, or A Plot Discover'd*. The story is founded on the *Histoire de la conjuration des Espagnols contre la Venise en 1618*, by the Abbé de Saint-Réal, but Otway modified the story considerably. The character of Belvidera is his own, and the leading part in the conspiracy, taken by Bedamor, the Spanish ambassador, is given in the play to the historically insignificant Pierre and Jaffier. The piece has a political meaning, enforced in the prologue. The Popish Plot was in Otway's mind, and Anthony, 1st earl of Shaftesbury, is caricatured in Antonio. The play won instant success. It was translated into almost every modern European language, and even Dryden said of it: "Nature is there, which is the greatest beauty."

The Orphan and *Venice Preserved* remained stock pieces on the stage until the 19th century, and the leading actresses of the period played Monimia and Belvidera. One or two prefaces, another weak comedy, *The Atheist* (1684), and two posthumous pieces, a poem, *Windsor Castle* (1685), a panegyric of Charles II., and a *History of the Triumvirates* (1686), translated from the French, complete the list of Otway's works. He apparently ceased to struggle against his poverty and misfortunes. The generally accepted story regarding the manner of his death was first given in Theophilus Cibber's *Lives of the Poets*. He is said to have emerged from his retreat at the Bull on Tower Hill to beg for bread. A passer-by, learning who he was, gave him a guinea, with which Otway hastened to a baker's shop. He began too hastily to satisfy his ravenous hunger, and choked with the first mouthful. Whether this account of his death be true or not, it is certain that he died in the utmost poverty, and was buried on April 16, 1685, in the churchyard of St. Clement Danes. A tragedy entitled *Heroick Friendship* was printed in 1686 as Otway's work, but the ascription is unlikely.

The Works of Mr. Thomas Otway with some account of his life and writings, published in 1712, was followed by other editions (1757, 1768, 1812). The standard edition is that by T. Thornton (1813). A selection of his plays was edited for the Mermaid series (1891 and 1903) by Roden Noel. See E. Schumacher, *Thomas Otway* (Bonn, 1924).

OUBLIETTE, a French architectural term used in two senses, of a dungeon in a prison or castle which could only be reached by a trap-door from another dungeon, and of a concealed opening or passage leading from a dungeon to the moat or river, into which bodies of prisoners might be dropped. Many so-called "oubliettes" in mediaeval castles were in reality the cesspools or receptacles of the castle latrines.

OUDENARDE, a town of Belgium in the province of East Flanders, 18 m. S. of Ghent. While it is best known for the great victory gained by Marlborough and Eugene over the French under Vendôme in 1708, Oudenarde has many features of interest. The town hall, which took ten years to build (1525-1535), has after that of Louvain the most elaborately decorated façade in Belgium. It was designed by H. van Peele and G. de Ronde, and is in tertiary Gothic style. The belfry tower of five storeys with three terraces, surmounted by a golden figure, is a striking feature. The council chamber contains a fine oak door and Gothic chimney-piece, both c. 1530. There are also two interesting old churches,

St. Walburga, partly of the 12th and partly of the 14th century, and Notre Dame, dating from the 13th century. The former contains several pictures by Craeyer and other Flemish masters.

The Battle of Oudenarde (June 30-July 11, 1708) was fought on the ground north-west and north of the town, which was then regularly fortified and was garrisoned by a force of the Allies. For an account of the strategic situation which led up to the battle, see SPANISH SUCCESSION, WAR OF THE. The French army under the duke of Burgundy and Marshal Vendôme, after an abortive attempt to invest Oudenarde, took up a defensive position north of the town when Marlborough and Eugene, after a forced march, arrived with the main Allied army. The advanced guard of the Allies under General (Lord) Cadogan promptly crossed the Scheldt, annihilated an outlying body of French troops, and established itself on the ground it had won, in front of the French centre. But the Allied main army took a long time to defile over the Scheldt and could form up (on the left of Cadogan's detachment) only slowly and by degrees. Observing this, Burgundy resolved to throw forward his right towards Oudenarde to engage and hold the main body of the Allies before their line of battle could be formed. This effected, it was hoped that the remainder of the French army could isolate and destroy Cadogan's detachment, which was already closely engaged with the French centre. But he miscalculated both the endurance of Cadogan's men (amongst whom the Prussians were conspicuous for their tenacity) and the rapidity with which in Marlborough's and Eugene's hands the wearied troops of the Allies could be made to move. Marlborough, who personally directed the operations on his left wing, not only formed his line of battle successfully, but also began seriously to press the forces that had been sent to check his deployment. Before long, while the hostile left wing still remained inactive, the unfortunate troops of the French centre and right were gradually hemmed in by the whole force of the Allies. The decisive blow was delivered by the Dutch marshal, Overkirk, who was sent by Marlborough with a large force (the last reserve of the Allies) to make a wide turning movement round the extreme right of the French, and at the proper time attacked them in rear. A belated attempt of the French left to intervene was checked by the British cavalry, and the pressure on the centre and right, which were now practically surrounded, continued even after nightfall. A few scattered units managed to escape, and the left wing retreated unmolested, but at the cost of about 3,000 casualties the Allies inflicted a loss of 6,000 killed and wounded and 9,000 prisoners on the enemy, who were, moreover, so shaken that they never recovered their confidence to the end of the campaign. The battle of Oudenarde was not the greatest of Marlborough's victories, but it affords almost the best illustration of his military character. Contrary to all the rules of war then in vogue, he fought a piecemeal and unpremeditated battle, with his back to a river, and with wearied troops, and succeeded.

OUDINÉ, EUGÈNE ANDRÉ (1810-1887), French sculptor and medallist, was born in Paris in 1810, and devoted himself from the beginning to the medallist's branch of sculpture, although he also excelled in monumental sculpture and portrait busts. He gained the grand prize for medal engraving in 1831, and in the same year exhibited his "Wounded Gladiator." He subsequently occupied official posts as designer to the Inland Revenue and to the Mint. His most famous medals are those struck in commemoration of the annexation of Savoy by France and of the peace of Villafranca. Others are "The Apotheosis of Napoleon I.," "The Universal Exposition," "The Establishment of the Republic," and "Napoleon's Tomb at the Invalides." Oudiné, who may be considered the father of the modern medal, died in 1887.

OUDINOT, CHARLES NICOLAS (1767-1847), duke of Reggio, marshal of France, was born at Bar-le-duc, on April 25, 1767. He served in the regiment of Médoc from 1784 to 1787, retiring with the rank of sergeant. On the outbreak of war in 1792 he became lieutenant colonel in the volunteers of the Meuse, being transferred to the regular army after his defence of the fort of Bitsch (1792). He was promoted general of brigade in June 1794, after the battle of Kaiserslautern. He served on the German frontier under Hoche, Pichegru and Moreau, and in the

Swiss campaign of 1799 with Masséna. He was made inspector-general of infantry, and in the war of 1805 he commanded the famous "grenadiers Oudinot," with which he seized the Vienna bridges, and gave the decisive blow at Austerlitz. In 1808 he was made governor of Erfurt and count of the Empire, and in 1809 after Wagram, he was promoted marshal. He was made duke of Reggio, and received a large money grant in April 1810. Oudinot governed Holland from 1810 to 1812, and commanded the II. corps of the *Grande Armée* in the Russian campaign. For his defeat at Gross Beeren see NAPOLEONIC CAMPAIGNS. He was superseded by Ney, who was defeated at Dennewitz. Oudinot again held important commands at Leipzig and in the 1814 campaign. He was made a peer under Louis XVIII., and did not join Napoleon in 1815. His last active service was in the French invasion of Spain in 1823, in which he commanded a corps, and was for a time governor of Madrid.

OUIDA, the pen name—derived from a childish attempt to pronounce "Louisa"—of Maria Louise [de la] Ramée (1839–1908), English novelist, born at Bury St. Edmunds, where her birth was registered on Jan. 7, 1839. Her father, Louis Ramée, was French, and her mother, Susan Sutton, English. In 1860 her first story, afterwards republished as *Held in Bondage* (1863), appeared in the *New Monthly* under the title of *Granville de Vigne*, and this was followed in quick succession by *Strathmore* (1865), *Chandos* (1866) and *Under Two Flags* (1867). The list of Ouida's subsequent works is a very long one; but it is sufficient to say that, together with *Moths* (1880), those already named are not only the most characteristic, but also the best. In a less dramatic genre, her *Bimbi: Stories for Children* (1882) may also be mentioned; but it was by her more flamboyant stories, such as *Under Two Flags* and *Moths*, that her popular success was achieved. She died at Viareggio Jan. 25, 1908.

OULU, a seaport of Finland on the Gulf of Bothnia in 65° N., 25° 29' E., linked by rail to Helsinki. Pop. (1925), 22,560. It is the chief town of a forested department of the same name. The accommodation in the harbour depends on the wind. The exports are timber, tar, pitch, fish, butter and leather and the imports colonial produce, coals, iron, hides and salt.

OUNCE. (1) A unit of weight, being the twelfth part of a pound troy, = 480 grains (through O.Fr. *unce*, modern *once*, from Lat. *uncia*, twelfth part, of weight, of a pound, of measure, of a foot, in which sense it gives the O.Eng. *ynce*, inch); in avoirdupois = 437.5 grains, $\frac{1}{16}$ of a pound. The fluid ounce is a measure of capacity; in the United Kingdom it is equivalent to an avoirdupois ounce of distilled water at 62° F; in the United States of America it is the 128th part of the gallon, = $\frac{1}{4}$ gill, = 456.033 grains of distilled water at its maximum density (see WEIGHTS AND MEASURES). (2) A name properly applied to the *Felis uncia* or snow-leopard (*q.v.*). It appears to have been originally used of various species of lynx, and is still sometimes the name of the Canada lynx.

OUNDLE, a town of Northamptonshire, England, 30½ m. N.E. of Northampton on the L.M.S. railway. Pop. (1921) 2,654. The manor, with a market and tolls, was among the possessions confirmed in 972 by King Edgar to the abbot of Peterborough, to whom it still belonged in 1086. After the Dissolution the market was granted with the manor to John, earl of Bedford, and still belongs to the lord of the manor. It is situated on a hill overlooking the river Nene. The church of St. Peter has Early English, Decorated and Perpendicular porticos. Oundle School was founded under the will of Sir William Laxton, Lord Mayor of London (d. 1556).

OURO PRETO ("Black Gold"), a city of the State of Minas Geraes, Brazil, 336 m. by rail N. by W. of Rio de Janeiro, and about 300 m. W. of Victoria, Espírito Santo, on the eastern slope of the Serra de Espinhaço and within the drainage basin of the Rio Doce. Pop. (1890) 17,860; (1900) decreased to 5,400. The city is built upon the lower slope of the Serra do Ouro Preto, a spur of the Espinhaço, deeply cut by ravines and divided into a number of irregular hills, up which the narrow, crooked streets are built and upon which groups of houses form each a separate nucleus. From a mining settlement the city grew as the inequali-

ties of the site permitted. The rough streets are too steep and narrow for vehicles. The climate is sub-tropical and humid, though the elevation (3,700–3,800 ft.) gives a temperate climate in winter. The days are usually hot and the nights cold, the variations in temperature being a fruitful cause of bronchial and pulmonary diseases. Ouro Preto has several historic buildings, the more noteworthy are the old Government house (now occupied by the school of mines), the legislative chambers, municipal hall and gaol—all fronting on the Praça da Independência—the old Casa dos Contos (afterwards the public treasury), a theatre (the oldest in Brazil, restored in 1861–62) and a hospital. There are 15 churches in the city, all dating from more prosperous days. Ouro Preto is the seat of Brazil's leading school of mines.

The city dates from 1701, when a gold-mining settlement was established in its ravines by Antonio Dias of Taubaté. The circumstance that the gold turned black on exposure to the humid air (owing to the presence of silver) gave the name of Ouro Preto to the mountain spur and the settlement. In 1711 it became a city with the name of Villa Rica, a title justified by its size and wealth. At one period of its prosperity its population was estimated at 25,000 to 30,000. In 1720 Villa Rica became the capital of the newly created captaincy of Minas Geraes, and in 1823 the capital of the province of the same name under the empire of Don Pedro I. When the empire was overthrown in 1889 and Minas Geraes was reorganized as a republican state, it was decided to remove the capital to a more favourable site and Bello Horizonte was chosen, but Ouro Preto remained the capital until 1898, when the new town (also called Cidade de Minas) became the seat of government. (See MINAS GERAES.)

OUSE, the name of several English rivers, an ancient word of disputed etymology.

(1) The Great Ouse rises in Northamptonshire, in the hills between Banbury and Brackley, and falls about 500 ft. in 160 m. to its mouth in the Wash (North sea). It flows east past Brackley and Buckingham and then turns north-east to Stony Stratford, receiving the Tove and the Ouzel at Newport Pagnell. It then follows a sinuous course past Olney to Sharnbrook, where it turns abruptly south to Bedford, then to flow north-east past St. Neot's to Godmanchester and Huntingdon, when the river trends easterly to St. Ives. Hitherto the Ouse has watered an open valley, but below St. Ives the river debouches suddenly upon the Fens; its fall from this point to the mouth, a distance of 55 m. by the old course, is little more than 20 feet. From Earith to Denver the waters of the Ouse flow almost wholly in two straight artificial channels called the Bedford Rivers, the old course being called the Old West River. This is joined by the Cam 4 m. above Ely. North of this point the river receives the Lark, the Little Ouse, or Brandon river, and the Wissey. Below Denver sluice, 16 m. from the mouth, the Ouse is tidal. It flows past King's Lynn, and enters the Wash near the south-east corner. The river is locked up to Bedford, a distance of 74½ m. by the direct course. A recent attempt to clear the river in order to make it more navigable and less liable to floods has been made, but has met with opposition from the farmers of the upper reaches.

(2) A river of Yorkshire. The river Ure, rising in the Pennines, and traversing Wensleydale, unites with the river Swale to form the Ouse near Boroughbridge, in the central plain of Yorkshire. The course of the Swale, which rises on the eastern flank of the Pennines, is mostly through this plain, and that of the Ouse is wholly so. It flows south-east passing York, Selby and Goole to the Trent, to form with that river the Humber estuary (*q.v.*). The course of the Ouse, thus defined, is 61 miles. The Swale and Ure are each about 60 m. long. Goole is a growing port, and the river bears much traffic up to York, smaller traffic up to Boroughbridge, from which the Ure Navigation (partly a canal) continues up to Ripon. The Swale is not navigable. The chief tributaries are the Nidd, the Wharfe, the Don and the Aire on the right, and the Derwent on the left. All traverse beautiful valleys, and the Aire and the Don, with canals, afford communications between south Yorkshire and the Humber ports. The Derwent is also navigable. It is tidal up to Naburn, 37 m. from the junction with the Trent.

(3) A river of Sussex, rising in the Forest Ridges between Horsham and Cuckfield, and draining part of the Weald. Like other streams here, it breaches the South Downs, and reaches the English Channel at Newhaven after a course of 30 miles. The Ouse is navigable for small vessels to Lewes, and Newhaven is an important harbour.

OUSEL or **OUZEL**, the ancient name of the blackbird, but now applied, in combination, to the dipper (*q.v.*) or water-ousel, and to the ring-ousel (*Turdus torquatus*). This latter is a relative of the blackbird, from which it is distinguished by its white gorget and dark bill. It is a summer visitor to the hilly districts of the British Isles and Europe generally.

OUSELEY, SIR FREDERICK ARTHUR GORE (1825-1889), English composer, son of Sir Gore Ouseley, ambassador to Persia, was born on Aug. 12, 1825, in London. He was a precocious child, and composed an opera at the age of eight years. Educated at Christ Church, Oxford, he took orders, and held two London curacies. In 1855 he succeeded Sir Henry Bishop as professor of music in the University of Oxford, was ordained priest and appointed precentor of Hereford. In 1856 he became vicar of St. Michael's, Tenbury, and warden of St. Michael's College. His works include the oratorio *Polycarp*, written for his Mus. Doc. degree (1854), a second oratorio, *Hagar* (Hereford, 1873), a great number of services and anthems, chamber music, songs, etc., and theoretical works. He died on April 6, 1889.

His uncle, **SIR WILLIAM OUSELEY** (1769-1842), British orientalist, wrote *Travels in Various Countries in the East, especially Persia, in 1810, 1811 and 1812* (3 vol., 1819-23).

OUSTER, a legal term signifying dispossession, especially the wrong or injury suffered by a person dispossessed of freeholds or chattels real. The wrong-doer by getting into occupation forces the real owner to take legal steps to regain his rights. Ouster of the freehold may be effected by *abatement*, i.e., by entry on the death of the person seized before the entry of the heir, or devisee; by *intrusion*, entry after the death of the tenant for life before the entry of the reversioner or remainderman; by *disseisin*, the forcible or fraudulent expulsion of the occupier or person seized of the property. Ouster of chattels real is effected by *disseisin*, the turning out by force or fraud of the legal proprietor before his estate is determined. Ouster by force, or forcible entry, was made a criminal offence by a statute of 1381.

OUTLAWRY, the process of putting a person out of the protection of the law; a punishment for contemptuously refusing to appear when called in court, or evading justice by disappearing. It was of very early existence in England, and was the punishment of those who could not pay the *were* or blood-money to the relatives of the deceased. By the Saxon law, an outlaw lost his *libera lex* and had no protection from the frank-pledge in the decenary in which he was sworn. He was, too, a *friendless man*, because he forfeited his friends; for if any of them rendered him any assistance, they became liable to the same punishment. An outlaw was *civilitur mortuus*. He could not sue in any court, nor had he any legal rights which could be enforced, but he was personally liable upon all causes of action. It was finally abolished in civil proceedings in 1879, while in criminal proceedings it has practically become obsolete, being unnecessary through the general adoption of extradition treaties.

In Scotland outlawry or fugitation may on the motion of the Crown be pronounced by the supreme criminal court when the panel has absconded and fails to appear to plead to the indictment on the day of trial.

OUTLAWRY OF WAR means, in the popular concept, the placing of war as a means of national policy outside the pale of law. War has been regarded in certain instances as the last resort of a state to obtain what it believes to be its lawful object. Certain writers have pointed out that, while an individual is prohibited by domestic law enforced by a police power from the use of force in his dealings with other individuals, a state under international law has heretofore been free to use war as a means of attaining its national objectives, excepting as limited in specific instances by its treaty engagements.

It was during the Thirty Years' War (1618-48) that Grotius published (1625) his monumental treatise *De Jure Belli ac Pacis*, in the foreword to which he said:

"Throughout the Christian world I observed a lack of restraint in relation to war, such as even barbarous races should be ashamed of; I observed that men rush to arms for slight causes, or no cause at all, and that when arms have once been taken up there is no longer any respect for law, divine or human; it is as if, in accordance with a general decree, frenzy had openly been let loose for the committing of all crimes."

Thus commenced the growth in International Law of a set of rules governing the conduct of wars.

Since then the development of International Law, the multiplication of arbitration and conciliation treaties and the provisions of the Covenant of the League of Nations and the Locarno treaties has been to effect a certain humanization of the practice of war and to lessen the number and kind of circumstances in which war could legitimately be resorted to. Up to 1928, however, war remained a recognized and respectable instrument of national policy. The advocates of the outlawry of war theory feel that so long as the institution of war remains respectable and enjoys a recognized place in the field of international relations, the root of the evil remains. Their solution of the problem is, in part, to oust war from its privileged position by denying it a legal status and placing a State indulging in hostilities against another State beyond the pale, that is to say, literally to outlaw it.

Among the principal advocates of the outlawry of war movement in the United States have been Judge Florence E. Allen, Senator William E. Borah, Dr. Nicholas Murray Butler, Professor John Dewey, Reverend John Haynes Holmes, Mr. S. O. Levinson, Dr. C. C. Morrison, Reverend M. V. Oggel, and the American Committee for the Outlawry of War.

From an article on this subject appearing in the *New Republic*, March 9, 1918, the following quotation from a suggested plan is given:

"As long as international law continues to legalize war all nations are moral accessories before the fact to 'collective murder.' Conversely, outlaw war and militarism is out of a job. War . . . would be branded as a crime and the force of the world would be organized to deal with the criminal . . . two things are indispensable to the reorganization of the world: The specific outlawing of war by the code of nations and the ability by force to execute the decrees of the international tribunal."

Senator William E. Borah in February 1923 introduced a resolution into the U.S. Senate reading in part as follows:—

"Resolved, That it is the view of the Senate of the United States that war between nations should be outlawed as an institution or means for the settlement of international controversies by making it a public crime under the law of nations. . . . That a code of international law of peace based upon equality and justice between nations, amplified and expanded and adapted and brought down to date should be created and adopted" also "That a judicial substitute for war should be created (or, if existing in part, adapted and adjusted) in the form or nature of an international court, modeled on our Federal Supreme Court in its jurisdiction over controversies between our sovereign States; such court to possess affirmative jurisdiction to hear and decide all purely international controversies, as defined by the code or arising under treaties, and to have the same power for the enforcement of its decrees as our Federal Supreme Court, namely, the respect of all enlightened nations for judgments resting upon open and fair investigations and impartial decisions, and the compelling power of enlightened public opinion!"

The fundamental difference between these two proposals is at once apparent. The first proposal postulated "an ability by force to execute the decrees of the international tribunal" while Senator Borah rejected the idea of a supernatural authority with power to use force in the execution of the decrees of a world court. The wisdom of Senator Borah's position on this point apparently commended itself to the American Committee for the Outlawry of War, for the draft treaty to outlaw war which the latter subsequently suggested as a basis for discussion provided that the signatory States would:—

" . . . condemn and abandon forever the use of war as an instrument for the settlement of international disputes and for the enforcement of decisions and awards of international tribunals, and hereby outlaw

¹Senate Resolution 441, 67th Congress, 4th Session. Reintroduced Dec. 20, 1923, as Senate Resolution 101, 68th Congress, 1st Session.

the immemorial institution of war by making its use a public crime as the fundamental law of nations."

would

"... agree to take immediate action for the equipment of an international court of justice with a code of the laws of peace... jurisdiction over all purely international disputes as defined and enumerated in the code or arising under treaties, with power to summon in a defendant nation at the petition of a complaining nation and to hear and decide the matters in controversy."

and would

"agree to abide by and in full good faith to carry out the decisions of such international tribunal! . . ."

thus dropping the idea of other than moral sanctions for the enforcement of the outlawry of war plan.

While the outlawry of war programme as outlined above has not been realized as such, the year 1928 saw more practical progress towards the elimination of war as a factor in international relations than had ever before been made.

It is probably true that as originally contemplated the outlawry of war programme was incapable of accomplishment; it involved a greater surrender of sovereignty than States are prepared to make.

But these points are not material at this writing. What is significant is that the outlawry of war movement, including, of course, that phase of it represented by the work of Professors Shotwell and Chamberlain of Columbia university (see *New York Times*, May 31, 1927), has paved the way for one of the most extraordinary manifestations of the universal desire for peace that has ever been witnessed in the history of the world. On Aug. 27, 1928, there was signed in Paris a multilateral treaty for the renunciation of war which may well mark the beginning of a new era in international relations. That treaty was signed after only eight months of active negotiations, by representatives of 15 world powers. At the time of writing (April 1929) 14 of the 15 original signatory states, or all except Japan, have adhered to the treaty. Besides these 25 states have adhered, 15 have taken steps towards their adherence and 7 have signified their intention to adhere thereto, thus promising to bring the peoples of at least 62 countries of the world within the scope of its beneficent provisions, a degree of universality without parallel in the history of peace. Moreover, the Pact was ratified by the United States, without condition, understanding or reservation, on February 17, 1929.

The statesman primarily responsible for the idea of bringing about the renunciation of war by means of an *ad hoc* treaty was Aristide Briand, French minister of Foreign Affairs. On June 20, 1927, Briand proposed to the United States the conclusion of a bilateral treaty the significant articles of which read as follows:—

ARTICLE I.

"The high contracting powers solemnly declare, in the name of the French people and the people of the United States of America, that they condemn recourse to war and renounce it respectively as an instrument of their national policy towards each other.

ARTICLE II.

"The settlement or the solution of all disputes or conflicts, of whatever nature or of whatever origin they may be, which may arise between France and the United States of America shall never be sought by either side except by pacific means."

In replying to this proposal on Dec. 28, 1927, the United States suggested that instead of contenting themselves with a bilateral declaration of the nature suggested by Briand, the two Governments might make a more signal contribution to world peace by joining in an effort to obtain the concurrence therein of a large group of powers with a view to perfecting among all the nations of the world a mechanism for peace heretofore suggested only as between France and the United States.

The details of the 1928 negotiations which culminated in the signature of the multilateral anti-war treaty at Paris on Aug. 27, 1928 cannot be discussed at length in this article. The relevant diplomatic correspondence has been published in the press and reprinted in pamphlet form (*The General Pact for the Renunciation of War*, etc., Washington, Government Printing Office,

¹*The Outlawry of War* by C. C. Morrison, p. 62 (Chicago, 1927).

1928), and is readily available for the student. The major points of the negotiations may, however, be outlined as follows:—

On April 13, 1928, the correspondence previously exchanged between France and the United States in connection with the treaty was submitted for the consideration of the British, German, Italian and Japanese Governments, together with a draft form of anti-war treaty representing the form of treaty which the United States was prepared to sign. A week later France circulated among the interested powers an alternative form of treaty, and commencing with the German note of April 27, 1928, the powers thus addressed rapidly communicated to France and the United States their views on this important project. Favourable replies having been received from all four Governments, the United States, on June 23, 1928, addressed a new note to the British, French, German, Italian and Japanese Governments transmitting a new draft treaty text slightly modified to meet certain points raised in the course of the negotiations. Identical communications were also sent to the five British Dominions and India, and to Belgium, Czechoslovakia and Poland. This procedure met the point raised by the British Government that the new treaty from its very nature was one in which that Government could not undertake to participate otherwise than jointly and simultaneously with the Dominion Governments and the Government of India, and by providing for the inclusion of all parties to the Treaties of Locarno it settled the question whether there was any inconsistency between the new treaty and the Locarno Treaty, thus meeting the observations of the French Government as to the necessity of extending the number of original signatories.

This note transmitting the final draft of the treaty contained the following statements which were also made in an address delivered before the American Society of International Law on April 28, 1928, by the American Secretary of State, and which referred to the six major considerations emphasized by France in its draft of April 20 and prior diplomatic correspondence with the United States:

"(1) *Self-defense*. There is nothing in the American draft of an anti-war treaty which restricts or impairs in any way the right of self-defense. That right is inherent in every sovereign state and is implicit in every treaty. Every nation is free at all times and regardless of treaty provisions to defend its territory from attack or invasion and it alone is competent to decide whether circumstances require recourse to war in self-defense. If it has a good case, the world will applaud and not condemn its action. Express recognition by treaty of this inalienable right, however, gives rise to the same difficulty encountered in any effort to define aggression. It is the identical question approached from the other side. Inasmuch as no treaty provision can add to the natural right of self-defense, it is not in the interest of peace that a treaty should stipulate a juristic conception of self-defense since it is far too easy for the unscrupulous to mold events to accord with an agreed definition.

"(2) *The League Covenant*. The Covenant imposes no affirmative primary obligation to go to war. The obligation, if any, is secondary and attaches only when deliberately accepted by a state. Article ten of the Covenant has, for example, been interpreted by a resolution submitted to the Fourth Assembly but not formally adopted owing to one adverse vote to mean that 'it is for the constitutional authorities of each member to decide, in reference to the obligation of preserving the independence and the integrity of the territory of members, in what degree the member is bound to assure the execution of this obligation by employment of its military forces.' There is, in my opinion, no necessary inconsistency between the Covenant and the idea of an unqualified renunciation of war. The Covenant can, it is true, be construed as authorizing war in certain circumstances but it is an authorization and not a positive requirement.

"(3) *The Treaties of Locarno*. If the parties to the treaties of Locarno are under any positive obligation to go to war, such obligation certainly would not attach until one of the parties has resorted to war in violation of its solemn pledges thereunder. It is therefore obvious that if all the parties to the Locarno treaties become parties to the multilateral anti-war treaty proposed by the United States, there would be a double assurance that the Locarno treaties would not be violated by recourse to arms. In such event it would follow that resort to war by any state in violation of the Locarno treaties would also be a breach of the multilateral anti-war treaty and the other parties to the anti-war treaty would thus as a matter of law be automatically released from their obligations thereunder and free to fulfill their Locarno commitments. The United States is entirely willing that all parties to the Locarno treaties should become parties to its proposed anti-war treaty either through signature in the first instance or by immediate accession to the treaty as soon as it comes into force in the manner provided in Article III. of the

American draft, and it will offer no objection when and if such a suggestion is made.

"(4) *Treaties of Neutrality.* The United States is not informed as to the precise treaties which France has in mind and cannot therefore discuss their provisions. It is not unreasonable to suppose, however, that the relations between France and the states whose neutrality she has guaranteed are sufficiently close and intimate to make it possible for France to persuade such states to adhere reasonably to the anti-war treaty proposed by the United States. If this were done no party to the anti-war treaty could attack the neutralized states without violating the treaty and thereby automatically freeing France and the other Powers in respect of the treaty-breaking state from the obligations of the anti-war treaty. If the neutralized states were attacked by a state not a party to the anti-war treaty, the latter treaty would of course have no bearing and France would be as free to act under the treaties guaranteeing neutrality as if she were not a party to the anti-war treaty. It is difficult to perceive, therefore, how treaties guaranteeing neutrality can be regarded as necessarily preventing the conclusion by France or any other power of a multilateral treaty for the renunciation of war.

"(5) *Relations with a 'Treaty-breaking' State.* As I have already pointed out there can be no question as a matter of law that violation of a multilateral anti-war treaty through resort to war by one party thereto would automatically release the other parties from their obligations to the treaty-breaking state. Any express recognition of this principle of law is wholly unnecessary.

"(6) *Universality.* From the beginning it has been the hope of the United States that its proposed multilateral anti-war treaty should be world-wide in its application, and appropriate provision therefore was made in the draft submitted to the other Governments on April 13. From a practical standpoint it is clearly preferable, however, not to postpone the coming into force of an anti-war treaty until all the nations of the world can agree upon the text of such a treaty and cause it to be ratified. For one reason or another a state so situated as to be no menace to the peace of the world might obstruct agreement or delay ratification in such manner as to render abortive the efforts of all the other Powers. It is highly improbable, moreover, that a form of treaty acceptable to the British, French, German, Italian and Japanese Governments as well as to the United States would not be equally acceptable to most, if not all, of the other Powers of the world. Even were this not the case, however, the coming into force among the above-named six Powers of an effective anti-war treaty and their observance thereof would be a practical guaranty against a second world war. This in itself would be a tremendous service to humanity and the United States is not willing to jeopardize the practical success of the proposal which it has made by conditioning the coming into force of the treaty upon prior universal or almost universal acceptance."

The draft multilateral anti-war treaty proposed by the United States on June 23, 1928, was promptly accepted by the other 14 Governments thus addressed, and the definitive instrument was, as stated above, signed at Paris on Aug. 27, 1928. As soon as it had been signed all the other Powers of the world were formally notified of the fact and furnished with a copy of the treaty text. They were also informed that the United States would be happy to receive from them at any time appropriate notices of adherence to the treaty from those Governments wishing to contribute to the success of the new movement for world peace by participating therein. The English text of the treaty, the first two articles of which it will be observed are practically identical with the corresponding articles of the bilateral treaty originally proposed by M. Briand, is as follows:—

"THE PRESIDENT OF THE GERMAN REICH, THE PRESIDENT OF THE UNITED STATES OF AMERICA, HIS MAJESTY THE KING OF THE BELGIANS, THE PRESIDENT OF THE FRENCH REPUBLIC, HIS MAJESTY THE KING OF GREAT BRITAIN, IRELAND AND THE BRITISH DOMINIONS BEYOND THE SEAS, EMPEROR OF INDIA, HIS MAJESTY THE KING OF ITALY, HIS MAJESTY THE EMPEROR OF JAPAN, THE PRESIDENT OF THE REPUBLIC OF POLAND, THE PRESIDENT OF THE CZECHOSLOVAK REPUBLIC,

"Deeply sensible of their solemn duty to promote the welfare of mankind;

"Persuaded that the time has come when a frank renunciation of war as an instrument of national policy should be made to the end that the peaceful and friendly relations now existing between their peoples may be perpetuated;

"Convinced that all changes in their relations with one another should be sought only by pacific means and be the result of a peaceful and orderly process, and that any signatory Power which shall hereafter seek to promote its national interests by resort to war should be denied the benefits furnished by this Treaty;

"Hopeful that, encouraged by their example, all the other nations of the world will join in this humane endeavor and by adhering to the present Treaty as soon as it comes into force bring their peoples within

the scope of its beneficent provisions, thus uniting the civilized nations of the world in a common renunciation of war as an instrument of their national policy;

"Have decided to conclude a Treaty and for that purpose have appointed as their respective Plenipotentiaries:

THE PRESIDENT OF THE GERMAN REICH:

Dr. Gustav Stresemann, Minister for Foreign Affairs;

THE PRESIDENT OF THE UNITED STATES OF AMERICA:

The Honorable Frank B. Kellogg, Secretary of State;

HIS MAJESTY THE KING OF THE BELGIANS:

Mr. Paul Hymans, Minister for Foreign Affairs, Minister of State;

THE PRESIDENT OF THE FRENCH REPUBLIC:

Mr. Aristide Briand, Minister for Foreign Affairs;

HIS MAJESTY THE KING OF GREAT BRITAIN, IRELAND AND THE BRITISH DOMINIONS BEYOND THE SEAS, EMPEROR OF INDIA:

For Great Britain and Northern Ireland and all parts of the British Empire which are not separate Members of the League of Nations: The Right Honourable Lord Cushendun, Chancellor of the Duchy of Lancaster, Acting Secretary of State for Foreign Affairs;

For the Dominion of Canada:

The Right Honourable William Lyon Mackenzie King, Prime Minister and Minister for External Affairs;

For the Commonwealth of Australia:

The Honourable Alexander John McLachlan, Member of the Executive Federal Council;

For the Dominion of New Zealand:

The Honourable Sir Christopher James Parr, High Commissioner for New Zealand in Great Britain;

For the Union of South Africa:

The Honourable Jacobus Stephanus Smit, High Commissioner for the Union of South Africa in Great Britain;

For the Irish Free State:

Mr. William Thomas Cosgrave, President of the Executive Council;

For India:

The Right Honourable Lord Cushendun, Chancellor of the Duchy of Lancaster, Acting Secretary of State for Foreign Affairs;

HIS MAJESTY THE KING OF ITALY:

Count Gaetano Manzoni, his Ambassador Extraordinary and Plenipotentiary at Paris.

HIS MAJESTY THE EMPEROR OF JAPAN:

Count Uchida, Privy Councillor;

THE PRESIDENT OF THE REPUBLIC OF POLAND:

Mr. A. Zaleski, Minister for Foreign Affairs;

THE PRESIDENT OF THE CZECHOSLOVAK REPUBLIC:

Dr. Eduard Benes, Minister for Foreign Affairs; "who, having communicated to one another their full powers found in good and due form have agreed upon the following articles:

ARTICLE I.

"The High Contracting Parties solemnly declare in the names of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national policy in their relations with one another.

ARTICLE II.

"The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.

ARTICLE III.

"The present Treaty shall be ratified by the High Contracting Parties named in the Preamble in accordance with their respective constitutional requirements, and shall take effect as between them as soon as all their several instruments of ratification shall have been deposited at Washington.

"This Treaty shall, when it has come into effect as prescribed in the preceding paragraph, remain open as long as may be necessary for adherence by all the other Powers of the world. Every instrument evidencing the adherence of a Power shall be deposited at Washington and the Treaty shall immediately upon such deposit become effective as between the Power thus adhering and the other Powers parties hereto.

"It shall be the duty of the Government of the United States to furnish each Government named in the Preamble and every Government subsequently adhering to this Treaty with a certified copy of the Treaty and of every instrument of ratification or adherence. It shall also be the duty of the Government of the United States telegraphically to notify such Governments immediately upon the deposit with it of each instrument of ratification or adherence.

"IN FAITH WHEREOF the respective Plenipotentiaries have signed this Treaty in the French and English languages, both texts having equal force, and hereunto affix their seals.

"DONE at Paris, the twenty-seventh day of August in the year one thousand nine hundred and twenty-eight."

 [SEAL] DR. EDUARD BENES

Much of the significance of the General Pact is to be found in its simplicity of form, which is readily understandable to the peoples of the world who desire peace and who dread war. Today these peoples are becoming increasingly articulate, and governments are growing more and more responsive to popular opinion.

In the future political leaders in any participating country who advocate a war-like policy must face a determined opposition on the part of large sections of their people, an opposition which will crystallize about this solemn pledge of their governments. Belligerent action to advance national policy on the part of any government will meet with opprobrium not only abroad but also at home.

Perhaps the most important aspect of the Pact is this moral force which may be expected to grow with the passage of time. It is not too much to hope that through their adoption of and adherence to the principles embodied in the Pact, the nations of the world are entering upon an era of better understanding in their dealings with one another. (F. B. K.; W. R. CA.)

OUTPUT: see PRODUCTION.

OUTRAM, SIR JAMES (1803–1863), English general, and one of the heroes of the Indian Mutiny, was the son of Benjamin Outram of Butterley Hall, Derbyshire, civil engineer, and was born on Jan. 29, 1803. His father died in 1805, and his mother, a daughter of Dr. James Anderson, the Scottish writer on agriculture, removed in 1810 to Aberdeenshire. From Udnay school the boy went in 1818 to the Marischal College, Aberdeen; and in 1819 an Indian cadetship was given him. Soon after his arrival at Bombay his remarkable energy attracted notice, and in July 1820 he became acting adjutant to the first battalion of the 12th regiment on its embodiment at Poona. In 1825 he was sent to Khandesh, where he trained a light infantry corps, formed of the wild robber Bhils, gaining over them a marvellous personal influence, and employing them with great success in checking outrages and plunder. Their loyalty to him had its principal source in their boundless admiration of his hunting achievements. For some time he was political agent in the Mahi Kantha district of Gujarat. In the first Afghan War in 1838 he was extra aide-de-camp on the staff of Sir John Keane. After conducting various raids against Afghan tribes, he was in 1839 promoted major, and appointed political agent in Lower Sind, and later in Upper Sind. He opposed the policy of his superior, Sir Charles Napier, which led to the annexation of Sind. When war broke out he heroically defended the residency at Hyderabad against 8,000 Baluchis: and it was Napier who then described him as "the Bayard of India."

On his return from a short visit to England in 1843, he was, with the rank of brevet lieutenant-colonel, appointed to a command in the Mahratta country, and in 1847 he was transferred from Satara to Baroda, where he incurred the resentment of the Bombay government by his fearless exposure of corruption. In 1854 he was appointed resident at Lucknow, in which capacity two years later he carried out the annexation of Oudh and became the first chief commissioner of that province. Appointed in 1857, with the rank of lieutenant-general, to command an expedition against Persia, he defeated the enemy with great slaughter at Khushab, and brought the campaign to a rapid conclusion.

From Persia he was summoned in June to India, with the brief explanation—"We want all our best men here." It was said of him at this time that "a fox is a fool and a lion a coward by the side of Sir J. Outram." Immediately on his arrival in Calcutta he was appointed to command the two divisions of the Bengal

army occupying the country from Calcutta to Cawnpore; and to the military control was also joined the commissionership of Oudh. Already the mutiny had assumed such proportions as to compel Havelock to fall back on Cawnpore, which he only held with difficulty, although a speedy advance was necessary to save the garrison at Lucknow. On arriving at Cawnpore with reinforcements, Outram, "in admiration of the brilliant deeds of General Havelock," conceded to him the glory of relieving Lucknow, and, waiving his rank, tendered his services to him as a volunteer. During the advance he commanded a troop of volunteer cavalry, and performed exploits of great brilliancy at Mangalwar, and in the attack at the Alambagh; and in the final conflict he led the way, charging through a very tempest of fire. The volunteer cavalry unanimously voted him the Victoria Cross, but he refused the choice on the ground that he was ineligible as the general under whom they served.

Resuming supreme command, he then held the town till the arrival of Sir Colin Campbell, after which he conducted the evacuation of the residency so as completely to deceive the enemy. In the second capture of Lucknow, on the commander-in-chief's return, Outram was entrusted with the attack on the side of the Gumti, and afterwards, having recrossed the river, he advanced "through the Chattar Manzil to take the residency," thus, in the words of Sir Colin Campbell, "putting the finishing stroke on the enemy." After the capture of Lucknow he was gazetted lieutenant-general. In February 1858 he received the special thanks of both houses of parliament, and in the same year the dignity of baronet with an annuity of £1,000. Shattered in health he returned finally to England in 1860. A movement to honour him further resulted in the presentation of a public testimonial and the erection of statues in London and Calcutta. He died on March 11, 1863.

See Sir F. J. Goldsmid, *James Outram, a Biography* (2 vols., 1880), and L. J. Trotter, *The Bayard of India* (1903).

OUT RELIEF: see POOR LAW.

OUTWORKERS: see HOMEWORKER.

OVAL: see CURVES, SPECIAL.

OVAR, a town of Portugal, at the northern extremity of the Lagoon of Aveiro (q.v.); 21 m. south of Oporto by the Lisbon-Oporto railway. Pop. (1911) 11,416. Ovar is the centre of important fisheries. Millet, wheat and vegetables—especially onions—are the chief products of the low-lying and unhealthy region in which Ovar is situated.

OVARIOTOMY or **OÖPHORECTOMY**, the operation for removal of one or of both of the female ovaries (for anatomy see REPRODUCTIVE SYSTEM). The progress of modern surgery has been conspicuously successful in this department. From 1701, the date when Houston of Carlisle, Lanarkshire, carried out his successful partial extirpation, progress was arrested for some time, although the Hunters (1780) indicated the practicability of the operation. In 1809 Ephraim M'Dowell of Kentucky, inspired by the lectures of John Bell, his teacher in Edinburgh, performed ovariectomy, and, continuing to operate with success, established the possibility of surgical interference. He was followed by others in the United States. The cases brought forward by Lizars of Edinburgh were not sufficiently encouraging; the operation met with great opposition; and it was not until Charles Clay, Spencer Wells, Baker Brown and Thomas Keith began work that the procedure was placed on a firm basis and was regarded as justifiable. Improved methods were introduced, and surgeons vied with one another in trying to obtain good results. Eventually, by the introduction of the antiseptic, and later, the aseptic, system of treating wounds, this operation, formerly regarded as one of the most grave and anxious in the domain of surgery, came to be attended with a lower mortality than any other of a major character.

OVEN-BIRD, the name given to birds of the genus *Furnarius* of the American family of wood-hewers (*Dendrocolaptidae*), on account of the structure of the nest. They are small thrush-like birds confined to South America.

The name oven-bird is commonly given in the United States to the golden crowned water-thrush (*Seiurus aurocapillus*), one of the wood warblers, which builds an oven-shaped nest on the

ground.

See C. Darwin, *Voyage of the Beagle* (1845); W. H. Hudson, *A Naturalist in La Plata* (1892).

OVERBECK, JOHANN FRIEDRICH (1789–1869), German painter, the reviver of "Christian art" in the 19th century, was born in Lübeck on the 4th of July 1789. His ancestors for three generations had been Protestant pastors; his father was doctor of laws, poet, mystic pietist and burgomaster of Lübeck. In 1806, after finishing his course at the gymnasium, Overbeck left Lübeck and entered the Academy of Vienna, then under the direction of Füger, a painter of the pseudo-classic school of David. Not finding the help on which he had counted, Overbeck turned to the early and pre-Raphaelite masters of Italy for inspiration. At the end of four years he was expelled. He thereupon went to live in Rome, where he gathered about him a group of friends which included Cornelius, Veit and Wilhelm Schadow.

The little group made their home in the old Franciscan monastery of San Isidoro on the Pincian, and in 1813 Overbeck joined the Roman Catholic church. The group became known as the "Nazaries," "pre-Raphaelites," or "German-Roman artists." They believed in hard, honest work and holy living, eschewed the antique as pagan and the Renaissance as false, and aimed at bringing about a revival on the basis of nature and the serious art of Perugino, Pinturicchio, Francia and the young Raphael. Their painting was characterized by nobility of conception, precision—not to say hardness—of outline, and scholarly composition. Light, shade and colour they admitted only in the interests of clearness and correctness, and not as softening elements. Overbeck, with his saintly character and lofty ideals, was the natural leader and mentor of the party. They would have fared badly however from a practical point of view but for the timely help of Niebuhr, Bunsen, Friedrich Schlegel, and the Prussian consul Bartholdi, who commissioned the four friends to decorate his villa with frescoes on the story of Joseph and his Brethren. This led to another commission from Prince Massimo to paint the ceilings and walls of his pavilion. Overbeck's failing health did not allow him to finish his share of this undertaking and he delegated it to Joseph Führich. His last work was a "Vision of St. Francis" with life-size figures for the walls of Sta. Maria degli Angeli near Assisi. All his paintings bear the mark of religious fervour and careful preparation and have an element of religious propaganda. The handling is dry and severe and the colour restrained. His faith found its clearest expression in his religious cartoons, the *Gospels* (1852), *Via Crucis* (1857) and the *Seven Sacraments* (1861). He died in Rome on Nov. 12, 1869, and was buried in San Bernardo.

Overbeck's principal oil and easel paintings are: "Christ's Entry into Jerusalem" (1824), in the Marien Kirche, Lübeck; "Christ's Agony in the Garden" (1835), in the great hospital, Hamburg; "Lo Sposalizio" (1836), Raczynski gallery, Berlin; the "Triumph of Religion in the Arts" (1840), in the Stadel Institut, Frankfurt; "Pietà" (1846), in the Marien Kirche, Lübeck; the "Incredulity of St. Thomas" (1851), in the possession of Mr. Beresford Hope, London; the "Assumption of the Madonna" (1855), in Cologne Cathedral; "Christ delivered from the Jews" (1858), tempera, on a ceiling in the Quirinal Palace—a commission from Pius IX., and a direct attack on the Italian temporal government, therefore later covered by a canvas.

There are biographies by J. Beavington Atkinson (1882) and Howitt (1886).

OVERBURY, SIR THOMAS (1581–1613), English poet and essayist, and the victim of one of the most sensational crimes in English history, was the son of Nicholas Overbury, of Bourton-on-the-Hill, and was born in 1581 at Compton Scorpion, near Ilmington, in Warwickshire. In the autumn of 1595 he became a gentleman commoner of Queen's college, Oxford, took his degree in 1598 and came to London to study in the Middle Temple.

About the year 1601, being in Edinburgh on a holiday, he met Robert Carr, then an obscure page to the earl of Dunbar; and the two youths came up to London together. When Carr attracted the attention of James I., in 1606, by breaking his leg in the tilt-yard, Overbury had for some time been servitor-in-ordinary to the king. He was knighted in 1608, and in 1609 travelled in France and the Low Countries. When Carr was made Lord Rochester in 1610, the intimacy between the two was maintained.

But early in 1611 the Court became aware of the mutual

attraction between Rochester and the youthful countess of Essex. To this intrigue Overbury was from the first violently opposed, and expressed his opinion of the countess in unmeasured terms. But Rochester was now infatuated, and he repeated to the countess what Overbury had said. Overbury also wrote, and circulated widely in ms., the poem called *The Wife*, which was a picture of the virtues which a young man should demand in a woman. The situation now resolved itself into a duel for the person of Rochester between the mistress and the friend. Overbury was thrown into the Tower on April 22, 1613, on a charge of disrespect to the king. Lady Essex, however, was not satisfied with his imprisonment; she was determined that "he should return no more to this stage." She bribed the gaoler, aided by Mrs. Turner, the widow of a physician, and by an apothecary called Franklin, to poison Overbury with copper vitriol. His constitution long withstood the timid doses they gave him, and he lingered until Sept. 15, 1613, when more violent measures put an end to his existence.

Two months later Rochester, now earl of Somerset, married Lady Essex. More than a year passed before suspicion was aroused, and when it was, the king showed disinclination to bring the offenders to justice. In the trial which followed, the plot was discovered. The four accomplices were hanged; the countess of Somerset pleaded guilty but was spared, and Somerset himself was disgraced. Meanwhile, Overbury's poem, *The Wife*, was published in 1614, and ran through six editions within a year. Much that must be spurious was added to the gathering snowball of Overbury's *Works*, the most famous of which are the *Characters*.

See C. Whibley, *Essays in Biography* (1913); E. A. Parry, *The Overbury Mystery* (1925).

OVERHEAD CHARGES. Overhead charges, or on-costs, are an important factor in cost accounts. Prime cost represents outlays directly incurred for a particular purpose, and thus capable of being charged directly thereto. In addition, there are a number of indirect expenses which can only be dealt with by spreading them as equitably as may be over the total output.

Generally speaking, Overhead charges consist of such items as rent, rates, taxes, salaries, depreciation, interest, discounts, bad debts, etc., from which may be deducted corresponding credits. But in order to arrive at costs that are comparable with those of similar undertakings, various adjustments become necessary. Thus, where business premises are owned, the rental value should be included, although not actually expended. When time is of importance, interest on outlays should be included, even although no interest may actually have been paid away. *Per contra*, interest on borrowed monies (including debentures) is not properly a factor in costs at all; and interest received on investments, although undoubtedly a profit, does not tend to reduce operative costs and should therefore be excluded. Many authorities also consider that bad debts have nothing to do with the costs. Depreciation of equipment is generally a very important factor but the modern tendency is to charge a *machine rate* of so much per hour as part of the direct costs, such rate being designed to cover depreciation, repairs and interest on capital; when this is done, no charge in respect of depreciation falls to be included as Overhead.

Formerly, it was thought to be sufficiently accurate to add a given percentage to prime cost as a loading to cover Overhead. It is now recognized that no satisfactory results can be achieved in this way. A uniform percentage of loading for Overhead would result in the aggregate amount actually charged against output varying directly with the prime cost, and thus the amount so charged would almost certainly be appreciably more or appreciably less than the true figure, according to whether the output was above or below the average. Further, such a system of allocation assumes that the fair loading for Overhead varies directly with the prime cost, whereas the employment of expensive materials does not necessarily increase the Overhead burden, and in many cases economies in labour costs can only be achieved by increasing the Overhead burden, e.g., when machine work is substituted for hand work. Most production is complex, and consists of a series of successive processes or operations, each involving its own Overhead

charges. The modern practice is accordingly in the direction of analysing Overhead into departments, and distributing the burden of the departmental Overhead over the output of the department, usually *pro rata* according to the time occupied. In this way some approach to substantial accuracy may be reached, but no cut and dried formula will meet all cases.

Sometimes costs are appreciably increased by "spoils"—the curtailment of saleable output as a result of defective materials, machinery, workmanship or supervision. The only satisfactory way to deal with losses arising from spoils is to charge them as part of the Overhead burden of the department causing the spoil. If and when this is done the loss is thrown upon the right shoulders, and the effect commonly is to reduce very materially the loss arising from spoils by compelling managers to enquire more carefully into causes and possible remedies. (L. R. D.)

OVERSEA INVESTMENTS: see CAPITAL, EXPORT OF.

OVERSEA SETTLEMENT COMMITTEE. This important body was appointed in 1919 to assist and advise the British Government in their policy of undertaking closer responsibility than they had exercised in the past in connection with the movement of British subjects wishing to settle in other parts of the empire or to emigrate to foreign countries. The functions of the Emigrants' Information Office, which was established in 1886, were absorbed by the Oversea Settlement Committee. The president of the committee is the secretary of state for dominion affairs. It is a representative and non-political body, composed partly of official members representing various Government departments and partly of unofficial members. The staff of the committee forms a department (the overseas settlement department) of the Dominions Office.

The committee is entrusted with the administration of the Empire Settlement Act, 1922, which now forms the basis of the policy of State-aided empire settlement. The act was passed as the result of a conference with representatives of the self-governing dominions in 1921 and empowers the secretary of state "in association with the Government of any part of His Majesty's Dominions, or with public authorities or public or private organisations either in the United Kingdom or in any part of such Dominions, to formulate and co-operate in carrying out agreed schemes for affording joint assistance to suitable persons in the United Kingdom who intend to settle in any part of His Majesty's Oversea Dominions." Such schemes may take the form of development or land settlement schemes, or of schemes for facilitating settlement overseas by assistance with passages, training or in other ways. The contribution of the secretary of state may not exceed half the cost of any approved scheme and the maximum expenditure allowed under the act in any one year is £3,000,000.

OVERSTONE, SAMUEL JONES LOYD, 1ST BARON (1796-1883), English banker, the son of a Welsh dissenting minister, was born on Sept. 25, 1796. He became a partner in Jones, Loyd and Company (afterwards incorporated in the London and Westminster Bank), and by 1832 was recognized as one of the foremost authorities on banking. As Liberal member for Hythe, he sat in parliament from 1819 to 1826. He gave important evidence before various committees of the House of Commons, and was responsible for the main outlines of the Bank Charter Act (1844). In 1850 he was created Baron Overstone. He died in London on Nov. 17, 1883, leaving one daughter.

In 1858 a volume of *Tracts and other Publications on Metallic and Paper Currency*, by Lord Overstone, was edited by McCulloch.

OVERT ACT: see INTENT; TREASON.

OVERTURE (Fr. *ouverture*, opening), in music, a detachable instrumental introduction to a dramatic or choral composition. The notion of an overture had no existence until the 17th century. The *toccata* at the beginning of Monteverdi's *Orfeo* is a barbaric flourish of every procurable instrument, alternating with a melodious section entitled *ritornello*; and, in so far as this constitutes the first instrumental movement prefixed to an opera, it may be called an overture. As an art-form the overture began to exist in the works of J. B. Lully. His favourite, but not his only, form constitutes the typical French overture that became classical in the works of Bach and Handel. This French overture

consists of a slow introduction in a marked "dotted rhythm" (i.e., exaggerated iambic, if the first chord is disregarded), followed by a lively movement in fugato style. The slow introduction was always repeated, and sometimes the quick movement concluded by returning to the slow tempo and material, and was also repeated (see Bach's French Overture in the *Klavierübung*).

The operatic French overture was frequently followed by a series of dance tunes before the curtain rose. It thus naturally became used as the prelude to a suite (*q.v.*); and the term was then applied to the whole suite.

Bach was able to adapt the French overture to choruses, and even to the treatment of chorales. Thus the overture—movements of his fourth orchestral suite became the first chorus of the church cantata *Unser Mund sei voll Lachens*; the choruses of the cantatas *Preise Jerusalem den Herrn* and *Höchst erwünschtes Freudenfest* are in overture form; and, in the first of the two cantatas entitled *Nun komm, der Heiden Heiland*, Bach has adapted the overture form to the treatment of a chorale.

Gluck could find no use for the French overture. In the epoch-making preface to *Alceste* he laid down the rule that the overture should be the musical argument of the drama. And the perfunctory overture to *Orfeo* is the only exception to the rule that in his great operas the orchestral introduction is actually interrupted by the rise of the curtain. In *Iphigénie en Tauride* it is merely the calm before the storm.

The abolition of the French overture did not, however, lead at first to any widespread adoption of Gluck's loose-knit Italian texture. The next form of overture was that of a three-movement symphony (*q.v.*) in sonata style. In Mozart's early opera *La Finta Giardiniera* the curtain rises upon what should have been the third movement; and in all later works the overture is distinguished from symphonic music in style as well as form. It is a single quick movement (with or without a slow introduction) in sonata form, loose in texture, without repeats, and frequently without a development section. Sometimes, in place of development, there is a melodious episode in slow time; as in Mozart's overtures to *Die Entführung* and to the fragment *Lo Sposo deluso*, in both of which cases the curtain rises at a point which throws a dramatic light upon this feature. Mozart at first intended a similar episode in the overture to *Figaro*, but struck it out as soon as he had begun it.

In Beethoven's hands the overture became more and more unlike the symphony, but it no longer remained an inferior species; and the final version of the overture to *Leonora* is the most gigantic single orchestral movement ever based on the sonata style. Weber's overtures work out prominent themes in his operas in a loose but effective sonata form, and are effective concert-pieces besides serving Gluck's purposes admirably. On the overture to Mendelssohn's *Elijah*, see MENDELSSOHN.

Overtures to plays naturally tend to become detached from their surroundings; and hence arises the concert overture, led by Beethoven's mighty *Coriolan*, and second only to the symphony as an orchestral art-form. Its derivation implies that it is programme-music (*q.v.*), but the programme need not impair the form, whether the form be Berlioz's or Brahms's, and the programme particular or generalized. Among overtures with a generalized programme Mendelssohn's *Hebrides* overture is a perfect masterpiece; and so is Brahms's Tragic overture, one of the greatest orchestral movements since Beethoven. Brahms's *Academic Festival Overture* is a glorious working out of German student songs.

In modern opera the overture, *Prelude*, *Vorspiel*, or whatever else it may be called, is often nothing more definite than that portion of the music which takes place before the curtain rises. *Tannhäuser* is the last important opera in which the overture retains vestiges of a self-contained sonata form. Fifty years before Wagner's wonderful *Vorspiel* to *Lohengrin*, Méhul had achieved an equally complete departure from classical forms in his interesting overtures to *Ariodant* and *Uthal*, in the latter of which a voice is heard on the stage before the rise of the curtain. Even the most self-contained of Wagner's later preludes lose by transference to the concert-room. The glorious *Vorspiel* to *Die*

Meistersinger is nobler when its long *crescendo* leads to the rise of the curtain and the engaging of all the listener's sense of sight and language, than when it can merely lead to a final tonic chord. Wagner himself added a page to finish the *Vorspiel* to *Tristan*, and by the richness and subtlety of that page he reveals how unready for independent existence the original *Vorspiel* was. He also finished the *Parsifal* *Vorspiel* for concert use by the addition of a few extra bars, which will always sound perfunctory. The four dramas of the *Ring* begin with introductions designed to prepare the hearer immediately for the rise of the curtain; and these works can no more be said to have overtures than Verdi's *Falstaff* and Strauss's *Salome*, *Electra* and *Die Frau ohne Schatten*, in which the curtain rises at the first note of the music. (D. F. T.)

OVERYSSEL, a Netherlands province, bounded south and south-west by Gelderland, west by the Zuider Zee, north by Friesland and Drente, and east by the Prussian provinces of Hanover and Westphalia. The north-east Polder will be in contact with the north of the province which has a present area, including Schokland in the Zuider Zee, of 1,295 sq.m.; pop. (1926) 483,185, showing nearly 50% increase during the present century. It is an extremely picturesque and varied glaciated delta land consisting of a sandy flat relieved by hillocks, and covered with waste stretches of heath broken by patches of wood and high fen; but the coastal strip north of Zwartsluis consists largely of low-lying fertile pasture lands with cattle-rearing and associated butter and cheese manufactures, while along the shores mats and brushes are made. The river system is determined by two main glacial ridges, of which the eastern one, separating the Dinkel and Regge, extends from Enschede northwards into the German enclave; the larger one runs parallel with it and commencing at Lochem (Gelderland) extends into south Drente. In the south it separates the Yssel and Regge; its summit height (Lemeler Hill, 262 ft.) is near where it is breached by the Vecht. This river crosses the province from east to west and joins a part of the Yssel near Zwolle to form the Zwarte Water, which communicates with the Zuider Zee by the Zwolsche Diep; the main Yssel enters the Zuider Zee separately below Kampen. The streams are flanked by small-estate fertile grasslands from which agriculture and cattle-rearing have gradually spread over the sand-grounds; much of the area, however, is still waste though forest culture is practised locally, especially in the east, and pigs are largely bred. The deposits of the Yssel and the Dinkel streams contain iron ore, which is extracted and exported to Germany. Peat-digging and fen reclamation have long been practised and much high fen north of the Vecht in the neighbourhood of Dedemsvaart has been reclaimed though the main reclamation at present is taking place along and near to the eastern ridge. Large scale manufactures are not important in Overijssel but cotton-spinning, together with bleaching-works, came into some prominence in the 19th century in the south-east district of Twente. The inhabitants for long had practised weaving as a home craft but capitalist Baptist refugees who arrived in the 17th and 18th centuries organized it into an industry. Deventer has iron foundries and carpet-factories but is more famed for its honey cakes. The capital of the province is Zwolle (39,000 pop. in 1926) though Enschede (46,750) is the largest town. Deventer, Hengelo and Almelo each exceed 20,000 population and all four are situated in the south. Deventer is an old but busy little river port with a 16th century weigh-house of unusual design. Kampen, on the Yssel with its harbour long since silted up, has lost much of its importance of Hanseatic days but its 14th century churches and gateways are interesting. Its Statuis (16th and 18th century) is probably the finest town hall in the Netherlands. It shares a fishing trade with Vollenhove and Blokzijl, all on the Zuider Zee. Tucked away in the extreme north near the Drente border is the delightful little settlement of Giethoorn, literally a water village, each house possessing its own quay, drawbridge and punt. The railway system of the province is supplemented by tramlines and the roads are good but the waterways still carry much traffic.

OVID [PUBLIUS OVIDIUS NASO] (43 B.C.—A.D. 17), Roman poet, the last of the Augustan age, was born in 43 B.C., the last

year of the republic. Thus the only form of political life known to Ovid was that of the absolute rule of Augustus and his successor. He was born on March 20 at Sulmo, picturesquely situated among the mountains of the Abruzzi: its wealth of waters and natural beauties seem to have quickened in him that appreciative eye for the beauties of nature which is one of the chief characteristics of his poems. Ovid, whose father was of equestrian family, belonged by birth to the same social class as Tibullus and Propertius, that of old hereditary landowners; but he was more fortunate than they in the immunity which his native district enjoyed from the confiscations made by the triumvirs. He and his brother had been brought early to Rome for their education, where they attended the lectures of two most eminent teachers of rhetoric, Arellius Fuscus and Porcius Latro, to which influence is due the strong rhetorical element in Ovid's style. His father did his best to dissuade him from poetry, and to drive him into the legal profession.

The earliest edition of the *Amores*, which first appeared in 5 books, and the *Heroides* were given by him to the world at an early age. "Virgil," he informs us, "he had only seen"; but Virgil's friend and contemporary Aemilius Macer used to read his didactic poems to him; and even the fastidious Horace sometimes delighted his ears with the music of his verse. He had a close bond of intimacy with the younger poets of the older generation—Tibullus, whose death he laments in one of the few pathetic pieces among his earlier writings, and Propertius, to whom he describes himself as united in the close ties of comradeship. The name of Maecenas he nowhere mentions. The time of his influence was past when Ovid entered upon his poetical career. But the veteran politician Messalla, the friend of Tibullus, together with his powerful son Cotta Messallinus and Fabius Maximus and other influential persons whose names are preserved in the *Epistles from Pontus* supported him. With the older poet, Macer, he travelled for more than a year. Whether this was immediately after the completion of his education, or in the interval between the publication of his earlier poems and that of the *Medea* and *Ars amatoria* is unknown, but it is in his later works, the *Fasti* and *Metamorphoses*, that we chiefly recognize the impressions of the scenes he visited. In one of the *Epistles from Pontus* (ii. 10) to his fellow-traveller there is a vivid record of the pleasant time they had passed together. They visited Athens, of course, the Mecca of all artistic pilgrimages then; went on to the site of Troy, and through the cities of Asia Minor; and finally spent a year in Sicily.

Life in Rome.—When settled at Rome, although a public career leading to senatorial position was open to him, and although he filled various minor posts, he had no ambition for such distinction, and looked upon pleasure and poetry as the occupations of his life. He was three times married; when little more than a boy to his first wife, whom he naively describes as unworthy of himself; but he was soon separated from her and took a second wife, with whom his union also did not last long. She was probably the mother of his one daughter. Later he married a third, of whom he always speaks with affection and respect. She was a lady of the great Fabian house, and thus connected with his powerful patron Fabius Maximus, and was a friend of the empress Livia. It therefore seems likely that he may have been admitted into the intimacy of the younger society of the Palatine. His liaison with his mistress Corinna, whom he celebrates in the *Amores*, took place probably in the period between his first and second, or between his second and third marriages. Ovid is not only a less constant but he is a less serious lover than his great predecessors Catullus, Tibullus and Propertius. His tone is that either of mere sensuous feeling or of irony. In his complete emancipation from all restraint he goes beyond them, and thus reflects the tastes and spirit of fashionable Rome between the years 20 B.C. and the beginning of our era.

Society was then bent simply on amusement; and, as a result partly of the loss of political interests, women came to play a more important and brilliant part in its life than they had done before. Julia, the daughter of the emperor, was by her position, her wit and beauty, and her reckless dissipation, the natural

leader of such a society. But the discovery of her intrigue (2 B.C.) with Iulus Antonius, the son of Mark Antony, was deeply resented by Augustus as being at once a shock to his affections and a blow to his policy of moral reform. Julia was banished and disinherited; Antonius and her many lovers were punished; and the Roman world awoke from its fool's paradise of pleasure. Nearly coincidentally with this scandal appeared Ovid's *Ars amatoria*, perhaps the most immoral work ever written by a man of genius, though not the most demoralizing, since it is entirely free from morbid sentiment. By its brilliancy and heartlessness it appealed to the prevailing taste of the fashionable world; but its appearance excited deep resentment in the mind of the emperor, as is shown by his edict, issued ten years later, against the book and its author. Ovid appears to have had no idea of the storm that was gathering over him.

But he was aware that public opinion had been shocked, or professed to be shocked, by his last work; and after writing a kind of apology for it, called the *Remedia amoris*, he turned to other subjects, and wrote during the next ten years the *Metamorphoses* and the *Fasti*. He had already written the *Heroides*, in which he had imparted a modern and romantic interest to the heroines of the old mythology, and a tragedy, the *Medea*, which must have afforded greater scope for the dramatic and psychological treatment of the passion with which he was most familiar. In the *Fasti* Ovid assumes the position of a national poet by imparting poetical life and interest to the ceremonial observances of the Roman religion; but it is as the brilliant narrator of the romantic tales that were so strangely blended with the realistic annals of Rome that he succeeds in the part assumed by him. The *Metamorphoses* is a narrative poem which recounts legends in which the miraculous involved transformations of shape. Beginning with the change from Chaos to Cosmos, legends first Greek and then Roman are passed in review, concluding with the metamorphosis of Julius Caesar into a star and a promise of immortality to Augustus. The *Metamorphoses* is strongly tinged with Alexandrine influence, being in fact a succession of epyllia in the Alexandrine manner. This work, which Ovid regards as his most serious claim to immortality, had not been finally revised at the time of his disgrace, and in his despair he burnt it; but other copies were in existence, and when he was at Tomi it was published at Rome by one of his friends. He often regrets that it had not received his final revision. The *Fasti* also was broken off by his exile, after the publication of the first six books, treating of the first six months of the year.

Banishment.—In A.D. 8 Ovid was ordered by Augustus into banishment; for this he assigns two causes, his *Ars amatoria* and an actual offence (*Trist.* ii. 207). It is natural that Augustus should have felt resentment against the *Ars*, because its doctrine was a direct challenge to his policy of moral reform. What the actual offence was is a secret which the poet leaves unrevealed; since his disgrace coincided with the banishment of Augustus' granddaughter, the younger Julia, on account of an intrigue with Silanus, it has been supposed that Ovid was concerned in abetting that intrigue, and that this constituted his unforgivable sin. But if Ovid had really assisted to bring about the moral scandal which befell the emperor's family, it is incredible that he could have dared to allude to it, as he does constantly, in his poems. This, and the fact that, even after Augustus' death, his successor Tiberius left Ovid unpardoned, makes it probable that the offence was political and specially displeasing to Tiberius and Livia because it somehow interfered with their dynastic policy. Ovid may have been implicated with those who were over-zealous in the interests of rival possible successors to the throne, either Agrippa Postumus, the grandson of Augustus, or Germanicus, the brilliant and popular nephew of Tiberius, with many of whose friends Ovid was associated. Ovid's banishment was the mildest possible (*relegatio*); it involved no deprivation of civic rights, and left him the possession of his property. He was ordered to remove to the half-Greek, half-barbaric town of Tomi, near the mouth of the Danube. For eight years he bore up in his dreary solitude, suffering from the unhealthiness of the climate and the constant alarm of inroads of barbarians.

The Epistle.—In the hope of procuring a remission of his punishment he wrote poetical complaints, first in the series of the five books of the *Tristia*, sent successively to Rome, addressed to friends whose names he suppresses; afterwards in a number of poetical epistles, the *Epistulae ex Ponto*, addressed by name to friends who were likely to have influence at court. He believed that Augustus had softened towards him before his death, but his successor Tiberius was inexorable to his appeals. His chief consolation was the exercise of his art, though as time goes on he is painfully conscious of failure in power. But although the works written by him in exile lack the finished art of his earlier writings, their personal interest is greater. They have, like the letters of Cicero to Atticus, the fascination exercised by all confessions; they are a sincere literary expression of the state of mind produced by a unique experience—that of a man, when well advanced in years but still retaining extraordinary sensibility to pleasure and pain, withdrawn from a brilliant social and intellectual position, and cast upon his own resources in a place and among people affording the dreariest contrast to the brightness of his previous life. The letters, which compose the *Tristia* and *Epistulae ex Ponto*, are addressed either to his wife, the emperor, or the general reader, or to his patrons and friends. To his patrons he writes in a vein of supplication, beseeching them to use their influence on his behalf. To his rather large circle of intimate acquaintances he writes in the language of familiarity, and often of affectionate regard; he seeks the sympathy of some, and speaks with bitterness of the coldness of others, and in three poems (*Trist.* iii., 11, iv. 9; v. 8) he complains of the relentless hostility of the enemy who had contributed to procure his exile, and whom he attacked in the *Ibis*. There is a note of true affection in the letter to the young lyric poetess Perilla, of whose genius and beauty he speaks with pride, and whose poetic talents he had fostered by friendly criticism (*Trist.* iii., 7). He was evidently a man of gentle and genial manners; and, as his active mind induced him to learn the language of the new people among whom he was thrown, his active interest in life enabled him to gain their regard and various marks of honour. One of his last acts was to revise the *Fasti*, and re-edit it with a dedication to Germanicus. The closing lines of the *Epistulae ex Ponto* sound like the despairing sigh of a drowning man who had long struggled alone with the waves:—

Omnia perdidimus: tantummodo vita relicta est,
Praebeat ut sensum materiamque mali.

Shortly after these words were written he died in his sixty-first year in A.D. 17.

Temperament.—The temperament of Ovid, as indicated in his writings, has more in common with the suppleness of the later Italian than with the strength and force of the ancient Roman. That stamp of her own character and understanding which Rome impressed on the genius of those other races which she incorporated with herself is fainter in Ovid than in any other great writer. He disclaims the manliness which was regarded as the birthright of the Roman. He is equally devoid of dignity in his brilliant prime, and in his later disgrace. His religion is devoid of reverence, his feeling for nature of depth, his loves of sincerity and, almost, even of passion.

These defects in strength and gravity show a corresponding result in Ovid's writings. Though possessing diligence, perseverance and literary ambition, he seems incapable of conceiving a great and serious whole. But with all the levity of his character he must have had qualities which made him, if not much esteemed, yet much liked in his own day, and which are apparent in the genial amiability of his writings. He claims for himself two virtues highly prized by the Romans, *fides* and *candor*—the qualities of social honour and kindly sincerity. There is no indication of anything base, ungenerous or morose in his relations to others. Literary *candor*, the generous appreciation of all sorts of excellence, he possesses in a remarkable degree. He heartily admires everything in literature, Greek or Roman, that had any merit. In him more than any of the Augustan poets we find words of admiration applied to the rude genius of Ennius and the majestic style of Accius. It is by him that

Lucretius is first named and his sublimity is first acknowledged. The image of Catullus that most haunts the imagination is that of the poet who died so early—

hedera juvenalia cinctus
Tempora,

as he is represented by Ovid coming to meet the shade of the young Tibullus in Elysium. To his own contemporaries, known and unknown to fame, he is as liberal in his words of recognition. He enjoyed society too in a thoroughly amiable and unenvious spirit. In his exile he did retaliate on one enemy and persistent detractor in the *Ibis*, a poem written in imitation of a similar work by Callimachus; but the *Ibis* is not a satire, but an invective remarkable rather for recondite learning than for epigrammatic stinging.

But Ovid's chief personal endowment was his vivacity, and his keen interest in and enjoyment of life. The age in which he lived was, as he tells us, that in which more than any other he would have wished to live. He is its most gifted representative, and by not rising above it he reflects it the more perfectly. The sympathy which he felt for the love adventures of his contemporaries, to which he probably owed his fall, quickened his creative power in the composition of the *Heroides* and the romantic tales of the *Metamorphoses*. None of the Roman poets can people a purely imaginary world with such spontaneous fertility of fancy as Ovid. In the power and range of imaginative vision he is surpassed by no ancient and by few modern poets. This power of vision is the counterpart of his lively sensuous nature. He has a keener eye for the apprehension of outward beauty, for the life and colour and forms of nature, than any Roman or perhaps than any Greek poet. This power, acting upon the wealth of his varied reading, gathered with eager curiosity and received into a singularly retentive mind, has enabled him to depict with consummate skill and sympathy legendary scenes of the most varied and picturesque beauty. If his tragedy, the *Medea*, highly praised by ancient critics, had been preserved, we should have been able to judge whether Roman art was capable of producing a great drama. In many of the *Heroides*, and in several speeches scattered through his works, he gives evidence of true dramatic creativeness. Among the poets of all times he can imagine a story with the most vivid inventiveness and tell it with the most unflagging animation. The faults of his verse and diction are those which arise from the vitality of his temperament—too facile a flow, too great exuberance of illustration. He has as little sense of the need of severe restraint in his art as in his life. He is not without mannerism, but he is quite unaffected, and, however far short he might fall of the highest excellence of verse or style, it was not possible for him to be rough or harsh, dull or obscure.

As regards the school of art to which he belongs, he may be described as the most brilliant representative of Roman Alexandrinism. The latter half of the Augustan age was, in its social and intellectual aspects, more like the Alexandrine age than any other era of antiquity. Poetry was the chief branch of literature, and the chief subjects of poetry were mythological tales, various phases of the passion of love, the popular aspects of science and some aspects of the beauty of nature. These two were the chief subjects of the later Augustan poetry. Ovid was the last of this class of writers.

Works.—His extant works fall naturally into three divisions, those of his youth, of middle life and of his later years. To the first of these divisions belong the amatory poems: (1) the three books of *Amores* (originally five, but reduced in a later recension to three) relating to his amours with his mistress Corinna; (2) the *Medicamina formae*, a fragment of a hundred lines on the use of cosmetics; (3) the three books of the *Ars amatoria*; (4) the *Remedia amoris* (one book), a kind of recantation of the *Ars amatoria*. To the second division belong (5) the fifteen books of the *Metamorphoses*, and (6) the six books of the *Fasti*, which was originally intended to be in twelve books, but which breaks off the account of the Roman calendar with the month of June. To the third division belong (7) the five books of the *Tristia*, (8) the *Ibis*, an invective against an enemy who had assisted to procure his fall, written in elegiac couplets probably soon after

his exile; (9) the four books of *Epistulae ex Ponto*. Of these the first three were published soon after the *Tristia*, while the fourth book is a collection of scattered poems published by some friend soon after the author's death. The *Halieutica* is a didactic fragment in hexameters on the natural history of fishes, of doubtful genuineness, though it is certain that Ovid did begin such a work at the close of his life.¹

In his extant works Ovid confined himself to two metres—the elegiac couplet and the hexameter. The great mass of his poetry is written in the first; while the *Metamorphoses* and the *Halieutica* are composed in the second. Of the elegiac couplet he is the acknowledged master. By fixing it into a uniform mould he brought it to its highest perfection; and the fact that the great mass of elegiac verse written subsequently has endeavoured merely to reproduce the echo of his rhythm is evidence of his pre-eminence. In the direct expression and illustration of feeling his elegiac metre has more ease, vivacity and sparkle than that of any of his predecessors, while he alone has communicated to it, without altering its essential characteristic of recurrent and regular pauses, a fluidity and rapidity of movement which make it an admirable vehicle for pathetic and picturesque narrative. It was impossible for him to give to the hexameter greater perfection, but he imparted to it also a new character, rapid, varied, animated in complete accord with the swift, versatile and fervid movement of his imagination. One other proof he gave of his irrepressible energy by composing during his exile a poem in the Getic (Gothic) language in praise of the imperial family, the loss of which, whatever it may have been to literature, is much to be regretted in the interests of philology.

It was in Ovid's writings that the world of romance and wonder created by Greek imagination was first revealed to modern times. His influence was first felt in the literature of the Italian Renaissance. But in the most creative periods of English literature he seems to have been read more than any other ancient poet, not even excepting Virgil, and it was on minds such as those of Marlowe, Spenser, Shakespeare, Milton and Dryden that he acted most powerfully. His influence is equally unmistakable during the classical era of Addison and Pope. The most successful Latin verse of modern times has been written in imitation of him; the faculty of literary composition and feeling for ancient Roman culture has been largely developed in the great schools of England and France by the writing of Ovidian elegiacs. His works afforded also abundant stimulus and materials to the great painters who flourished during and immediately after the Renaissance. Thus his first claim on the attention of modern readers is the influence which he has exercised on the development of literature and art; for this, if for no other reason, his works must always retain an importance second only to those of Virgil and Horace.

He is interesting further as the sole contemporary exponent of the last half of the Augustan age, the external aspects and inner spirit of which is known from the works, not of contemporary historians or prose-writers, but from its poets. The successive phases of Roman feeling and experience during this critical period are revealed in the poetry of Virgil, Horace and Ovid. Virgil throws an idealizing and religious halo around the hopes and aspirations of the nascent empire. Horace presents the most complete image of its manifold aspects, realistic, and ideal. Ovid reflects the life of the world of wealth and fashion under the influence of the new court, its material prosperity, its refinement, its frivolity and its adulation. He is the last true poet of the great age of Roman literature, which begins with Lucretius and closes with him. But the type of genius of which he affords the best example is more familiar in modern Italian than in ancient Roman literature. While the serious spirit of Lucretius and Virgil reappeared in Dante, it is Ariosto who may be said to reproduce the light-hearted gaiety and brilliant fancy of Ovid.

BIBLIOGRAPHY.—The life of Ovid was first treated systematically by J. Masson, *Ovidii vita ordine chronologico digesta* (1780) (often reprinted, e.g., in Burmann's edition). Modern literature on this subject will be found in Teuffel's *History of Roman Literature* (Eng. trans., ed. 2), § 247, and S. G. Owen's edition of *Tristia*, bk. i. The very numerous manuscripts of Ovid are chiefly of late date, 13th to

¹Plin. *Hist. Nat.* xxxii. 152.

15th century. The earliest and best are: for the *Heroides* a Paris ms. of the 9th, a Wolfenbüttel ms. of the 12th and an Eton fragmentary ms. of the 11th century (the *Epistula Sapphus*, found in no early ms., is best preserved in a 13th-century Frankfurt, and a 15th-century Harleian ms.); for the *Amores*, *Ars amatoria*, *Remedia amoris*, two Paris mss. of the 9th and 10th century respectively; for the *Medicamina formae* a Florence ms. (Marcianus) of the 11th; for the *Metamorphoses* two Florence mss. (Marcianus and Laurentianus) and a Naples ms., all of the 11th century; for the *Fasti* two Vatican mss. of the 10th and 11th century; for the *Tristia* a Florence ms. of the 11th; for the *Epistulae ex Ponto* a fragmentary Wolfenbüttel ms. of the 6th and a Hamburg and two Munich mss. of the 12th; for the *Ibis* a Trinity College, Cambridge, ms. of the 12th; for the *Halieutica* a Paris ms. of the 9th or 10th, and a Vienna ms. of the 9th century. Important for the text of the *Heroides* and *Metamorphoses* is the interesting paraphrase written in Greek by the monk Maximus Planudes in the latter half of the 13th century at Constantinople; that of the *Heroides* is printed in Palmer's edition of the *Heroides* (1898), that of the *Metamorphoses* in Lemaire's edition of *Ovid*, vol. v., edited by Boissonade. See also Gudeman, *De Heroidum Ovidii codice Planudeo* (Berlin, 1888).

Two independent editions of Ovid were published contemporaneously in 1471, one at Rome, printed by Sweynheym and Pannartz, and one at Bologna by Balthasar Azoguidius; these present entirely different texts. See Owen's *Tristium libri*, v. p. lv. ff. The following are the most important editions: those marked with an asterisk have explanatory notes. Of the whole works: *Heinsius-Burmman (1727); *Amar-Lemaire (1820-24); Merkel-Ehwald (1874-88); Riese (1871-80); Postgate's *Corpus poetarum Latinorum*, by various editors (1894), reprinted separately (1898). Of separate works: *Amores*, *Némethy (1907); *Heroides*, Sedlmayer (critical) (1886); *Palmer (1898); *Epistula Sapphus* (separately), *De Vries (1888); *Ars amatoria*, *P. Brandt (1902); *Medicamina formae* (critical), Kunz (1881); *Metamorphoses*, *J. C. Jahn (1821); *Loers (1843); Korn (critical) (1880); *Haupt-Ehwald (1898-1903); Magnus (1914); *R. S. Lang (Oxford, 1927); *Fasti*, *Gierig (1812); Merkel (1841) (critical, with learned prolegomena on the sources, the Roman calendar, etc.); *Keightley (1848); *Paley (1854); *Peter (1889); *Cyril Bailey (Oxford 1921); *Tristia*, *Loers (1839); S. G. Owen (1889) (critical); with notes and translation (1924); *Bk. i. (1885); *Bk. iii. (1889); *Cochia (1900); *Epistulae ex Ponto*, Korn (1868) (critical), Bk. i. *Ellis (1881); *Némethy (1915); *Halieutica*, *Birt, *De Halieuticis Ovidio poetae falso descriptis* (1878). There is a free verse-translation of the *Amores* by Marlowe (c. 1600), and Dryden, with other hands under his supervision, published translation of various works between 1683 and 1717.

The special treatises on matters connected with Ovid are very numerous; a fairly complete list up to the time of publication is given in Owen's *Tristia* (critical edition), p. cviii. ff.; in Teuffel's *History of Roman Literature* (trans. by Warr) and in Schanz's *Geschichte der römischen Literatur*; and by Ehwald in the *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft*, xxxi. (1884) pp. 157 ff., lxxx. (1894) pp. 1 ff., cix. (1902) pp. 157 ff. The following deserve special mention. On the history of the text: Ehwald, *Ad historiam carminum Ovidianorum symbolae* (1889); *Kritische Beiträge zu Ovids Epistulae ex Ponto* (1896); Sedlmayer, *Prolegomena ad Heroidas* (1878); Gruppe, *Minos*, pp. 441 ff. (on interpolations). On style: Ovid's diction in connection with other writers.—A. Zingerle, *Ovidius und sein Verhältnis zu den Vorgängern* (1869-71); *Marialis Ovid-Studien* (1877); W. Zingerle, *Untersuchungen zur Echtheitsfrage der Heroiden Ovids* (1878); W. Vollgraff, *Nikander und Ovid* (Groningen, 1909) foll.). Peculiarities of Ovid's style: van Iddekinge, *De Ovidii Romani iuris pritis* (1811); Washietl, *De similitudinibus imaginibusque Ovidianis* (1883); M'Crea, *On Ovid's Use of Colour and Colour Terms* (Classical studies in honour of H. Drisler) (1894). Metre: the structure of the Ovidian pentameter examined in relation to the textual criticism.—Hilberg, *Gesetze der Wortstellung im Pentameter des Ovid* (1894) (fully reviewed by Ellis, *Classical Review*, ix. 157). Literary appreciation: Sellar, *Roman Poets of the Augustan Age*; Lafaye, *Les Métamorphoses d'Ovid et leurs modèles grecs*. Ovid's relation to works of art: Wunderer, *Ovids Werke in ihrem Verhältnis zur antiken Kunst* (1890-91); Engelmann, *Bilder-Atlas zu Ovids Metamorphosen* (1890). Cause of exile: the most interesting discussion is by Boissier in his *L'Opposition sous les Césars*. See also Nageotte, *Ovide, sa vie, ses œuvres* (1872); Huber, *Die Ursachen der Verbannung des Ovid* (1888). Influence of Ovid upon Shakespeare: T. S. Baynes, *Shakespeare Studies* (1894), pp. 195 ff.; Constable, Shakespeare's "Venus und Adonis" in *Verhältnis zu Ovids Metamorphosen* (1890). See also S. G. Owen, *Ovid and Romance* (1912).

(S. G. O.; X.)

OVIEDO, a maritime province of northern Spain, bounded on the north by the Bay of Biscay, east by Santander, south by Leon and west by Lugo. Pop. (1920) 743,726; area, 4,205 sq.m. In popular speech Oviedo is often called by its ancient name of Asturias, which only ceased to be the official title of the province in 1833, when the Spanish system of local government was reorganized. An account of the physical features, history and in-

habitants of this region is given under **ASTURIAS** (q.v.). Oviedo is rich in forests, coal, streams and waterfalls, greatly contributing to its modern industrial development. The horses of Oviedo rank among the best in Spain. Wild deer, boars and bears were formerly common among the mountains; and the sea-coasts, as well as the streams, abound with fish, including salmon and lampreys. The climate is mild and wet; the broken relief hinders cultivation.

Although no trace exists of the gold for which Asturias was celebrated under its Roman rulers, Oviedo possesses valuable coal measures, which are worked at Langreo (34,033), Mieres (40,560), Siero (27,210) and elsewhere. The copper mines near Avilés (14,642) and Cangas de Onís (9,753) have lost their importance; but lead, magnesia, arsenic, cobalt, lapis lazuli, alum, antimony, jet, marble and rock-crystal are found in various parts of the province, while amber and coral are gathered along the coast. There are manufactures of fine textiles, coarse cloth and ribbons in Salas (14,972), Piloña (18,323) and Avilés; of paper in Pianton; of porcelain and glass in Gijón (57,573), Avilés and Pola de Surro; of arms in Oviedo and Trubia; while foundries and works for the manufacture of agricultural implements, rails and pig-iron are numerous. An important highway is the 16th century *Camino real*, or royal road, leading from Gijón to Leon and Madrid, which cost so much that the emperor Charles V. inquired if it were paved with silver. A railway from Madrid to Oviedo, Gijón and Avilés runs through some of the most difficult parts of the Cantabrian chain. There are also several branch railways, including numerous narrow-gauge lines.

OVIEDO, an episcopal city and capital of the Spanish province of Oviedo; 16 m. S. of the Bay of Biscay, on the river Nalon, and on the Leon-Gijón Oviedo-Trubia and Oviedo-Infiesto railways. Pop. (1920) 69,375. Oviedo is built on a hill rising from a broad and picturesque valley, which is bounded on the north-west by the Sierra de Naranco. Oviedo, founded in the reign of Fruela (762), became the fixed residence of the kings of the Asturias in the time of Alphonso II., and continued to be so until about 924, when the advancing reconquest of Spain from the Moors led them to remove their capital to Leon. The university was founded by Philip III. in 1604. The Gothic cathedral, founded in 1388, occupies the site of a chapel founded in the 8th century, of which only the Camara Santa remains. The Camara Santa (dating from 802) contains the famous *arca* of Oviedo, an 11th century Byzantine chest of cedar, overlaid with silver reliefs of Biblical scenes. In it are preserved two crosses dating from the 8th and 9th centuries. The cathedral library has some old mss., including a deed of gift made by Alphonso II. of Asturias in 812, and a collection of illuminated documents of the 12th century, called the *Libro gótico*. On the Sierra de Naranco is the ancient Santa Maria de Naranco, originally built by Ramiro I. of Asturias in 850 as a palace, and afterwards turned into a church. Higher up the hill is San Miguel de Lino, also of the 9th century; and on the road to Gijón, about a mile outside the town, is the Santullano or church of St. Julian, also of very early date. Oviedo is the centre of an agricultural trade. Other industries are marble-quarrying, the manufacture of arms, cotton and woollen fabrics, iron goods, leather and matches.

OVIEDO Y VALDÉS, GONZALO FERNÁNDEZ DE (1478-1557), Spanish historian, was present at the surrender of Granada and saw Columbus previous to his voyage to America. He visited America himself on several occasions in an official capacity. Appointed historiographer of the Indies, Oviedo wrote—besides a romance of chivalry, *Don Claribalte* (1519)—two historical works: *Sumario de la natural y general istoria de las Indias* (1526) and *La historia natural y general de las Indias, Islas e Tierra Firme del mar oceano* (1535-57). The latter work embodies a mass of curious information collected at first hand.

OVOLO, in architecture, a convex moulding (q.v.), whose profile approximates a quarter circle, a quarter ellipse, or a similar curve; known commonly in the building trades as a quarter round. In its elliptical forms it is the characteristic moulding of the echinus of the Greek Doric order and in its round forms of the echinus of the Roman Doric. It is also important as part of the bed-mould (q.v.) of many cornices. In

carpentry, at a small scale, it is one of the most common mouldings used to cover a joint in a re-entrant angle, as between a base board and the floor, or between the side of a beam and the ceiling.

OWATONNA, a city of south-eastern Minnesota, U.S.A., on the Straight river at an altitude of 1,140 ft., 70 m. S. of Minneapolis; the county seat of Steele county. It is on Federal highways 14, 65 and 218, and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Chicago and North Western, and the Rock Island railways and by motor bus lines. Pop. (1920) 7,252 (84% native white); 1928 local estimate, 8,200. It is the trading and shipping centre of a rich grain-growing and dairying region; has large nurseries; and its manufactures include creamery and cereal products, ventilating systems, acetylene lighting plants, and farm implements. West of the city is the State School for Dependent and Neglected Children (1886). Owatonna was settled about 1855, incorporated as a village in 1865, and chartered as a city in 1875. The name is a Sioux word meaning "straight."

OWEGO, a village of southern New York, U.S.A., the county seat of Tioga county; on the north bank of the Susquehanna river, 21 m. W. of Binghamton. It is served by the Erie, the Lackawanna and the Lehigh Valley railways. Pop. (1925) 4,743 (State census). It is a lumber-shipping point and has a number of factories. Owego occupies the site of an Indian village called Ah-wa-ga ("where the valley widens"), which was destroyed by Gen. Clinton in 1779. A white settlement was established in 1785 and the village was incorporated in 1827.

OWEN, JOHN [OVENUS or AUDENUS] (c. 1560–1622), Welsh epigrammatist, born at Plas Dhu, Carnarvonshire, about 1560, was educated at Winchester school, and at New college, Oxford. He was a fellow of his college from 1584 to 1591, when he became a schoolmaster, first at Trelleck, near Monmouth, and then at Warwick. His perfect mastery of the Latin language brought him the name of "the British Martial."

Owen's *Epigrammata* are divided into twelve books, of which the first four were published in 1606, and the rest at four different times. Owen frequently adapts and alters to his own purpose the lines of his predecessors in Latin verse, and one such borrowing has become celebrated as a quotation, though few know where it is to be found. It is the first line of this epigram:—

Tempora mutantur, nos et mutamur in illis:
Quo modo? fit semper tempore prior homo.

(Lib. I. ad Edoardum Noel, epig. 58.)

This first line is altered from an epigram by Matthew Borbonius, one of a series of mottoes for various emperors, this one being for Lothaire I.

Omnia mutantur, nos et mutamur in illis:
Illa vices quasdam res habet, illa vices.

There are editions of the *Epigrammata* by Elzevir and by Didot; the best is that edited by Renouard (2 vols., Paris, 1795). Translations into English, either in whole or in part, were made by Vicens (1619); by Pecke, in his *Parnassi Puerperium* (1659); and by Harvey in 1677, which is the most complete. La Torre, the Spanish epigrammatist, owed much to Owen, and translated his works into Spanish in 1674. French translations of the best of Owen's epigrams were published by A. L. Lebrun (1709) and by Kérivalant (1819).

OWEN, JOHN (1616–1683), English Nonconformist divine, was born at Stadham in Oxfordshire in 1616, and educated at Queen's college, Oxford. He was chaplain and tutor in the families, first of Sir Robert Dormer, and later of Lord Lovelace, but lost his place by siding with parliament in the Civil War. He then lived in Charterhouse yard, in London, and on April 29, 1646, preached, before the Long Parliament, a sermon which showed his tendency towards the tolerant Independent or Congregational system of Church government. He now became pastor at Coggeshall in Essex. He was chosen to preach to parliament on the day after the execution of Charles. Cromwell took him in 1649 as his chaplain to Ireland, where he regulated the affairs of Trinity college, and in 1650 to Scotland, making him chancellor of Oxford (1651), dean of Christ-church (1651–52) and vice-chancellor in 1652.

When Richard Cromwell succeeded his father, Owen lost his vice-chancellorship, and joined the Wallingford House party, throwing his influence on the side of a simple republic as against

a protectorate. In March 1660 the Presbyterian party being uppermost, he was deprived of his deanery and returned to Stadham. Driven to London by the Conventicle and Five Mile Acts, he gathered a congregation there; at the revival of the Conventicle Acts in 1670 he drew up a protest to the House of Lords. After the Declaration of Indulgence (1672) he frequently preached in congregations of Independents and Presbyterians, and was in favour with Charles II. and James II. He died at Ealing on Aug. 24, 1683.

See Gould's edition of Owen's *Works* (1850–55); W. Orme, *Memoirs of Owen* (1820); and *The Golden Book of John Owen*, edited with a study of his life by James Moffat (1904).

OWEN, SIR RICHARD (1804–1892), English biologist, was born at Lancaster on July 20, 1804. In 1820 he was apprenticed to a local surgeon and apothecary, and in 1824 he proceeded as a medical student to the university of Edinburgh. After completing his medical course in St. Bartholomew's Hospital, London, where he came under the influence of the eminent surgeon, John Abernethy, he contemplated a professional career; but being induced by Abernethy to accept the position of assistant to William Clift, conservator of the museum of the Royal College of Surgeons, he devoted himself to the more congenial work of scientific research. He prepared an important series of catalogues of the Hunterian collection in the Royal College of Surgeons; and in the course of this work acquired the unrivalled knowledge of comparative anatomy which facilitated his researches on the remains of extinct animals. In 1836 he was appointed Hunterian professor in the Royal College of Surgeons, in 1849 he succeeded Clift as conservator, and in 1856 he became superintendent of the natural history department of the British Museum. He then devoted his energies to a scheme for a National Museum of Natural History, which eventually resulted in the removal of the natural history collections of the British Museum to a new building at South Kensington, the British Museum (Natural History). He retained office until the completion of this work in 1884, when he received the K.C.B., and thenceforward lived in retirement at Sheen Lodge, Richmond Park, until his death on Dec. 18, 1892.

While occupied with cataloguing the Hunterian collection, Owen seized every opportunity of dissecting fresh subjects. He had the privilege of investigating the animals which died in the Zoological Society's gardens; and when that society began to publish scientific proceedings in 1831, he was the most voluminous contributor of anatomical papers. His first notable publication, however, was his *Memoir on the Pearly Nautilus* (1832), which was soon recognized as a classic. Henceforth he continued to make important contributions to every department of comparative anatomy and zoology for over fifty years. Among Entozoa his most noteworthy discovery was that of *Trichina spiralis* (1835), the parasite infesting the muscles of man in the disease now termed trichinosis. (See also, however, the article on PAGET, SIR JAMES.) He also studied the Brachiopoda, Mollusca and he proposed the universally-accepted subdivision of the Cephalopoda into the two orders of Dibranchiata and Tetrabranchiata (1832). The problematical Arthropod *Limulus* was also the subject of a special memoir by him in 1873.

Owen's technical descriptions of the Vertebrata were still more numerous and extensive than those of the invertebrate animals. He not only studied existing forms, but also devoted great attention to the remains of extinct groups, and immediately followed Cuvier as a pioneer in vertebrate palaeontology. Early in his career he made exhaustive studies of teeth, both of existing and extinct animals, and published his work on *Odontography* (1840–1845). Most of his work on reptiles related to the skeletons of extinct forms, and his chief memoirs on British specimens were reprinted in a connected series in his *History of British Fossil Reptiles* (4 vols., 1849–1884). He also wrote widely on extinct birds. With regard to living mammals, the more striking of Owen's contributions relate to the monotremes, marsupials, and the anthropoid apes. Most of his writings on mammals, however, deal with extinct forms. Sir Thomas Mitchell's discovery of fossil bones in New South Wales provided material for the first of Owen's long series of papers on the extinct mammals of Australia,

which were eventually reprinted in book-form in 1877.

Owen's detailed memoirs and descriptions require laborious attention in reading, on account of their nomenclature and ambiguous modes of expression. But it must be remembered that he was a pioneer in concise anatomical nomenclature.

Besides the above mentioned works, Owen wrote: *Comparative Anatomy and Physiology of Vertebrates* (3 vols., 1866-68); *History of British Fossils, Mammals and Birds* (1844-46); *Monograph of the Fossil Mammalia of the Mesozoic Formations* (Paleont. Soc., 1871); *Antiquity of Man as deduced from the Discovery of a Human Skeleton* (1884); *Catalogue of the Fossil Reptilia of South Africa* (1876); *Archetype and Homologies of the Vertebrate Skeleton* (1848).

OWEN, ROBERT (1771-1858), British reformer and Socialist, was born at Newtown, Montgomeryshire, on May 14, 1771. His father had a small business in Newtown as saddler and ironmonger, and there young Owen received his school education, which terminated at the age of nine. After serving in a draper's shop for some years he settled in Manchester, where his success was rapid. When only 19 years of age he became manager of a cotton mill in which 500 people were employed, and by his administrative intelligence and energy soon made it one of the best establishments of the kind in Great Britain. In this factory Owen used the first bags of American sea-island cotton ever imported into the country; it was the first sea-island cotton from the Southern States. Owen also made improvements in the quality of the cotton spun; and indeed there is no reason to doubt that at this early age he was the first cotton-spinner in England, a position entirely due to his own capacity and knowledge of the trade. On becoming manager and partner in the Chorlton Twist Company at Manchester, Owen induced his partners to purchase the new Lanark mills, and after his marriage with Miss Dale, the daughter of the former proprietor, he settled there as manager and part-owner. Encouraged by his great success in Manchester, he had already formed the intention of conducting New Lanark on higher principles than the current commercial ones.

Connected with the mills were about 2,000 people, 500 of whom were children, brought, most of them, at the age of five or six from the poorhouses and charities of Edinburgh and Glasgow. The children especially had been well treated by Dale, but the general condition of the people was unsatisfactory. Crime and vice bred by demoralizing conditions were common; education and sanitation were alike neglected; and housing conditions were intolerable. It was this population which Owen set himself to elevate and ameliorate. He greatly improved their houses, and mainly by his personal influence trained them to habits of order, cleanliness and thrift. He opened a store, where the people could buy goods of the soundest quality at little more than cost price; and the sale of drink was placed under the strictest supervision. His greatest success, however, was in the education of the young, to which he devoted special attention. He was the founder of infant schools in Great Britain; and, though he was anticipated by reformers on the Continent, he seems to have been led to institute them by his own views of what education ought to be, and without hint from abroad.

In all these plans Owen obtained success. Though at first regarded with suspicion as a stranger, he soon won the confidence of his people. The mills continued to be a commercial success, but some of Owen's schemes involved considerable expense, which was displeasing to his partners. Tired at last of the restrictions imposed on him by men who wished to conduct the business on the ordinary lines, Owen formed a new firm, who, content with 5% of return for their capital, were ready to give freer scope to his philanthropy (1813). In this firm Jeremy Bentham and the well-known Quaker, William Allen, were partners. In the same year Owen published *A New View of Society, or Essays on the Principle of the Formation of the Human Character*, in which he expounded the principles on which his system of educational philanthropy was based. From an early age he had lost all belief in the prevailing forms of religion, and had thought out a creed for himself, which he considered an entirely new and original discovery. The chief points in this philosophy were that man's character is formed by circumstances over which he had no control and that he is not a proper subject either of praise or blame.

These convictions led Owen to the conclusion that the great secret in the right formation of man's character is to place him under the proper influences from his earliest years. The irresponsibility of man and of the effect of early influences are the keynote of Owen's whole system of education and social amelioration.

Owen's new views theoretically belong to an old system of philosophy; his originality is to be found in his application of them. For the next few years Owen's work in New Lanark continued to have a national and even European significance. New Lanark itself became a much frequented place of pilgrimage for social reformers, statesmen, and royal personages, including Nicholas, afterwards emperor of Russia. According to the unanimous testimony of all who visited it, the results achieved by Owen were singularly good. The children brought up on his system, which included instruction through the eye as well as the ear, country walks, nature study, singing and dancing, were graceful, genial and unconstrained; health, plenty and contentment prevailed; and the business was a commercial success.

In 1815 Owen started, apparently single-handed, an agitation for factory reform. He drafted a bill to apply to all textile factories, prohibiting employment before ten years of age, and night-work before 18, limiting hours for those under 18 to 10½ a day, and providing for inspection. He failed to gain support from his fellow employers in Scotland, but found influential sympathizers in London, and the bill was introduced into parliament. There it was so emasculated that, after two sessions, Owen ceased to work for it, and disclaimed all responsibility for the mutilated measure passed in 1819. Hitherto Owen's work had been that of the practical reformer, whose distinction was the originality and ceaseless unselfishness of his methods. It was in 1817 that he first put forward the ideas which made him the forerunner of Socialism and Co-operation. These ideas were embodied in a report communicated to the committee of the House of Commons on the poor law.

The general misery and stagnation of trade consequent on the termination of the Napoleonic Wars was engrossing the attention of the country. After clearly tracing the special causes connected with the war which had led to such deplorable conditions, Owen pointed out that the permanent cause of distress was to be found in the competition of human labour with machinery, and that the only effective remedy was the united action of men, and the subordination of machinery. His proposals for the treatment of pauperism were based on these principles. He recommended that communities of about 1,200 persons each should be settled on quantities of land from 1,000 to 1,500 ac., all living in one large building in the form of a square, with public kitchen and mess-rooms. Each family should have its own private apartments, and the entire care of the children till the age of three, after which they should be brought up by the community, their parents having access to them at meals and all other proper times. These communities might be established by individuals, by parishes, by counties, or by the State; in every case there should be supervision by duly qualified persons. Work, and the enjoyment of its results, should be in common. The size of his community was no doubt suggested by his village of New Lanark; and he soon advocated such a scheme for the reorganization of society in general. In its fully developed form it was as follows. He desired that communities of from 500 to 3,000, mainly agricultural but possessing the best machinery, and being, as far as possible, self-contained, "should increase in number, unions of them federatively united shall be formed in circles of tens, hundreds and thousands," till they should embrace the whole world in a common interest.

His plans for the cure of pauperism were received at first with considerable favour. The *Times* and *Morning Post* and many of the leading men of the country countenanced them, one of his most steadfast friends being the duke of Kent, father of Queen Victoria. But at a large meeting in London, Owen declared his hostility to the received forms of religion. After this act of defiance his theories became suspect to the ruling classes though he did not lose all support from them. The radicals were intent

on political reform, which seemed to Owen on the wrong lines. His point of view was that machinery had come to stay and made social control of industry necessary to prevent the oppression and poverty of the workers. When he found there was no hope of Government action he turned to groups of sympathizers to carry out his plan of self-contained Communities. In 1825 he bought 30,000 ac. of land in Indiana, U.S.A., from the Rappite religious community, and re-named it New Harmony. There was no effective choice of colonists, and some necessary trades were inadequately represented. For a time the community life was well ordered and contented under Owen's practical guidance, and a constitution was adopted within a year, based on community of property and a representative government. But differences about the form of government and religion soon appeared, and all the numerous attempts at reconstruction failed to compose them, though there is a consensus of testimony to the admirable spirit which prevailed amidst all the dissensions. The community was wound up in 1828, and Owen lost £40,000—four-fifths of his fortune. The other chief Owenite Community experiments were at Queenwood, Hants (1839-45), in which Owen took part for three years; and Orbiston, near Glasgow (1825-28) and Ralahine in Ireland (1831-33), with neither of which he was directly concerned.

In 1828, after a long period of friction with William Allen and some of his other partners, Owen resigned all connection with New Lanark, and made his headquarters in London. Before he established New Harmony, U.S.A., he had begun to turn to the workers for support for his ideas. In his *Report to the County of Lanark* (a body of landowners) in 1820, he declared definitely that not reforms but a transformation of the social order was required. The appeal of such a doctrine to the workers is obvious. From 1820, his proposals for communities attracted the younger workers, brought up under the factory system, and between 1820 and 1830 numerous societies were formed and papers started to advocate his views. The growth of trade unionism and the emergence of a working-class point of view caused Owen's doctrines to be accepted as the expression of the workers' aspirations. When he returned to England in 1829 he found himself regarded as their leader. In the trade unions, Owenism stimulated the formation of self-governing workshops, and their need for a market led to the formation of "The Equitable Labour Exchange" in 1832.

Here Owen applied his principle that labour is the source of all wealth. Prices were calculated according to the cost of raw material and the time expended in making the article, and "Labour Notes" were used as the currency for dealings with the Exchange. After a few months of prosperity, rapacious demands from the landlord and the fact that the prices did not correspond with real exchange value brought the Labour Exchange to an end. The unprecedented growth of trade unions made it seem possible that the separate industries and eventually all industry might be organized by these bodies. Owen and his followers carried out an ardent propaganda all over the country, with the result that the new National Operative Builders Union turned itself into a Guild to carry on the building industry, and the Grand National Consolidated Trades Union was formed (1833-4). The enthusiasm and the numbers joining were remarkable, but the determined opposition of the employers and the severe repression by the Government and law courts, ended the movement in a few months. It was two generations before socialism, which was first popularly discussed at this time, again influenced trade unionism.

Throughout these years Owen's community ideas maintained their hold. From 1825 numerous co-operative societies for mutual trading were organized by Owen's followers, the profits being accumulated to provide funds for starting Owenite communities. Although the communities did not materialize, these short-lived co-operative stores showed that co-operative trading was possible and started the idea of using it as a means of changing the social system. They thus performed an important part in preparing the ground for the world-wide Consumers' Co-operative Movement which sprang from the Rochdale Pioneers Co-operative Society founded in 1844. These Pioneers were inspired by Owen's teach-

ing, though their method of organizing production to supply their own needs developed on very different lines from his communities.

After 1834, Owen devoted himself to preaching his educational, moral, rationalist and marriage reform ideas. He formed the Association of All Classes of All Nations, and he was untiring in writing and speaking. His love of children and his great personal charm impressed all who came in contact with him up to the end of his life. At the age of 82, he became a spiritualist. He died on a visit to his birthplace, Newtown, on Nov. 17, 1858, his last act, the day before his death, being to draw up a plan for re-organizing the education of the town. He was buried at Newtown, and a memorial tablet was erected on his grave in 1902 by the Co-operative Union.

Robert Owen's four sons all became American citizens. The eldest, ROBERT DALE OWEN (1801-1877), sat in Congress (1844-47), and drafted the bill founding the Smithsonian Institution. In the Indiana House of Representatives, 1836-39 and 1851-52, and Constitutional Convention, 1850, he was instrumental in securing a married woman's property law, a common free school system, and more freedom in divorce. From 1853 to 1858 he was United States ambassador to Naples. He was a strong believer in spiritualism.

Of R. Owen's numerous works in exposition of his system, the most important are the *New View of Society*; the *Report* communicated to the Committee on the Poor Law; *The Report to the County of Lanark*; the *Book of the New Moral World*; and *Revolution in the Mind and Practice of the Human Race*. See *Life of Robert Owen written by himself* (1857), and *Thrading my Way, Twenty-seven Years of Autobiography*, by R. D. O. (1874). There are also *Lives of Owen* by A. J. Booth (1869), W. L. Sargant (1860), Lloyd Jones (1889), F. A. Packard (Philadelphia, 1866), F. Podmore (1906) and G. D. H. Cole (with bibliography 1925). See also H. Simon, *Robert Owen: sein Leben und seine Bedeutung für die Gegenwart* (Jena, 1905); E. Dolléans, *Robert Owen* (Paris, 1905); G. J. Holyoake, *History of Co-operation in England* (1906); Leonard Woolf, *Co-operation and the Future of Industry* (1919) and the article COMMUNISM.

OWENSBORO, a city of Kentucky, U.S.A., the county seat of Daviess county; on the Ohio river and Federal highway 60, 112 m. S.W. of Louisville. It is served by the Illinois Central, the Louisville and Nashville and the Louisville, Henderson and St. Louis railways, interurban trolleys and motor-bus lines and river steamers. Pop. 21,955 in 1920 (about 16% negro); estimated locally at over 25,000 in 1928. It is an important market for tobacco (handling 35,000,000 lb. in a normal year) and for corn, wheat, potatoes, dairy and poultry products and live stock. Its manufactures are varied and important, with an output in 1927 valued at \$9,787,720; and it is the centre of a gas and oil field including (1928) over 700 producing wells, with a daily production of 7,500 bbl. of crude oil. The city has a commission form of government. The site of Owensboro was known to the early boatmen of the Ohio as Yellow Banks. The first cabin was built in 1799. The town was laid out for the county seat in 1815 and named Rossborough. In 1817 it was incorporated under the present name, after Col. Abraham Owen (1769-1811), but the old name of Yellow Banks clung to it until the '40s. It was chartered as a city in 1866.

OWEN SOUND, a city and port of entry in Ontario, Canada, and capital of Grey county, situated 99 m. N.W. of Toronto, on Georgian Bay. Pop. (1921) 12,190. It is the terminus of branches of the Canadian Pacific and Canadian National railways, and of the Canadian Pacific and other steamship lines plying to ports on Lakes Huron and Superior. Its harbour is one of the best on Lake Huron, and navigable by lake vessels of the largest size. It is a flourishing town, containing shipbuilding yards, and manufactories of mill machinery, agricultural implements, furniture and sewing-machines, flour-mills, saw-mills and large grain elevators.

OWL, the general name for the nocturnal birds of prey. The owls form a very natural assemblage, and this suborder, *Striges*, is not closely related to the hawks and eagles. Owls vary in length from 5 in. in *Glaucidium cobanense* to more than 2 ft. The plumage is very soft, rendering the flight noiseless. On each side of the base of the beak are several rows of small, curved, stiff-shafted feathers, which form a ruff to support the long feathers of the

"disc" or space around the eyes. The ears are large, with well-developed, and often asymmetrical folds of skin, so that the right and left ears may be differently shaped. Many species of owl show two phases of colouration—one in which the brown inclines to red, the other in which it inclines to grey. The outer toes of all owls are reversible. Unlike most birds, owls incubate from the laying of the first egg.

The type of the family *Alucoidae* is the tawny owl (*Strix aluco*), found throughout Europe and in Asia Minor, Palestine and Barbary. A woodland bird, it feeds largely on rats, mice, voles, and shrews. Allied species are found in America, northern Europe and Asia. The remaining owls form the family *Strigidae*.

The eagle owl, *Bubo ignavus*, ranges over most of Europe and Asia north of the Himalayas. The allied *B. virginianus* extends over all North America. They are sombre-coloured birds and among the largest species. Equally large is the snowy owl (*Nyctea scandiaca*), a circumpolar species with white plumage. In winter it migrates southward.

The long- and short-eared owls (*Asio otus* and *A. accipitrinus*) are common to the northern parts of Europe and America; the latter, often seen abroad in the daytime, preferring open country, also extending into North Africa, all South America, and the Sandwich Islands. The long-eared owl keeps to woods. Both possess erectile tufts on the side of the head. *Speotyto cunicularia* of America lives in burrows, frequently sharing those of the prairie dog and biscacha. The bird of Pallas Athene is *Athene noctua*, the little owl of Europe, which has been introduced into Great Britain, where it has spread rapidly of late. *A. brama* replaces it in India. The American screech-owl (*Megascops asio*), in its numerous varieties, is found practically throughout North America except at the far north. It varies much in colour and size. It can be distinguished from other owls at night by its peculiar screams, snarls and hisses.

OWOSSO, a city of Shiawassee county, Michigan, U.S.A., 33 m. N.E. of Lansing, on the Shiawassee river. It is served by the Ann Arbor, the Grand Trunk and the Michigan Central railways, and by interurban trolley and motor-bus lines. The population was 12,575 in 1920 (87% native white) and was estimated locally at 16,500 in 1928. It is a division point on the Ann Arbor railroad, which has repair shops here employing 600 men, and the trade centre of a rich agricultural region, raising great quantities of sugar beet. Its manufacturing industries are many and important, with products valued in 1925 at \$10,582,978, and including sugar, flour, malleable iron, automobile bodies and furniture. The city was founded in 1833 and chartered in 1859.

OX, strictly speaking, the Saxon name for the males of domesticated cattle (*Bos taurus*), but in a zoological sense employed so as to include not only the extinct wild ox of Europe but likewise bovine animals of every description, that is to say true oxen, bison and buffaloes. The characteristics of the sub-family *Bovinae*, or typical section of the family *Bovidae*, are given in the article *Bovidae* (q.v.); for the systematic position of that family see *PECORA*. For the typical oxen, as represented by the existing

domesticated breeds see *CATTLE*.

OXALIC ACID, one of the oldest known organic acids. Scheele in 1776 prepared it by oxidizing sugar with nitric acid, and showed it to be identical with the acetoselic acid obtained from wood-sorrel, with the formula $H_2C_2O_4$, or, in its usual crystalline form, $H_2C_2O_4 \cdot 2H_2O$. It is found in the form of its acid potassium salt in many plants, especially in wood-sorrel (*Oxalis Acetosella*) and in varieties of *Rumex*; as ammonium salt in guano; as calcium salt in rhubarb root, in various lichens and in plant cells; as sodium salt in species of *Salicornia* and as free acid in varieties of *Boletus*. It is also present in urine and in urinary calculi. It is formed in the oxidation of many organic compounds (e.g., sugar, starch and cellulose) by nitric acid, and also by the fusion of many oxygen-containing compounds with caustic alkalis, the latter method being employed for the manufacture of oxalic acid. In this process cellulose (in the form of sawdust) is made into a stiff paste with a mixture of strong caustic potash and soda solution and heated in flat iron pans to 200–250° C. The somewhat dark-coloured mass is lixiviated with a small amount of warm water in order to remove excess of alkali, the residual alkaline oxalates converted into insoluble calcium oxalate by boiling with milk of lime, the lime salt separated, and decomposed by means of sulphuric acid. It is found that the sawdust obtained from soft woods is the best material for use in this process. It may be obtained synthetically (as sodium salt) by heating sodium in a current of carbon dioxide to 360° C, or by heating sodium formate to 400° C (V. Merz and W. Weith, 1882), by the oxidation of ethylene glycol and by the spontaneous hydrolysis of an aqueous solution of cyanogen gas.

The hydrated acid crystallizes in prisms which effloresce in air, and are readily soluble in water. It loses its water of crystallization at 100° C, and begins to sublime at about 150–160° C, whilst on heating to a still higher temperature it partially decomposes into carbon dioxide and formic acid, or into carbon dioxide, carbon monoxide and water, the latter decomposition being also brought about by heating oxalic acid with concentrated sulphuric acid. The anhydrous acid melts at 189.5° C and is frequently used as a condensing agent. Phosphorus pentachloride decomposes it into carbon monoxide and dioxide, the reaction being the one generally applied for the purpose of preparing phosphorus oxychloride. When heated with glycerin to 100° C it yields formic acid and carbon dioxide; above this temperature, allyl alcohol is formed. Nascent hydrogen reduces it to glycollic acid. Potassium permanganate in acid solution oxidizes it to carbon dioxide and water; the manganese sulphate formed has a catalytic accelerating effect on the decomposition.

Oxalic acid is very poisonous, and by reason of its great similarity in appearance to Epsom salts, it has been very frequently mistaken for this substance with, in many cases, fatal results. The antidotes for oxalic acid poisoning are milk of lime, chalk, whitening or even wall-plaster, followed by evacuation brought about by an enema or castor oil. Only the salts of the alkali metals are soluble in water. Beside the ordinary acid and neutral salts, a series of salts called quadroxalates is known, these being salts containing one molecule of acid salt, in combination with one molecule of acid, one of the most common being "salt of sorrel," $KHC_2O_4 \cdot H_2C_2O_4 \cdot 2H_2O$. The oxalates are readily decomposed on heating, leaving a residue of carbonate, or oxide of the metal. The silver salt decomposes with explosive violence, leaving a residue of the metal.

Potassium ferrous oxalate, $FeK_2(C_2O_4)_2 \cdot H_2O$, is a strong reducing agent and is used as a photographic developer. *Potassium ferric oxalate*, $FeK_3(C_2O_4)_3$, is used in the preparation of platinotypes, owing to the fact that its solution is rapidly decomposed by sunlight, $2FeK_3(C_2O_4)_3 = 2FeK_2(C_2O_4)_2 + K_2C_2O_4 + 2CO_2$. *Ethyl oxalate*, $(CO-OC_2H_5)_2$, prepared by boiling anhydrous oxalic acid with absolute alcohol, is a colourless liquid which boils at 186° C. *Methyl oxalate*, $(CO-OCH_3)_2$, which is prepared in a similar manner, is a solid melting at 54° C. It is used in the preparation of pure methyl alcohol (q.v.). *Oxalyl chloride*, a liquid boiling at 64° C (m.p. -12° C), has been obtained by the action of phosphorus pentachloride on anhydrous oxalic acid. *Oxamic acid*,

EUROPEAN BARN-OWL (*STRIX FLAMMEA*); THE AMERICAN BARN-OWL IS VERY SIMILAR

SPOTTED-OWL (*STRIX OCCIDENTALIS*) OF WESTERN U.S.

$\text{HO}_2\text{C}\cdot\text{CONH}_2$, is obtained on heating acid ammonium oxalate; by boiling oxamide with ammonia; and among the products produced when amino-acids are oxidized with potassium permanganate. It is a crystalline powder difficultly soluble in water and melting at 210°C (with decomposition). Its ethyl ester, known as oxamethane, crystallizes in rhombic plates which melt at $114\text{--}115^\circ\text{C}$. Oxamide $(\text{CONH}_2)_2$, is best prepared by the action of ammonia on the esters of oxalic acid. It is also obtained by the action of hydrogen peroxide on hydrocyanic acid, or of manganese dioxide and sulphuric acid on potassium cyanide. It is a white crystalline powder which is almost insoluble in cold water. It melts at $417\text{--}419^\circ\text{C}$ (with decomposition) when heated in a sealed tube (A. Michael, 1895). When heated with phosphorus pentoxide it yields cyanogen. It is readily hydrolysed by hot solutions of the caustic alkalis. Substituted oxamides are produced by the action of primary amines on ethyl oxalate.

OXALIS, in botany, a large genus of small herbaceous plants, comprising, with a few small allied genera, the family Oxalidaceae. The name is derived from Gr. $\acute{\alpha}\lambda\acute{\iota}\varsigma$, acid, the plants being highly acid to the taste. It contains about 300 species, chiefly South African and tropical and South American. It is represented in Great Britain and eastern North America by the wood-sorrel (*O. Acetosella*), a small, stemless plant with radical, trefoil-like leaves growing from a creeping, scaly rootstock, and the flowers borne singly on an axillary stalk; the flowers are regular with five sepals, five obovate, white, purple-veined, free petals, ten stamens and a central five-lobed, five-celled ovary with five free styles. The fruit is a capsule, splitting by valves; the seeds have a fleshy coat, which curls back elastically, ejecting the true seed. The leaves, as in the other species of the genus, show a "sleep-movement," becoming pendulous at night.

Besides the wood-sorrel, some 20 other species occur in North America, among which are the yellow wood-sorrel (*O. stricta*), of the eastern United States and Canada, with yellow flowers; the violet wood-sorrel (*O. violacea*), of the eastern United States,

WOOD SORREL (*OXALIS ACETOSELLA*)

with rose-purple flowers; the redwood wood-sorrel (*O. oregana*), of the coast redwood belt from California to Oregon with pink to white flowers and *O. cernua*, known as Bermuda buttercups, with showy yellow flowers, native to South Africa and naturalized in Florida and the Bermudas.

Oxalis crenata, the oca of South America, is a tuberous-rooted half-hardy perennial, native of Peru. Its tubers are comparatively small, and somewhat acid; but if they be exposed in the sun from six to ten days they become sweet and floury.

Oxalis Deppei, a bulbous perennial of Mexico, has scaly bulbs.

from which are produced fleshy, tapering, white, semi-transparent, edible roots, about 4 in. in length and 3 to 4 in. in diameter.

Various species are in cultivation as basket plants for window gardens, border plants and hot house ornamentals.

OXENSTJERNA, COUNT AXEL GUSTAFSSON (1583–1654), chancellor of Sweden, was born at Fönö, and was educated with his brothers at the universities of Rostock, Jena and Wittenberg. On returning home in 1603 he was appointed *kammerjunker* to King Charles IX. In 1606 he was entrusted with his first diplomatic mission, to Mecklenburg, was appointed a senator during his absence, and henceforth became one of the king's most trusted servants. In 1610 he was sent to Copenhagen to prevent a war with Denmark. This unsuccessful embassy marks the beginning of Oxenstjerna's long diplomatic struggle with Sweden's traditional rival in the north. Oxenstjerna was appointed a member of Gustavus Adolphus's council of regency. High aristocrat as he was, he would at first willingly have limited the royal power. An oligarchy guiding a limited monarchy was his ideal government, but the genius of the young king was not to be fettered. On Jan. 6, 1612, he was appointed chancellor. His controlling, organizing hand was speedily felt in every branch of the administration. For his services as first Swedish plenipotentiary at the Peace of Knäred, 1613, he was richly rewarded.

During the frequent absences of Gustavus in Livonia and Finland (1614–1616) Oxenstjerna acted as his vice-regent. It was his principal duty during the king's Russian and Polish wars to supply the armies and the fleets with everything necessary, including men and money. In 1622 he accompanied Gustavus to Livonia, where Oxenstjerna was appointed governor-general and commandant of Riga. His services in Livonia were rewarded with four castles and the whole bishopric of Wenden. He was entrusted with the peace negotiations which led to the truce with Poland in 1623, and succeeded, by skillful diplomacy, in averting a threatened rupture with Denmark in 1624. On Oct. 7, 1626, he was appointed governor-general of the newly-acquired Prussian province. In 1629 he concluded the truce of Altmärk with Poland. In 1628 he had arranged with Denmark a joint occupation of Stralsund, to prevent the fortress from falling into the hands of the Imperialists. After the battle of Breitenfeld (Sept. 7, 1631) he was summoned to assist the king with his counsels and co-operation in Germany. During the king's absence in Franconia and Bavaria in 1632 he was appointed *legatus* in the Rhine lands, with plenipotentiary authority over all the German generals and princes in the Swedish service.

Although he never fought a battle, Oxenstjerna was a born strategist. His military capacity was strikingly demonstrated by the skill with which he conducted large reinforcements to Gustavus through the heart of Germany in the summer of 1632. But it was only after the death of the king at Lützen that Oxenstjerna's true greatness came to light. He inspired the despairing Protestants both in Germany and Sweden with fresh hopes. He reorganized the government both at home and abroad. He united the estates of the four upper circles into a fresh league against the common foe (1634), in spite of the envious and foolish opposition of Saxony. By the patent of Jan. 12, 1633, he had already been appointed legate plenipotentiary of Sweden in Germany with absolute control over all the territory already won by the Swedish arms. No Swedish subject, either before or after, ever held such an unrestricted and far-reaching authority. Richelieu himself declared that the Swedish chancellor was "an inexhaustible source of well-matured counsels."

Less original but more sagacious than the king, he had a firmer grasp of the realities of the situation. Gustavus would not only have aggrandized Sweden, he would have transformed the German empire. Oxenstjerna wisely abandoned these vaulting ambitions. All his efforts were directed towards procuring for the Swedish crown adequate compensation for its sacrifices. Simple to austerity in his own tastes, he nevertheless recognized the political necessity of impressing his allies and confederates by an almost regal show of dignity; and at the abortive congress of Frankfurt-on-Main (March 1634), held for the purpose of uniting all the German Protestants, Oxenstjerna appeared in a carriage drawn

by six horses, with German princes attending him on foot. But from first to last his policy suffered from the slenderness of Sweden's material resources, a cardinal defect which all his craft and tact could not altogether conceal from the vigilance of her enemies. The success of his system postulated an uninterrupted series of triumphs, whereas a single reverse was likely to be fatal to it. Thus the frightful disaster of Nördlingen (Sept. 6th, 1634; see SWEDEN: History) compelled him to solicit direct assistance from France. But he refused at the conference of Compiègne (1635) to bind his hands in the future for the sake of some slight present relief. In 1636, however, he concluded a fresh subsidy-treaty with France at Wismar.

The same year he returned to Sweden and took his seat in the Regency. For the next nine years his voice, especially as regarded foreign affairs, was omnipotent in the council of state. He drew up beforehand the plan of the Danish War of 1643-1645, so brilliantly executed by Lennart Torstensson, and saw Denmark crippled by the Peace of Brömsebro (1645). His later years were embittered by the jealousy of the young Queen Christina, who thwarted the old statesman in every direction. He always attributed the exiguity of Sweden's gains by the Peace of Osnabrück to Christina's undue interference. Oxenstjerna was opposed at first to the abdication of Christina, because he feared mischief to Sweden from her appointed successor, Charles Gustavus. The extraordinary consideration shown to him by the new king ultimately, however, reconciled him to the change. He died at Stockholm on Aug. 28, 1654.

See *Axel Oxenstjernas skriften och brevveling* (Stockholm, 1888-1905); A. de Marny, *Oxenstjerna et Richelieu à Compiègne* (Paris, 1878); F. V. Wrangel, *Voyage en France d'Oxenstjerna* (1917); *Gabriel Gustafssons bref till Riks Konsler Axel Oxenstjerna, 1611-1640* (Stockholm, 1890).

OXENSTJERNA, COUNT BENGT OR BENEDICT GABRIELSSON (1623-1702) was the son of Axel Oxenstjerna's half-brother, Gabriel Bengtsson (1586-1656). After a careful education he began his diplomatic career at the great peace congress of Osnabrück. During his stay in Germany he made the acquaintance of the count palatine, Charles Gustavus, afterwards Charles X., whose confidence he completely won. Two years after the king's accession (1654), Oxenstjerna was sent to represent Sweden at the *Kreistag* of Lower Saxony. In 1655 he accompanied Charles to Poland and was made governor of the conquered provinces of Kulm, Kujavia, Masovia and Great Poland. The firmness and humanity which he displayed in this new capacity induced the German portion of them, notably the city of Thorn, to side with the Swedes against the Poles. During Charles's absence in Denmark (1657), Oxenstjerna, in the most desperate circumstances, tenaciously defended Thorn for ten months; the terms of capitulation were made the basis of the subsequent peace negotiations at Oliva. During the domination of Magnus de la Gardie he played but a subordinate part in affairs. From 1662 to 1666 he was governor-general of Livonia. In 1674 he was sent to Vienna to try and prevent the threatened outbreak of war between France and the empire, and he was one of the Swedish envoys to the Congress of Nijmegen (1676). From 1680 to 1697 he conducted the foreign relations of Sweden.

His leading political principles were friendship with the maritime powers (Great Britain and Holland) and the emperor, and a close anti-Danish alliance with the house of Holstein. Charles XI. appointed Oxenstjerna one of the regents during the minority of Charles XII. The martial proclivities of the new king filled the prudent old chancellor with alarm and anxiety. He advised Charles in vain to accept the terms of peace offered by the first anti-Swedish coalition. Oxenstjerna has been described as "a shrewd and subtle little man, of gentle disposition, but remarkable for his firmness and tenacity of character."

OXFORD, EARLS OF, an English title held successively by the families of Vere and Harley. The three most important earls of the Vere line are noticed separately below. The

Veres held the earldom from 1142 until March 1703, when it became extinct on the death of Aubrey de Vere, the 20th earl. In 1711 the English statesman Robert Harley was created earl of Oxford (q.v.); but the title became extinct in this family on the death of the 6th earl in 1853. It was revived in favour of H. H. Asquith who became earl of Oxford and Asquith (q.v.).

OXFORD, EDWARD DE VERE, 17TH EARL (in the Vere line) OF (1550-1604), son of John de Vere, the 16th earl, was born on April 12, 1550. He studied at Queen's and St. John's Colleges, Cambridge. He was known as Lord Bolebec or Bulbeck until he succeeded in 1562 to the earldom and to the hereditary dignity of great chamberlain of England. As a royal ward the boy lived under the care of Lord Burghley, who in 1571 gave him his eldest daughter, Anne, in marriage. Oxford wished for a military or a naval command, but Burghley hoped that he would win a high position at court. His accomplishments secured Elizabeth's favour, but he offended her by going to Flanders without her consent in 1574, and more seriously in 1582 by a duel with one of her gentlemen, Thomas Knyvet. In 1579 he insulted Sir Philip Sidney on the tennis-court at Whitehall.

Sidney challenged Oxford, but the queen forbade him to fight, and required him to apologize on the ground of their difference of rank. On Sidney's refusal and consequent disgrace Oxford is said to have schemed to murder him. The earl sat on the special commission (1586) for the trial of Mary queen of Scots; he took part in the trials of Philip Howard, earl of Arundel, for high treason in 1589, and of Essex and Southampton in 1601. In 1575 he brought back from Italy various inventions for the toilet, and his estate was rapidly dissipated in satisfying his extravagant whims. His first wife died in 1588, and from that time Burghley withdrew his support, Oxford being reduced to the necessity of seeking help among the poor men of letters whom he had befriended. He was a lyric poet of no small merit. His fortunes were partially retrieved on his second marriage with Elizabeth Trentham, by whom he had a son, Henry de Vere, 18th earl of Oxford (1593-1625). He died at Newington, near London, on June 24, 1604.

His poems, from various anthologies—the *Paradise of Dainty Devices*, *England's Parnassus*, *Phoenix Nest*, *England's Helicon*—and elsewhere, were collected by Dr. A. B. Grosart in vol. iv of the Fuller Worthies Library (1876).

OXFORD, JOHN DE VERE, 13TH EARL OF (1443-1513), was second son of John, the 12th earl, a prominent Lancastrian, who, with his eldest son Aubrey de Vere, was executed in February 1462. John de Vere the younger was himself attainted, but two years later was restored as 13th earl. But his loyalty was suspected, and for a short time in 1468 he was in the Tower. He sided with Warwick, the king-maker, in 1469, accompanied him in his exile next year, and assisted in the Lancastrian restoration of 1470-1471. As constable he tried John Tiptoft, earl of Worcester, who had condemned his father nine years before. At the battle of Barnet, Oxford was victorious in command of the Lancastrian right, but was ultimately defeated and escaped to France. In 1473 he organized a Lancastrian expedition, which, after an attempted landing in Essex, seized St. Michael's Mount in Cornwall. After a four months' siege Oxford was forced to surrender in Feb. 1474. He was sent to Hammes near Calais, whence, ten years later, in Aug. 1484, he escaped and joined Henry Tudor in Brittany. He fought for Henry at Bosworth, and was rewarded by restoration to his title, estates and hereditary office of Lord Chamberlain. At Stoke on June 16, 1486, he led the van of the royal army. In 1492 he commanded the expedition to Flanders, and in 1497 was foremost in the defeat of the Cornish rebels on Blackheath. Oxford was high steward at the trial of the earl of Warwick, and one of the commissioners for the trial of Sir James Tyrell and others in May 1502. He died March 10, 1513.

See *The Paston Letters*, ed. J. Gairdner; *Chronicles of London*, ed. C. L. Kingsford (1905); Sir James Ramsay, *Lancaster and York*; and *The Political History of England*, vols. iv. and v. (1906).

OXFORD, ROBERT DE VERE, 9th Earl of (1362-1392), English courtier, was the only son of Thomas de Vere, 8th earl of Oxford, and Maud de Ufford, a descendant of King Henry III. He became 9th earl of Oxford in 1371, and married Philippa (d.

1412), daughter of his guardian Ingelram de Couci, earl of Bedford, a son-in-law of Edward III. Already hereditary great chamberlain of England, Oxford was made under Richard II. a member of the privy council and a Knight of the Garter; while castles and lands were bestowed upon him, and he was constantly in the company of the young king. In 1385 Richard sent him to govern Ireland, but although preparations were made for his journey he did not leave England. The king's partiality for Oxford was one of the causes of the dissatisfaction of the barons. Oxford also made powerful enemies by divorcing his wife, Philippa, and by marrying a Bohemian lady.

The king, however, indifferent to the gathering storm, created Vere duke of Ireland in Oct. 1386, and gave him still more powers in that country. Richard was deprived of his authority for a short time, and Vere was ordered in vain to proceed to Ireland. He was then accused by the king's uncle Thomas of Woodstock, duke of Gloucester, and his supporters in 1387; and rushing into the north of England he gathered an army to defend his royal master and himself. At Radcot bridge in Oxfordshire, however, his men fled before Gloucester's troops and Oxford himself escaped in disguise to the Netherlands. In the parliament of 1388 he was found guilty of treason and condemned to death, but as he remained abroad the sentence was never carried out. With another exile, Michael de la Pole, duke of Suffolk, he lived in Paris until after the treaty between England and France in 1389, when he took refuge at Louvain. He was killed by a boar whilst hunting, and left no children.

OXFORD, ROBERT HARLEY, 1ST EARL OF (1661-1724), English statesman, commonly known by his surname of HARLEY, eldest son of Sir Edward Harley (1624-1700), a Herefordshire land-owner, was born in Bow street, London, on Dec. 5, 1661. His school days were passed at Shilton, near Burford, in Oxfordshire, in a small school which produced at the same time a lord high treasurer (Harley), a lord high chancellor (Simon Harcourt) and a lord chief justice of the common pleas (Thomas Trevor). The principles of Whiggism and Nonconformity were instilled into his mind at an early age, and if he changed the politics of his ancestors he never formally abandoned their religious opinions. At the Revolution of 1688 Sir Edward and his son raised a troop of horse in support of the cause of William III., and took possession of the city of Worcester in his interest. Young Harley then (1689) entered parliament for the "pocket" borough of Tregony. Later he sat for New Radnor, a seat which he held until his elevation to the peerage in 1711.

From the first Harley gave great attention to the conduct of public business, and from the general election of Feb. 1701 until the dissolution of 1705 he held the office of speaker. In 1704 he became a principal secretary of State for the northern department. In 1703 Harley first made use of Defoe's talents as a political writer, and this alliance with the press proved so successful that he afterwards called the genius of Swift to his aid in many pamphlets against his political opponents. While he was secretary of State the union with Scotland was effected. At the time of his appointment as secretary of State Harley had given no outward sign of dissatisfaction with the Whigs, and it was mainly through Marlborough's good opinion of his abilities that he was admitted to the ministry. For some time Harley acted loyally with his colleagues. But in the summer of 1707 it became evident to Godolphin that some secret influence behind the throne was shaking the confidence of the queen in her ministers. Abigail Hill, who was secure in the queen's confidence, was Harley's cousin, and his instrument in influencing the queen against her ministers. These bided their time, until an opportunity for Harley's overthrow was provided. A clerk in Harley's department divulged the contents of secret documents in his office, which should have been inaccessible to anyone but the chief, and the queen was thereupon informed that Godolphin and Marlborough could no longer serve in concert with him. They did not attend her next

council (Feb. 8, 1708), and the queen found herself forced (Feb. 11) to accept the resignations of both Harley and St. John.

Harley went out of office, but his cousin, who had now become Mrs. Masham, remained at court to further his interests. The cost of the protracted war with France, and the danger to the national church, the chief proof of which lay in the prosecution of Sacheverell, were the weapons which he used to influence the masses of the people. Marlborough himself could not be dispensed with, but his relations were dismissed from their posts in turn. When the greatest of these, Lord Godolphin, was ejected from office, five commissioners to the treasury were appointed (Aug. 10, 1710), and among them figured Harley as chancellor of the exchequer. It was the aim of the new chancellor to frame an administration from the moderate members of both parties, and to adopt with but slight changes the policy of his predecessors; but he failed. By an unexpected event, his popularity was restored at a bound. A French refugee, the ex-abbé de la Bourlie (better known by the name of the marquis de Guiscard), was being examined before the privy council on a charge of treachery, when he stabbed Harley in the breast with a penknife (March 8, 1711). On May 23, 1711, the minister became Baron Harley of Wigmore and earl of Oxford and Mortimer; and immediately afterwards lord treasurer and a Knight of the Garter.

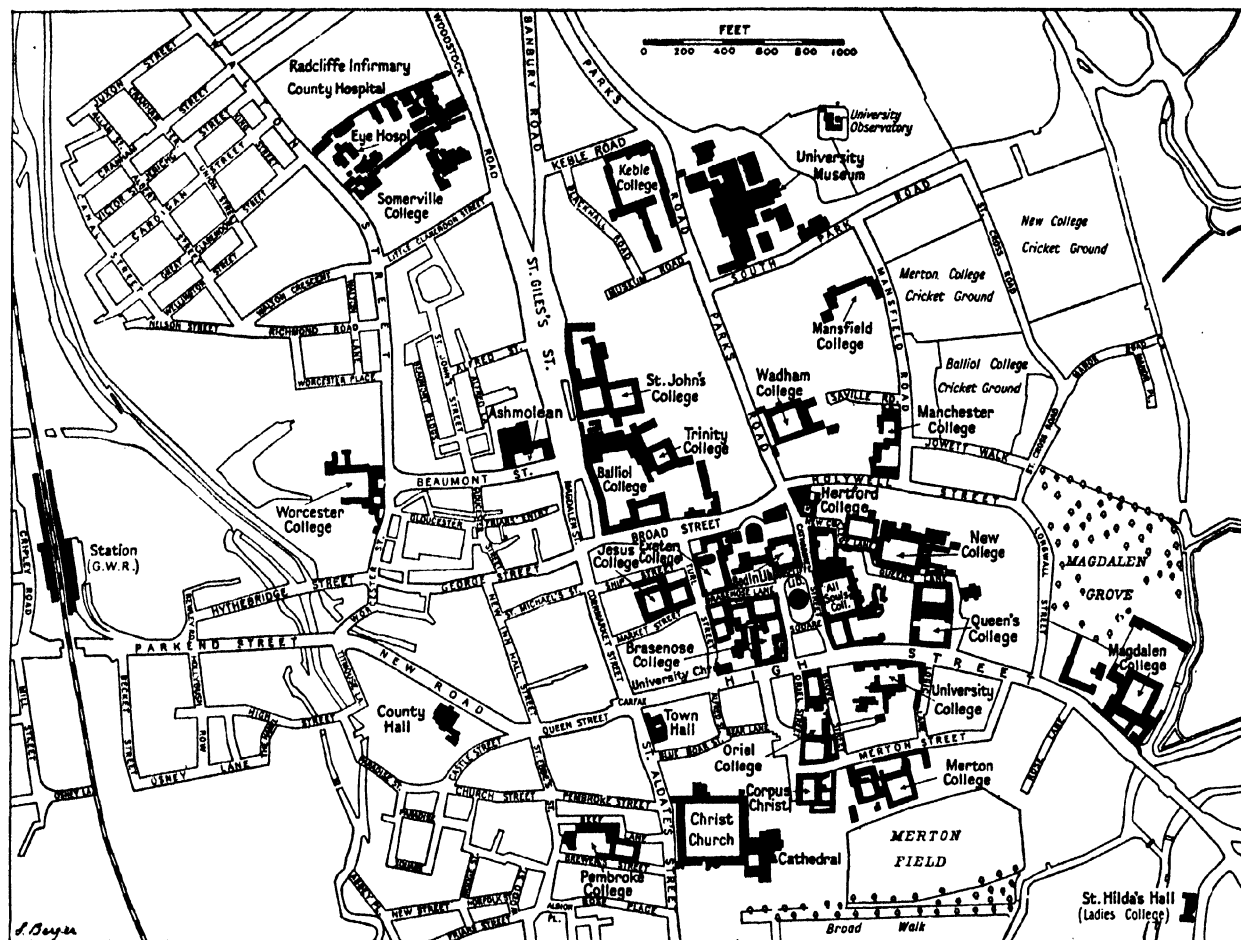

Oxford rearranged the nation's finances, and supplied resources for carrying on the campaign, though his emissaries were in communication with the French king, and were settling the terms of a peace independently of England's allies. After many weeks of vacillation and intrigue, the preliminary peace was signed, and in spite of the opposition of the Whig majority in the Upper House, which was met by the creation of 12 new peers, the treaty of Utrecht was concluded (March 31, 1713). While these negotiations were under discussion the friendship between Oxford and St. John, who had become secretary of State in Sept. 1710, was fast changing into hatred. The latter had resented the rise in fortune which the stabs of Guiscard had secured for his colleague, and when he received a viscounty instead of the expected earldom his resentment knew no bounds. Mrs. Masham deserted her cousin for his more vivacious rival. The Jacobites lost faith in his repeated promises. Queen Anne transferred her confidence from Oxford to Bolingbroke; and he surrendered his office a few days before the queen died.

On the accession of George I. the defeated minister retired to Herefordshire, but a few months later he was committed to the Tower (July 16, 1715). After an imprisonment of nearly two years he was released in July 1717, but he took little part in public affairs, and died almost unnoticed in London on May 21, 1724.

The books and the manuscripts which the first earl of Oxford and his son collected were among the glories of their age. The manuscripts became the property of the nation in 1753 and are now in the British Museum; the books were sold to a bookseller called Thomas Osborne in 1742 and described in a printed catalogue of five volumes (1743-45), Dr. Johnson writing an account of the library. A selection of the rarer pamphlets and tracts, which was made by William Oldys, was printed in eight volumes (1744-46), with a preface by Johnson. The best edition is that of Thomas Park, ten volumes (1803-13). In the recollection of the Harleian manuscripts, the Harleian library and the *Harleian Miscellany*, the family name will never die.

OXFORD, the county town of Oxfordshire, England, a municipal and parliamentary borough, cathedral city, and seat of an ancient university, lies on the river Thames, 51 m. by road and 63½ m. by rail W.N.W. of London (G.W. railway); main railways also to Worcester and Birmingham (G.W. railway); direct service also via Banbury to Leicester and Sheffield (L.N.E. railway), branch line L.M.S. to Cambridge crossing main line at

BY COURTESY OF HIS MAJESTY'S STATIONERY OFFICE

MAP OF OXFORD, SHOWING THE PRINCIPAL COLLEGES

Bletchley. The Thames is navigable below Oxford; there is a canal to the Avon valley and Birmingham; and numerous local road motor services. Population (1921), 57,036.

The site of Oxford is a low gravel terrace between the upper Thames and its tributary, the Cherwell, which meet in wide water meadows within a gap in a line of oolitic plateaux represented by Headington hill on the East and the twin crests of Cumnor Hurst and Wytham on the west. Though there are sparse Romano-British habitations on both sides of the valley, the Roman road northwards from Dorchester to Alchester lies far back to the east, and only a few finds betray a track across the valley from Headington towards Binsey. Oxford itself only becomes perceptible in Saxon times, in the church of St. Martin (whose dedication and some rude masonry in the tower mark its early date) close to Carfax (Lat. *quadrifurcus*, French *carrefour*) the intersection, in the heart of the city, of north-south and east-west roads. Eastward the High street crosses the Cherwell by Magdalen bridge, and offers alternative routes to London via Headington or Littlemore; southwards St. Aldate's, formerly Fish street, crosses the Thames (Isis) at Folly bridge, for Abingdon and Newbury; northwards, by Cornmarket, are the roads to Banbury and Woodstock; westward, Queen street leads round the south side of the Norman castle to Quaking bridge, over the mediaeval mill stream towards Osney: the modern New road, north of the castle, leads direct to the railway stations and Seven Bridges road for the upper Thames, and south-west England. Early traces are: (1) the Priory (afterwards Augustinian), commemorating St. Frideswide, a local heroine whose good works and adventures, about 720-740, touch also Binsey and Abingdon; of her original church there are arches near her shrine in the cathedral; (2) the

conspicuous mound raised (probably about A.D. 900) to command the passage from Mercia into Wessex; (3) Osney village, beyond the nearest channel of the upper Thames, whose name (Ousen-eye: "water-island") explains the Oksnaforda and Orsnaforda of 10th century Saxon coins, whence *Oxenford* and *Oxford* arose by assimilation to names like Swinford and Shefford. Upstream, between Osney, Binsey and Wolvercote, the "Port Meadow" is still held in common by the freemen of Oxford.

Oxford just appears in history when Edward the Elder, in A.D. 912, "held Lundenbyrg (London) and Osnaford and all the lands that were obedient thereto" as flanking fortresses of his Thames valley frontier. But the principal centres of the district were not here, but at Abingdon, commanding access to the Vale of White Horse, with an early and wealthy abbey, and Dorchester, similarly dominating the Thames valley, with its pre-Roman earthworks, and Saxon bishopric. River traffic bound for Oxford long paid toll to the abbot of Abingdon. However, several "gemots" were held at Oxford, under Edric, Canute, and Harold I.; and repeated devastation by the Danes (979, 1002, 1010, 1013) attests military and economic importance.

The Norman governor, Robert d'Oilo (d'Oily), incorporated the Saxon mound in a great fortress (1170-1219), of which one tower stands, and Bullock lane and St. Peter le Bailey mark the outworks; he built the Hythe bridge, which reveals the terminal wharfs of the river traffic; enclosed the town (partially "wasted" in Domesday) with walls of which foundations remain at the (north) Bocardo gate, the fine tower annexed to St. Michael's church. To d'Oilo's time belong the rebuilding of St. Frideswide's (the present cathedral dates mainly from the fire of 1120), St. Ebbs' near Carfax, St. Peter's, in the east, probably outside the first

OXFORD, FOUR OF ITS COLLEGES, AND A VIEW OF HIGH STREET

1. Oriel College, showing a corner of the quadrangle. 2. Bodleian library extending over upper storey of "Old Schools Building." 3. Christchurch from Merton Fields. "Tom Tower" built by Wren in centre, cathedral spire to right, hall and belfry to left. 4. General view of Oxford from the air. University Church (spire) Radcliffe Library (dome) and Bodleian

Library surrounded by college quadrangles. 5. Corner of Quadrangle of Corpus Christi College, showing entrance and sundial. 6. High Street, Oxford. At the left, University College. At the right, Queen's College, All Souls College, University church, Brasenose College and All Saints church beyond

east wall, and Holywell by the Cherwell beyond. His son Robert founded the splendid Osney abbey, beyond the castle (fragments in the cemetery beyond the G.W. railway). Outside the city, also, north of the cattle market in Gloucester Green, Henry I. built his Beaumont palace overlooking Osney and Port Meadow, and under his "Beau-clerc" patronage Theobald of Etampes already, about 1120, was teaching "60 to 100 clerks." As residence of the empress queen Maud, Oxford suffered siege by Stephen.

While domestic business was conducted between the Corn Market and the High, within the walls, the wool fair and strangers' market, outside the north gate, had, about 1200, a church of St. Giles, its patron. Beyond it lay the leper house (later St. Giles' parsonage), and east of it other establishments mainly for strangers, the Scots college of John de Balliol, Durham college (afterwards Trinity), a Cistercian house (afterwards St. Bernard's, then St. John Baptist's college); and, when Beaumont palace was granted by Edward II. to the Carmelites, the Benedictines occupied the site they had left with the older "cottages" of Worcester college. Other Cistercians built Rewley abbey beyond Hythe bridge; Dominican and Franciscan houses in the poorer south-west quarter leave their names in Blackfriar street, Preacher's bridge and Friars wharf; and the Austin Canons of St. Frideswide acquired endowments for teaching and added the Latin chapel to their church. By the mid 13th century then mediaeval Oxford had taken permanent shape. The walls were reconstructed, and probably extended from an older line in Cat street, to include St. Peter's in the east, with an East gate spanning the High near the hotel of that name, between the splendid north-east stretch of wall conserved by New college, and the south-east angle around Merton.

But before this, in the old north-east angle, now occupied by the Bodleian and Radcliffe libraries, "School street" traversed a kind of "Latin quarter" frequented by wandering scholars, whose *universitas* or guild comes into history with the visit of Giraldus Cambrensis in 1185, and the nomination of a chancellor in 1214. (See OXFORD UNIVERSITY.) On the south frontage of this resort of scholars, St. Mary's church became their meeting hall and lecture room; its bell tower and spire, congregation house and library were built about 1320; a new nave and aisles replaced, in 1388, the old Faculty chapels; and the Renaissance porch marks Archbishop Laud's reconstitution of the university, and still dates "*in parvo*" the certificates of satisfactory "responsions" of novices to the "masters of the schools" who controlled their admittance. For the history of this university, and the several fortunes of its colleges, see below.

The 13th century was the great age of mediaeval Oxford. Several parliaments were held here, notably the "Mad Parliament" of 1256, with its "Provisions of Oxford." But the growth of the university, and the wealth and influence of its colleges, were unfavourable to normal development as a mediaeval borough, with its guilds of craftsmen and traders. The "liberties" of the university, in relation with the city, were defined by charter in 1248, and revised in favour of the "chancellor, masters and scholars" after the town-and-gown riots of St. Scholastica's day, 1354-55, and other occasions; in 1523 the university was even allowed to incorporate all kinds of tradesmen, exempting them from civic jurisdiction. These unusual but once necessary provisions were only revoked or became obsolete with the modern transformation of the university itself, which retains, however, magisterial authority over its students, a censorship of public entertainments, and direct representation on the City Council and Guardians.

The Renaissance and the Reformation affected Oxford mainly through academical controversies, the foundation of a fresh series of colleges, and the creation by Henry VIII. of a bishopric, with St. Frideswide's church as its cathedral, and a chapter, the dean and canons of Christ church, economized out of Wolsey's "Cardinal college." But in the Civil War, Oxford's strategical importance made it the Royalist headquarters. The king retired hither after defeats at Edgehill, Newbury and Naseby; Prince Rupert made hence his raids in 1643. Not till May 1644 was the king forced by the concerted advances of the earl of Essex and Sir W. Waller to evacuate this fortress, and after Cropredy

bridge he re-occupied it. Only in May 1646, when all other strongholds were lost and Charles himself had escaped in disguise, was Oxford besieged by Fairfax and surrendered on June 24. The extent of the city at this time beyond the mediaeval wall is outlined by traces of the "Kings Mound," enclosing Holywell, Wadham college (1611) and St. Giles. Though the university was mainly Royalist, the citizens had been secretly Parliamentary; on both sides were losses, and party feelings were disastrous; and though Cromwell himself was chancellor (1651-57), his successor, Gilbert Sheldon, had much work to restore efficiency; his monument is the Sheldonian theatre, for the business and ceremonies of the reconciled masters; the Clarendon press and the Ashmolean museum, Christ church library and Peckwater quadrangle, large additions to New college and Magdalen, and the total rebuilding of Queen's college, are academical counterpart to a general rebuilding of mediaeval and Tudor Oxford, in the next half century. Though Charles II. held a parliament here in 1681, the restored Stuarts temporarily alienated university loyalty, but in the 18th century the university became Jacobite, and the city strongly Hanoverian. This feud, however, was reconciled at the visit of George III. in 1785, and Oxford passed out of national politics. The city, however, grew but little, until the reform of the university in 1858 admitted "married dons," while restricting membership of congregation to residents within 1½ m. from Carfax. The obstinate opposition of the university to Brunel's project for a "great western" railway system radiating from Oxford; and the restrictive policy of St. John's college, which owned almost all land north of St. Giles', had already aggravated urban congestion. The modern Oxford which emerged includes: (1) northward, a compact residential area, not wholly academic, along the Banbury and Woodstock roads beyond St. Giles', Keble, the Museum and laboratories, and the university parks and college playing fields; (2) eastward, beyond Magdalen bridge, the diverging roads to Marston, Headington, Cowley and Illey, already enclosed fan shaped suburbs mainly of small dwellings, when the establishment of the Morris motor works at Cowley introduced a new and strenuous element into Oxford's industrial life, hitherto almost confined to the Clarendon press and private printing firms, robe making and tailoring, and the distribution of local dainties, sausages, marmalade, and the like; (3) to west and south, "ribbon development" along the trunk roads has disfigured the water meadows without adding to health or convenience. The real suburban areas here lie beyond, around or upon the Boar's-hill-Cumnor-Wytham upland. The Oxford Preservation Trust, established almost too late in 1927, a town planning scheme, 1925, and a new Incorporation Act, 1928, are attempts to adjust to the strict and peculiar circumstances of the site and its past, the requirements of "post-war" Oxford, with its partially modernized university, its interminable "summer schools" and vacation-conferences, its growing industries, trade, and professional interests, and the perennial stream of tourists. (J. L. MY.)

OXFORD, a village of Butler county, Ohio, U.S.A., 40 m. N.W. of Cincinnati, at an altitude of 1,000 ft.; on Federal highway 27 and the Baltimore and Ohio railroad. Pop. (1920) 2,146. It is an educational centre, the seat of Miami university (chartered 1809, opened 1824) with which Oxford College for Women (1830) was consolidated in 1928; and the Western College for Women (1855). The students and faculty of the educational institutions outnumber the resident population. The village was founded about 1800.

OXFORD, PROVISIONS OF, the articles constituting a preliminary scheme of reform enacted by a parliament which met at Oxford on June 11, 1258. King Henry III. had promised on May 2 that the state of his realm should be rectified and reformed by 24 counsellors who were to meet at Oxford for this purpose five weeks later. Twelve of these counsellors were chosen by the king, and 12 by the earls and barons. When the parliament met the 24 drew up a provisional scheme of reform, known as the Provisions of Oxford. By this it was arranged that a council of 15, chosen by four of the 24, should be appointed to advise the king in all matters. The new council was to meet three times a year in parliaments to which 12 commissioners

were to be summoned to discuss the affairs of the realm on behalf of the whole community. Another body of 24 was appointed to treat of an aid. Desiring to limit the power of the king and his household officers, the barons determined to revive the justiciarship, in abeyance since 1234. But they did not want over-powerful great officials. It was therefore decided that one or two justiciars should be appointed for one year who should be paid, but should be accountable at the end of the year. The chancellor and treasurer similarly had to account; the sheriffs, too, were appointed for one year only. Enquiries into abuses were begun and further reforms were to be reported on by Christmas. The king declared his adhesion to the Provisions on Oct. 18.

Disputes broke out in the baronial party. Simon de Montfort, earl of Leicester, supported by Edward, the king's son, demanded the logical extension of the reforms in local government to include the baronial franchises. The earl of Gloucester opposed this. Forced by Edward, a second series of Provisions, known as the Provisions of Westminster, was issued in Oct. 1259. The quarrels among the barons encouraged Henry to break free. On April 13, 1261, a papal bull absolved him from his oath to observe the Provisions. After three years on the verge of civil war, both parties agreed to refer the question to the arbitration of Louis IX. of France, who formally annulled them on Jan. 23, 1264, but expressly declared that his decision was not to invalidate the privileges, liberties and laudable customs of the realm of England, which had existed before the time of the provisions.

Stubbs, *Constitutional History* (1873), and *Select Charters* (1870, several later editions); Charles Bémont, *Simon de Montfort* (1884); T. F. Tout, *Charters in the Administrative History of Mediaeval England* (1920); and E. F. Jacob, *Studies in the Period of Baronial Reform and Rebellion* (1925).

OXFORD AND ASQUITH, HERBERT HENRY ASQUITH, 1st EARL OF (1852-1928), born at Morley, Yorks., on Sept. 12, 1852. His origins were Liberal, Nonconformist and middle class in character. Joseph Dixon Asquith, his father, owned a cloth manufacturing business in Morley, and his mother was the daughter of William Willans, a Huddersfield merchant. His father died while he, his brother (who afterwards became a master at Clifton), and his sister were children, and the two boys were left in the care of an uncle in London, where they went to the City of London school, then under the able headmastership of Dr. Abbott. Upon him the future prime minister made a deep impression, and to him Asquith in after life was accustomed to express a great debt of gratitude. He won a Balliol scholarship, and at Oxford he took a Craven university scholarship and firsts in "Mods" and "Greats," became president of the Union and a fellow of his college.

Adopting the bar as a profession, he first attracted public notice by his defence of Cunninghame Graham and John Burns for their part in the riot in Trafalgar square, but it was the Parnell Commission, in 1889, in which he acted as junior to Sir Charles Russell, that established his legal reputation, his deadly cross-examination of the manager of *The Times* giving the first indication of the dramatic issue of the trial. His success at the bar was assured, and in the next year he took silk, but the law was only a stepping-stone to the political career that from boyhood he had always had in view. He had entered parliament as member for East Fife in 1886, and on the formation of the Gladstone Government in 1892 he was appointed home secretary. He had just previously sustained a heavy domestic blow by the death of his wife, Helen, the daughter of a Manchester surgeon, whom he had married in 1877 and by whom he had four sons and one daughter. In office, Asquith's great parliamentary gifts were at once apparent, and his administration of the Home Office was made memorable by the appointment of the first women inspectors, improvements in the administration of the Factory Acts, the stiffening of the machinery, and the passing of the Employers' Liability bill, which was rejected by the Lords, and of a Factory bill which became law. He was bitterly and most unjustly attacked in connection with the shooting of two miners by soldiers who were called in to deal with a strike at the Featherstone colliery. He did not summon the soldiers, and appointed

a commission immediately to enquire into the affair, but the legend that he was personally responsible pursued him, and for years his platform appearances were always greeted with cries of "Featherstone."

In 1894, while still at the Home Office, Asquith married a second time, his bride being the brilliant Miss Margaret ("Margot") Tennant, one of the daughters of the wealthy iron-master, Sir Charles Tennant. She was a prominent member of the most exclusive society circle, and the marriage very definitely changed the current of Asquith's social life, and in some measure affected his political relationships. The period was one of great disruption within the Liberal Party. The feud between the Rosebery and Harcourt groups was at its height, and after the fall of the Liberal Government in 1895, the conflict with the Boer republics divided the party into two hostile camps, the Liberal Imperialists, led by Lord Rosebery, and the pro-Boers led by Campbell-Bannerman. Asquith, who had returned to the bar, associated himself with the Rosebery group, which endorsed the Chamberlain policy. In this he was influenced, no doubt, by his confidence in Sir Alfred Milner, who had been his friend from his Balliol days, and who had become the instrument of British policy in South Africa. When the Boer controversy culminated in war, it seemed that the quarrel between the Roseberyite and Campbell-Bannerman factions must result in permanent separation, and the formation of the Liberal League, of which Lord Rosebery was president and Asquith vice-president, apparently put reconciliation out of the question.

From this catastrophe the Liberal Party was saved by the raising of the Tariff Reform issue. On this subject Lord Rosebery spoke with an equivocal voice, but Asquith at once became the most formidable protagonist of Free Trade. The discussion of the subject became largely a duel between him and Chamberlain, and the series of speeches he delivered throughout the country were among the most conspicuous triumphs of his career. It restored him to the full confidence of the party, and when Campbell-Bannerman formed his Government at the end of 1905 his appointment as chancellor of the exchequer was a matter of course. The moderation of his temper, and the entirely public-spirited motives that always inspired him contributed to the return of harmony within the party, and his achievements as chancellor established his claim to the succession to the premiership. His record at the Treasury, culminating in his final budget, which inaugurated old age pensions, gave him a place among the most illustrious chancellors in history. On the resignation of Campbell-Bannerman, through illness, in 1908, Asquith became prime minister by universal consent, with Lloyd George as chancellor of the exchequer. No prime minister since Pitt had been called upon to face such grave issues as those which confronted Asquith at the beginning and developed as his long term of office—the longest of any prime minister since Lord Liverpool—advanced. A new mood of revolt filled the labour world with unrest and menace, the long struggle for the enfranchisement of women had passed out of the academic phase into a phase of unprecedented and almost fantastic violence, the sky over Europe was visibly darkening with the naval activity of Germany, and over and above all two capital issues reached a crisis—the issue of the House of Lords and the issue of Ireland. It was the first of these two questions that first tested the stuff of which the new prime minister was made. The budget of 1909, which dealt with the taxation of land, was rejected by the House of Lords. Asquith appealed to the country against its rejection in Jan. 1910, and his Government was reinstated, though only with the support of Labour and the Irish members. He addressed himself forthwith to the question of the abolition of the veto of the House of Lords, and during the summer made efforts to reach a pacific solution of the question by compromise. But the conference with the Opposition leaders broke down, and in the following December he appealed once more to the country and was once more returned—this time with a majority over the opposition of 126.

The opening of the session of 1911 may be taken as the crowning moment in Asquith's public career. The issue of the constitutional struggle with the Lords was not yet decided, but it was

no longer in doubt. The decisive mandate which the country had given in December dictated the issue that immediately occupied the new parliament. A bill abolishing the veto of the House of Lords was introduced into the House of Commons and passed all its stages by the beginning of the summer. But the final struggle had yet to come. The battle had still to be won in the Lords and there the opposition were entrenched in overwhelming power. Ever since the emergence of the issue it had been evident that the attainment of Asquith's goal depended on whether he could in the last resort invoke the authority of the Crown to dilute the House of Lords with new peers sufficient to change its complexion. The question was answered on July 20. The Parliament Bill, then in the House of Lords undergoing its second reading, was so amended as to deprive it of any utility for the purpose for which it was framed. Asquith therefore addressed to Balfour, the leader of the Opposition, a letter stating that the Government had decided, if the bill in its essential form could be passed in no other way, the Crown would be advised to create a sufficient number of peers to ensure its passage, and that the Crown had signified its willingness to accept such advice. The publication of this letter aroused an unprecedented storm, and on July 24, on rising in the House of Commons to make a statement, Asquith was greeted with a demonstration without parallel in living memory. For the best part of an hour he stood speechless before the roar of anger that issued from the Opposition benches, and at last resumed his seat without having uttered a continuous sentence. What became known as "the pothouse brawl" inaugurated the last stage of the struggle. The Government was accused of "dragging in the King," and the Opposition organized an uncompromising resistance in the belief that they would not dare to carry their threat into execution. But on Aug. 10, when the final debate was taking place in the House of Lords, Lord Morley confirmed the Government's previous intimation of His Majesty's intention. Up to this point the "Die-Hards" seemed to be assured of a majority, but in the division they were defeated. The bill was passed. On Aug. 18 the Parliament Act received the Royal Assent.

From this victory Asquith proceeded to his next great task, with the ground sensibly cleared for action. Gladstone's successive Home Rule adventures had broken on the rock of the Lords' veto; that rock no longer obstructed the channel. But before the Irish issue was fully launched another controversy absorbed the prime minister's activities. Discontent had long been growing prevalent in the mining industry, and at the end of Feb. 1912, having failed to secure the concessions and advances they demanded, the miners' union declared a strike. Vast dislocation followed. From the outset the Government endeavoured to bring the conflicting parties to agreement and Asquith took on himself the personal charge of the negotiations. After a month's fruitless efforts, the Government thereupon introduced the Miners' Minimum Wage Bill, which, by providing a half-way solution, forced the hands of both sides and brought the immediate struggle to an end, although the issue incidentally raised—that of the reorganization and control of the coal industry—was to perplex parliament and the country for many years to come.

Meanwhile, the Home Rule Bill had been introduced and passed through the House of Commons, while the Parliament Act provided adequately against the resistance of the House of Lords. That House fought the delaying action, which was all the Opposition now had in its power, by rejecting the bill in two successive sessions. After its next passage through the Commons it would have overridden opposition and automatically become law. By this time, however, the opposition to the measure had taken an extra-parliamentary shape. The Ulster Covenant had been promulgated in the previous September and talk of open rebellion, should Home Rule be passed, was already current. In June arms had been discovered both at Belfast and Dublin. As the year wore on the outlook became still more serious and a speech by Bonar Law, the leader of the Conservative Party, at Blenheim, seemed to give encouragement to the idea of resistance by force. On Sept. 25 the Ulster Unionist Council appointed a Provisional Government and prominent Conservatives openly preached armed resistance; Sir Edward Carson, the leader of the Ulster Unionists,

left no doubt that in the last resort Ulster would fight.

With the close of the session of 1913 there came a brief lull, and during the recess conversations with the Opposition leaders were opened by Asquith, who throughout preserved an attitude of patience and forbearance. It will always be matter for controversy whether, when the policy of violent resistance had been adopted, he was justified in ignoring so direct a challenge to constitutional government. His natural disposition was to allow the utmost scope for the play of discussion and the influence of the time element; but it is an open secret that he would have taken up the challenge but for the persuasions of John Redmond, the leader of the Irish Nationalists, who believed that the prosecution of the Ulster leaders would prejudice the prospects of friendly relations with Ulster when Home Rule was actually on the statute book. In any case, the conversations of the autumn were futile, and on March 9, 1914, the Government announced the provisions of their amending bill, their last word of compromise. The chief provision of this bill was that any county in the north of Ireland was to be allowed to vote itself out of the operation of Home Rule for a period of five years.

The offer was rejected by the Opposition and now events rushed forward to an apparently unavoidable catastrophe. On the night of April 24-25, 55,000 rifles were landed at Larne from a German port for the use of the Ulster army. On the other side of the border the Nationalists were beginning to enrol a volunteer army and to make counter-preparations. Meanwhile a more sinister menace appeared. In the debate on the vote of censure on the Government on March 19 Bonar Law, speaking on the Home Rule issue, had used the ominous phrase "soldiers are citizens like the rest of us." There had been much talk of disaffection in the army in regard to the coercion of Ulster, and on March 20 it took shape in the Curragh incident (*see IRELAND; IRELAND, NORTHERN*), which led to the resignation of Col. Seely, the secretary for war. For a moment it seemed that the loyalty of the army was imperilled and the situation that confronted the Government looked desperate. But the announcement by Asquith next day that he would assume the secretaryship for war created a profound impression in parliament and stopped for the time being, at all events, what had seemed like a riot in the army. Following the mutilation of the amending bill by the House of Lords and Sir Edward Carson's challenge to the Government to "give us a clean cut or come and fight us," the king, on Asquith's advice, summoned a conference at Buckingham Palace on July 20 to see if some agreement was still not possible. It broke down four days later and the last hope of avoiding violence seemed gone.

What Asquith would have done to avert a civil war while maintaining the authority of the Constitution was not to be revealed, for on the day that the Buckingham Palace Conference broke up Austria sent her ultimatum, and within ten days the British army was embarking, not for Ulster, but for Flanders. In the feverish struggle within the Cabinet that preceded the entry of Great Britain into the World War Asquith's position was never in doubt. He had throughout been a party to the ambiguous military understandings and conversations which had been in progress with France since before the fall of the Balfour Government in 1905, and when the war came he did not waver in his conviction that both the duty and the interest of the country lay in throwing the country's whole weight into the scales against what he considered to be the calculated design of the Central Powers to establish a military despotism over Europe.

The invasion of Belgium by Germany saved his Government from disruption, and he addressed himself, free from domestic disquietudes, to the heaviest task ever imposed on a British prime minister. For the moment even the Irish trouble subsided, all political differences were shelved and Asquith became the voice of a united nation in a measure unequalled in modern Parliamentary history. The speeches he delivered in the early days of the war have taken their place beside the classic orations of Pitt during the Napoleonic wars, and his constancy of mind and freedom from all personal ambition played a dominating part during the next two years in laying the foundations of the ultimate victory. It was not to be expected that in the presence of so vast a con-

vulsion discontents would not develop. They became clamant as the true character of the struggle emerged. Asquith had made no change in the political constitution of his cabinet at the outbreak of war, although he had taken the leaders of the Opposition into his confidence and private counsels, but by the spring of 1915 it became clear that this informal relation would have to yield to a formal coalition.

In February Bonar Law and Lord Lansdowne intimated that they could accept no responsibility for the way in which the war was being conducted, and in the popular press a powerful and ceaseless agitation arose, directed mainly against Asquith, Grey and Haldane, and inspired by the inevitable shortage of munitions which the progress of the war had revealed. Coincidentally, a violent disagreement as to the employment of the navy in the Gallipoli adventure had arisen between Churchill, the first lord of the Admiralty, and Fisher, the first sea lord, and on May 26 Asquith reformed his cabinet on a coalition basis, bringing in the leaders of the Opposition and excluding Haldane. To meet the growing need for munitions, a special Ministry of Munitions was set up with Lloyd George at its head.

The reconstruction of the Ministry did not allay dissatisfaction. Within the cabinet friction developed, and, outside, the press agitation grew in violence. There was a persistent leakage of cabinet secrets, certain newspapers betraying a knowledge of most confidential Government business with such regularity as to suggest inspiration. A phrase, "Wait and See," which Asquith had used in reply to a question in the House of Commons years before, became the daily gibe of the malcontent press, and Sir Edward Grey, then in the midst of the most delicate situation with the United States, was accused of "feeding Germany" because of his attitude on the subject of contraband from America. The war-weariness that had overtaken the country provided an atmosphere in which this propaganda of discontent flourished, and the prime minister was the easier target for attack because he neither "squared" the press nor hit back at his critics. The inevitable rupture came in the autumn of 1916, when the German raid into Rumania—now seen in its true proportions—served to drive home the attack, and when Asquith was severely stricken by the loss of his eldest son in the war.

It arose over a question of cabinet reorganization. For some time the formation of an inner cabinet had been under discussion. At the beginning of Dec. 1916 Lloyd George, who upon the death of Kitchener had become secretary for war and whose prestige with the press had long been in the ascendant, submitted a definite scheme for the formation of such a body. From this body the prime minister was to be excluded. His right to control policy was not challenged, but he would not direct the deliberations of the inner cabinet. The *coup* burst upon the country with the announcement of the popular newspapers that Lloyd George was "packing up" in sheer despair at the inefficient conduct of the war. His highly confidential challenge to the position of Asquith was under consideration when an article appeared in *The Times* (then owned by Northcliffe) giving full details of the supposed arrangements and suggesting that Asquith had already agreed. Lloyd George denied any knowledge of this article; but Asquith, after consulting with his friends, decided to reject the proposal. Upon this Lloyd George resigned, and his resignation being followed by that of other influential members of the cabinet—including some who hoped that their action would give the prime minister the opportunity of reforming his cabinet on a new basis—Asquith informed the King that he could no longer be responsible for carrying on the business of government; and within a few days the second Coalition Government was formed with Lloyd George as prime minister. (See ENGLISH HISTORY: 1901-28; WORLD WAR.)

Thus ended Asquith's long and memorable tenure of the premiership. For the remainder of the war he occupied a seat in the front Opposition bench, speaking rarely and only on occasions when the interest of the nation seemed to demand his intervention. At the election of 1918, when Lloyd George swept the country with an appeal for the maintenance of the Coalition, he did not escape the general wreck of the Liberal Party, losing the seat of East Fife, which he had held throughout his parliamentary career.

In 1920 he returned to the House of Commons as member for Paisley and resumed his position as head of the remnant of the succeeding parliaments. In 1924, after an election fought on the issue of protection, he, as the head of a pivotal majority, was responsible for the accession to power of the first Labour Government, and later in the year for the Government's overthrow on a question of alleged governmental interference with the prosecution of a communist. At the next election he was defeated and retired to the Lords as earl of Oxford and Asquith.

Other honours were conferred on him. He became a member of the judicial committee of the privy council, a knight of the garter and a fellow of the Royal Society. After he entered the House of Lords he rarely intervened in public discussion. But at the outbreak of the General Strike in 1926, he urged the paramount duty of concentrating on the struggle against the "coercion of a new dictatorship," though he blamed the Government for not taking steps during the preceding nine months to make constructive proposals for the coal industry. Some recrimination followed, and there was a split in the Liberal Party (*q.v.*). He still retained the leadership of the Liberal Party, to which Lloyd George had now returned. But on the outbreak of the General Strike in 1926 a sharp difference appeared in the attitude of Lord Oxford and Lloyd George towards the event, and the latter declined to consult his colleagues. Lord Oxford thereupon formally intimated that he could have no political relations with him, and as the result of the consequent breach Oxford retired from any active part in the affairs of the party which he had led for 18 years. In his retirement he devoted himself to writing a book of reminiscences and reflections, under the title of *Fifty Years of Parliament*, and in the autumn of 1927 he also published a volume of his speeches. Thereafter his health gave way and he died on Feb. 15, 1928, being buried, according to his wish, in the churchyard of All Saints church, Sutton Courtney, Oxfordshire, where he had long had a country home.

Asquith will take his place among the most illustrious of British prime ministers, not merely by virtue of the momentous events in which he played a part, but still more because of his remarkable parliamentary gifts. In this respect he was in the true succession to Gladstone. He had little of the Sinaitic fervour of that great man, but he was not inferior to him in his mastery of the House of Commons. That mastery was achieved, not by emotional passion, but by the force, direction and lucidity of his speech, the intellectual sovereignty that he exercised over his audience, and the qualities of a plain, unaffected character and a singularly dispassionate mind. No man who ever played a great part in affairs was more conspicuously free from the common vices of public life. If he was ambitious it was only the ambition of conscious power directed to public ends. He was the least egotistic of men, and his magnanimity almost bordered on weakness. He was so little of a demagogue that he seemed to avoid rather than invite popular applause, a character to which a certain temperamental shyness contributed. His loyalty to his colleagues, even when they were lacking in loyalty to him, was one of his most striking attributes, and he was so indifferent to his own interests that he not only allowed the praise that belonged to himself to be appropriated by others, but often assumed the burden of mistakes which others had committed. He was the antithesis of that 18th century statesman of whom it was said that if there was credit to be got no one was so skilful in wriggling in, and if there was discredit to be borne no one was so skilful in wriggling out. He bore the odious slanders and insults of a demented press during the war with a certain proud and indifferent scorn, and his bearing both in private and public after the consummation of the intrigues against him was a model of dignity and public spirit. He was never betrayed into violent speech, and if his passion were roused, it was roused, not by personal issues, but by the outrages against public law and the sanctity of constitutionalism. He shared with the younger Pitt the view that the greatest quality in statesmanship was patience, and in all the perplexities with which he had to deal he exercised that quality to the utmost. He would never force a situation while there was a hope that a reasonable and pacific solution could be found. This confidence in the beneficent

operation of rational processes led many to suspect him of weakness, and it is undoubtedly true that there was in him an indisposition to anticipate events or to indulge in the histrionics of statesmanship. But on vital issues he was adamant, and his judgment on all great matters was never vitiated by the smaller considerations of personal and irrelevant motives. His mind moved in the undistracted orbit of a deeply considered philosophy of government, and it may be said of him, as of another, that if he was sometimes on the wrong side, he was never on the side of wrong. He will live in history not only as one of the most illustrious of British premiers but as a type of all that is best in the English character.

The general affection and regard in which Oxford was held was shown by the gift, in 1927, from 17 of his friends and admirers, including some Conservatives, of a capital sum and an income for life. By his first marriage he had four sons and one daughter. Raymond Asquith, his brilliant eldest son, was killed in action in 1916. By his second marriage he left a son, Anthony, and a daughter, Elizabeth, Princess Bibesco. He was succeeded in the earldom by his grandson, Julian, only son of Raymond Asquith.

OXFORD AND ASQUITH, MARGOT, COUNTESS OF, the sixth daughter of Sir Charles Tennant, 1st Bart., married, in 1894, as his second wife, H. H. Asquith, later the Earl of Oxford and Asquith (*see* p. 990). Before her marriage she was well known as a member of the coterie known as the "Souls," and maintained her reputation as one of the wittiest and most brilliant women in London society. In 1922 she published *The Autobiography of Margot Asquith* (2 vol.), which reflected the natural frankness of her character. It is a valuable chronicle of the time. After its publication she undertook a lecture tour in America.

Her other works include *Places and Persons* (1925), *Lay Sermons* (1927) and a novel *Octavia* (1928).

OXFORDSHIRE or **OXON**, a south-east midland county of England, bounded north-east by Northamptonshire, north-west by Warwickshire, west by Gloucestershire, south-south-west and south east by Berkshire and east by Buckinghamshire. It was originally part of the Mercian kingdom, but its boundaries, except for the Thames on the south (71 m. from Kelmscot near Lechlade, Gloucestershire, to Remenham below Henley-on-Thames, with the exception of two points near Oxford) are artificial. They were slightly changed by act of William IV. and Victoria to extend the area of the county (755.7 sq.m.). The 14 Oxfordshire Hundreds include five of the Chiltern Hundreds, the jurisdiction over which belonged to the manor of Benson, and in 1199 to Robert de Harecourt. The county encloses small portions of Berkshire (in Bampton Hundred) and of Buckinghamshire (in Ploughley Hundred).

Structure and Topography.—The county lies across the central portion of the Jurassic and Cretaceous outcrops. The strike of the strata is in each case from north-east to south-west, for Tertiary movements have tilted them gently down to the south-east so that the transition from north-west to south-east is from older to newer rocks passing in succession from the Lias over the Lower, Middle and Upper Oolite to the Lower Greensand, Gault, Upper Greensand and Chalk. In the north-west, the Marlstone of the Middle Lias and the Limestones of the Oolitic series are permeable and relatively resistant, and the Marlstones and the Inferior Oolite rocks being specially hard, stand out as a sharp north-west edge, continuing the line of the Cotswolds at a lower level (average 500 ft.), but rising to 700 ft. in Edge Hill in the north-east of the county. In the south-east, the chalk is also permeable and resistant, and the hard chalk-with-flints crowning the Chilterns also presents a sharp edge to the north-west.

Between these two upland regions the intermediate geological series forms a broad vale (20 m.) of alternating clays and calcareous, sandy beds. The Upper Greensand forms a low feature at the foot of the chalk hills; this is succeeded by the Gault, with width of outcrop varying from 4 m. to 1½ m. between Dorchester

and Sydenham. The lower Greensand appears from beneath the Gault at Culham and Nuneham Courtney and in outliers north of Cuddesdon; Portland limestone, Portland sands and Purbeck beds lie between it and the Kimmeridge clays, which outcrop between Sandford and Waterperry. Coral Rag is traceable from Sandford to Wheatley and beyond this comes a broad outcrop of Oxford clay followed by the Cornbrash (a brownish rubbly limestone). This outcrops at Norton Bridge, Woodstock and Shipton, forms a broad plateau between Middleton Stoney and Bicester, and also occurs as inliers at Islip, Charlton, Merton and Black Horse Hill. The county lies almost wholly in the basin of the upper Thames, in which the significant drainage is that of the Cherwell-Thames. The drainage pattern as a whole, consists of numerous consequent streams from the scarplands (Evenlode, Windrush, etc.), which have been captured and diverted into the Cherwell-Thames by powerful subsequent streams (Ock, Upper Thames, Ray, Thame), working along lines of weakness in the strike of the rocks, obsequent streams flowing down the scarp edge often being a further result of the capturing.

The Cherwell occupies a broad sag between Edge Hill and the Northampton Uplands. It flows south-south-east, joins the Thames coming from the west at Oxford, after which the combined stream continues the south-south-east direction, passing by a deep gorge through the chalk between Wallingford and Reading. That the gap must have originated north-west of its present position is argued from the fact that the level of the river bed at this point is 100 ft. while that of the hills on either side is 700-800 feet. It is an old, but rejuvenated drainage system, which, working upon calcareous rocks, has given rise to a characteristic topography; streams graded to base level but with very steep-sided upper valleys and wide intervening spaces between the head streams that have no surface streams; broad main valleys from which streams have disappeared, or where drainage is beneath the surface; misfit streams, due to capture by the river Severn of an earlier drainage to the Thames from the Welsh plateau, or to carving out of valleys by flood waters following the retreat of the ice. There is little glacial drift except in the north-east of the county. Gravel deposits, both plateau (North Leigh, Combe, Tiddington, etc.) and flood plain (Bampton, Oxford, Dorchester, etc.), are very important; tracts of clay-with-flints, brick-earth and gravel, as well as outliers of the London clay (Nettlebed, Caversham, etc.) occur on the dip slope of the chalk.

History and Early Settlement.—The bare Lias and Oolite uplands and the flood plain gravels were sites of late Neolithic settlement, as witness numerous Long Barrows (characteristic of the Cotswold area) as far east as the Cherwell. The Rollright stones (probably Neolithic) on the Oolite scarp need special mention. Quantities of bones of cattle, pigs, sheep, etc., are found in the gravels, and pottery (characteristic of the Wash area) is distributed east of the Cherwell-Thames line. Settlement on the dip slope of the Chilterns was debarrd by forests, as also in the forested north-eastern portion of the county, but the Icknield Way, generally on the Greensand, and the Ridgeway, on the Chalk above, followed the scarp face to the Thames crossing, forming parallel routes to a trackway along the limestone uplands. An influx of the people who made Beaker pottery is indicated for the region between the Evenlode and the Windrush and on the valley gravels (Eynsham, Stanlake, Brighthampton, Oxford, Burcot, Dorchester, etc.). In the Iron Age camps were established along the same routes (*e.g.*, Chastleton, Tadmarton). During the Roman period the area was thickly populated and roads were made linking Alchester and Dorchester in the Cherwell-Thames with Towcester (Northamptonshire) to the north and Silchester (Hampshire) to the south. Alchester was also connected by Akeman Street with Verulamium (Hertfordshire) to the east and Cirencester (Gloucestershire) to the west. The Saxon settlements are noticeably on valley sites, occupied in pre-Roman times, and these have continued as nucleated settlements to the present day; isolated farms are noticeably on plateau or vale from which forest was cleared comparatively late. In the 6th century the West Saxons took Benson and Eynsham. (*See the Saxon Chronicle* for 571.)

In the 7th century the Mercians held all the northern border of

the Thames, and during the 8th century this district fell to Wessex after the battle of Burford, and to Mercia after a battle at Benson, when it was included in the diocese of Lincoln. The bishopric at Dorchester given to Birinus (the apostle of Wessex), 634, seems to have come to an end on the establishment of the see of Winchester. Before the Mercian conquest in 777 Oxfordshire was in the diocese of Sherborne. In 873 the jurisdiction of Dorchester reached to the Humber, and when the Danes were converted it extended over Leicestershire and Lincolnshire, Oxfordshire forming about an eighth of the diocese. In 1092 the seat was transferred to Lincoln. In 1542 a bishopric of Osney and Thame was established, taking its title from Oxford, the last abbot of Osney being appointed to it. In 1546 the existing bishopric of Oxford was established. The ecclesiastical boundaries remain as they were when archdeacons were first appointed—the county and archdeaconry being coterminous—and the county being almost entirely in the diocese of Oxford.

The Danes overran the county during the 11th century; Thorkell's army burnt Oxford in 1010, and the combined armies of Sweyn and Olaf crossed Watling Street and ravaged the district, Oxford and Winchester submitting to them. At Oxford, in 1018, Danes and Englishmen chose Eadgar's law. Here also Harold allowed Tostig to be outlawed and Morkere to be chosen earl in his place, thus preparing the way for his own downfall and for the Norman Conquest. The destruction of houses in Oxford recorded in the Domesday Survey may possibly be accounted for by the ravages of the rebel army of Eadwine and Morkere on this occasion. Large possessions in the county fell to the Conqueror, and to Odo, bishop of Winchester. The bishop of Lincoln and many religious houses (*e.g.*, Abingdon, Osney and Godstow) held much land in the county. Robert D'Oiloi, heir of Wigod of Wallingford, held many manors and houses in Oxford, of which town he was governor. The importance of Oxford was already well established; the shire moot there is mentioned in Canute's Oxford laws, and it was the seat of the county court from the first, the castle being the county gaol. For events between this period and the Civil War see OXFORD (city). The dissolution of the monasteries, though it affected the county greatly, caused no general disturbance.

When King Charles I. won the battle of Edgehill (Oct. 23, 1642), Oxford at once became the stronghold of the royalist cause. For the campaign of 1643 its rôle was to detain the main parliamentary army until the royalists from the north and the west could come up, after which the united forces were to close upon London. More than once, notably at Chalgrove Field (June 18, 1643), Prince Rupert's cavalry struck hard and successfully. In the campaign of Newbury skirmishes took place as the parliamentary troops under Essex passed through north Oxfordshire on their way to the relief of Gloucester, and at the close of the campaign the fortresses of the county offered the defeated royalists a refuge which Essex was powerless to disturb. In the following campaign Charles abandoned the idea of an envelopment and decided to use Oxfordshire as the stronghold from which to strike in all directions. Material wants made it impossible for Charles to maintain permanently his central position, and eventually Essex headed for the south-west, leaving Waller to face the king alone. The battle of Cropredy Bridge followed (Jan. 29), and the victorious king turned south to pursue and capture Essex at Lostwithiel in Cornwall. In the operations of 1644 Oxfordshire again served as a refuge and base (Newbury and Donnington).

On the appearance of Cromwell and the New Model army a fresh interest arose. Leaving Windsor (April 20, 1645), the future Protector carried out a daring cavalry raid. He caught the royalists unawares at Islip, pursued the fugitives to Blenheim and forced the governor to surrender. He swept round Oxford, fought again at Bampton, and rejoined Fairfax, in Berkshire. A few days later Charles again marched northwards, while Fairfax was ordered to besiege Oxford. Charles was compelled to turn back to relieve the city, and the consequent delay led to the campaign and disaster of Naseby. Yet even after Naseby Oxfordshire still retained its importance, but in 1646 the Roundheads closed in from all sides and Stow-on-the-Wold witnessed the final battle of the war. On May 9 Banbury surrendered, on June 24

Oxford capitulated, and three days later Wallingford, the last place to give in, followed its example.

Architecture.—The limestone of the Oolite series has provided beautiful material for both ecclesiastical and domestic architecture, the castles, of which there are few, were probably built for temporary defence in the civil strife of Stephen's reign (1100–1135). Considerable portions of the Norman Oxford castle survive, and slighter remains of the castle at Bampton, the seat of Aylmer de Valence in 1313. Among remains of former mansions Greys Court near Henley-on-Thames (14th century), Minster Lovell, on the Windrush above Witney, and Rycote, between Thame and Oxford may be noted. Minster Lovell was the seat of Francis, Lord Lovel, the son of a Lancastrian who incurred the hatred of that party by serving Richard III.; he afterwards aided Lambert Simnel, and mysteriously disappeared after the battle of Stoke. Rycote is of fine Elizabethan brick and in the chapel attached to the manor there is remarkable Jacobean woodwork, the entire fittings being of this period. Here Elizabeth resided both before and after her accession. Broughton castle near Banbury (14th century), Shirburn Castle (mainly 15th century Perpendicular), and Stanton Harcourt (1450, with a gatehouse of 1540, a vast kitchen, and Pope's Tower) are ancient mansions still inhabited. Mapledurham, on the Thames above Reading, is a fine Tudor mansion of brick; and Water Eaton on the Cherwell, is a singularly perfect Jacobean house of stone. Blenheim palace, near Woodstock, should also be mentioned.

A large number of monastic foundations arose in the neighbourhood of the university; Augustinian at Bicester, Caversham, Cold Norton, Dorchester, Osney (a magnificent foundation just outside the walls of Oxford) and Wroxton; Cistercian at Bruern and Thame; Benedictine, at Cogges, Eynsham, Milton; Mathurin, at Nuffield; Gilbertine, at Clattercote; Templar at Sandford-on-Thames. Gosford possessed one of the only two preceptories of female Templars in England. Of all these, excepting the abbey church at Dorchester, remains are scanty. A few domestic buildings remain at Studley; the boundary walls still stand of Godstow Nunnery on the Thames, the retreat and burial place of Rosamund Clifford, or "Fair Rosamond" the object of Henry II.'s famous courtship; and there are traces of Rewley Abbey within Oxford.

In ecclesiastical architecture Oxfordshire, apart from Oxford itself, is remarkably rich, but nearly all the churches are of mixed dates. Ifley, Adderbury and Minster Lovell are types of a single style. Ifley, 1 m. S. of Oxford, is one of the finest examples of pure Romanesque in England, with a highly ornate west front. Adderbury, 4 m. S. of Banbury, is a great cruciform Decorated church with a massive central tower and spire. Minster Lovell, also cruciform, is pure Perpendicular; its central tower is supported on four detached piers. The short, ungainly spire of Oxford cathedral was among the earliest, if not the first, constructed in England, and served as a model from which were probably developed the splendid central spires of the great churches at Witney, Bampton, Shipton-under-Wychwood and Bradwell. There are also fine spires at Bloxham, Adderbury and King's Sutton (in Northants). Bloxham church, mainly Decorated, with Romanesque portions and a remarkable Early English west front is one of the largest and most beautiful in the county. In the west, Burford (Romanesque and later) is noteworthy, and in the porch of the fine Romanesque church of Langford is a crucifix with the figure cloaked. At South Leigh are remarkable mural paintings of the 15th century. About 5 m. N. of Oxford there are Kidlington (Decorated), with a beautiful needle-like Perpendicular spire, and Islip, as the birthplace of Edward the Confessor. In the south-east Dorchester Abbey, with its nave of transitional Norman, has a curious Decorated Jesse window. At Cuddesdon there is another cruciform church, Romanesque and later. Ewelme church (Perpendicular) is remarkable for the tomb of Alice, Duchess of Suffolk (1475), gorgeous with tracery and gilded canopy, and that of Sir Thomas Chaucer (1434), ornamented with enamelled coats of arms. Here William de la Pole, Duke of Suffolk, founded in 1436 the picturesque hospital and free school still standing.

Climate and Agriculture.—The climate, healthy and dry,

except in the low ground bordering the Thames, is colder than the other southern districts in England, especially in the exposed regions of the Chilterns. The county is essentially rural. The surface soils lie in belts, corresponding to the underlying rocks, the heavy clays giving rise to grass lands and the calcareous, sandy soils to arable. Many villages occur where springs issue at the junction of permeable and impermeable strata, thus securing flood-plain pasture for cattle, upland pasture for sheep and upland patches of lighter soil, with a sandy aspect, which could be worked by primitive communities often with a two-field rotation. Wool was early a source of wealth and was famous in the 12th and 13th centuries. Salt is mentioned in Domesday as a product of the county; glass was made at Benson and Stokenchurch in the reign of Henry VI. and other subsidiary products were plush at Banbury, leather at Bampton and Burford, gloves at Woodstock, and malt at Henley. At the beginning of the 14th century, Oxford was the second most prosperous county in England, but the Black Death (1349) and decreasing arable land, the enclosures of the 16th century and the wars of the 17th, brought depression and discontent, and on the enclosure of Otmoor (1830) serious riots broke out.

At the present day a high proportion of the county (nearly seven-eighths) is under cultivation. Stock are raised on the clay lowlands, and dairying (Shorthorns, Alderneys and Devonshire cows) is important. The Cornbrash is specially good for grain growing, and good crops of wheat, oats and barley are grown (91,049 ac. in 1926). Sheep (Southdowns, Leicesters and Cotswolds) are still reared in large numbers on the uplands and are folded on the root crops (turnips, swedes, mangolds), which are important. The cultivation of sugar-beet is a growing industry (1,196 ac. in 1926). Many pigs are reared and poultry do well on gravel sites. The county has few mineral resources; iron is obtained from the Middle Lias and the Inferior Oolite at various places; Oolitic limestone is quarried for cement, stone slates and, though less than formerly, for building stone. The clays are used for brickmaking, and have been largely utilized for the building of the new town which has arisen around the motor industry at Cowley south-east of Oxford.

Manufactures.—These are mainly those dependent on agriculture. Blankets are manufactured at Witney, and tweed, girths and horsecloths at Chipping Norton. There are paper mills at Shiplake, Sandford-on-Thames, Wolvercot and Eynsham, using the pure water of the streams. Agricultural implements and portable engines are made at Banbury, and glove and lace-making are ancient industries. Banbury has been long celebrated for the manufacture of a peculiar cake.

Communications.—Many of the roads are ancient routes on the plateau or following the strike of the rocks, but the main railways are markedly transverse, linking London with the industrial north-west. The county is served entirely by the G.W. Railway (except for a branch of the L.M.S. Railway from Bicester to Oxford). One main line from London passes through the Reading gap to Oxford, and here bifurcating, sends one line north along the Cherwell valley to Banbury and another across the north-west of the county, via the Evenlode valley, to link up with the Severn valley, Worcester and Birmingham; Kingham on the borders of Gloucestershire, being a junction for a line west to Cheltenham (Glouc.) and a line north-east to King's Sutton (Northants). In order to compete with fast trains from London to Birmingham on the L.M.S. Railway the G.W. Railway has built a loop line across the north-east of the county, leaving Oxford to the west and linking Banbury with the joint L.N.E. Railway and G.W. Railway line passing through the Princes Risborough (Bucks.) gap (from which point also a line runs along the Thames valley to Oxford). There are other branch lines.

Population and Administration.—The area of the ancient county is 483,626 acres. The area of the administrative county, including the city and county borough of Oxford, is 479,220 ac. with a population in 1921 of 189,615. The municipal boroughs are Banbury, Chipping Norton, Henley-on-Thames, Oxford, a city and the county town, and Woodstock. The county is in the Oxford circuit and assizes are held at Oxford. It has one court of quarter

sessions, and is divided into 11 petty sessional divisions. The borough of Banbury and the city of Oxford have separate courts of quarter sessions and commissions of the peace, and the borough of Henley-on-Thames has a separate commission of the peace. The total number of civil parishes is 304. Oxfordshire is in the diocese of Oxford, and contains 244 ecclesiastical parishes or districts, wholly or in part. The ancient county (which in 1289 sent two members to parliament) is divided (since 1918) into two parliamentary divisions, Banbury and Henley, each returning one member. It also includes part of the parliamentary borough of Oxford, returning one member, in addition to which the university of Oxford returns two members.

OXFORD UNIVERSITY. The stories connecting Oxford University with Brute the Trojan, with king Mempeic (1009 B.C.) and with the Druids, cannot be traced back beyond the 14th century. The town, in fact, is considerably older than the university. (See OXFORD.) Authentic history appears to begin in 1133 with the arrival from Paris of the theologian, Robert Pullen, who lectured here. There is, however, little evidence that Oxford was regarded as a fully equipped university before 1163—allusions to its being a *studium generale* (see UNIVERSITIES) only occur after that date and these by some authorities are held to be inconclusive. Subsequent progress must, however, have been rapid as, about 100 years later, the deputies of Oxford, in an appeal to the king, described the university as *Schola secunda ecclesiae* or second to Paris. The coming of the religious communities, the Dominicans, Franciscans and Carmelites in the 13th century, and the Benedictines a little later on, profoundly affected the advancement of learning. The names of Roger Bacon, Duns Scotus and Wycliffe, are sufficient to indicate the prominence of Oxford in the middle ages. The earliest colleges to be founded were University college (1249, the mythical foundation by Alfred in 872 is no longer accepted), Balliol (about 1263), Merton (1264). The last named was established with a view to provide a collegiate discipline for the secular clergy, and its statutes served as a model for subsequent creations, not only at Oxford but at Cambridge. For the others see the list on pp. 996 and 997.

From the 13th century onward a succession of charters from the Crown strengthened the position of the university at the expense of the town. At the Renaissance the new learning found its leading exponents in Erasmus, who lectured here, and in such famous scholars as Grocyn, Dean Colet and Sir Thomas More. The old scholasticism received its death-blow from the royal injunctions of 1535. Oxford, as well as Cambridge, suffered from numerous confiscations of land and revenues during the Reformation period. In 1571 the act of Elizabeth incorporated and re-organized the two universities. The statutes of the university were codified in 1836 by the chancellor, Archbishop Laud. With certain modifications, they formed the official code of the university till 1858. During the civil war the university sided with the king, while the town sympathized with the parliament, but no open breach between the two occurred. Under Cromwell, who acted as chancellor from 1651–57, a strong effort was made to restore the standards in work and discipline which had suffered from the civil wars. During the reign of James II., the university acquired great popularity by its successful resistance to James's effort to throw open the university to Catholics, even to the extent of imposing his own Catholic nominee on the fellows of Magdalen. The university, however, soon returned to its Jacobite allegiance, and at the coming of the Georges was definitely anti-Hanoverian, a phase, however, that came to an end after the visit of George III. in 1785. In the latter half of the 18th century the influence of the Wesleys on Oxford was far less than on the country at large; on the other hand the Tractarian movement (see NEWMAN), at

the beginning of the 19th century had a most profound effect on the Church of England, which is still potent to-day. There was a general rise in the level of studies towards the end of the 18th century, as written examinations gradually supplemented the old oral examinations, often merely formal, and henceforth the range of studies themselves extended. By the reform of 1858 the professoriate was increased, reorganized and re-endowed, and dissenters were admitted to entrance to the B.A.—the M.A. being thrown open in 1871.

The reforms of 1877 directed a certain proportion of the college revenues to the use of the university—especially for the encouragement of natural science, and improved the position of professors and lecturers, thus leading to the growth of a regular resident professoriate. Schools and degrees alike multiplied (*see* UNIVERSITIES) and the history of the university was one of general progress and expansion. None the less there was a widespread feeling that a certain amount of reform was advisable if the university was to keep step with the times. In 1909 Lord Curzon, the then chancellor of the university, issued his *Principles and Methods of University Reform*. Committees of council were formed to prepare definite schemes. Several reforms were proposed, notably the abolition of compulsory Greek, the reform of the Hebdomadal Council (*q.v.*), a remodelling of the boards of faculties, and a revision of the financial relation between the university and the colleges. Most of these have since (*see* below) been realized in one way or another.

The two most important facts in the history of the university since 1911 have been the World War and the two commissions. In the war 14,561 Oxford men served in the British forces, and 2,660 lost their lives. Again, thanks to the O.T.C., nearly 2,000 Oxford men received commissions in the first two months of the war, while for the last three years of the war, there always were nearly 2,000 cadets in Oxford. The examination schools and those colleges which were not given up to cadets became hospitals. The number of undergraduates fell to 1,087 in Jan. 1915, and 550, 460 and 369 in the same months in 1916, 1917 and 1918 respectively. The tide began to turn in the latter part of 1918; in Jan. 1919 there were 1,357 men in residence; and in the following 18 months the entries were so heavy that by Oct. 1920 there were about 4,500 men and 650 women actually in residence. Since that time, all the men's colleges have striven to reduce their numbers; so that the figures for undergraduates were, in 1928, about 3,500 men and 750 women. Women, in 1920, were admitted as full members of the university, but a statute was passed in 1927 limiting their number to one-fourth that of men.

New Statutes.—The royal commission, set up in 1919, reported in 1922. Its recommendations were embodied in statutes by a second commission (set up 1923) which came into force in 1926. It was satisfactory to Oxford men to find that a body appointed by a reforming Government, and composed of men of all political parties, reported so favourably on the work of the universities as a whole; so far from being pronounced to be homes of idleness, the main complaint made against most of the teachers was that they worked too hard. (*See Report*, pp. 26, 39, 48.) To remedy this, and to allow for the extension of university activities, the royal commission recommended a grant to Oxford and to Cambridge of £110,000 a year each; only £60,000 was given at first, but in the spring of 1925 this was increased to £85,000.

The aim of the commissions especially was to encourage research work. The growth of this was already a marked feature in Oxford. To encourage it, the degrees of Bachelor of Letters and Bachelor of Science were set up in 1895, the Doctorate of Philosophy in 1917; the regulations for the B.Litt. have now been (1927–28) remodelled in the light of experience. In the examination, too, for the honours degree in natural science, students of chemistry can only obtain a class if they spend a year on a piece of research. Probably the most important proposal in the new statutes is the setting apart, out of the Government grant, of an annual sum of £10,000 to assist college lecturers, who will be appointed by the boards of the faculties to be also "university lecturers," carrying out some special work.

Apart from this grant, the most important changes have been:

- (1) The full enjoyment of college scholarships will be limited to those in need of financial help; the election, however, will be made by colleges as before, and entirely on intellectual grounds.
- (2) All professors are made *ex officio* fellows and members of the governing bodies of colleges. But these changes only make statutory and universal what was already done in most colleges.
- (3) A retiring age is fixed for all posts, whether college or university. A pension scheme has also been instituted.
- (4) The machinery of university government has been changed. The Hebdomadal Council is now made representative of the whole university, not of separate orders of members, and congregation is to consist entirely of those doing university work, whether teaching or administrative. These changes again had been largely anticipated by university action since 1900.
- (5) The power of convocation to override congregation is practically abolished. This change is more important in theory than in practice; the one subject on which convocation had interfered decisively—the refusal to open theological degrees to members of all denominations—had been settled by agreement in 1920.
- (6) The general board of faculties, set up in Lord Curzon's reform of 1913, has been made more representative of the whole university, and given fuller power over its studies. The financial machinery of Oxford had been already remodelled by statutes passed in 1912 and 1920.

On the whole it may be said that the essential principle of Oxford life, the independence of colleges, has been maintained. The university can advise as to college elections and appointments, and make general rules, but colleges retain their full powers of election and administration.

Benefactions.—Natural science has been the chief gainer from recent benefactions, with new laboratories for engineering (1912), for chemistry (thanks mainly to Dyson Perrins) in 1915, for pathology from the Dunn trustees and for biochemistry from Mr. Whitley and the Rockefeller foundation (opened in 1926 and 1927 respectively). The Welch bequest (1915) has added another £50,000 to the resources of biological science, and the Government, by placing at Oxford the institutes of Agricultural Engineering (1923) and of Imperial Forestry (1924), has shown its confidence in the oldest university as the fittest place to provide for the newest needs of the empire.

Next to the development of natural science, the most marked feature of the last 20 years has been the growth of modern language teaching. Professorships of French, Italian and Spanish have been founded by Sir B. Zaharoff, A. Serena and W. R. Morris respectively; Sir Heath Harrison has provided scholarships for undergraduate travel (1919), and Mr. Laming has founded travelling fellowships in connection with his old college, Queen's (1924). Closely allied with this development is the increasing number of fellowships for study in the universities of the United States (*e.g.*, the Commonwealth and the Davison fellowships), which are being founded by Americans as a counterpart to the work of Cecil Rhodes. His trustees are building, on part of what had been the garden of Wadham, a great building, designed by Sir H. Baker, to be a centre of the advanced studies, on the humanistic side, of students from the whole English-speaking world.

The Bodleian continues to receive gifts, not only of books and pictures as in Lord Curzon's Napoleonic collection (1925), but also in cash, as Walter Morrison's £50,000 in 1920, but its accommodation is becoming seriously inadequate, and during the next decade either great extensions must be carried out, or the policy of the library seriously changed. In any case, very large benefactions will be required. The same must be said of the Oxford Preservation Trust, founded 1927, to preserve the beauties of Oxford, both in the city itself and also in its surroundings. Mention should also be made of Barnett house, founded in 1914 in memory of Rev. S. A. Barnett, for the promotion of social and economic studies.

List of Colleges and Halls.—In addition to the three colleges mentioned above, University, Balliol and Merton, the other colleges in their order of foundation are: Exeter (originally called Stapelton Hall, 1314), Oriel (1326), Queen's (1340, named after the well-known Queen Philippa), New college (creation of William of Wykeham, 1379), Lincoln (1427), All Souls (1437), Mag-

dalen (1458), Brasenose (1509), Corpus Christi (1516), Christ Church (begun by Wolsey in 1525, final foundation by Henry VIII., 1546), St. John's (1555), Trinity (1555), Jesus (founded by Queen Elizabeth, 1571), Wadham (1612, charter received 1610), Pembroke (1624), Worcester (1714), Keble (created as memorial to John Keble, 1870), Hertford (after many vicissitudes, 1874). For further details see OXFORD. Of the various academical halls, St. Edmunds (reputed foundation, 1226) is the only one that now survives.

Non-collegiate students were first admitted in 1863. They are known as members of St. Catherine's college. There are four women's colleges, founded—Somerville (1879), Lady Margaret Hall (1879), St. Hugh's Hall (1886) and St. Hilda's (1893); a certain number of women are also admitted to the university as "home students." Among the independent foundations mainly intended for teaching theology are Pusey House (1884) and Wycliffe Hall (1878), both Church of England, and Mansfield college (1886) and Manchester college (1893, Nonconformist).

Other Academic Buildings of Note.—Oxford also possesses an unusual number of fine academic buildings—to quote only the names of some of the principal ones—they are described at length in the article on OXFORD; first, the notable group of buildings comprising the Bodleian library, the University school, the Convocation house with the Sheldonian theatre and the original Ashmolean museum, and the Ratcliffe library not far away. "The university church" of St. Mary lies just to the south of the latter. Another massive pile of buildings is devoted to the Taylor institute, the University galleries and the present Ashmolean museum. Other important buildings are the University museum, the Pitt-Rivers Ethnographical museum, the University observatory, and the famous Clarendon press. Mention should also be made of the botanical garden by the Cherwell and the Oxford Union Society, founded 1625.

University Constitution and Art Institution.—"The chancellor, masters and scholars of the University of Oxford" form a corporate body, within which the colleges are so many individual corporations. The highest officer of the university is the chancellor, who is elected by the members of convocation, holds office for life, and is generally a distinguished member of the university. The vice-chancellor is practically the head. He is nominated annually by the chancellor, and must be the head of a college. Two proctors (*q.v.*) are appointed annually by two of the colleges in rotation. The university returns two members to parliament, the privilege dating from 1604, under a system of proportional representation.

The Hebdomadal (from Greek *ἑβδομάς*, the number seven; the Hebdomadal board instituted in 1631 was appointed to hold a weekly meeting) Council consists of the chancellor, vice-chancellor, the ex-vice-chancellor or the next vice-chancellor, and proctors as official members and of 18 other members (heads of houses, professors, etc.) elected for terms of six years by the congregation of the university. The council takes the initiative in promulgating, discussing and submitting to convocation all the legislation of the university, and controls its general business and its policy. The ancient house of congregation includes all college deans, examiners and Regent masters, *i.e.*, M.A.'s of not more than two years' standing; it once was concerned with university education and discipline, but it now has practically no functions beyond the granting of degrees. It lost its wider powers under the act of 1854, when the congregation of the university was created. This body, which includes, besides certain officials, all members of convocation concerned in the educational and administrative work of the university who have resided for a fixed period within 2½ m. of Carfax, approves or amends legislation submitted by the Hebdomadal Council previously to its submission to convocation; it also has considerable powers in the election of the various administrative boards. The house of convocation consists of all masters of arts and doctors of the higher faculties who have their names on the university books, and has the final control over all acts and business of the university. There are boards of curators for the Bodleian library, the university chest and other institutions, delegates of the common university fund, the mu-

seum and the press, for extramural teaching, local examinations and other similar purposes, visitors for the Ashmolean museum and university galleries, and many other administrative bodies. There are boards for the following faculties: theology, law, medicine, natural science and arts (including *literae humaniores*, oriental languages and modern history). The general board of the faculties, elected by all the resident teachers in the university, arranges and controls the teaching, appoints one class of university lecturers, and can make suggestions to colleges as to the appointment of the fellows as lecturers, on the recommendation of the special boards of faculty. The income assigned to it for the purpose is £10,000. Among the numerous professorships and readerships in the various subjects of study, the oldest foundation is the Margaret professorship of divinity, founded in 1502 by Margaret, countess of Richmond and mother of Henry VII. This was followed by the five Regius professorships of divinity, civil law, medicine, Hebrew and Greek, founded by Henry VIII.

The colleges consist of a head, whose title varies in different colleges, fellows (who form the governing body) and scholars. To these are to be added the commoners, *i.e.*, those who either receive no emoluments, or hold exhibitions which do not (generally) entitle them to rank with the scholars. The college officer who is immediately concerned with the disciplinary surveillance of members of the college *in statu pupillari* is the dean (except at Christ Church). Each undergraduate (this term covering all who have not yet proceeded to a degree) is, as regards his studies, under the immediate supervision of one of the fellows as tutor. The examinations for the B.A. are as follows: (a) Responsions, always now passed before entrance; exemption is granted to all candidates who have taken the school's leaving certificate. (See EXAMINATIONS.) (b) Honours or pass moderations, the latter often takes the form of a diploma in a special subject. (c) Final schools (in the case of *literae humaniores*, called familiarly "Greats," and now applied to other honours schools), with pass schools for ordinary students. Arrangements exist whereby members of the universities of Cambridge or Dublin may be "incorporated" as members of Oxford university; and whereby the period of necessary academical residence at Oxford university is reduced in the case of students from "affiliated" colleges within the United Kingdom. Special provisions are also made in the case of students from any foreign university and from certain colonial and Indian universities.

OXIDATION and REDUCTION are chemical terms which are constantly employed to express two opposing reactions. In the first place, oxidation denotes a direct addition of oxygen to an element or compound, as in the burning of sulphur to sulphur dioxide or the conversion of carbon monoxide into the more oxygenated carbon dioxide, the latter chemical change being manifested in the blue flame frequently observed in a brightly burning coal fire. Secondly, oxidation may indicate a removal of hydrogen from a hydride or other hydrogenated substance, as in the incomplete combustion of sulphuretted hydrogen, $\text{SH}_2 + \text{O} = \text{H}_2\text{O} + \text{S}$, or in the conversion of oxalic acid into carbon dioxide and water, $\text{H}_2\text{C}_2\text{O}_4 + \text{O} = 2\text{CO}_2 + \text{H}_2\text{O}$. Thirdly, oxidation involves an increase in the valency of an element, even although there may be no direct addition of oxygen or removal of hydrogen, as, for example, in the change of ferrous to ferric salts, $2\text{FeSO}_4 + \text{H}_2\text{SO}_4 + \text{O} = \text{Fe}_2(\text{SO}_4)_3 + \text{H}_2\text{O}$. The action of the oxygen is indirect and the oxygen itself may be derived from the air or from a chemical reagent, such as potassium permanganate or bichromate. Similarly stannous chloride is converted into stannic chloride, $\text{SnCl}_2 + 2\text{HCl} + \text{O} = \text{SnCl}_4 + 2\text{H}_2\text{O}$.

In the former instance the valency of iron is increased from two to three; in the latter the valency of tin is changed from two to four. Oxidation is often facilitated by the presence and interaction of water, as in the rusting of iron to hydrated ferric oxide (see

CORROSION), or in the permanent bleach of coloured goods (cottons, calico, etc.) as carried out by chlorine water. In the latter instance the effective agent is probably hypochlorous acid (HClO).

Reduction is the converse chemical change to oxidation. Firstly, reduction in its original metallurgical sense implies a removal of oxygen from an oxide. Tinstone (cassiterite) heated with carbon or anthracite becomes reduced to free tin, $\text{SnO}_2 + 2\text{C} = 2\text{CO} + \text{Sn}$. Occasionally it is an analogue of oxygen, such as sulphur or selenium, which is removed from the metal. In the Welsh process of lead smelting lead sulphide and lead sulphate interact and the lead of both compounds is reduced to the metallic condition, $\text{PbS} + \text{PbSO}_4 = 2\text{Pb} + 2\text{SO}_2$. Secondly, reduction signifies an addition of hydrogen, as in photosynthesis (*q.v.*), $\text{CO}_2 + \text{H}_2\text{O} = (\text{CH}_2\text{O})_x + \text{O}_2$, where carbon dioxide is reduced successively to formaldehyde and other more complex carbohydrates. When arsenious oxide is treated with a mixture evolving hydrogen, oxygen is replaced by this element, $\text{As}_2\text{O}_3 + 24\text{H} = 4\text{AsH}_3 + 6\text{H}_2\text{O}$. Thirdly, reduction involves a decrease in the valency of an element as when a ferric salt is converted into ferrous salt by nascent hydrogen (engendered by zinc and dilute sulphuric acid), $\text{Fe}_2(\text{SO}_4)_3 + \text{H}_2 = 2\text{FeSO}_4 + \text{H}_2\text{SO}_4$. Occasionally such reductions are effected by light or radiant energy and such changes are utilized in photography: thus, ferric oxalate is reduced to ferrous oxalate, $\text{Fe}_2(\text{C}_2\text{O}_4)_3 = 2\text{FeC}_2\text{O}_4 + 2\text{CO}_2$, and aqueous mercuric chloride is reduced to mercurous chloride $4\text{HgCl}_2 + 2\text{H}_2\text{O} = 2\text{Hg}_2\text{Cl}_2 + 4\text{HCl} + \text{O}_2$.

(G. T. M.)

OXIDE, in chemistry, a binary compound of oxygen and another element. Oxides are the most plentiful and characteristic components of the earth's hydrosphere and lithosphere; the former of these envelopes consists essentially of water, the commoner oxide of hydrogen, and the latter largely consists of simple and complex oxides. The second type of oxide is the more abundant and includes such important rock-forming materials as carbonates, silicates, aluminates, and aluminosilicates. The ordinary ingredients of soil, subsoil, and rocks, including sand, clay, marl, chalk, limestone, dolomite, mica, shale and slate are composed of oxides in either anhydrous or hydrated forms.

Oxygen can be made to combine directly with most elements, although sometimes it will not do so in the entire absence of water vapour (*see* DRYNESS, CHEMICAL); in a few cases in which direct methods are unavailing, as, for example, in the case of noble metals such as gold or platinum which remain unaffected in air even at very high temperatures, indirect methods can be used and oxides can be prepared from the salts of the metals. Hitherto, however, it has been found impossible to prepare oxides of bromine or of the inert gases helium, neon, argon, etc.; fluorine was (until 1927) regarded as being in this category, but it has now been made to yield an oxide indirectly. (*See* FLUORINE.)

Many elements form a series of several oxides; thus, nitrogen yields five: N_2O , NO , N_2O_3 , NO_2 (N_2O_4 at lower temperatures), and N_2O_5 . In general, the acidic character of the oxide increases with increase in the oxygen content. For purposes of classification, it is usual to assign a typical oxide to each element; usually this oxide is the highest having acidic or basic properties and is related to the position of the element in the periodic classification (*see* PERIODIC LAW) as follows: The typical oxides of Group I. are of the form M_2O , those of Group II. of the form MO , those of Group III. are M_2O_3 , and so on, those of Group VI. being MO_3 .

Types of Oxide.—Oxides are often classed as (1) acidic oxides; (2) basic oxides; (3) amphoteric; (4) neutral; (5) suboxides; (6) saline oxides; and (7) peroxides (either acidic or basic); an oxide may not fall clearly into any one of these classes, but have the characteristics of two.

(1) Acidic oxides are those which combine with bases or basic oxides to form salts. Many of the oxides of non-metals, *e.g.*, carbon, nitrogen, phosphorus and sulphur, are of this type. Some acidic oxides are "mixed" anhydrides; thus nitrogen peroxide reacts with water to give two acids, nitrous and nitric, and with bases to form nitrites and nitrates.

(2) Basic oxides similarly react with acids or acidic oxides to form salts, and many of the oxides of metals fall into this class.

(3) Amphoteric oxides behave as acidic oxides towards bases

and as basic oxides towards acids; thus, zinc and aluminium oxides dissolve in either acids or bases to give salts of the acid or zincates (aluminates) of the base, respectively.

(4) Neutral oxides are those which neither react to form salts nor combine with water to give acids or bases; carbon monoxide and nitrous oxide are examples, for, although they result from formic and hyponitrous acids, respectively, by loss of water, they do not combine with water to give these acids and are therefore not acidic anhydrides.

(5) Suboxides are oxides having less oxygen than those oxides which give rise to a definite series of salts, and in a sense they are neutral oxides, for on reacting with an acid they give the metal and a salt corresponding to a higher oxide. Few suboxides are definitely known, but that of lead, Pb_2O , exhibits the behaviour just described—there are no such salts as Pb_2SO_4 or PbCl , and the action of acids upon it results in the production of metallic lead and a salt derived from PbO .

(6) Saline oxides of non-metals are not known. As indicated above, some metals form two oxides of which the lower is basic and the higher acidic; two such oxides may therefore combine to give another oxide which is to some extent a salt. Many higher oxides of metals may thus be regarded as saline, *e.g.*, $\text{Pb}_3\text{O}_4 = 2\text{PbO} \cdot \text{PbO}_2$; $\text{Pb}_2\text{O}_3 = \text{PbO} \cdot \text{PbO}_2$.

(7) Peroxides are, strictly, those oxides having more oxygen than the typical oxide as determined by the periodic classification. This definition, however, fails in certain cases, for it would exclude lead peroxide, PbO_2 , from the category, since this is regarded as typical of Group IV. to which lead belongs, whereas the oxide is certainly a peroxide. It is therefore customary, in the case of basic peroxides, to regard them as being those oxides which are more highly oxygenated than the oxide which gives rise to a regular series of salts, and since, in the case of lead, this is the oxide PbO , the oxide PbO_2 is a peroxide. In the case of acidic peroxides, permanganic anhydride Mn_2O_7 , for instance, is the typical oxide of Group VII. and also gives rise (as an acid) to a definite series of salts (the permanganates), so no difficulty arises; and oxides such as CrO_4 and S_2O_7 , which are higher than the typical oxides CrO_3 and SO_3 , are acidic peroxides and give rise to perchromates and persulphates.

It is convenient to subdivide basic peroxides according to their chemical behaviour: those which react with water or with dilute acids to form hydrogen peroxide (a neutral peroxide) are classed as *superoxides*, and the others as *polyoxides*. Mendeleyev, to whom this idea is due, pointed out that this subdivision could be related to structural formulae, for the former class includes oxides in which the oxygen atoms are linked together, *e.g.*,

whereas in the latter class these atoms are all attached solely to the metal, *e.g.*, $\text{O}=\text{Pb}=\text{O}$, $\text{O}=\text{Mn}=\text{O}$. Such a subdivision can be extended to distinguish between acidic superoxides and polyoxides; thus, S_2O_7 is a superoxide

whereas Mn_2O_7 is a polyoxide

(compare above).

Peroxides are characterised by their oxidising properties; thus lead peroxide oxidises SO_2 so that the resulting PbO and SO_3 form lead sulphate PbSO_4 ; and manganese dioxide oxidises hydrochloric acid to chlorine, being itself reduced to the manganous state: $\text{MnO}_2 + 4\text{HCl} = \text{MnCl}_2 + \text{Cl}_2 + 2\text{H}_2\text{O}$.

Many oxides combine with water to form hydroxides (*q.v.*), and all hydroxides lose water on heating to give the corresponding oxide. The chemical properties of an hydroxide are almost identi-

cal with those of the corresponding oxide, but the latter is somewhat more inert especially if it has been very strongly heated.

For further details see HYDROXIDES; OXIDATION and REDUCTION; and H. B. Weiser, *The Hydrous Oxides* (New York, 1926.) (A. D. M.)

OXIMES, in organic chemistry, compounds containing the grouping $>C:N:OH$ and obtained by the action of hydroxylamine on compounds containing the $>CO$ group. They were first prepared by Victor Meyer in 1882. The commonest are those of the general formulac $RHC:NOH$ and $RR'C:NOH$ where R and R' are alkyl or aryl groups; the former, prepared from aldehydes, are known as aldioximes, and the latter, from ketones, as ketoximes.

The lower alkyl aldioximes and ketoximes are readily soluble in water, but the solubility decreases with increase in molecular weight; if an aryl group be present, the compounds are usually sparingly soluble in water. Generally the oximes are readily soluble in the common organic solvents and may be extracted from aqueous solutions by their means; they are weak acids and dissolve in aqueous solutions of alkali hydroxides to form salts which are decomposed, with liberation of the oxime, by carbon dioxide or by ammonium chloride. At the same time ethereal solutions of most oximes yield with hydrogen chloride precipitates of hydrochlorides, and sulphates may be obtained by dissolving the oximes in concentrated sulphuric acid; both hydrochlorides and sulphates are rapidly decomposed by water with regeneration of the oxime. Oximes are hydrolysed by boiling with dilute acids (the parent aldehyde or ketone being formed); on reduction with sodium amalgam in alcoholic acetic acid, or in the vapour phase by hydrogen in the presence of nickel (see HYDROGENATION), they yield primary amines; on oxidation they yield a number of products, aldioximes giving hydroxamic acids $R.C(OH):NOH$ or peroxides $R.CH:NO.ON:CH.R$, and ketoximes nitro-hydrocarbons $RR'CH:NO_2$. Dehydrating agents convert aldioximes into nitriles $RCH:NOH \rightarrow RCN + H_2O$. With phosphorus pentachloride ketoximes undergo the Beckmann change (see below).

Aldioximes and ketoximes are generally prepared by the action of hydroxylamine (liberated from the hydrochloride *in situ* by sodium carbonate or sodium hydroxide) upon the aldehyde or ketone; they are also formed by the oxidation of primary amines with Caro's acid, $RR'CH.NH_2 \rightarrow RR'CH.NH(OH) \rightarrow RR'C:N.OH$ (E. Bamberger, 1902), and by the reduction of primary or secondary nitro-hydrocarbons with stannous chloride and hydrochloric acid: $RR'CH:NO_2 \rightarrow RR'CH:NO \rightarrow RR'C:N.OH$. Aldioximes are formed by the reduction of unsaturated nitro-hydrocarbons with aluminium amalgam in dilute acetic acid.

$RR'C:CH:NO_2 \rightarrow RR'C:CH.NH(OH) \rightarrow RR'CH:CH:N.OH$, by the action of alkyl iodides on sodium nitrohydroxylamine and by the action of mercury fulminate on phenols or benzenoid hydrocarbons in the presence of a mixture of anhydrous and hydrated aluminium chloride (see ALDEHYDES). Ketoximes are formed by the reduction of pseudo-nitriles,

$RR'C(NO_2)NO \rightarrow RR'C(NH.OH)_2 \rightarrow RR'C:NOH + NH_2.OH$. Many oximes form co-ordination compounds with metals and the insolubility of some of these compounds is utilized in quantitative analysis; for example, dimethylglyoxime and α -benzildioxime are used for the determination of nickel, and β -naphthaquinone-monoxime for cobalt.

Stereochemistry of the Oximes.—Many unsymmetrical oximes (*i.e.*, where R and R' are different) exist in isomeric forms. This isomerism is now usually explained on the hypothesis of Hantzsch and Werner (1890), in which the assumption is made that the three valency directions of the nitrogen atom do not lie in one plane, the space models of the compounds being represented as (I.) and (II.), or more briefly as (III.) and (IV.).

The isomerism is determined by the nearness of the hydroxyl group to R' in one compound, and to R in the isomeride. Evidence that the three valency directions of a nitrogen atom doubly linked to carbon are not coplanar has been obtained by Mills and others. (See STEREOCHEMISTRY.)

The configuration of the aldioximes is determined by the action upon them of acetic anhydride, which converts both varieties to acetyl derivatives. One of these compounds on treatment with dilute sodium hydroxide is slowly hydrolysed back to the original oxime, and the other is at once decomposed to the nitrile. Hantzsch assumed that the compound containing the methine hydrogen and the acetoxy-group near together (V.)

would most readily lose acetic acid to give the nitrile; he therefore gave the configuration (VII.) to the oxime from which this acetyl compound was prepared and (VI.) to the other

The configuration of the ketoximes is determined by the "Beckmann change" (1891) by which the ketoxime is converted into an amide, usually by the action of phosphorus pentachloride in ether at 0° C.

The assumption was made that the group adjacent to the hydroxyl changed places with it, and became attached to nitrogen. Meisenheimer, however, has adduced (1921) evidence in favour of the *trans* rather than of the above *cis* interchange of groups in the Beckmann change. Moreover, Brady and Bishop (1925) favour the *trans* rather than the *cis* elimination of acetic acid from the acetyl derivatives of the aldioximes. These authors suggest in consequence that the configurations assigned by Hantzsch should all be reversed. Since, however, the question is still unsettled, the old configurations are here retained.

Aldioximes in which R is an alkyl group are known only in the β - or *syn*-form; where R is a benzene or naphthalene nucleus, the oxime, as obtained by the action of hydroxylamine on the aldehyde, has the α - or *anti*-configuration. In order to obtain the *syn*-aldoxime in the latter case the oxime is dissolved in dry ether and the solution saturated with dry hydrogen chloride at 25–30° C. The precipitated hydrochloride is decomposed with aqueous sodium carbonate, and the *syn*-oxime obtained is purified by crystallization; or the *anti*-oxime, in benzene, is exposed in silica vessels to the action of ultra-violet light. In certain cases it has been found impossible to obtain the *syn*-aldoxime by any of the known methods. The *syn*-aldioximes are unstable and are converted to the *anti*-isomerides by traces of dilute acids, or in many cases by keeping; they are much weaker acids and less soluble than the corresponding *anti*-compounds.

Ketoximes in which R and R' are both alkyl groups are known in one form only; where R is alkyl and R' aryl, usually only one form is known, but where R and R' are both aryl groups the action of hydroxylamine on the ketone frequently yields a mixture of the two isomerides which can be separated by fractional crystallization. There is no known method of converting the stable into the unstable isomeride in the case of the ketoximes; the reverse change occurs on keeping.

The alkylation of the oximes affords valuable support for the Hantzsch-Werner theory; for example, the isomeric β -nitro-benzophenone oximes yield four methyl derivatives, as demanded by the stereo-chemical hypothesis, the methyl group being

attached to the oxygen atom (*O*-ether) or to the nitrogen atom (*N*-ether), respectively:

The aldoximes give only three alkyl derivatives, both anti- and syn-aldoxime yielding the same *N*-alkyl compound, this being regarded as derived from the tautomeric form of the oximes $\text{RR}'\text{C:NH:O}$. (O. L. B.)

OXNARD, a city of Ventura county, California, U.S.A., on the Southern Pacific railway, midway between Los Angeles and Santa Barbara, and 4 m. from the ocean. Pop. 4,417 in 1920 (30% foreign-born white); estimated locally at 8,000 in 1928. It is the trading centre for an extensive agricultural district, and has a large beet-sugar factory, a rabbit-packing plant and other manufacturing industries. Since 1924 an annual Eisteddfod has been held. Oxnard was founded in 1898 and incorporated in 1903.

OXUS or **AMU DARYA**, one of the great rivers of Central Asia. From Lake Victoria (Sor-Kul) in the Pamirs, which was originally reckoned as the true source of the river, to Khamiab, on the edge of the Andkhui district of Afghan Turkistan, for a distance of about 680 m., the Oxus forms the boundary between Afghanistan and Russia. For another 550 m. below Khamiab it follows an open and sluggish course till it is lost in the Aral sea, being spanned at Charjui, 150 m. below Khamiab, by the wooden bridge which carries the Russian railway from Merv to Samarkand. The level of Lake Victoria is 13,400 ft. above sea. At Khamiab the river is probably rather less than 500 ft. The total length of the river is 2,400 km. and its catchment area about 300,000 sq.km. The rainfall of this basin varies probably between 90 and 150 cu.km. p.a. and its discharge into the Aral sea is about 32 cu.km. p.a. About 6,000 sq.km. depend on its waters for irrigation.

Sources.—The final survey of the Pamir region (wherein the heads of all the chief tributaries of the river lay hidden), by the Pamir boundary commission of 1895 established the following facts. The elevated mountain chain, now called the Nicolas range, which divides the Great from the Little Pamir, is a region of vast glaciers and snow-fields, supplying the greater part of the water of the lakes lying immediately north and south. The Nicolas range may be regarded as the chief fountain-head, through Victoria and Chakmaktin lakes, of at least two of the upper tributaries of the Oxus, namely, the Aksu (or Murghab) and the Pamir river, and as contributing largely to a third, the Ab-i-Panja. It is possible that there may be warm springs on the bed of Lake Victoria, as such springs are of frequent occurrence in the Pamirs; but there is no indication of them in the Chakmaktin basin, which is an expansion occurring in the course of the Aksu and not the fountain-head of the stream. There are indications that the beds of these lakes are rapidly silting. The enormous glaciers which lie about the upper or main branch of the Ab-i-Panja (called the Ab-i-Wakhjir or Wakhan), which rises under the mountains enclosing the head of the Taghdumbash Pamirs are another important source of the river. If the Aksu (or Murghab) and the Pamir river from Lake Victoria are to be considered in the light of independent tributaries, it is probable that the Ab-i-Panja contributes as much glacial flood to the Oxus as either of them.

Kala Panja to Ishkashim.—From the point where the rivers of the Great and Little Pamirs join at Kala Panja to Ishkashim, at the elbow of the great bend of the Oxus northwards, the river valley and the northern slopes of the Hindu Kush, which near Ishkashim extend in slopes of barely 10 m. in length from the main watershed to the river banks, have been carefully mapped. These slopes represent the extent of Afghan territory which exists north of the Hindu Kush between Kala Panja and Ishkashim. From Ishkashim northwards the river passes through the narrow rock-bound valleys of Shignan and Roshan, thence north and west through the mountains and defiles of Darwaz. This part of

the Oxus, until it once again emerges from the Bokhara hills into the open plains bordering Badakshan on the north, falls within the area of Russian surveys.

At Langar Kisht, a little to the east of the Oxus bend, there is a small Russian post of observation. About 50 m. north, where the Suchan or Ghund joins the Oxus from the Alichur Pamir, there is another and larger post called Charog. On the left bank of the river the Afghans maintain a frontier post at the fort of Kala Bar Panja. A road connects Charog with the Alichur Pamir, following the general course of the Ghund stream, forming a valuable link in the chain of communications between Bokhara and Sarikol. Eighty-five miles north of Ishkashim, at Kala Wamar, the river which rises in the Little Pamir, and which is called Aksu, Murghab, or Bartang, joins the Oxus from the east. It is on this river that the Russian outpost, Murghabi, (or Pamirski), is situated, at an elevation of 12,150 ft. above the sea. Fort Murghabi is connected by a good military road with Osh. At this point the measurement of the comparative lengths of the chief Pamir tributaries of the Oxus is as follows:—to the head of the Aksu at Lake Chakmaktin 260 m.; to the head of the most easterly tributary of Lake Victoria, in the Great Pamir, about 230 m.; to the glacial sources of the Ab-i-Wakhjir, about 230 m. For 120 m. the two latter are united in the main stream of the Oxus, the volume of which has been further increased by the Ghund and Shakh dara draining the Alichur Pamir and the heights of Shignan.

Ishkashim to Kolab.—The narrow cramped valley of the river between Ishkashim and Kala Wamar is hedged in on the west by a long ridge flanking the highlands of Badakshan; on the east the buttresses and spurs of the Shignan mountains (of which the strike is transverse to the direction of the river and more or less parallel to that of the main Hindu Kush watershed) overhang its channel like a wall, and afford but little room either for cultivation or for the maintenance of a practicable road. Yet the lower elevation (for this part of the Oxus stream is not more than about 7,000 ft. above sea-level) and comparatively mild climate give opportunities to the industrious Tajik population for successful agriculture, and a track exists on the left bank of the river to Kala Bar Panja opposite the Ghund (or Suchan) debouchment, which is practicable for mules. There are no bridges, and the transit of the river from bank to bank can be effected only by the use of inflated skins.

Beyond the Bartang (or Murghab) confluence the valley narrows, and the difficulties of the river route increase. Between Kala Wamar (6,580 ft.) and Kala Khum (4,400 ft.), where the Oxus again bends southwards, its course to the north-west is almost at right angles to the general strike of the Darwaz mountains, which is from north-east to south-west, following the usual conformation of all this part of high Asia. Thus its chief affluents from the north-east, the Wanji and the Yaz Ghulam, drain valleys which are comparatively open. At Kala Khum the river is 480 ft. wide, narrowing to 350 ft. in the narrowest gorge. Its level varies with the obstructions formed by ice, falling as much as 28 ft. when its upper channels are blocked.

In the valleys of the Waksh and the Surkhab to the north of Darwaz, which form an important part of the province of Karategin, maple, ash, hawthorn, pistachio and juniper grow freely in the mountain forests, and beetroot, kohl rabi and other vegetables are widely cultivated. About the cliffs and precipices of the Panja valley near Kala Khum are the wild vine, cerasus and pomegranate, and the plane tree and mulberry flourish in groups near the villages. Here also, amongst other plants, the sunflower decorates village gardens. The houses are built of stone and mortar, and above the thatched straw roof which surmounts the double-storeyed buildings the square water-tower rises gracefully. The left bank of the river belongs to Afghanistan.

From Kala Khum, which fort about marks the most northerly point of the great bend of the Oxus round Badakshan, the river follows a south-westerly course for another 50 m. through a close mountainous region and widens into the more open valley to the south of Kolab.

The topography of Darwaz south of the river is not accurately known, but at least one considerable stream of some 60 m. in

length drains to the north-east, parallel to the general strike of the mountain system into the transverse course of the Oxus, which it joins nearly opposite to the lateral valleys of Yaz Ghulam and Wanj. This stream is called Pangi-Shiwa, or Shiwa. Another of about equal length, the Ragh or Sadda, starting from the same central water-parting of this mountain block, and included within the Oxus bend, follows a transverse direction at almost right angles to the Shiwa, and joins the Oxus valley near its debouchment into the more open Kolab plains, where the course of the Oxus has again assumed a direction parallel to the mountain strike. Towards its junction with the Oxus it cuts through successive mountain ridges, which render its course impracticable as a roadway. It is necessary to avoid the river, and to pass by mountain tracks which surmount a series of local spurs or offshoots from the central plateau, in order to reach the Oxus. The existence of this route, which traverses the Darwaz mountains from east to west, cutting off the northern bend of the Oxus, and connecting those easterly routes which intersect the Pamirs by means of the Ghund and Shakh dara (and which concentrate about Lake Shiwa) with Kolab in eastern Bokhara, is important. (See BADA KSHAN.)

Badakshan Region.—From about the point where the Oxus commences to separate Russian territory from the comparatively open Afghan districts of Rustak and Kataghan, it adopts an uncertain channel and splits, leaving broad central islands. Between Kolab and Pata Kesar, immediately north of the Turkistan city of Mazar-i-Sharif, there are at least three well-known *guzars* or fords. Besides the Kolab and Surkhhab (or Waksh), the great muddy affluents from Karateghin on the north—the Kabadian, the Surkhan, and the Darbant are very considerable tributaries from Bokhara. The last is the river on which the well-known trade centre of Shirabad is built, some 20 m. north of the river. Near the junction of the Surkhan with the Oxus are the ruins of the ancient city of Termez, on the northern bank, and the ferry at Pata Kesar connects Bokhara and Mazar.

From the south the Kokcha and the Khanabad (or Kunduz) join the Oxus between Kolab and the Mazar crossings. The valley of the Kokcha leads directly from the Oxus to Faizabad, the capital of Badakshan, and its head is close above Ishkashim at the southern elbow of the great Oxus bend, a low pass of only 9,500 ft. dividing its waters from those of the main river. This undoubtedly was a section of the great central trade route of Asia, which once connected Ferghana and Herat with Kashgar and China. (See BADA KSHAN.) This river and the Khanabad tap the northern slopes of the Hindu Kush; their sources are in the unmapped Kafiristan mountains. To the west of the Kunduz no rivers find their way through the southern banks of the Oxus. Throughout the plains of Afghan Turkistan the drainage from the southern hills is arrested and lost in the desert sands.

At Airatan, a little above the Pata Kesar ferry, there are ruins, as also at Khisht Tapa (where the road from Kabadian to Tashkurghan leaves the river) and at Kalukh Tapa.

The Oxus in flood is here rarely less than 1,000 yards wide, and in some places fully a mile. Its winter channel is from two-thirds to three-fourths of its flood channel, except where it is confined within narrow limits by a rocky bed, as at Kilif, where its unvarying width is only 540 yards. The average strength of the current in flood is about 4 m. per hour, varying from 2½ to 5 m. The left bank above Kilif is, as a rule, low and flat, with reed swamps and a strip of jungle between the reeds and the edge of the elevated sandy desert. The jungle is chiefly tamarisk and padah (willow). Swamp deer, pheasants and occasionally tigers are found in it. The right bank is generally higher, drier, more fertile and more populated than the left.

Irrigation.—A wide belt of blown sand (or Chul), sprinkled with saxaul jungle, separates the swamps on the south side of the river from the cultivated plains of Afghan Turkistan; but in places, notably for about 12 m. above Khamiab where the Russo-Afghan boundary touches the river, through the Khwaja Salar district and in a less degree for 50 m. above the Kilif ferry, the Ersari Turkman has repelled the encroaching desert sand-waves, and a strip of riverain soil averaging about a mile in width has

been reclaimed and cultivated by irrigation. The cultivation, principally of wheat and barley, supported by canals drawn from the Oxus (the heads of which are constantly being destroyed by flood and again renewed) is of a very high order. The fields are intersected by narrow stone-walled lanes, bright with wayside flowers, amongst which the poppy and the purple thistle of Badghis are predominant; the houses, neatly built of stone, are scattered in single homesteads, substantial and comfortable; and the willow and mulberry offer a grateful shade in summer, when the heat is often insupportable. The fiery blasts of summer, furnace-heated over the Kizil Kum, are hardly less to be feared than the ice-cold north-western blizzards, which freeze men in the open desert, and frequently destroy whole caravans.

The Oxus ferries are large flat-bottomed boats which are towed across the river by small horses attached to an outrigger projecting beyond the gunwale by means of a surcingle or bellyband. They are thus partially supported in the water whilst they swim. The horses are guided from the boat, and a twenty- or thirty-foot barge with a heavy load of men and goods will be towed across the river at Kilif (where, as already stated, the width of the river is between 500 and 600 yards only) with ease by two of these animals. The Kilif ferry is on the direct high-road between Samar-kand and Akcha. It is perhaps the best-used ferry on the Oxus.

Below Khamiab, to its final disappearance in the Aral sea, the Oxus flows through a vast expanse of sand and desert. Under Russian auspices a considerable strip of alluvial soil on the left bank has been brought under cultivation, measuring 4 or 5 m. in width, and there is more cultivation on the banks of the Oxus now than there is in the Merv oasis itself; but it is confined to the immediate neighbourhood of the river, for no affluents of any considerable size exist. The river is navigable below Charjui. There is now a regular steamer service as far as Pata Kesar. The steamers are flat-bottomed paddle boats drawing 3 feet. About 100 m. above the Aral sea is the ancient oasis of Khwarezm or Khiva, entirely dependent on the Oxus for irrigation. The river here perpetually shifts eastwards, causing a constant need for lengthening the irrigation channels lest the oasis become a desert.

Previous Bed.—It appears that there was a time in the post-Pliocene Age when a long gulf of the Caspian sea protruded eastwards nearly as far as the longitude of Merv, covering the Kara Kum sands, but not the Kara Kum plateau to the north, which is separated from the sands by a distinct sea beach. At the same time another branch of the same gulf protruded northwards in the direction of the Aral, probably as far as the Sary Kamish depression, which lies to the west of the Khivan delta of the Oxus, separated from it by wide beds of loess, clays and gravel, covering rocks of an unknown age. The Murghab river and the Hari Rud, which terminate in the oases of Merv and Sarakhs, almost certainly penetrated to the gulf of the Kara Kum, but the question whether the Oxus was ever deflected so as to enter the gulf with the Murghab cannot be said to be answered decisively at present. The former connection between the Caspian and Aral by means of the gulf now represented by the Sary Kamish depression seems to be admitted by Russian scientists, nor would there appear to be much doubt about the connection between the Khivan oasis and the north end of the Sary Kamish.

OXY-ACETYLENE BLOWPIPE. An apparatus with a mixing jet which produces an intensely hot flame by projecting and burning acetylene with oxygen. It is of great value for metal working, producing a flame which attains about 6,000° F at the hottest part. In the high-pressure system, which is best for portable outfits, both the acetylene and the oxygen are delivered under pressure to the blowpipe, both from cylinders. In the

low-pressure system the acetylene is drawn direct from a generator. The blowpipes are manipulated either by hand, or guided in a machine. They are used for cutting out various shapes, parting thick sections, cutting out pieces for repairs or breaking-up purposes or welding to make new articles. When used for cutting, an excess of oxygen, about that needed for combination with the acetylene, is fed into the jet. This excess oxygen oxidizes or burns the hot metal. The oxide or "rust" thus formed is removed by the force of the jet and a "cutting" effect results.

When used for welding an excess of acetylene is fed into the jet. This causes any surface oxide to be removed and the hot metal surfaces readily combine, or become welded. Parts can also be heated conveniently for bending or straightening, and glass can be heated for working. The oxy-acetylene flame is too hot for brazing purposes, for which an oxy-coal-gas blowpipe has to be used. The approximate temperature of the oxy-acetylene flame may be compared with those of other flames from the following figures: Oxy-acetylene, $4,400^{\circ}\text{C}$; oxy-hydrogen, $2,420^{\circ}\text{C}$; oxy-coal-gas, $2,200^{\circ}\text{C}$; air-acetylene, $2,500^{\circ}\text{C}$; air-coal-gas, $1,800^{\circ}\text{C}$. (See WELDING.)

OXYGEN, a colourless, odourless, tasteless gas, somewhat heavier than air (sp.gr. 1.10523); it is slightly soluble in water, and this dissolved oxygen plays an essential part in the respiration of aquatic animals. (Symbol O, atomic number 8, atomic weight 16.000.) Oxygen combines with nearly all the elements under suitable conditions, but these reactions often do not take place if the substances are perfectly dry. With the exception of the "noble" metals, gold and the platinum group (*q.v.*), the metallic elements all oxidize when heated in oxygen, although molten silver dissolves 22 volumes of the gas without combining chemically with it, the absorbed oxygen escaping again when the metal cools.

Oxygen is by far the most abundant element, being nearly equal in amount to all the others put together. It forms 21% by volume of the atmosphere, eight-ninths by weight of water, and nearly one-half by weight of all the rocks composing the half-mile crust of the earth. Growing plants absorb carbon dioxide (*q.v.*), assimilating carbon and rejecting oxygen. It is the only gas able to support respiration.

Preparation and Properties.—It is readily prepared on a small scale by heating a mixture of potassium chlorate with about one-third of its weight of manganese dioxide, which facilitates the decomposition. From 1886, for about 20 years, oxygen was produced commercially by the Brin or barium oxide process. Barium monoxide was heated to $1,000^{\circ}\text{F}$ and absorbed oxygen from the air to form the dioxide. At $1,600^{\circ}$ the oxygen thus absorbed was again set free, the monoxide being regenerated. In later methods the temperature was maintained constant at about $1,200^{\circ}\text{F}$, and change of pressure was relied upon for determining the respective phases of oxidation and deoxidation. The purity obtainable, however, was not more than 94%.

In 1902 Linde applied the process of rectification to liquid air and was able to extract oxygen of 98.5% purity in economical yield. Air is freed of its carbon dioxide, compressed, cooled and then expanded, either in an engine doing external work or merely through a valve to perform internal molecular work; in both cases heat is lost and the temperature further lowered. This cooling effect is made cumulative by means of heat interchangers, tubular metal devices by which the cold gases after expansion are made to travel in indirect contact with and in counter-current to the incoming uncooled compressed air, so that the latter becomes continually colder at the point of expansion, until a limit is set by liquefaction. The liquid so produced is made to flow down a rectification column, fitted with numerous plates fashioned to ensure its intimate contact with ascending gas, which is produced at the base of the column by evaporating the liquid as it arrives there. When equilibrium is attained, almost pure oxygen can be drawn from the bottom of the column in gaseous or liquid form. Improvements in construction introduced in 1926 enable the separation of the nitrogen and oxygen of air to be effected almost completely, the oxygen purity being 99.5%, and the nitrogen over 99%.

Oxygen is also a by-product in hydrogen manufacture by the

electrolysis of water. The much greater power consumption, however, prevents this process competing with the liquid-air process for oxygen production only. The gas is supplied in steel cylinders at a pressure of 120–150 atmospheres. During 1926 the world's production of oxygen, in cylinders, was about 5,000 million cubic feet. The estimation of oxygen in a gas is most conveniently made by means of an alkaline solution of pyrogallol, by metallic copper in conjunction with an ammoniacal solution of ammonium carbonate, by sticks of phosphorus, or by a weakly alkaline solution of sodium hydrosulphite.

Oxygen condenses to a pale blue magnetic liquid, boiling at -182.9°C . By rapid evaporation and consequent cooling, or by cooling in liquid hydrogen, oxygen forms a bluish-white solid, melting at -219°C . When gaseous oxygen is acted on by the silent electric discharge, an unstable modification, ozone (*q.v.*) O_3 , is produced.

Uses.—Most of the oxygen is employed in industry for the fusion welding of metals, *e.g.*, steel, cast iron, aluminium, lead, and for the cutting of steel. Gas welding is generally accomplished by the aid of the oxy-acetylene flame, the two gases being supplied to a blowpipe wherein they are thoroughly mixed before combustion. In practice a little more oxygen than acetylene is used, and the resulting flame has an inner white core with a temperature above $4,000^{\circ}\text{C}$; it is quickly able to reduce these metals to the molten state locally, where two edges are to be joined. For metal cutting, a separate jet of "cutting" oxygen is provided in a similar blowpipe, either in the centre of the heating jet or behind it. As a rule, the melting point of an oxide is higher than that of the metal from which it is derived; but the fusion point of industrial iron varies between $1,400$ – $1,500^{\circ}\text{C}$, and the mixture of iron oxides fuses at about $1,350^{\circ}\text{C}$. In the cutting the oxides of iron are formed and blown away in the molten state before the unoxidized iron reaches its melting point, the necessary temperature being maintained chiefly by the heat of combustion itself, but to a less extent by an independent heating jet. When the cutting blowpipe is moved mechanically, and therefore regularly, over the metal a remarkably smooth regular cut is obtained, even through metal $1\frac{1}{2}$ in. thick.

Oxygen is widely used in medical practice, inhalation being of service in cases of pneumonia, heart complaints, etc.; also in cases of gas poisoning, especially by carbon monoxide. It is used with nitrous oxide by anaesthetists.

Liquid oxygen has considerable industrial applications. If a rod of hard gas-carbon be heated to redness at one end and then immersed in liquid oxygen, it burns in the liquid with intense evolution of light and heat, the carbon dioxide resulting being frozen and retained as a white solid in the liquid. If the carbon is presented to the oxygen in a porous form, *e.g.*, wood charcoal, lamp-black, soot, cork meal, sawdust, or wood pulp, the mixture forms a powerful explosive, more than twice as effective as blasting gelatine. It is so remarkably effective because the oxygen is free, and not chemically combined with other elements as in explosives like gunpowder or nitro-compounds, the explosion being an instantaneous oxidation of carbon, hydrogen or other elements. The materials are formed into cartridges in a paper wrapping; these may be 8 in. long and $1\frac{1}{2}$ in. in diameter. They are thoroughly soaked in liquid oxygen and placed in the bore hole, and, after tamping, fired electrically or by fuse. This explosive has the great advantage that it automatically becomes dead in a short time if not fired, owing to the evaporation of the oxygen. It is exceptionally suitable for use in iron mines and in tunnelling, as it gives rise to no harmful gases.

The highly volatile liquid is transported in double-walled spherical vessels, made of spun copper with long, narrow necks. A good vacuum is created mechanically between the walls. When the excessively cold liquid oxygen is introduced into the vessel, activated charcoal (*q.v.*), placed in the vacuous space and in contact with the inner sphere, becomes cooled, and then possesses the remarkable property of absorbing the residual gas and converting the vacuum to one of an exceedingly high order (a few millionths of a mm. of mercury). This vacuum, coupled with the highly polished metal surfaces, prevents the ingress of heat

to a large extent. A 25-litre container (the usual size) loses by evaporation only 5% of its full liquid charge per day. The liquid is poured from them into smaller dipping flasks, of similar construction, but cylindrical in shape with open top, so that the cartridges can be readily inserted and withdrawn. (For oxygen in relation to muscular contraction see MUSCLE.)

OXYHYDROGEN FLAME, the flame attending the combustion of hydrogen and oxygen, and characterized by a very high temperature. Hydrogen gas readily burns in oxygen or air with the formation of water. The temperature of the flame is dependent on the circumstances in which the process takes place. It obviously attains its maximum in the case of the firing of pure "oxyhydrogen" gas (a mixture of hydrogen with exactly half its volume of oxygen, the quantity it combines with in becoming water, German *Knall-gas*). It becomes less when the "oxyhydrogen" is mixed with excess of one or the other of the two reacting gases, or an inert gas such as nitrogen, because in any such case the same amount of heat spreads over a larger quantity of matter. It acquired considerable application in platinum works, this metal being only fusible in the oxyhydrogen flame and the electric furnace; and also for the production of limelight, as in optical (magic) lanterns. But these applications are being superseded, e.g., by the electric furnace, electric light and the oxyacetylene flame.

OYAMA, IWAO, PRINCE (1842-1916), Japanese field-marshal, was born in Satsuma. He was a nephew of Saigo, with whom his elder brother sided in the Satsuma insurrection of 1877, but he nevertheless remained loyal to the imperial cause and commanded a brigade against the insurgents. When war broke out between China and Japan in 1894, he was appointed commander-in-chief of the second Japanese army corps, which, landing on the Liaotung Peninsula, carried Port Arthur by storm, and, subsequently crossing to Shantung, captured the fortress of Wei-hai-wei. For these services he received the title of marquis, and, three years later, he became field-marshal. When (1904) his country became embroiled in war with Russia, he was appointed commander-in-chief of the Japanese armies in Manchuria, and in the sequel of Japan's victory the mikado bestowed on him (1907) the rank of prince. He received the British Order of Merit in 1906. He died on Dec. 12, 1916.

OYER AND TERMINER, the Anglo-French name, meaning "to hear and determine," for one of the commissions by which a judge of assize sits (see ASSIZE). By the commission of oyer and terminer the commissioners (in practice the judges of assize, though other persons are named with them in the commission) are commanded to make diligent inquiry into all treasons, felonies and misdemeanours whatever committed in the counties specified in the commission, and to hear and determine the same according to law. By the Treason Act 1708 the Crown may issue commissions of oyer and terminer in Scotland for the trial of treason and misprision of treason.

In the United States oyer and terminer is the name given to courts of criminal jurisdiction in some States, e.g., New York, New Jersey, Pennsylvania and Georgia.

OYSTER. Many marine animals are popularly called oysters, but most of these are only distantly related to the genus of true oysters, *Ostrea*. The different kinds of true oysters differ among themselves in shape, size and ornamentation of the shell and in their biological characters. Their nearest allies are the fan-shells (*Pinna*) and *Lima*. Window-pane oysters, pearl-oysters (*Margaritifera*) and crow-oysters are distant allies. All belong to the class Lamellibranchia (*q.v.*) of the Mollusca (*q.v.*).

At the present time oysters occur mainly between tidemarks or in shallow water, especially in estuaries, off the coasts of all continents except in the polar seas. A few species (including *Ostrea cochlear*) have been dredged from deep water down to 4,300 feet. As fossils, oysters occur from the Triassic onwards; the type form begins in the Jurassic. More than 500 supposed species of fossil oysters have been described but probably many of them are mere varieties.

Kinds.—Although more than 100 species have been described on shell-characters, it is probable that the total will diminish as more is discovered about the different forms. The most important species of economic value are given in the following table.

TABLE I. *Economic Species of Oyster*

Common name	Scientific name	Where found
(1) Rock oyster	<i>O. cucullata</i>	N.W., N., E. and S.E. coasts of Australia; East Indies; India; Norfolk Is.; New Caledonia; N. Is. of New Zealand; N.E. coast and inland sea, Japan; S.E. coast of South Africa.
(2) American-Canadian oyster	<i>O. virginica</i> = <i>O. elongata</i>	Atlantic coast of N. America from St. Lawrence R. to Mexico.
(3) Portuguese oyster	<i>O. angulata</i> or <i>Gryphaea angulata</i>	S.W. European and N.W. African coasts.
(4) The Japanese gigantic oyster	<i>O. gigas</i> , doubtful variety of <i>O. cucullata</i>	N.E. coast of Japan and coast of China.
(5) European or flat oyster	<i>O. edulis</i>	Atlantic coast of Europe and Mediterranean sea, from Norway to the Adriatic sea, including the British Isles.
(6) The British Columbian oyster	<i>O. lurida</i>	W. coast of N. America from about Queen Charlotte sound to California.
(7) The Australian mud oyster	<i>O. angasi</i> = <i>O. sinuata</i>	S. and S.E. coasts of Australia, Tasmania, and S. Is. of New Zealand.
(8) A Japanese oyster	<i>O. densilamellosa</i>	S. and E. coasts of Japan.
(9) A Chinese oyster	<i>O. rivularis</i> = <i>O. sinensis</i>	Off the coasts of China.

REPRODUCTION

So far as is known, all oysters reproduce by one of the two following methods.

Method I.—This may be illustrated by the European oyster, *O. edulis*, other oysters which exhibit similar or the same sex forms being the Australian mud oyster, the British Columbian oyster and the Japanese shallow-water oyster, *O. densilamellosa*.

Sex and Sex-change.—Individuals are normally at one instant either male or female, but they change from male to female, and back again many times during life. Hermaphrodites, however, do occur in varying proportions, but usually function as females.

Spawning.—The Sperms have a "head" about $\frac{1}{2000}$ in. or 2 μ , and a tail 20 to 30 μ and are shed directly into the sea; females collect the sperms from the sea-water and store them. The female-functioning individual spawns its eggs from the body, but retains them inside the shell where they develop into tiny motile bivalve larvae before they leave the parent. These larvae are frequently incorrectly called "spat" (see below). An individual three to four years old spawns about 500,000 eggs, while one seven to eight years old may spawn about 1½ millions or more in a season.

Development.—As the eggs, which are about 150 μ in diameter, are extruded they are fertilized, and begin to develop at once into embryos. The embryos begin swimming slightly when three to four days old. At the age of four to five days the shell begins to form and the embryo by a stronger development of its swimming organs passes into the larval stage.

Up to this time the embryos have remained white in colour, but as the shell grows larger the larva becomes grey and then passes through various shades of blue-grey and slate and, finally, becomes purplish-black when the shell is fully developed at a size of 180 to 210 μ . As the shell develops the cilia grow stronger. At this stage (at an age of about ten days) the larva leaves the parent to swim freely in the sea, although largely at the mercy of winds and tides. It swims about for a week to ten days or more, feeding and growing to a size of about 270 μ before settling down to a permanent sedentary life.

The larva may "settle" on a great variety of objects at any level in the water. It attaches itself by cementing the left valve of the shell to the object, loses its swimming organs, and quickly develops rudimentary adult organs, being then known as a *spat*. New shell material is deposited at the edge of the larval shell in a few hours and the shell thereby also soon assumes the adult form. The settling of larvae on objects in the sea is called a *spatfall*. Studies of spatfalls show there is a tendency of the larvae to settle in situations where the light is subdued. It is probable that the larvae of tropical species settle more easily than those of temperate species.

When an oyster is carrying white embryos or larvae it is said to be *whitesick*; when carrying grey larvae, *greysick*, and when bluish-grey to black, *blacksick*.

Method II.—This can be illustrated by the Canadian and American oyster (more fully described by Stafford, in the reference given below) but with little alteration this may be applied to the rock oyster, *O. cucullata*, the Portuguese oyster and the gigantic Japanese oyster.

Each individual is normally either male or female. So far as is known there is no change of sex. Both sexes shed their sexual products directly into the sea, where haphazard fertilization occurs. A good sized individual may shed at one spawning upwards of 50 to 60 million eggs. The egg, which is small (about 50 μ), develops into an embryo and larva in 8 to 12 hours. Within about two days the larva grows a complete bivalve shell, which in a period of two weeks or more reaches a size of about 380 μ before cementing itself to some object in the sea. After settling, the larva rapidly grows shell and develops adult organs to become a spat in the same way as the European oyster larva.

Artificial fertilization can easily be performed in this type of oyster by mixing ripe eggs and sperm in sea-water, provided clean conditions are ensured and excess of sperm avoided. In the *O. edulis* type artificial fertilization is more difficult.

Food and Mode of Feeding.—The main food of the oyster consists of microscopic plants, diatoms and peridinians, although microscopic animals probably always contribute an important portion. Decaying sea-weeds with their dependent bacteria have also a definite but unknown food-value. Oysters do not, however, feed all day long, nor at all times of the year. The American oyster does not feed late at night and in early morning, and relatively little on the ebb tide, little or no feeding occurs in late autumn and winter; below a temperature of about 4° C. (39° F) this oyster practically ceases to feed. Other oysters probably behave similarly but the temperature minimum varies for each species.

Oysters obtain their food by means of the gills, which are used at one and the same time as a water pump, food-collector and food-transporter. This living machine draws water into the shell into the inhalant chamber, and expels it from the exhalant chamber. The gills constitute the sole partition between these two chambers, and sieve off all the particles in the water drawn through the shell-space. The food particles arrested on the surface of the gill are collected into minor channels situated on the radial markings and from these are transported mainly to a large channel on the *free* edge of each gill leaflet. As the food-particles pass into these larger channels they are rolled into a sausage-shaped mass by mixing with a sticky fluid, mucus, and then passed to the lips or palps, which may either direct it into the mouth to be eaten, or pass it on to the mantle whence it is eventually rejected from the shell. Food-masses containing much heavy material, such as sand or mud, are rejected, others eaten. All

these manifold functions are performed by rows of microscopic whip-like organs (cilia) beating in sets rhythmically and in co-ordination. Throughout these operations mucus is manufactured and thrown out to entrap and retain the captured particles, and to permit of their easy transport in bulk. Unwanted material in the inhalant chamber is carefully collected together and literally blown out of the shell by sudden closing of the valves.

Breeding.—It has been seen that breeding comprises the two distinct operations of spawning and spatting. In the European and the American oysters, it is found that the beginning of breeding varies according to the warmth of the season and of the locality (see Table II). Probably other species behave similarly. The European species spawns little when the sea-temperature falls below about 59°–60° F., and the American, Canadian and Portuguese forms appear to require a temperature round about 68° F. for successful spawning, the European oyster tends in estuaries to spawn on the spring tides, and in 1925 spawned especially on the full-moon tides in the Fal estuary.

TABLE II. *Spawning Seasons*

Kind of oyster	Locality	Approximate spawning season	Authority
European or Flat. <i>O. edulis</i>	Taranto (Italy)	March–April to Oct.	Proprietors (Dean)
	Arcachon (France)	May to Sept.	De Bon
	Thames estuary (England)	End of May to Sept.	Anson and Willett
	Fal estuary (England)	End of June to Sept.–Oct.	Orton
	Norway (fattening ponds)	Aug. to Sept.	Helland-Hansen
American-Canadian. <i>O. virginica</i>	Norway (offshore)	little or rare	do.
	Chesapeake bay, (Md.)	May–June to Aug.	Winslow, Brooks
	Barnegat bay, (N.J.)	End of June to ?	J. Nelson
British Columbian. <i>O. lurida</i>	Malpeque (Canada)	June–July to ?	Stafford
	Boundary bay	May to Oct.	Stafford

On European oyster beds the greatest spatfalls of *O. edulis* undoubtedly occur in the warmer localities and in the warmer seasons, and probably a higher temperature (not less than 63° F.) than that required for spawning (59°–60° F.) is more favourable, if not actually necessary, for spatting. Other oysters are probably similar to *O. edulis* in this respect. Very good spatting seasons occur sporadically; for example, 1913, 1914 and 1921 were exceptionally good seasons in the Thames estuary. In the same locality bad and moderate spatting seasons have occurred on the average about twice as frequently as good or very good seasons. Similar fluctuations occur in all parts of the world.

Oyster Beds.—In times of scarcity when the spatfall has failed for a longer succession of years than usual, and when the adults on the beds have been reduced beyond a certain minimum, particular beds have gradually died out, as in the Firth of Forth, the German bight, and elsewhere. In open waters, beds die out more easily from these causes than in enclosed estuarine waters. On the other hand, new oyster beds sometimes occur off the coast when swarms of larvae have been carried long distances seawards by tidal currents, and found congenial ground. It is in this manner that deep-sea beds are mostly formed. By careful study of situations it is possible to start new oyster beds artificially by importing a species appropriate to a locality. Of the unknown factors favourable for a good spatting probably food and the physical condition of the water are most important.

Fattening.—Oysters are said to be fat when the body is naturally large, but largeness of body may be caused either by a well-developed reproductive organ only, or by accumulation of reserve food-products. Fatness during the summer or breeding time is mainly of the former type. Fattening by accumulation of reserve products occurs mainly at the close of the breeding season, when food may be taken in faster than it can be utilized. The food-reserves consist largely of glycogen (animal starch),

which is semi-liquid in the living animal and stored in the large bladder-cells found in most parts of the body. Abundance of food is dependent ultimately upon the chemical constituents of the sea-water, of which phosphates and nitrates are the most important.

Shell Growth.—Shell growth in oysters occurs in spurts, and one or more fringes of new shell may be added during one period of growth. In the European oyster in some localities, e.g., Fal estuary, shell growth occurs twice a year, in spring and autumn. The rate of growth of the shell varies locally and from season to season, so that it is impossible to fix any special size for any special age. In the case of the European oyster, if the larva settles in early summer, it may grow into a spat 1 to 1½ in. at the end of the growing period of that year, but if larvae settle late in the year they may finish growth in their first summer at a size of even ½ inch. The average size of natural spat on oyster beds, however, at the end of the first summer lies between ⅓ and ½ inch. (Under artificial conditions spat may grow much larger in the first summer, but have then usually extremely thin fragile shells.) In the same way average sizes at the end of the second summer of growth are about 1 to 1½ in.; in the third summer, about 1½ to 2 in.; fourth summer, average 2½ to 2½ in.; fifth summer, average 2½ to 2½ in. with a range to about 4 inches.

The average size at a given age will usually be higher on the shallower than on the deeper beds in an estuary, but is probably very high on deep-sea beds. American, Portuguese and tropical oysters grow much more rapidly than the European species; for example, the American species is said to reach a length of 2½ in. in seven months in South Carolina.

Enemies and Parasites.—The oyster's natural enemies are more numerous in early than late stages of life. The larva is eaten by small fishes, jelly-fishes, other bivalves, sea-squirrels (Ascidians), worms, anemones and small crustaceans, all of which are usually common on oyster beds. Spat, young and old oysters are attacked by borers which bore a hole through the shell and eat the oyster through the hole (especially *Murex* in Europe, *Xymene* in Australia, *Urosalpinx* in America). Fifty per cent of a spatfall may be destroyed where borers are abundant. Crabs (*Carcinus* in Europe, *Scylla* in Australia) attack weak oysters, especially the small ones, and do great damage. Large fishes with special crushing teeth devour large and small oysters (*Myliobatis*, Europe and Australia, *Pogonias* in America). Starfishes (especially *Asterias* species in Europe and America) consume at times quantities of stock, and a flat-worm is reported to be a pest on certain beds in America. The shell is bored into and used for protection by the sponge, *Cliona*, and often in large numbers by the worm *Polydora*. Competitors for food are numerous, such as all bivalves, especially mussels and, in general, all animals which feed in fundamentally the same way as the oyster.

Parasites are not numerous in oysters and are rarely dangerous. In *O. edulis* the spirochaete, *Cristispira* always occurs in the crystalline style. Occasionally the Coccidian, *Chytridiopsis* is found in the eggs, the gregarine (*Nematopsis*) in kidney and gills, and the bucephalus larva of the trematode (*Gasterostomum gracilescens*) in the body tissues generally. The metacercariae of trematodes cause serious damage to the Japanese gigantic oyster.

Diseases.—Weakness and heavy mortality may occur from functional derangement due to bad treatment by man or unfavourable general conditions of life. A normal mortality of 10% per annum due to all causes has been estimated to occur in England, but figures of 20 to 25% are estimated for Dutch beds. In oysters carried from one bed to another a mortality of 15% or more may occur, with possibly higher rates in the second season after relaying. Excess of fresh water, especially from melting snow, may produce great weakness with subsequent high mortality. Prolonged immersion in freshlets of water produces swelling. Sudden cold periods following warm weather in the summer are believed to be harmful. Gales sometimes result in the smothering of immense numbers of oysters on sandy beds, and a great loss may be experienced on muddy beds by silting up. *O. edulis* will live well in sea-water under thick ice, and in water warmed to a temperature of 90° F, and several species can with-

stand deprivation of oxygen for a week or more in winter, but not in summer. Stunted shell growth occurs in *O. edulis* on many beds, due apparently to a functional disturbance of the growth mechanism; such individuals are usually fat and esteemed for eating. Myolysis, or degeneration of muscular tissue, was associated strongly with the mortality in the Thames estuary in 1920, and has been observed elsewhere, but its cause (or causes) is at present unknown.

Oyster Industry.—The oyster industry constitutes an important source of income, especially in the United States, Holland and France, and in the former country is one of the most important fishery industries on the Atlantic seaboard. The statistics for the world's production—excluding Italy for which no figures are available—shown in Table III., give some indication of the fluctuations in production over a short period, and show mainly a marked decline from about 1920, especially in the United States, British isles, Holland, France and Japan. The chief causes of this decline are (1) over-fishing; (2) the failure of the spatfall in recent years to meet the demand; (3) possible occurrence of increased pollution, which reduces the spatfall, and (4) in Europe, the unusually heavy mortality in 1919-21.

Oyster Culture.—Oyster culture is carried out in four main operations which may be enumerated as (1) care of the beds; (2) production; (3) rearing, and (4) fattening. (1) On all grounds it is necessary to supervise and work on the beds to remove enemies, pests, sea-weeds and dangerous accumulations of all kinds, and otherwise keep the beds clean. (2) A breeding stock is maintained to supply a sufficiency of larvae. When the larvae are ready to settle various materials are placed in the water at suitable times and places to provide settling areas for the young oyster. This material is called *cultch* and varies in different countries. In England, America and Canada the commonest practice is to use clean shell, especially that of the oyster itself. In Holland and France earthenware tiles coated with lime are laid out in selected parts of the beds. In Italy, Australia, Norway, China and Japan branches of trees are thrown into or fixed in the water. Stones are used largely in Australia, New Zealand and China. It is especially important that the material used for providing settlement area should be clean at the time the larvae are ready to settle. If material be placed in water too soon it becomes slimy, overgrown with marine organisms, and, technically, dirty. In Italy bundles of twigs are placed in the water as early as April; in France and Holland tiles are put out in June; in England shell-cultch is usually put out in June, or, in a late season, in July. Bamboos are put out in Japan about April. The best place in a locality to put out the cultch can only be determined by local experience. Good spatfalls may be obtained in either a strong current or on banks covered by calm water. Certain oyster beds are only suitable for producing young oysters, which are sold at ages of one, two or three years for transplanting to or relaying on beds suitable for fattening. (3) Different methods are used in different countries for rearing the young. When shell-cultch is used below low-water mark, rearing may consist simply of leaving the spat on the ground until they are large enough (1½ to 2 in.) to be separated from the cultch (culling from the cultch) and then either removed to special beds suitable for growth, or returned to the same bed. Spat on sticks or stones above low-water mark is left in position during the summer or longer and then shaken off and relaid on growing beds. (4) Fattening oysters for the market is the final stage in oyster-culture. Owners of beds suitable for fattening buy from producing grounds young oysters generally three to four years old. These are merely relaid in the sea on special beds and fattening occurs automatically according to the season without further aid. Fattening grounds are only found by experience and may fail to produce fattened oysters in certain years. Artificial manuring of the waters over oyster-beds with phosphates and nitrates has been suggested to ensure fattening. Oysters placed in fresh water absorb water and become falsely fat. In France oysters are fattened artificially and rendered green by being kept in ponds in which an exuberant growth of the diatom *Navicula ostrearia* is cultivated. The greening is due to accumulation of pigments in the gill and palps from the

TABLE III. The World's Oyster Production (according to statistics)

Country	Oyster species	Unit of number, volume or weight	Production			Value: 1924, 1925 or 1926
			1911	1920	1926	
U.S.A.	<i>O. virginica</i>	Bushels	30,000,000 (1911-1918)		20,000,000 (1925)	\$ 14,000,000
Canada	<i>O. virginica</i> <i>O. lurida</i>	Barrels, each = 3 imperial bushels	31,746	14,526	22,255	152,073
England and Wales	<i>O. edulis</i>	Number	26,358,100	39,439,200	15,857,900	£159,757
do. Fal Estuary	do.	do. estimated	20,000,000	10,000,000	2,500,000	£8,750
Scotland	<i>O. edulis</i>	Number	1,158,045	253,731	83,188	£579
Ireland	<i>O. edulis</i> mainly	Number	2,773,980	3,620,764	1,622,344	£7,619
Holland	<i>O. edulis</i>	Number	30,349,000 (1914)	36,369,600	17,069,900	Gldrs. 1,967,850 nil
Holland (Zuider Zee)	do.	do.	8,405,295	952,985	nil	Fr. 78,272,524
France	<i>O. angulata</i> <i>O. edulis</i>	do. do.	790,262,500 922,305,600	378,363,500 403,309,000	1,083,706,000 10,867,000	Fr. 7,942,660 £85,141
New S. Wales	<i>O. cucullata</i> <i>O. angasi</i>	Bags, each = about 3bu. (1914)	21,526 (1914)	25,021	28,380 (1924)	£19,470
New Zealand	<i>O. angasi</i> <i>O. cucullata</i>	Bags, each = about 3bu. (1914)	24,793 (1914)	26,703	27,828	£8,344
Natal	<i>O. cucullata</i> <i>O. prismatica</i>	Dozens	24,310 (1914)	21,900	17,288	£762
Japan	<i>O. cucullata</i> <i>O. gigas</i> <i>O. densilamellosa</i>	Kwan = 3.75kg. = 8.27 lb.	3,29,836 (1914)	10,676,966	3,032,744 (1924)	Yen 616,713

ingested diatoms. Similar natural greening of oysters occurs in certain creeks in Essex and elsewhere. A green colour due to an accumulation of copper shows mostly in the body, rarely in the gills. The copper is present mainly in the blood cells. Metalliferous oysters occur in many parts of the world, viz., Falmouth (England), the Tagus, and certain American beds.

Artificial production of spat has been successfully performed in pits in France, in ponds in Norway, and recently in tanks by the British Government fishery research staff.

In Relation to Human Diseases.—It is known that oysters are liable to filter and retain alive from water contaminated with sewage certain bacteria which when swallowed by man may produce enteric fever. All oysters sent to the London market are scrutinized or sampled by the Fishmongers Company and, if necessary, tested for purity by bacteriological analysis. Oysters from beds contaminated by sewage may be purified in tanks of sterilized water, or by transplanting them for two or three weeks to beds remote from sources of pollution, but in the latter case it is desirable to prove the purity by bacteriological analysis before such oysters are pronounced fit to eat and finally placed on the market.

As oysters are often in poor condition in summer during the breeding period, and as dangerous bacilli in contaminated oysters would rapidly reproduce in warm weather, a close season is imposed in most countries at some period. Such regulations are beneficial also for spawning and spatting. In England the close season for native oysters varies in different localities but generally extends from March-April to August-September. Foreign oysters of any species may be sold in England at any time providing they show a clean health bill. A clean fat oyster may be eaten with impunity at any time of the year.

OYSTER BAY, a village of Nassau county, New York, U.S.A., on the north shore of Long Island, 28 m. N.E. of the Brooklyn Borough Hall; served by the Long Island railroad and in summer by ferries to Greenwich, Stamford and New Rochelle. The summer population in 1928 was estimated locally at 8,500. Oyster Bay is a residential village, with many country estates in the vicinity. Oyster-dredging is the principal industry. It was the beloved home of Theodore Roosevelt, and his grave is on a hill-side in Youngs Memorial cemetery. His home, "Sagamore Hill," stands on high ground, commanding delightful views. A seaside park, established as a memorial to Roosevelt, was opened in 1928. Oyster Bay harbour was explored by de Vries in June 1639. A settlement from Lynn (Mass.) was attempted in 1640 but was prevented by Governor Kieft, and for some years the territory around the harbour was claimed by both English and Dutch. The first permanent settlement was made by Peter Wright and others from Massachusetts in 1653. The harbour was a famous smuggling centre at the end of the 17th century.

OYSTER-CATCHER or SEA-PIE, a genus of wading birds, allied to the plovers. Conspicuous in both sexes by its black and white plumage and long red beak, the common oyster-catcher (*Haematopus ostralegus*) is found on all coasts from Iceland to the Red Sea. It feeds largely on marine worms, crustaceans and molluscs, and is very wary. The hen lays three clay-coloured eggs blotched with black, usually on a shingle-bank near the sea. The young are at first clothed in protectively coloured down and can run at once. Usually seen in pairs, oyster-catchers sometimes congregate in large flocks. The courtship consists of a dance in which one or both birds run round piping. Sometimes this dance, losing its original significance, is performed as a social function by a number of birds.

The American species (*H. palliatus*) has a longer bill and less white on the back, and its call-note differs from the musical "tu-lup" of the European bird. Various other species occur, some of which are entirely black.

OZANAM, ANTOINE FRÉDÉRIC (1813-1853), French scholar, was born at Milan on April 23, 1813. Antoine studied law at Paris, where he fell in with the Ampère family, Chateaubriand, Lacordaire, Montalembert, and other leaders of the neo-Catholic movement. In conjunction with other young men he founded in May 1833 the celebrated charitable society of St. Vincent de Paul, which numbered before his death upwards of two thousand members. In 1840 he became assistant professor of foreign literature at the Sorbonne, and in 1844 full professor. He died at Marseilles on Sept. 8, 1853.

TYPE OF OZONE WATER-PURIFIER FOR SWIMMING-POOLS

Water-purifier, showing row of ozone generators in centre. Ozone, a more active form of oxygen, is produced in these generators, by the action of the so-called silent, or brush high-tension electric discharge. Brought in contact with water from the swimming-pool, the action of ozone is to oxidize and destroy bacteria and organic matter, transforming them into harmless products, and rendering the water free from objectionable and dangerous elements

Ozanam was the leading historical and literary critic in the neo-Catholic movement in France during the first half of the 19th century. In contemporary movements he was an earnest advocate of Catholic democracy and socialism, and of the view that the church should adapt itself to the changed political conditions consequent to the Revolution.

His works were published in eleven volumes (Paris, 1862-65). They include *Deux chanceliers d'Angleterre, Bacon de Verulam et Saint Thomas Cantorbéry* (Paris, 1836); *Dante et la philosophie catholique au XIII^{ème} siècle* (Paris, 1839; 2nd ed., enlarged 1845); *Études germiques* (2 vols., Paris, 1847-49), translated by A. C. Glyn as *History of Civilization in the Fifth Century* (London, 1868); *Documents inédits pour servir à l'histoire de l'Italie depuis le VIII^{ème} siècle jusqu'au XIII^{ème} siècle* (Paris, 1850); *Les poètes franciscains en Italie au XIII^{ème} siècle* (Paris, 1852). His letters have been partially translated into English by A. Coates (London, 1886).

There are French lives of Ozanam by his brother, C. A. Ozanam (Paris, 1882); Mme. E. Humbert (Paris, 1880); C. Huit (Paris, 1882); M. de Lambel (Paris, 1887); L. Curnier (Paris, 1888); and B. Faulquier (Paris, 1903). German lives by F. X. Karker (Paderborn, 1867) and E. Hardy (Mainz, 1878); English biography by Miss K. O'Meara (Edinburgh, 1867; 2nd ed., London, 1878).

OSARK MOUNTAINS, more properly called highlands, are a group of moderate elevation lying in five States, Missouri, Arkansas, Oklahoma, Kansas, and Illinois. The total area is estimated at about 50,000 sq. m., of which 33,000 are in Missouri. The highlands are an elevated peneplain developed upon an asymmetrical dome whose apex is formed by igneous rocks outcropping in St. Francis and adjacent counties, in Missouri. The topography is dominantly of the ridge and valley type; most of the area has been sculptured out of limestone by streams with the abundant aid of underground solution. Except on the south and south-east the transition from highland to plain is very gradual. On the south-east there are high rocky bluffs that rise precipitously on the Mississippi, and on the south the Boston mountains constitute a well-defined escarpment bordering on the Arkansas lowlands.

The Boston of Arkansas, reaching elevations of about 2,300 ft. above sea-level and the highest points in the Ozarks, have been sculptured into truly mountainous form by the Arkansas and White river systems. In Missouri there are several isolated knobs more than 1,700 ft. above sea-level and one, Taum Sauk, in Iron county reaches an elevation of 1,750 feet. Turbulent streams flowing through deep cut gorges, numerous caverns and springs, and well-wooded hills have made parts of the Ozarks attractive to summer visitors.

OZOKERITE or **OZOCERITE** may be designated as crude paraffin wax; it is found in many localities in varying degrees of purity, and is named from Gr. *ὄζειν*, to emit odour, and *κνός*, wax. Specimens have been obtained from Scotland, Northumberland and Wales as well as from about 30 different countries; it was formerly worked commercially in Utah, U.S.A., but these deposits are now worked out and the sole sources of commercial supply are in Galicia, at Boryslaw, Dzwiniaz and Starunia. While formerly as much as 20,000 tons were mined annually, the industry has latterly suffered from the competition of the greatly increased output of paraffin wax extracted from petroleum.

Ozokerite usually occurs in thin stringers and veins up to 1 ft. or so in thickness and is believed to have originated from the slow evaporation and oxidation of paraffin base petroleum. It is generally characterized by a higher melting point than the wax extracted from oils, though the paraffin "scale" deposited on the casing of certain oil wells in Trinidad was found to approximate closely in melting point to native ozokerite.

As found in nature, ozokerite ranges from a very soft wax to a hard as gypsum, the specific gravity varying from 0.85 to .95 and the melting point from 58° to 100° C. It is soluble in benzene, chloroform, carbon disulphide, etc. Galician ozokerite varies from light yellow to dark brown and usually melts at 62° C.

The ozokerite as mined is separated from its mineral impurities by boiling in water, when the wax rises to the surface. This crude ozokerite is refined by treatment first with concentrated sulphuric acid and afterwards with charcoal, the result being the ceresine

or cerasin of commerce.

On distillation in a current of superheated steam, ozokerite yields a candle-making material resembling the paraffin obtained from petroleum and shale-oil but of higher melting point, and therefore of greater value if the candles made from it are to be used in hot climates. There are also obtained in the distillation light oils and a product resembling vaseline (q.v.). The residue in the stills consists of a hard, black, waxy substance, which in admixture with india-rubber is employed under the name of *Okonite* as an electrical insulator. From the residue a form of the material known as *heel-ball*, used to impart a polished surface to the heels and soles of boots, is also manufactured. (J. R.)

OZONE is a gas which possesses the odour of chlorine or of moist phosphorus. It may be formed (a) by chemical action; (b) by electrolysis; (c) by the electro-static field; (d) by ultraviolet rays; (e) by the radioactive elements; (f) by incandescent solids in air; (g) by the evaporation of water. Ozone has found quite general usage in many countries for the purification of water. At Philadelphia a Vosmaer sterilizing tower 33 ft. high and 3 ft. in diameter has been shown to be capable of sterilizing 50,000 gallons of water per hour, using an ozone concentration of one gram per cu. metre; the plant supplying Paris deals with 24 millions of gallons of water daily. Ozonized air has been utilized in food preservation, in surgery and therapeutics, in the bleaching and refining of oils, fats and varnishes. Its use in the fine chemical industry is of increasing importance. It is successfully employed in the manufacture of the flavouring material, vanillin, and the perfume, heliotropin.

Ozone, allotropic oxygen, chemical symbol O_3 (see ALLOTROPY), is normally a colourless gas. In great thickness or under pressure the colour is blue. It is sparingly soluble in water (coefficient of solubility, 0.044); it has been liquefied to a deep blue liquid which is, however, dangerous to handle owing to its tendency to spontaneous explosion. Its boiling point is variously given as -106° C (Olszewski) and -119° C (Troost). Ozone is seven times as soluble in carbon tetrachloride as in water. Its solutions in this solvent and in acetic acid, acetic anhydride and chloroform are blue and fairly stable.

The simplest form of laboratory ozonizer was due to W. von Siemens (1857) and consists of two concentric glass tubes, the inner surface of the inner one and the outer surface of the outer one being coated with tin foil, and each of the tin foil conductors being in metallic contact with the terminals of an electrical induction coil. A slow stream of dry oxygen is passed through the ozonizer and under the influence of the silent electric discharge the gas becomes charged with from 3 to 8% of ozone. Two types of ozonizers are employed on a large scale: those which have dielectrics in the path of the discharge—the Siemens and Halske, and Linder ozonizers—and those which have no dielectrics—the Schneller and the Vosmaer ozonizers. In the "ozonair" system a series of mica or micanite plates covered on both sides with a gauze of aluminium alloy are mounted side by side in a case into which air can be passed. Alternate plates are charged and earthed. The production is about 40-60 gm. of ozone per kilowatt-hour of energy at a concentration of 2 gm. of ozone per cu. metre of air.

The first recorded observation on ozone was by Van Marum (1785) who found that electrified oxygen had a peculiar smell and tarnished mercury. In 1840 C. F. Schönbein noticed these properties in air subjected to the silent electric discharge, in oxygen generated by electrolysis of water and in the slow aerial combustion of phosphorus. He gave to the new gas the name ozone (*ὄζειν*, to smell). Ozone is evolved in many chemical reactions, as by the action of sulphuric acid on barium or sodium peroxide and on many per-salts (perborates, percarbonates, permanganates, persulphates, etc.). Fluorine decomposes water with the production of blue ozonized oxygen (H. Moissan, 1891). The least volatile portions of liquid ozone contain a denser gas of great chemical activity to which the name *oxozone* has been given with a molecular formula O_4 . (C. D. Harries, 1911. See OZONIDES.)

The constitution of ozone as O_3 was demonstrated by T. Andrews and P. G. Tait (1860), J. L. Soret (1866-67) and B. Brodie

(1872), by making use of the fact that certain essential oils (cinnamon and turpentine) absorb ozone without taking up any marked amount of oxygen. The loss in volume by absorption of the ozone from ozonized oxygen was twice that observed during the original ozonization of the gas. It was inferred from these experiments that 3 volumes of oxygen are condensed to produce 2 volumes of ozone. This conclusion was confirmed by comparing the rates of diffusion of ozone and chlorine, when the density of ozone calculated on the basis of T. Graham's law of gaseous diffusion was approximately 24 ($H=1$), agreeing with a molecular formula of O_3 (48).

Moeller, *Das Ozon* (Brunswick, 1921); J. W. Mellor, *A Comprehensive Treatise of Inorganic and Theoretical Chemistry*, vol. 1 (1922). (G. T. M.)

OZONIDES, in chemistry, combinations of organic compounds with ozone. Soret's observation that ozone (*q.v.*) is absorbed by turpentine and oil of cinnamon was a forerunner of the remarkable results subsequently obtained by C. D. Harries

(1905-15) by passing ozonized oxygen into solution of unsaturated organic compounds in inert solvents such as methyl or ethyl chloride or glacial acetic acid. Ethylene gives ethylene ozonide, $C_2H_4O_3$, which on treatment with water yields formaldehyde and hydrogen peroxide. Benzene gives rise to an explosive triozonide, $C_6H_6.3O_3$, which is decomposed by heat to give glyoxal. Oleic acid from olive oil gives an ozonide which on decomposition gives two aldehydes and their two peroxides. These decompositions of ozonides are used in determining the position of unsaturated ethylene linkings in the organic molecule and also in the preparation of certain aldehydes. Harries applied the method of ozonide decomposition to the problem of the constitution of caoutchouc and indiarubber. In certain cases unsaturated organic compounds take up O_3 at the double linkage. The products are termed oxozonides, and are regarded as being due to the presence of oxozone, O_4 , in ozonized oxygen. Propylene gives $C_3H_6O_4$ and butylene forms both ozonide, $C_4H_8O_3$, and oxozonide, $C_4H_8O_4$.
